These acquisitions should add significant value if the company can perform like it has in the past, and I believe that the market is currently underappreciating American Tower's demonstrated ability to integrate new assets, increase tenancy ratios, and ultimately increase returns on capital as it acquires new towers. And I believe the company has a lot more room to grow as the global wireless market consolidates and matures. We hope to hold our shares and maintain exposure via calls for at least three to five years, and hopefully longer than that.

How It Fits Into *Pro*

Now that American Tower has been in our portfolio for almost 18 months, we feel comfortable enough with our investment thesis and with management's strategy and execution to target leveraged upside with a LEAPS call purchase. We aim to start with a small 0.5% allocation, knowing that American Tower may see some volatility along with the rest of the REIT sector when the Fed decides to change course on its interest rate policy. If American Tower suffers along with the REIT sector like it did in mid-to-late 2013 when "tapering" was the risk *du jour*, we may have an opportunity to add to our stake at lower prices. If not, we still benefit from leveraged upside.

This call purchase will increase our total look-through exposure (including both owned shares and calls) to 6.3%, making it in effect our second-largest position (our dollar exposure is 4.3%, making it tied for our sixth-largest position). Between American Tower's demonstrated operational execution, excellent management, strong industry tailwinds, and attractive economics, we think buying calls will turn out to be a smart decision.

More That Matters

- **Maximum loss:** Our entire 0.5% investment if American Tower stock is less than $80 at January 2017 expiration.
- **Maximum gain:** Unlimited as American Tower rises.
- **Breakeven:** $100.50 at expiration.
- **Follow-up:** We aim to start with a small 0.5% allocation, and will look to add more calls if the stock falls. And come expiration, we may roll our 2017 calls out for another year or two if we want to stay invested. Finally, if our call purchase is nicely profitable, we may eventually write diagonal calls against it or turn it into a bull call spread.

Alternative Trades

Members for whom one contract would over-allocate their portfolios can consider a few choices:

- Buy 0.5% more in stock, bringing your stake to 4.3%. Realize you won't benefit from the leverage calls provide, although you will have a better breakeven price and no expiration.
- Consider allocating 0.5% to a bull call spread at small strike increments. The in-the-money $90/$92.5, $92.5/$95, and $95/$97.50 spreads all offer attractive annualized returns (lately, 30%, 37%, and 42%, respectively) if the stock price is above the higher strike price at expiration. Out-of-the-money spreads offer higher

returns but an increased chance of total capital loss. (Our sister service, *Motley Fool Options*, offers what we think is an excellent overview of bull call spreads here.)

The Perilous Pitfalls of Multiples-Based Valuation

Published Dec 15, 2014 at 2:39PM

Fellow Fools,

How much is a company's stock truly worth? The question may be straightforward, but the process of answering it is anything but. This is why valuing companies using multiples — price-to-earnings, price-to-sales, price-to-book-value, etc. — has garnered so many adherents. Human beings are, to a large extent, lazy. And using multiples is quick and easy.

That's not to say that using multiples is bad, per se. People who rely on them almost always have the right intentions. They want to buy the cheap stocks and sell (or short) the most expensive. The problem is that they're taking a tool and using it as a solution. Price multiples may convey useful information, but they never tell the whole story. So it should come as no surprise that when we rely too heavily on them, the outcome is usually less than desirable. Let's take a look at some of the reasons why.

Apples to Apples, or Apples to Apple Pie?

One tech company is trading at 30 times earnings. Another is trading at 34 times. Which stock is a better value and worthy of a spot in your portfolio? If you decide based solely on their P/E multiples, then you are implicitly accepting that these two companies are equal with respect to everything except how much you're paying for shares — if they weren't, a difference in price would be warranted.

Flash back to May 2001. George W. Bush was just four months into his first term as president, and the animated film *Shrek* was the No. 1 movie in America. Two computer hardware companies by the name of **Apple** (NASDAQ: AAPL) and Dell were trading for similar multiples — 34 and 30, respectively — even though Dell was larger and more profitable. Their growth rates were as follows:

Company	1997	1999	1999	2000	2001
Apple	(28%)	(16.1%)	3.2%	30.1%	(32.8%)
Dell	46.5%	58.9%	48%	38.5%	26.2%

Apple staged somewhat of an operational recovery in 2000, but it was well on its way to another stinker in 2001, and the invite for the unveiling of the first-generation iPod was still five months away. For those who compared the two using multiples, choosing to invest in Dell over Apple probably looked like a no-brainer at the time. Since then, Apple has returned more than 8,000%, while Dell returned (43%) until it was taken private earlier this year. Peel back the first layer, and you'll often find that an apples-to-apples comparison is actually anything but.

The Best House in a Bad Neighborhood

This bullet point is simple, but it's imperative that you never forget it:

- It's possible that all of your comparables are overvalued.

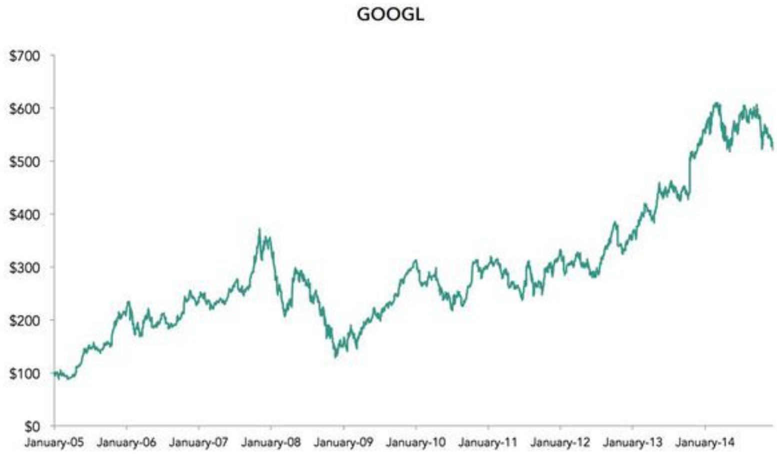
If that's the case, a particular stock may be widely overvalued even though it looks dirt cheap when compared to its peers, *à la* the dot-com bubble. There is little solace to be found when a peer group falls 45% but your stock only falls 40%.

Results May Vary

Did you know there's a mountain of academic research to support the claim that "value" stocks tend to outperform their more expensive "growth" brethren? I feel like I'm reminded of this fact on a weekly basis. Unfortunately, I think a crucial aspect of these studies is lost on most people (or outright ignored): Those studies were done using *large baskets* of value and growth stocks. The results hold on the whole, but individual results *will* vary wildly. Just because a stock looks cheap on the basis of its multiples doesn't mean it's a surefire market-beater. The next time someone cites this research to support their method of investing, ask them how many value stocks they hold in their portfolio. If their value portfolio is highly concentrated, politely remind them that individual results may vary.

Grow, Baby, Grow!

Over-reliance on multiples can also cause investors to pass on huge winners. Why? Because some companies really do grow into their valuation. Let's take another trip back in time, only this time to the start of 2005. Brent Crude oil had just broken $50 for the first time two months prior, and the Robert De Niro and Ben Stiller comedy *Meet the Fockers* was No. 1 in theaters. Imagine I approached you back then and told you to buy the stock of a company that was trading at about 250 times earnings and 20 times revenues, even though I knew the P/E multiple was going to contract by some 89% by the end of 2014. Would you have listened? I wish I had. The stock in question is **Google** (NASDAQ: GOOGL), and it's outperformed the S&P 500 by more than 360% since then:



Will *Pro*'s second-largest position, **Facebook** (NASDAQ: FB), follow a similar route? I don't know. But what I *do* know is that if you think we should sell, you're going to need to come up with a far better rationale than "it's trading at too high a multiple."

Foolishy yours,

— JP (TMFYossarian)

Set Up a Put Ratio Spread on the SPDR S&P 500

Published Dec 15, 2014 at 1:59PM

- **Is this for you?** Please take a deep breath, read this report carefully, and move slowly. This is a hedge, which we employ to reduce volatility and earn returns during a meaningful market decline. You don't need to hedge to succeed with *Pro*, but if you want to — and you have cash available, as we do, and can write naked put options and set up spreads (a high level of permission) — then you should follow along. Those without a margin account can't write naked puts, so they should consider the Alternative Trades at the end of this report, as should those managing less than $182,000.

How You Participate

- **Action:** Set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** 10%. Set up one 2:1 put ratio spread for every $182,000 you manage and want to hedge; *Pro* will sell 24 puts and buy 12.
- **Price Guidance:** You receive a small net credit to set up the trade.
  - Write ("sell to open") two March 31, 2015, $182 puts, and simultaneously buy ("buy to open") one March 31, 2015, $195 put for every $182,000 you're hedging. Note that these are quarterly options that expire at the end of March.
    - Sell to open two March 31, 2015, $182 puts: $3.35 (x2 = $6.70 credit)
    - Buy to open one March 31, 2015, $195 put: $6.50
    - Net credit: About $0.20 per spread (prices will change, but aim for a credit or no cost)
    - SPY price: $200

What We're Thinking

First off, today's recommendation is not a reaction to the recently declining stock market, and it's not done with any new concerns in mind — lower energy prices, for example, should ultimately help the economy grow. Rather, we've been planning a hedge for several weeks. The market's decline of 4% from its high doesn't play a role, nor are we suggesting the market will continue to decline. If pressed, I'd guess it'll be higher a few months from now, but obviously nobody knows. That's why we insure against declines. This is just what we do. And in *Pro*, we aim to hedge in attractive ways.

This hedge costs nothing out of pocket, and it won't work against us if the market increases in price — it will simply expire unused, paying us some income to boot. Income aside, this hedge generates a positive return for us if the index declines between about 2.5% and 15% by our March expiration, a wide range that represents the typical magnitude of a near-term market decline.

The only catch of this "credit" hedge is that — as with any put-writing trade — you need to be ready to buy the underlying investment (in this case, the SPY ETF) if it falls enough. If the index falls more than 15%, the hedge becomes a liability, one that starts at a loss for us if SPY is below $169 at expiration.

So, our breakeven on the position is about 15% lower than the current SPY price — a healthy cushion on a large index, but not outside the realm of possibility. It's also worth noting that this hedge doesn't benefit us at expiration unless SPY is at least 2.5% lower than its recent $200. That's by design; as we often say, there's little to be done about small market declines (typically we say 7% or less), but we want to hedge against larger falls. This hedge will reach its maximum profit if the index declines another 9%, and will provide some profit all the way up to a 15% or so market decline. Some details on allocation and returns:

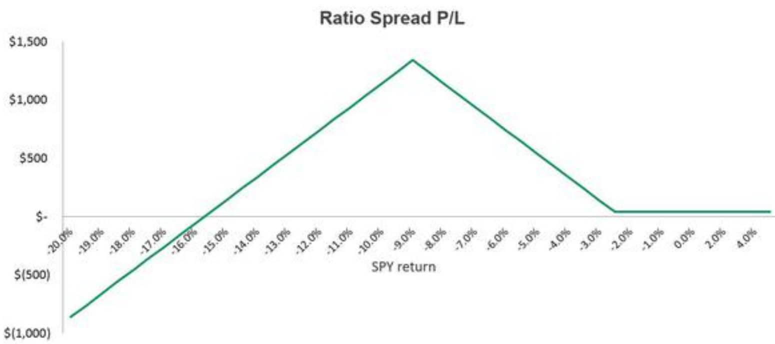
- Recent portfolio value: $2,300,000
- 10% of that value: $230,000
- Buy to open $195 puts (12 contracts, representing 100 shares each) = $234,400 in look-through exposure, or a 10%+ hedge on our current portfolio value
- Sell to open 24 $182 puts (half of which become a potential obligation, also about a 10% possible stake)
- Make sure you only write two puts and buy one for every $18,200 in SPY you could afford if you were forced to buy shares. (That number is $1,820 if you use the March 20, 2015, Mini options in our alternative trade below. These minis are denoted by a "NS.")

Return Details

SPY Price at Expiration	Value of 1 Purchased $195 Put	Value of 2 Written $182 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $200

SPY Price at Expiration	Value of 1 Purchased $195 Put	Value of 2 Written $182 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $200
$195 or higher	$0	$0	$0.20 per spread (or the credit received from initiating the trade)	Any increase in price, or any decline of less than about 2.5%
$193	$2 x $100 = $200	$0	$200	3.5%
$191	$4 x $100 = $400	$0	$400	4.5%
$189	$6 x $100 = $600	$0	$600	5.5%
$187	$8 x $100 = $800	$0	$800	6.5%
$182	**$13 x $100 = $1,300**	**$0**	**$1300** (max profit per spread)	**9%**
$181	$14 x $100 = $1,400	($1) x 200 = ($200)	$1,200	9.5%
$179	$16 x $100 = $1,600	($3) x 200 = ($600)	$1,000	10.5%
$177	$18 x $100 = $1,800	($5) x 200 = ($1,000)	$800	11.5%
$175	$20 x $100 = $2,000	($7) x 200 = ($1,400)	$600	12.5%
$173	$22 x $100 = $2200	($9) x 200 = ($1800)	$400	13.5%
$169	**$26 x $100 = $2,600**	**($13) x 200 = ($2,600)**	**$0** (break-even)	**15.5%**
$165	$30 x $100 = $3,000	($17) x 200 = ($3,400)	($400)	17.5%

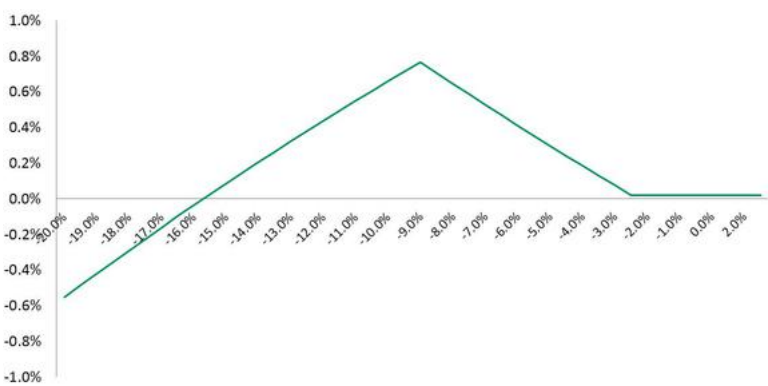
The first bold line above shows that our maximum profit will be earned if SPY declines 9% from its recent price, to $182, by our March 31, 2015, option expiration. Our breakeven on the strategy is $169 per share. If you're more of a visual learner, it breaks down like this:



Assuming we set this up for a credit, the trade will result in a small profit even if the market rises or treads water. But you need to be ready to fulfill the $182 put obligation if the index ETF declines below that price. Depending on the situation, we could start a 10%-or-so allocation in the S&P 500 index then. Or, we'll look at rolling our strategy to future months if we wish to avoid buying shares. Or, we may consider buying calls on SPY instead — to get the discounted price but use less cash. Or we may close the SPY puts to invest in stocks that we like more than SPY and that have declined more.

How It Fits Into *Pro*

Pro has consistently used hedges to lower its market exposure, or risk, in part because we have a North Star goal that calls for positive returns every rolling three years. Given this, any small advantage we can gain in a falling market will make a difference. In this case, if the market declines about 10%, this hedge will add about 0.68 of a percentage point in returns to the portfolio. It doesn't sound like much, but every half-point counts over the years, and even small annual differences end up as large amounts. That's compounding in action. Here's how this hedge can help the portfolio as SPY's price changes.



Alternative Trades

- **If you're hedging in an IRA or can't write naked puts:**
  - For a cost, you can set up a **bear put spread**, a strategy with capped risk that most IRAs allow. Using a spread order, "buy to open" March 31, 2015, $195 puts, and "sell to open" *an equal number* of March 31, 2015, $188 puts. Recently, this will cost you around $2 ($200) per spread, and that is your maximum risk. This strategy would be worth up to $7 ($700) per spread on a decline to $188 or lower, but you should be prepared to lose your $2 per spread if the market doesn't decline enough. As with any market hedge that you pay to set up, you have to *expect* to lose your investment most of the time, especially on a hedge that only kicks in during a lasting market decline.
  - **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
    - Set up the original put ratio spread as recommended, but also "buy to open" puts at a strike price well below $169. Buy half as many as the number of $182 puts you wrote. When you do so, all of your $182 puts will be "covered" (half by your $195 puts, and half by the other puts you buy at a much lower strike). You will only need cash in your account to cover the difference between your two lowest strike prices.

- **Managing less than $182,000?**
  - Use Mini options.If you want to use the non-standard (NS) Mini-options, which represent just 10 shares of SPY instead of 100, then use the **March 20, 2015 Mini options (there are no March 31 Minis)** to set up one 2:1 put ratio spread for every $18,200 you want to hedge. Use the same strike prices as our official recommendation, and use a limit order on the options.

- **Want to talk about SPY?** We have a board for that.

A Second Look at Warren Buffett's Favorite Market Indicator

Published Dec 8, 2014 at 12:24PM

Dear *Pro* Fools,

There's no denying it: By many conventional metrics, the stock market is overvalued. Here are some data points to help illustrate that point:

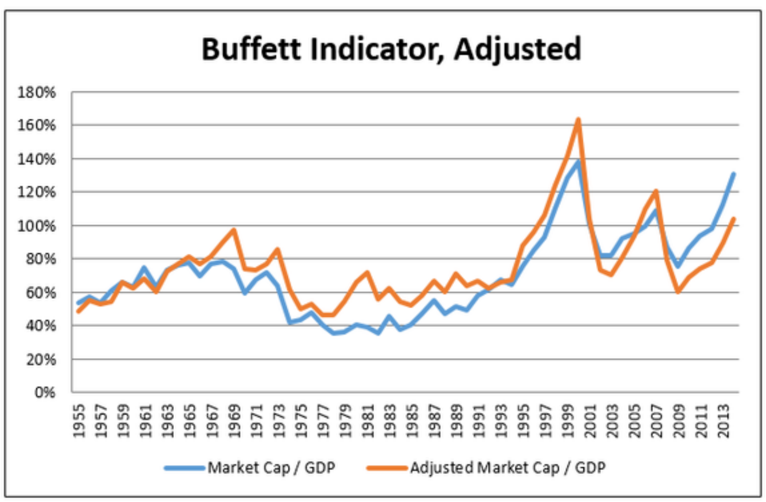
- Market indices are at all-time highs, with the S&P 500 and the Dow Jones Industrial Average closing at record highs last Friday, Dec. 5.
- Since the lowest point of the 2008-2009 financial crisis (March 9, 2009), the S&P 500 is up 207% (22% annualized) over a span of almost six years.
- The S&P 500's valuation metrics are higher than their historical norms:
  - P/E ratio: 20.1 (historical mean = 15.5)
  - P/S ratio: 1.8 (historical mean = 1.4)
  - P/B ratio: 2.8 (historical mean = 2.7)
  - Shiller Cyclically Adjusted P/E Ratio (CAPE): 27.3 (historical mean = 16.6)

Warren Buffett's favorite market indicator, the total U.S. market cap-to-gross-national-product ratio, also suggests the stock market is overvalued. In a *Fortune* article in 2001, Buffet mentioned the market cap-to-GNP ratio and explained that it has "certain limitations in telling you what you need to know.[1] Still, it is probably the best single measure of where valuations stand at any given moment."

Because I am familiar with the perils of single-variable analysis, I decided to take a different look at the Buffett indicator by adjusting for another variable – interest rates.

The effect of interest rates on stock valuations is complex, but it can be boiled down to a simple concept: supply and demand. When rates decrease, demand for safer investment vehicles like bonds decreases as well (thanks to the lower yields), and money flows to stocks in search of a higher return on investment. Conversely, when rates increase, demand for bonds increases, and money flows out of stocks into bonds.

Since 1955, a linear regression model shows that changes in the Fed Funds Rate have been able to explain 22% of the variability in the total U.S. market cap. As such, we can adjust the data to correct for the valuation-boosting effect of low interest rates. When we do that, this is what the Buffett indicator [2] looks like:



Sources: U.S. Bureau of Economic Analysis, Federal Reserve, analyst adjustments

When explaining his indicator, Buffett said, "If the percentage relationship falls to the 70% or 80% area, buying stocks is likely to work very well for you. If the ratio approaches 200% — as it did in 1999 and a part of 2000 — you are playing with fire."

As you can see, the unadjusted Buffett indicator (the blue line) is quite high, above 120% and approaching levels last seen at the peak of the late-'90s / early 2000s dot-com bubble. However, once the valuation effects of interest rates are taken into account, the adjusted Buffett Indicator is just over 100%, and the market looks less expensive relative to its own history.

To this exercise you might say, "Billy, you're arguing that the stock market isn't as overvalued as we think because rates are low. But if the Fed expects to raise the federal funds rate in 2015, then by the same token, shouldn't we expect market valuations to fall when that happens?"

Statistically speaking, the answer is yes. If I use the same adjustment techniques and account for an expected 2015 federal funds rate of around 1.5%,[3] the simple model predicts a 1.7% drop in the total U.S. market cap. Not too bad.

Am I saying that's what's going to happen? Absolutely not. For a reflexive system like the stock market, we cannot expect that what happened in the past will happen in the future. So if someone asked me what will happen when rates rise, my answer would be "we'll see."

To discuss this Memo, visit the Memo Musings board.

Fool on!

— Billy (TMFTailwind)

1. This article discusses some of the limitations of the Buffett indicator.

2. I used GDP instead of Buffett's quoted GNP because the data was easier to find. The difference between GDP and GNP in the United States is trivial.

3. 1.5% comes from the most recent FOMC economic projections (see "Appropriate pace of policy firming" in Figure 2).

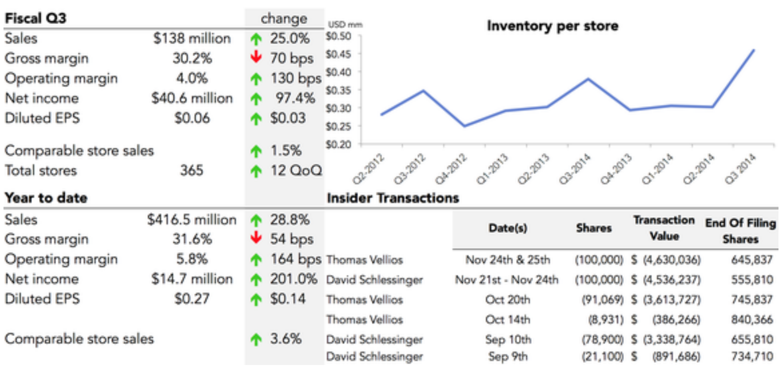
Pro Catch-Up Trade

- **Five Below** (NASDAQ: FIVE): Results for the Thanksgiving weekend shopping extravaganza from this price-capped retailer came in below expectations, and the early read from other tween retailers suggests that the weakness is likely to persist. The volatile stock remains a short at a 1.5% allocation.

Five Below's Third Quarter Was a Mixed Bag

Published Dec 8, 2014 at 11:49AM

Five Below's (NASDAQ: FIVE) third-quarter results and earnings call had a bit of everything.



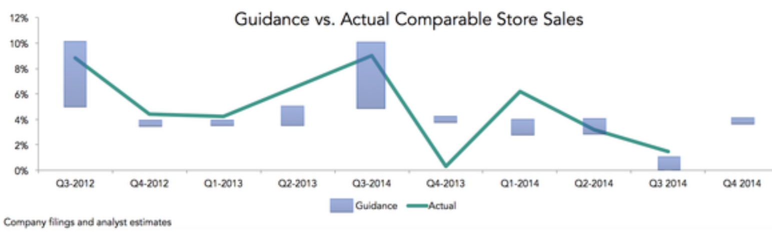
Fiscal Q3		change
Sales	$138 million	↑ 25.0%
Gross margin	30.2%	↓ 70 bps
Operating margin	4.0%	↑ 130 bps
Net income	$40.6 million	↑ 97.4%
Diluted EPS	$0.06	↑ $0.03
Comparable store sales		↑ 1.5%
Total stores	365	↑ 12 QoQ
Year to date		
Sales	$416.5 million	↑ 28.8%
Gross margin	31.6%	↓ 54 bps
Operating margin	5.8%	↑ 164 bps
Net income	$14.7 million	↑ 201.0%
Diluted EPS	$0.27	↑ $0.14
Comparable store sales		↑ 3.6%

Insider Transactions

	Date(s)	Shares	Transaction Value	End Of Filing Shares
Thomas Vellios	Nov 24th & 25th	(100,000)	$ (4,630,036)	645,837
David Schlessinger	Nov 21st - Nov 24th	(100,000)	$ (4,536,237)	555,810
Thomas Vellios	Oct 20th	(91,069)	$ (3,613,727)	745,837
Thomas Vellios	Oct 14th	(8,931)	$ (386,266)	840,366
David Schlessinger	Sep 10th	(78,900)	$ (3,338,764)	655,810
David Schlessinger	Sep 9th	(21,100)	$ (891,686)	734,710

The Good

Starting out with the good (which is bad for folks like us who are short the stock), top- and bottom-line growth came in at a respectable 25% and 97.4%. This strength was driven primarily by a store count increase of 20%, but comparable-store sales did contribute with a positive 1.5% comp for the quarter. This actually exceeded my expectations, given that the company was going up against the 9% rubber band loom comp from last year. Breaking the trend that has been in place since going public, comp growth was driven primarily by ticket size in Q3.



Company filings and analyst estimates

Gross margins continued to come under pressure, largely because of disruption at the West Coast ports. As alluded to last quarter, management decided to incur higher costs and shift receipts from November into October in order to mitigate the risk of not having enough inventory in Q4. Given the company's reliance on Q4 sales, this was prudent.

The Bad

But this move to accelerate import deliveries resulted in inventory on a per-store basis jumping 51% quarter over quarter and 20.6% year over year. This particular metric had been trending higher as the company filled up its new distribution facility in Mississippi, but that kind of growth is unprecedented for the company. For reference, inventory per store grew 26% QOQ and 9.4% YOY last year even though management's forecasts for Q4 2013 were more optimistic. Although prudent, this move could end up backfiring if traffic and sales come in below what management is hoping for. It also means that we should expect the downward pressure on gross margins to continue.

Speaking of traffic, results for this past holiday weekend shopping extravaganza came in below estimates. As a company with no e-commerce strategy in place, Five Below isn't exactly well positioned for the move toward online shopping. These preliminary results, combined with guidance for the all-important holiday quarter that was below expectations, sent the stock down more than 12%. The company expects sales to come in at $262 million to $266 million (implying top-line growth of 23% to 25%) based on one more new store and a 4% increase in comparable-store sales. Taken at face value, these expectations might sound fine, but it is crucial that you view them in light of (1) the fact that FIVE's results last holiday were quite poor, giving them a favorable benchmark, and (2) the expectations embedded in the current stock price.

The Ugly

The two co-founders, Thomas Vellios and David Schlessinger, continue to liquidate their holdings. Interestingly, they took advantage of SEC rule 10B5-1 to sell during quiet periods and sold 119,000 shares one week before earnings. These may be listed as "automatic dispositions," but color me skeptical. In the past three months, the two have liquidated 400,000 shares – good for almost 27% of their holdings at the beginning of the quarter. And this isn't a new development, either. I have a time viewing this as anything other than a negative. If management's forecast of 2,000-plus stores is realistic, why would they be selling when they're not even 20% of the way there? Having received $3,700,000 and $3,600,000, respectively, in cash compensation in 2013, it probably isn't because they need cash.

The Puzzle

In a move that few saw coming, CEO and co-founder Vellios announced his plans to pass the reins over to current COO Joel Anderson. Joel joined the company a little less than six months ago after leaving his position as the CEO of Walmart.com. The speed of with which this all happened leads me to believe that this was part of the reason Anderson decided to join Five Below, though there are rumors that the writing was on the wall for Anderson at Wal-Mart.

Current Valuation

Historical	
EV/EBITDA	25.3
P/E	51.9
P/S	3.25
P/CFO	45
P/FCF	128
Forward	
EV/EBITDA	19
P/E	38
P/S	2.6

The Bottom Line

Q3 results may have beat expectations, but the guidance for the holiday quarter was underwhelming. Given that Q4 traditionally accounts for around 40% of the company's yearly sales, I think this is a trade-off that short sellers should be happy to take every time. I currently view Five Below as a combination of two of the worst places to be in retail – non-discretionary low-priced retail (low barriers to entry, product mix that doesn't support an online presence, etc.) and tween retail (extremely fickle customer base). The true test for our short thesis will come this holiday, but as it stands right now, I struggle to see how Five Below's current business model will support 2,000-plus stores.

Our Favorite Time of Year

Published Dec 5, 2014 at 4:24PM

Greetings, *Pro* members!

We hope you're enjoying the approach of the coming holidays — and to our new members, we hope you're enjoying setting up your *Pro* investment portfolio, too! In our Portfolio Building Reports, we've recommended that new members start to purchase shares in nearly two dozen *Pro* companies that grace our portfolio, and that veteran members already own. These are companies that we have known well, in most cases for many years, and that we of course believe in enough to own ourselves. We see bright futures for our investments. At the same time, we look forward to inevitable market volatility, too, whenever it occurs, as an additional opportunity.

As you saw in last week's *Pro* Portfolio Positioning report (and live event), we're currently working on new portfolio hedges, and dissecting more companies as short-sale candidates. We want *Pro* to handle market downturns with relative grace, if not outright ease. And as always, we have new possible buys (either stocks or call options) and income ideas in the works. In 2015, we're going to continue to target at least 12 new option income recommendations.

It's my favorite time of year. Like many of us, I enjoy using the quiet time at the end of December to reflect and set key goals for the year ahead. When it comes to *Pro*, one goal will be to continue to have a portfolio that we feel 100% great about. This means steady reassessment and adjustments, but our overarching approach is time-tested, and we feel very good about the years to come. We feel confident we will continue to grow strong value over the time frame that matters: the coming years. We're grateful that you're a *Pro* member with us, and we're here to help you however we're able.

Another Live Chat Coming Up

Whether you joined us for our Dec. 3 chat or not, we'd love to see you in our regular monthly live text chat at 4 p.m. Monday. Please bring your questions — and your own goals to share.

Foolishly,

Pro Portfolio Points

Published Dec 5, 2014 at 10:58AM

Greetings, *Pro* members! I look forward to reflection over the coming holidays, and to being well-positioned for the coming years, as well.

It's late 2014 ... here's where we are:

- We're hoping to have at least 33% more value in our portfolio by 2017, three years from now (that's 10% a year).
- The S&P 500 trades at 19.6 times trailing-12-month EPS, and 16.1 times 2015 estimates (re: Cap IQ). It's on the high side but still within historical averages. Lower oil prices could increase GDP growth overall more than lately expected.
- Many of our stocks trade at lower forward valuations, such as Gilead at 10 times, Skyworks at 13, and Oracle at 12.7.
- As late as mid-November, 73% of large-company value managers were "underperforming" the S&P 500 Value Index, and 94% of large-cap fund managers were trailing the S&P 500 Growth Index, Stovall says. This generally means they'll be reaching for returns this month and to do better in 2015.

Pro

- *Pro* is about 83% net long; new members are around 79% invested once they follow all five of our Building/Positioning reports from the past month.
- We have about 13% cash excluding shorts; new members have 17% or so.
- The *Pro* Port as of today is up 16.7% this year, ahead of the North Star (S&P is up 12% re: Cap IQ).
- Compounding is something: We're up 16% this year, but that means we added $330K in value, or a whole 33% on our original assets this year alone (33% would be one of the market's best yearly returns, and we're earning it in stealth fashion this year on our starting base). That's why long-term stock investors win out: even a 7% annual market gain can be a huge return on the money they invested 10 years ago.
- We've averaged 74% net long this year, and earned 139% of the market's return.
- Members should take their time to continue to get invested following our Building/Positioning Reports, and of course add our new recommendations following new trade alerts as we have them.
- You absolutely don't need to short or hedge or even use options if you're not ready.
- We're here to use a better long-term investing approach (a three-year outlook) in good and weak markets. The market is likely going to be more challenging the coming few years than the last few. We want to be ready.
- We're comfortable with our current exposure, but we're working on new market hedge positions.
- We'll likely lower our exposure to 70% or less as we bring out some hedge ideas, but we're comfortable for the moment.
- We are also working on new company shorts and potential buys (with calls or straight stock)
- All of our stocks are rated Buy First or Buy except **O'Reilly Automotive** (NASDAQ: ORLY), which is on hold for now. We'll have updated thoughts soon.
- All of our shorts can be shorted today except **Five Below** (NASDAQ: FIVE), which we recommend waiting on because it reports earnings tomorrow — in other words, hold off if you're new. Also, you can't really short **UltraShort Real Estate ProShares** (NYSEMKT: SRS) anymore because it is too small. Short more **Direxion Daily Financial Bear 3X Shares ETF** (NYSEMKT: FAZ) in place of starting a SRS short.
- Our synthetic long on **Coca-Cola** (NYSE: KO) is not recommended for newcomers at the moment. A price dip could change that. The diagonal on Coke from *Motley Fool Options*, in which many members participated, was a good alternative anyway. We'll almost surely have more opportunities in Coke for everyone.
- Our position on **Expeditors International of Washington** (Nasdaq: EXPD) was updated for newcomers in [a recent trade alert](). If you didn't do it then, you should wait for a *Pro* Catch-Up Trade to get on board with it.
- If you can't short FXE or FAZ directly, consider the synthetic shorts in the [Positioning Report]() today. But watch your allocations; each syn short is 100 shares. Instead of shorting FAZ or SRS, you can also simply add 1% more to one of our long financials or "real estate" holdings (**MasterCard** (NYSE: MA), **Wells Fargo** (NYSE: WFC), **American Tower** (NYSE: AMT), etc), rather than short FAZ.

Now that [our five reports are out](), as new members slowly take those in, we can spend more time focused on new recommendations that are in the works.

Best,

Jeff

The Pro Portfolio

Published Dec 5, 2014 at 10:07AM

What Is Exposure?

The "Exposure" table at the bottom of our Recommendations page shows how exposed we are to the market's upside and downside. We're simply measuring the amount of the *Pro* portfolio that's invested long versus short as a percentage of total portfolio value.

- "Long" includes all the stocks, bullish ETFs, and options we own – and positions expected to increase in price as the market increases, and decline when the market declines, including our shorts of bearish ETFs.
- "Short" includes all the short stocks, owned shares in bearish ETFs, and options we've written in the portfolio. This excludes our shorts of inverse or bearish ETFs, because those behave like longs.
- Our long exposure *plus* our short exposure equals our gross exposure (or total exposure to the market, long and short).
- Our long exposure minus our short exposure equals our net exposure (or total long exposure to the market). A net number higher than 50% means we're more than 50% long. A number of 70% means we're net 70% long. And so forth.
- "Hedged Out": The percentage of our long portfolio that is currently hedged by in-the-money options (typically covered calls). Once in-the-money, these positions do not offer us more upside, so they're tracked as "hedged out" unless and until they decline below the hedging strike price.
- "True Long": The amount of our assets that is invested long and unencumbered by shorts or hedges. This provides us a clear view of the amount of capital that currently has uncapped upside potential.
- "Cash Ex-Shorts" is the cash we have left *after* the current cost to close all of our short stock, ETF, and option positions, so it's our true cash balance.
- "Short Put Exposure" shows how much cash we would need to spend if all our written (or short) puts were exercised. Keep in mind, we can roll or close our written puts, so we don't often plan to turn all our written puts into cash-based positions. This means this number can be larger than our cash balance for long periods, even though we're not borrowing any funds.

Portfolio Building Report No. 4

Published Dec 1, 2014 at 4:19PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

[Part 1]() [Part 2]() [Part 3]() [Part 4]() [Portfolio Positioning Event]()

Dear *Pro* member,

The stocks in your fourth Portfolio Building Report range from one of the strongest and fastest-growing biotech companies in the world, to the company earning by far the most profit on the young mobile computing revolution. Once you've read this report, you'll have our updated thinking on the rest of the *Pro* stocks that are rated Buy or Buy First, and our recommendation that you buy them. As always, though, take your time, ask questions on the discussion boards, and only invest as you're comfortable doing so. Average in over time if you prefer, or as you have cash available. We are investing to win over the long haul — that's the only time frame that ultimately matters. Nobody knows what the stock market will do over the coming months (so take your time), but we feel strongly that our companies will create great value over the coming years.

Next up is our Portfolio Positioning Report and live event with you on Dec. 3. We can't wait to see you there! During that event, we'll talk about shorting, hedging, and options, and the accompanying report will provide recommendations on those positions. As you gradually build your *Pro* portfolio of stocks, it becomes time to consider hedges, shorts, and options if you're following along with us in these versatile and promising investment tools. We look forward to the event and then to helping you every step of the way to long-term investing success.

Have a great Thanksgiving! Be Foolish!

— Jeff and the *Pro* Team

Table of Contents

Download this report as a PDF

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products could see more growth than anyone expects.

Suggested Allocation: 4.6%

What It Does

Led by its iPhone and iPad, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces. iTunes alone earns more revenue each year ($18 billion) than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, approaching $200 billion in annual sales — and still growing strongly, with 20% earnings-per-share growth last quarter. The company's uniquely integrated hardware and software have made for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, only Apple makes it easy to transition from one to the other seamlessly.

For More

- *Pro*'s original recommendation (2/14/12)
- Talk about Apple
- Most recent earnings update (11/22/14)

How It's Working

Over the past year, Apple refreshed all of its product lines and announced Apple Pay and Apple Watch. The Watch rolls out in early 2015, while the new iPhone 6 is already achieving record sales with demand far outstripping ready supply. Tim Cook teases that Apple has more product ideas in the works. Meanwhile, Apple has maintained its magic touch and is not chasing the lower-priced phone market, instead protecting profit margins. We like this choice. Apple earns by far the highest profits in the mobile computing industry, making it the most cash-rich company on earth, with $50 billion in free cash flow last year.

What We Expect

In the longer term, we expect more great innovations from Apple, including other new product categories. We believe customer loyalty will drive healthy recurring sales of phones, tablets and Macs, and new customers and market expansion will add more growth. The stock is priced to produce North-Star type returns as long as Apple maintains its healthy glow, as we believe it will.

Buy: The Buckle (NYSE: BKE)

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 2.5%

What It Does

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests. The Buckle sells jeans, other apparel, and accessories at 463 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. The store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company's same-store sales are down 0.5% year to date, while online sales are up 2.8%. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. Management's stellar performance has earned the benefit of the doubt:

Metric	2003	2013	Annual Growth
Stores	316	450	3.6%
Sales per Store	$1,354	$2,335	5.6%

Metric	2003	2013	Annual Growth
FCF per Store	$121	$326	10.4%
Sales per Square Foot	$274	$461	5.3%
Inventory Turnover	4.1 times	4.9 times	1.8%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

What We Expect

For More

- *Pro*'s original recommendation (6/20/12)
- Most recent earnings coverage (11/25/14)
- Talk about The Buckle

With 463 stores located in 43 states as of the end of the most recent quarter, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. Recent expansion into footwear, accessories, and children's offerings should provide enough fuel to keep same-store sales healthy, while a commitment to customer service entices repeat visits.

The Buckle also has a history of paying special dividends with its excess cash; since 2008, it's paid out almost $15 worth. This past January, *Pro* members holding the stock received a $1.42-per-share payout from the company (after a 1:16 stock split) in addition to the regular $0.22 dividend. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has approached North Star-level returns. We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle.

Buy First: Gilead Sciences (NASDAQ: GILD)

One of the strongest biotech companies on earth, Gilead is positioned to keep rewarding owners.

Suggested Allocation: 4%

What It Does

Gilead Sciences (NASDAQ: GILD) helps millions of people fight life-threatening diseases. Its HIV drugs are prescribed to 9 out of 10 new HIV patients, and are already helping millions enjoy much better lives. The company's HIV products represented the majority of Gilead's revenue until its Hepatitis C cure, Sovaldi, was approved this year. The most successful drug launch in history, Sovaldi topped $8.5 billion in sales in three quarters, though it has only been prescribed to about 117,000 patients so far (as of Sept. 30).

An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, and a whole 2.8% of the world (almost 200 million people) is thought to have this common blood-borne infection. That means tens of millions could conceivably benefit from Sovaldi or its newer single-pill version, Harvoni, and this would still leave plenty of room for upcoming competing drugs to do well, too.

How It's Working

Gilead's revenue rose 117% in the quarter just reported, sending earnings per share up 255%. The company's products have a healthy lead over competitors' Hepatitis C drugs still awaiting approval, first in the U.S. and then in other countries where it will take even longer. And because Gilead's Hep C drugs look as or more effective than competing products, doctors have few reasons to wait or switch. Gilead's new Harvoni drug, approved in October, is the first single-pill regimen for curing Hepatitis C, and competitors aren't likely to match it anytime soon. Meanwhile, the company's HIV franchise remains unparalleled, and Gilead has more than 200 compounds in clinical trials.

For More

- *Pro*'s original recommendation(4/30/14)
- Talk about Gilead
- Most recent earnings update (11/22/14)

What We Expect

Going into 2015, we expect more growth as Harvoni is prescribed to tens of thousands of new patients around the world. And that won't stop next year; countries will slowly approve the drug and its reimbursement over many years, and we expect Gilead to be the leader in the cure of Hepatitis C. Even if new competitors bring about a slip in pricing, the profits should remain substantial. And by signing generic drug agreements, Gilead is poised to lead the industry in providing a Hep C cure to 90 emerging-market countries. Meanwhile, we expect Gilead's refreshed HIV franchise and growing oncology franchise to keep increasing shareholder value even beyond the Hepatitis C market.

Buy: MasterCard (NYSE: MA)

Plastic — and digital — is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.5%

What It Does

MasterCard (NYSE: MA) is among the most attractive businesses in the world. Here's why: The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ...

it's still cash. Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives -- like MasterCard.

How It's Working

For More

- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard
- Most recent earnings update (11/22/14)

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — especially in developing nations. In the first nine months of 2014, MasterCard processed $3 trillion in purchase volume, $2 trillion of which came from outside the United States. Growth in its U.S. business was 8.3%, strongly outpacing our economy (as measured by GDP). And worldwide growth, excluding the U.S., clocked in at a tremendous 14.8% in local currencies. Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard. In its October conference call, MasterCard called out India, Japan, Europe, Australia and China as being some of its largest opportunities. Cash is by far the leading means of transaction in each place.

What We Expect

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner in 2015 and beyond. CEO Ajay Banga and team are doing a tremendous job moving the company forward, and keeping it at the vanguard in new ways to pay, too. Digital payments are another avenue for growth as MasterCard's invaluable connections to banks and millions of merchants make it a leading choice, along with Visa, for digital payment platforms such as **Apple**'s (NASDAQ: AAPL) Apple Pay. Though we value it conservatively, we expect MasterCard will continue to surprise the world with strong growth for years to come.

Buy: Medtronic (NYSE: MDT)

For once, maybe we can all profit from growing older.

Suggested Allocation: 3.2%

What It Does

No matter how good Grandma and Grandpa look at Thanksgiving, the honest truth is that ever more people in developed nations are advanced in age — and getting more advanced (that's the nicest way we can say it!). Global health care is a growth market we'd be silly to miss. Since 2009, *Pro* has stood by **Medtronic** (NYSE: MDT) because of its global reach, unrivaled commitment to research and development, and attractive financial profile. In that time, shares have risen 90%, but only now does the business finally looked poised to consistently grow, offering more upside to long-term owners like us.

Medtronic is in business to "alleviate pain, restore health, and extend life" for the chronically ill. The company has grown from a garage operation into one of the world's largest medical technology companies by keeping its patient-centric mission front and center. Today, Medtronic has a vast suite of high-tech products; it boasts market-leading share in key technologies; and it has successfully defended that position over time by keeping the pedal to the metal regarding research and development. And with approximately 9% of sales directed back into R&D, there are research dollars left over to keep the company's new product pipeline humming. Finally, Medtronic has made selective acquisitions to target higher-growth areas and fill product holes, and it now racks up nearly half of its annual sales in international markets. That trend will only grow stronger: Revenue was up 12% in emerging markets last quarter and only 5% in the U.S. Meanwhile, Medtronic prepares to acquire European-based Covidien, which should drive more growth.

How It's Working

Over the past few years, some of Medtronic's core markets have come under duress; in some cases, competition has picked up, while in others, product efficacy and sales practices have been questioned. As of late, though, all that has been stabilizing — and the company's other businesses, and its growth in emerging markets, were busy picking up the slack. Product diversification has been a big help in maintaining sales levels, and management's deft execution of its goals and impressive expense management have turned modest sales performance into admirable bottom-line results and cash generation.

Although sales have only advanced 3% annually over the past five years, earnings, dividends, and free cash flow have grown faster as management has cut costs, consistently rewarded shareholders, and maintained discipline with its reinvestments.

For More

- *Pro*'s original recommendation (7/1/09)
- Talk about Medtronic on our discussion board
- Most recent earnings update (11/22/14)

What We Expect

Under CEO Omar Ishrak (who came aboard in 2011), we expect Medtronic to continue its clinical excellence and focus on chronic diseases. We are also witnessing disciplined execution, a strong focus on building the infrastructure for ongoing emerging-market growth, and a healthy balance between the clinical benefits of the company's products and their economic value. Management expects the company to generate $25 billion worth of free cash flow over the next five years, and half of that is likely to be returned to shareholders in the form of dividends and share buybacks. The diagnosis is healthy for Medtronic to continue its North-Star topping returns.

Buy: Parexel International (NASDAQ: PRXL)

Outsourced drug development benefits this respected contract research organization.

Suggested Allocation: 3.3%

What It Does

Parexel (NASDAQ: PRXL) is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 90% of the top 200 selling drugs.

For More

- [*Pro*'s original recommendation] (12/23/13)
- Most recent earnings update (11/10/14)
- Talk about Parexel

How It's Working

From 2004 to 2013, outsourcing penetration -- the number of development dollars outsourced to CROs -- has increased by almost 50%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work (and those massive staffing needs) can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex. That makes a large, proven CRO with expertise and global capabilities more of a value-adding partner than a transactional customer.

Although Parexel's revenue and backlog growth have been lumpy recently as it competes for new partnerships, margins have already expanded as the company uses its assets more often and more efficiently. Since the first quarter of 2014, which ended Sept. 30, 2013, the company has increased gross margins from 32.5% to 35.2% and operating margins from 9.3% to 10.9%, leading to 34% earnings-per-share growth on a trailing-12-month basis.

What We Expect

From today's price, we believe the company's business performance will drive its stock to out-earn our North Star over the next decade. A continued industry shift from transactional, project-based relationships to integrated partnerships should ultimately make revenue more reliable. The company's operating leverage should lead to margin expansion over time as the company uses its assets ever more efficiently and revenue growth outpaces expense growth. And if our forecasts of the company's core business and industry tailwinds prove too optimistic, we could still see a nice return from its rapidly growing technology division, PAREXEL Informatics (PI) -- whether that's in the form of a possible spinoff, or just the market's acknowledgement of PI's hidden value.

Time Out!

Published Dec 1, 2014 at 11:55AM

Dear Fools,

Like many folks, I often find myself in a reflective mood during the holidays. This past Thanksgiving was my first opportunity to return to my hometown since relocating to work at Fool HQ, so there was plenty to think about. I always make sure to spend time reflecting on what I'm thankful for, but I also find myself eschewing some holiday traditions in order to spend my downtime thinking about where I need to improve — or to steal a fellow Fool's "motley value," trying to figure out how I can get "better every day."

Upon arriving at my parents' house this year, I was eager to resume one of my favorite activities — spending time in the woods with my best friend and fellow lover of nature, my dog Hobbes. Before I moved to Alexandria, I always made sure to do this as often as possible, not just because it's fun but because research suggests this activity actually makes me better at my job.

I only take two items with me during these adventures, a water bottle and a leash, because I want to give my brain a chance to unplug and do exactly what Hobbes does — wander. We live in a society that often praises those who work around the clock, but downtime is extremely important. It is during this downtime, referred to as random episodic silent thought (REST), that our brains enter the optimal state to achieve creative insight.

Investing is very much a mathematical exercise, but it is also a creative one. The best investors are those who can synthesize information and form connections that others can't. The result is that things appear to be obvious to these individuals at the time, but to everyone else only after the fact. Think about the impact of the iPhone back in 2007 or the recovery of AIG after the financial crisis. The arrival of your own "Eureka!" moments may seem random, but the process is anything but. As noted by Nancy C. Andreasen, psychiatrist and director of the Neuroimaging Research Center and the Mental Health Clinical Research Center at The University of Iowa, this process tends to move through stages:

> *It begins with **preparation**, a time when the basic information or skills are assembled. It continues on to **incubation**, a relaxed time during which the person does not work consciously to solve the problem, but when connections are unconsciously being made. This then leads eventually to **inspiration**, the eureka experience when the person suddenly sees the solution. It ends with **production**, a time when the insights are put into a useful form. The specifics of this basic process will vary depending on the type of creativity; writing a novel is different from identifying a new chemical synthesis. But the basic process and principles are the same across many different types of creativity.*

During REST, our brains engage in free-ranging and uncensored thought. Andreasen has found that our association cortices tend to be "wildly active" during REST and that this suggests our brains are spontaneously reorganizing and acting as self-organizing systems during this crucial state. This is why it is often so effective to take a break when you hit a mental roadblock — the word "break" and acronym "REST" are irony at its finest (with the latter being intentional).

Unfortunately, I got away from structuring REST into my daily routine after moving to Alexandria. I wanted to jump headfirst into my new role and take on any opportunity that came my way. It my seem counterintuitive, but I firmly believe that as I was working more, the quality of my output suffered. This became readily apparent to me last week. Shortly after returning to the woods and turning off my brain, I was greeted with a flood of new ideas — ideas that were unable to make their way to the surface of my consciousness while I was constantly seeking out new tasks to occupy my thoughts. Now, I'm not saying that all these ideas will turn out to be good. In fact, most probably won't. But that's another great thing about incorporating REST into your day: You actually have time to process your ideas and figure out if they are truly any good.

Now if you'll excuse me, Hobbes and I have some more exploring to do before I return to Alexandria.

Foolishly yours,

— JP (TMFYossarian)

Positioning Report

Table of Contents

Download this report as a PDF

Dear *Pro* Member,

The majority of the recommendations in this report are "shorts" — they're investments that we believe will decline in value, adding profits to a portion of our portfolio in the process. But let's take the pressure off right away: For reasons I explain below, we don't expect that many of you will initiate many of the positions in this report right away, or perhaps at all. And that's perfectly fine! Owning *Pro* stocks, you will still be positioned to compound your value over time.

Shorting in Short

For those new to shorting, let's step back for a quick overview. When you sell something short, you borrow shares from a broker and immediately sell them, collecting the proceeds. In the future, you'll need to buy shares back to replace the shares you borrowed. This is called "cover" or "buy to cover" or even "buy to close." You hope to buy the shares back at a lower price than when you opened the position. The difference between your original sell — or short — price and the price you pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock soars to $30, you've lost $10 per share when you buy it back. Why do we short in *Pro*? It's one good way to profit when the market (or a weak company) falls. We also like to short flawed investment vehicles that, because of the way they're constructed, are destined to lose value over the long haul.

Hedging ... in Short

Similar to shorting, but different in intent, hedging is used to describe when we sell short a market index to simply hedge our long exposure to the market. A hedge is like insurance. We know our hedge will go up in value whenever the market goes down. But we don't expect to have to need this "insurance." It's there in case the market falls a lot. Most times, the market won't fall, and our hedge will go unused, usually being a small drag on our portfolio. As with shorting, you should only hedge if you want to. Currently, *Pro* is deciding on a new hedge and will issue a trade alert once it's finalized.

Shorting and Hedging Are Optional

Not every *Pro* member is comfortable with shorting or hedging. Practical considerations can have an impact as well. First, you cannot sell short in an IRA — you need a margin account. Second, you have to accept that shorts can run strongly against you. Third, you'll usually pay an annual fee of anywhere from 1% to 5% (of the short value) to short something. Finally, in many cases it's hard to borrow shares to short, period. That is the unfortunate situation with a few of our current shorts today. Fourth, short shares have the risk of being "called away" on you at the worst time, when they're up in price. If brokers can no longer borrow shares, you're forced to "buy in" at market prices to return your borrowed shares.

So, what do you do? You can use options to short in some cases; we explain how to do so wherever appropriate. You can also consider opening a new brokerage account that is more friendly to shorting (Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting); or you can wait and see if shares become available in your existing, traditional brokerage account. Or, if you're not drawn to it, you don't have to short at all.

Options Are Optional, Too — but Advised!

Our options positions are also … optional. But we do strongly advocate learning to use options and following along over time. Options are powerful tools for income, hedging, upside and more. We know from experience that they're worth the time it takes to learn them. Options can make you a much more confident and versatile investor. So, if you're new to options, you're in a great place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership!), to learn how to use these great tools.

This Positioning Report

Returning to the main show, this Portfolio Positioning Report, and the special live chat accompanying it Dec. 3 at 1 p.m. ET, will (when you're ready!) help you short vehicles we believe will decline, and generate returns from options as prices dictate — either now, when we go to press, or later, in which case we'll guide you with future

Catch-Up Trades in *Pro*. Keep in mind that this is just a start; we'll have many brand-new investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming at first — or if you're still catching up with our core stock positions — that's perfectly fine, too. You don't need to start all these positions now. Stock investments are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro* in the long term, let alone immediately.

As you progress with us, just keep your exposure to the stock market in mind; hedging is about portfolio exposure. If you've bought all of our stock recommendations to date, your *Pro* portfolio is about 84% invested, meaning you have enough cash that you don't need to hedge quite yet unless you want to! If you want to, then adding the shorts in this report will bring your portfolio exposure down to a bit less than 80% net long. We are working on a hedge that would bring our exposure down even further, to 70% net long or less, while still leaving you more than 80% invested in great stocks. Neat trick, hey? We think so.

In closing, I'll stress again that you shouldn't feel pressured to act. We will continue to make recommendations on an ongoing basis, including in Catch-Up Trades — and brand-new opportunities emerge regularly. That's part of the fun! So, take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making *Pro* Fit You discussion board.

Foolishly,
— Jeff Fischer, *Pro* advisor

Sell Short: Caesars Entertainment (NASDAQ: CZR)

The indebted casino operator is trying to escape a messy bankruptcy. Expect volatility!

Suggested Short Allocation: 2%

How It Fits Into *Pro*

The modern saga of U.S.-based casino operator Caesars Entertainment begins during the Age of the Mega-Buyout. In December 2006, private equity firms TPG Capital and **Apollo Management** (NYSE: APO) agreed to take Caesars (then known as Harrah's) private in one of the largest leveraged buyouts (LBOs) in stock market history, for a total consideration of almost $30 billion. At the time, Harrah's was the world's largest gaming company by revenue, and business was booming.

Shortly before the deal closed in January 2008, the financial system started its epic freefall and nearly collapsed, and the economy sank into the Great Recession. What looked like a brilliant idea in 2006 became a fight to pay off creditors and stay afloat.

The same casinos that were once rolling in cash and experiencing never-ending increases in demand were suddenly no longer profitable. When revenue began to drop precipitously, Caesars' significant fixed costs remained and the company began to burn cash. Today, Caesars is trying to avoid an involuntary default on debt by organizing a restructuring with agreeing debt holders. But it has moved valuable assets into a new subsidiary to try to protect them from debtors, some of which are now suing.

What happens next is anyone's guess, making this a highly volatile situation. The stock could be close to worthless next year, or could go higher if Caesars can pull off a restructuring. But we are betting against its crippling debt load and sagging operations.

Availability

Some brokers have shares available for shorting. Interactive Brokers recently had 450,000 shares available and charged 3.25% a year.

Alternative Trade

If you only want to risk $3 per 100 shares, or $300 minimum, you can lately buy March 2015 $15 puts. Just realize that if the stock remains above $15 by then, your puts end without value. If the stock falls below $12 by expiration, your puts have value. Caesars also has 2017 options for those who want to set up a synthetic short using a strike price at the current share price, selling to open one call, and buying to open one put, for every 100 shares you want to short. Do not over-allocate! Each short call at $16 is $1,600 in short stock exposure.

Sell Short: CurrencyShares Euro Trust (NYSEMKT: FXE)

Shorting the euro against the dollar is relatively low-risk disaster insurance.

Suggested Short Allocation: 2.4%

How It Fits Into *Pro*

We've been shorting the euro against the dollar for a few years. We view this position as a quiet investment where the risk to us is relatively known (and reasonable) and the profit potential, while less known, is worth pursuing. For this position to work against us, the euro would strengthen against the dollar, but likely only by so much (assuming the U.S. doesn't go belly-up). Even if the euro returns to its all-time high against the dollar ($1.60 — currently one euro is worth $1.24) our losses will be tolerable. Meanwhile, the euro would have to decline to about $0.80 to a dollar to touch its all-time low. So, it's right in the middle of its historical range. If the worst happens in Europe, the euro could fall apart. The vehicle we're shorting (it's called a trust, but trades like a stock) only holds physical euros, so it's a pure way to short the euro against the dollar in our U.S.-based brokerage account.

For More

- *Pro*'s recommendation history
- Talk about FXE on our discussion board

Availability

Shares of FXE are often available for shorting at various brokers; the annual fee is 1.7% at Interactive Brokers, and there is no fee at TD Ameritrade.

Alternative Trade

If your broker does not have shares available for shorting, and you're trading in a margin account, you can instead set up a synthetic short. "Sell to open" January 2017 $123 call options on FXE, and to buy to open an equal number of January 2017 $123 put options. Just realize that you are, just like us, short the vehicle at today's price, and you will have paper losses if FXE's price goes up. Also, only sell to open one call option for every $12,300 in FXE you can afford to be short, remembering that each option represents 100 shares. If 100 shares is too large an allocation for you and you can't short fewer shares directly, then just sit this one out! There are no IRA alternatives at this time that are attractive enough to merit your IRA dollars.

Sell Short: Direxion Daily Financial Bear 3x (NYSEMKT: FAZ)

Daily leverage keeps steady downward pressure on this bearish ETF.

Suggested Short Allocation: 0.5% to 1%

How It Fits Into *Pro*

This bearish ETF is meant to provide 3 times (300%) the daily inverse results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we're effectively 3 times long, on a daily basis, the U.S. large-cap financial sector.

Leveraged ETFs like this one are flawed vehicles because they rebalance their derivative positions daily in order to maintain a constant leverage. Over longer holding periods, the costs involved with rebalancing eat away at returns, keeping downward pressure on the vehicle as a whole. As our original buy report details, we continue to believe that large-cap U.S. financials are cheaply priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

That said, shorting it has become difficult over the years, and our position size has dwindled. New members can skip this position if shorting it proves difficult (or use options if you have a six-figure account). We own plenty of strong financial companies instead.

For More

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

Availability

This is hard to borrow! Lately, only 90,000 shares of FAZ were available for shorting at Interactive Brokers at a 5.7% annual fee.

Alternative Trade

If you can't short shares directly, then in a margin account you can set up a synthetic short. "Sell to open" January 2017 $13 calls on FAZ, and "buy to open" an equal number of January 2017 $13 puts. You will pay less than $1 per contract, net. This makes you short FAZ with a start price a bit above $12, and sets you up to profit if and as FAZ declines in price. Only sell one call for every $1,300 in FAZ you are able to comfortably short. On a $130,000 account, one contract would be a 1% allocation. That's as much as we recommend (our own FAZ short is 0.5%, but newcomers are unable to short another similar position we have in our portfolio, so you can make FAZ about 1% instead). Never over-allocate to a short.
There are no IRA-friendly alternatives for this short. If you can't short it, you could add 0.5% to one of our financial companies instead, including **Wells Fargo** (NYSE: WFC) or **MasterCard** (NYSE: MA).

The Rest of *Pro*'s Positions!

As a *Pro* member with an especially keen eye (and great memory!), you will note that we haven't updated you on every position in the portfolio yet — even with this, our fifth report in the last month. Here, one by one, is the status on those few remaining positions:

Coca-Cola

Pro holds a 2016 synthetic long option position on **Coca-Cola** (NYSE: KO), but the stock has run up sharply (for Coke), from $38 to $44.50, since we started it this year. We advise new members to wait for a downdraft, at which point we may issue a *Pro* Catch-Up Trade. (Some of you started an option position on Coca-Cola with *Motley Fool Options* — that's a fine substitute for now and perhaps indefinitely, unless we get a good new opportunity.)

Five Below

We are short shares of pre-teen retailer **Five Below** (NASDAQ: FIVE) at a 1.7% allocation, but … drum roll … the company announces earnings tomorrow, Dec. 4. Since we have no idea how the stock will respond to earnings (it could crash, it could soar, it could do nothing), we think it best that new would-be short sellers wait until we see Thursday's news and assess it. We'll let you know soon after with a *Pro* Catch-Up Trade if we believe newcomers should short the shares.

O'Reilly Automotive

We have a 4% stock position in **O'Reilly Automotive** (NASDAQ: ORLY), but it's on hold for new members. Don't buy yet. We'll provide an update to all members early this month, moving the stock back to Buy if that appears to be the best decision.

ProShares UltraShort Real Estate

We have a small (0.4%) short remaining in the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). We enjoy its slow descent in price, but the ETF itself only has $38 million in assets now, making it too small to recommend to new members. Plus, it's nearly impossible to borrow shares to sell short now, and if you're able to, the annual percentage fee to short is high. Instead, as shared in this report above, we recommended that you sell short up to 1% in FAZ as an alternate. We're short 0.5% of FAZ ourselves.

In Conclusion

We may recommend all of these positions (except the SRS short) to new members once we reaffirm sufficient opportunity compared to current risk for newcomers in each, or when pricing improves. Just watch for *Pro* Catch-Up Trades.

At the same time, we're not standing still. From our reports, you have many great *Pro* investments to move into gradually, and we will continue to send brand-new investment recommendations to all members. It's not vital that your portfolio be 100% attuned to ours. But being closely attuned to it, especially with our core stocks, will position you to succeed well with *Pro* over the time frame that matters.

Fool on!
— Jeff (TMFFischer) and the *Pro* team

Transcript

JEFF FISCHER:

…just for comparison. Even though the market isn't our benchmark, it's very nice to do better than it, while being defensive, as well, especially in a year where 80-90% of fund managers are trailing the market [and] mutual funds continue to underperform. Anyways, that's where we're at. Pro is in a good position.

The market itself — the S&P 500, Chris — trades at 19.6x trailing earnings, which is the high end of its historical average range, which is about 15-20x. But it trades at 16.7x next year's estimates, so that's right in the middle of its historical average. And now you have lower oil prices which historically does, and now could, increase GDP growth, because for almost everybody, lower energy prices is a net benefit.

Next year could be a decent year, as well. Where we stand in Pro is we hope that in the next three years, our portfolio will be at least 33% higher, more valuable, in 2017 than it is right now. If we can make 10% a year, we'll end up 33% more valuable in three years. And think about that for compounding purposes, too. And that's our minimum hope, our goal, and that's whatever the market does. We know there will be rough spots in those three years, but we hope, overall.

And the reason we can say that is a lot of our companies are priced inexpensively, still. Gilead is at 10x forward earnings. Skyworks at 13x expected. Oracle at 12x expected. We have a lot of great, Class A names at good valuations, and we hope to compound with them and I'll stop right there for now.

CHRIS HILL:

Just one more question regarding 2014. Are you at all surprised by how the market has done this year? Because go back one year and 2013, [the] market was up somewhere in the neighborhood of 30%. It was one of the best years we had, had in decades. I don't know about you. I'm quite pleased with how the market has done, generally, this year. I don't want to say I was fearing for the worst, but I had sort of steeled myself for having the dreaded correction.

JEFF FISCHER:

Yes, or at least a rocky year back and forth. I am surprised too, Chris, and I think many veteran Pro members are, as well. We've given up about 2-3 percentage points this year to hedges and generally that's our charter. We want to be hedged and smooth out downside volatility and we know we're going to pay for that hedging when the market goes up. So, we're a little surprised, but we're happily surprised because we're still doing well, anyway. But yes, given the recent strength of the market, it's human nature to expect [that] it's time to give some back.

But, that's not how the market works. And if companies continue — lately their revenue growth has been healthy and earnings growth has been even better — next year could pleasantly surprise, as well. We would take a 5-6% gain in the market happily, because we will probably do considerably better than that.

CHRIS HILL:

Let's talk a little bit about what has led us to this positioning event, and that is over the past month, Pro has been advising members to buy Pro stocks.

JEFF FISCHER:

Exactly. New members who joined about a month ago — we've advised them through the course of four portfolio-building reports to buy all of our core stocks — and that's where you start. And Chris, we'll make this discussion a little about portfolio construction.

It makes sense that first you want to put your money in positions that should compound over time. We don't want to mess around with little positions or games on the side. You want most of your money in the direction, in the investments that it should be for the long haul, and we think in terms of at least three years forward — three rolling years. It's not that long of a time, sadly. That goes very fast, but happily that means returns grow quickly.

CHRIS HILL:

It's not that long of a time, but it is, when you look at all the research data. That is longer than the average holding period for the average investor.

JEFF FISCHER:

Oh, man, it's so much longer. It's so much longer, Chris, and that's part of the Fool's advantage and our advantage. I think you know this better than I may. The average stock is now held for weeks…

CHRIS HILL:

Yes.

JEFF FISCHER:

…and that's it.

CHRIS HILL:

Basically upside of five or six months.

JEFF FISCHER:

Yes. And I don't understand that at all. Like I'm really happy to be able to say [that] I bought Google and MasterCard the years they came public and I still own them. And some day I hope to hand that to my child and say, "Here. Here's a stock from 2005."

CHRIS HILL:

Right.

JEFF FISCHER:

"You better not sell it!"

CHRIS HILL:

Don't blow it.

JEFF FISCHER:

But we use options to make money on stocks so that we can keep owning stocks for the long haul, and that's how you really compound. These portfolio-building reports — the first four — are to get you in these stocks that we believe will compound your money over the only time that compounding works, which is the coming years. Remember why you're here — it's to make money. I like to think of it, because you can digest it, [that] every rolling three years you're here to make good money.

CHRIS HILL:

So, we've got the core holdings that you talked about. Could you spend just a couple of minutes talking a little bit about the shorts involved in Pro's service?

JEFF FISCHER:

Once you have your core holdings, it makes sense to consider shorts, if you want to, and then hedges and options, as well, so we're getting there gradually. The shorts — by most measures, so far, it's a good thing that we're not very short. The portfolio is about 84% net long. New members, now, who buy all of our core stocks will be a little less than 80% net long. It still means you have 20% to play with, so you don't really need to hedge.

We're looking for more shorts of companies to add to the portfolio — stocks that are overvalued and don't look promising, and we'll build that out over time. We have a couple right now. One is Caesars, which is still a recommended short at about 2%. One is Five Below, which is a recommended short around 1.5%. But, in this report, we say wait on that one because they announce earnings tomorrow, so we would hate to say to new members, "Hey, short that company today," when we just don't know what tomorrow will bring. We'll assess those earnings and then let you know.

CHRIS HILL:

One more question and then we'll get questions from members who are participating. When you think about the Pro portfolio [and] building a portfolio, how should members think about timing? And we've talked about this before specifically with options — that there is a tendency, almost an institutional tendency, to add urgency to think, "Gosh. I have to make this trade immediately." How should members think about the timing of these trades when it comes to building a Pro portfolio?

JEFF FISCHER:

It's a great question, Chris. You have to have the right time frame if you're going to succeed, and you shouldn't rush on anything. I sound like a broken record saying that to members on the boards and in these events when I can — that the only time that matters is going to be the coming years. You're not going to change your financial status in a few weeks or a few months. I don't understand the trading mentality. I tried it in my early twenties. I think most of us start that way and then…

CHRIS HILL:

How'd that work out for you?

JEFF FISCHER:

Not well. Not well. But that's what so many people think when they start to invest. You need to have action to invest. I met someone yesterday who was getting interested in investing. He's in his thirties and saved some money. I mentioned Warren Buffett, and he thought Buffett had made his money by trading, and so he thought he would really have to work hard to do it. And I had to point out [that] no, he's owned stocks since the seventies. American Express — he just buys it and sits on it. That's how it works.

So, there's no urgency for the options or the shorts. Arguably, I would say, there's more urgency to buy your core stocks and start to let them work for you. But even there, gradually go into it. A lot of members are adding money every month from their paychecks. Some members have a fixed amount. And especially those of you with a fixed amount — invest gradually. Average into our core stocks. Even though we put out all these reports in a month, we don't expect you to make all the trades or all the investments in that month if you're not ready to. Take your time, because time is on your side.

CHRIS HILL:

All right, let's get to some of the questions that have been coming in. From one of our members. How are the percent allocations determined in Pro?

JEFF FISCHER:

Good question. Managing the portfolio, we're trying to set up something that will do well in a strong market and do better than a falling market. So, the allocation percentages play a role in that. We are comfortable putting 4% into something like Oracle, but only, say, 1.5% into a short that's a small cap like Five Below. So, that will be our starting point.

Over time, as the allocations change, which they naturally do, we look at them every day. We literally, every day, start with a review of where we are at and make sure we like the allocations, because we know new members coming in are going to be told to match our current allocations. [We know] that's the only way we can get you onboard and then manage one portfolio together. So, the allocations will naturally fluctuate, and we make sure we're always comfortable recommending the allocation we currently have.

And the great thing about not adjusting them too much is we don't want to create unnecessary turnover, costs, taxes … but even better than that, our winners become a stronger part of the portfolio and the losers become less and less significant over time. So, I'm not big on balancing, per se, until you're reliant on your portfolio for retirement income. And if you are, then you usually keep three years out in fixed income investments.

So, we let the allocations go, over time, as long as we're comfortable with them, and we start them to begin with, in an allocation that we think serves the portfolio's goals over all. And that's a key thing everyone has to remember. We're a full-portfolio service. We're managing the portfolio to make money. There are some positions in there that we don't think will make money — hedges, for example — but they're in there as insurance or to balance a portfolio out during adverse events, so it's the whole thing that we want to make money.

CHRIS HILL:

A question from B.J. Can I buy puts to implement the short sales?

JEFF FISCHER:

B.J., a good question. In today's positioning report, we talk about synthetic shorts. On the currency shares short — FXE, the Euro — and the Financial [Bear 3x] ETF. On those you can set up long-term, 2017, synthetic shorts which is the equivalent to shorting the shares themselves. So, watch your allocation. Each synthetic short you set up is 100 shares.

I imagine if you're trying to do this in an IRA, you can't do a synthetic short. I imagine that might be your question — where it comes from — and that is just buy puts. We didn't recommend that because the puts are so expensive. The cost to get into that is so high that we think you can just pass on that. It just wouldn't do it.

CHRIS HILL:

A question from M. Facebook has been a big winner for me — both stock and options positions. Thank you for recommending it. Which new stock do you foresee being a big winner, like that one, for the next couple of years? Yes, Jeff, what will be the next big winner?

JEFF FISCHER:

I think it's the couple that we're working on that we may issue by the end of the year or early January. We're looking at some that are promising. In the portfolio, actually, I think Facebook is going to continue to be a good performer the next three years. It trades at 39x expected earnings for the next year and I bet it's going to grow like 45-50% year over year.

And they're doing what Google did early on, which was spending a lot to then propel future growth, so the next year or two may look a little light, free cash flow wise, because they're investing so much. But they'll get that back a couple of years down the road and the multiple on the stock will really contract in a good way. The value multiple on the shares should keep appreciating if everything goes as planned. So, I like Facebook a lot. I like Gilead a lot. Skyworks Solutions. All these companies, for the next couple of years, I think are, and then beyond, ideally promising.

CHRIS HILL:

A question from one of our members. What's the best way to judge the latest buy recommendations when the price of today is already much higher than the fair price value?

JEFF FISCHER:

A good question. When our fair value estimate is a bit lower than the current share price, that's okay. The fair value estimate is really a range that we have, and we publish to the conservative side of that range for obvious reasons. And you have to remember, too, that a fair value estimate is fair for a buyer as well as a seller. It's a fair price. From that price, we expect to earn our desired return, which typically is 10-11% annualized.

So, if a stock is 5% above that, it still should earn that return, more or less, over the next rolling three years because there's a lot of room for error in that estimate, and as long as we believe in the business and what they're doing, we're very comfortable keeping it as a buy, even when it's a bit above our fair value estimate.

The other thing to keep in mind is that fair value estimate goes up quarterly as the company grows, assuming the company does grow. But we only update it, typically, every six months to sometimes even once a year, although we try to do it every six months. So, the fair value estimate will go up, in kind, with the stock and members who have been around have seen that happen very much like clockwork, so far.

CHRIS HILL:

That's one of those risks that I think when you're starting investing nobody really focuses on because I suppose there are more important risk factors to consider. But the idea that you look at a price at which you're willing to buy a stock and you, in some ways, almost fall in love with that price and you say [that] if it's a little bit higher, then I'm not going to buy. I'm just going to wait for it to come down. And this has happened to me a couple of times, early in my investing days, where I just wanted it to fall a little bit further and it never did.

JEFF FISCHER:

Yes, that's true. We had that happen early on with a company called Tractor Supply, which many people had never heard of, and now is becoming a household retailer. But the stock was mid $30s. We wanted to buy in the low $30s. We passed on it. It ran up to $120 and split and it's still going up. So, anchoring is a dangerous thing, of course.

I would prefer to not even have our fair value estimate published, because it is a range and it's an estimate. And our cost basis or our return as well, I would rather not show people, because they anchor on that. They look and see [that] they're up 200% on Papa John's. I shouldn't buy it now. Whereas, that's really irrelevant. It may be cheaper now compared to what it's earning in cash flow than it was 200% ago. So, anchoring is a very prevalent and yet somewhat dangerous thing in investing that we all work to try to avoid.

CHRIS HILL:

A question from Paul. I'm new and not sure how to set up my core portfolio when I have multiple accounts — one SEP, two IRA accounts, my kids' 529 account, and a general account. Is there information on the site than can help me figure this out? I have $250,000 to invest now. Any suggestions?

JEFF FISCHER:

Let's go the Making Pro Fit You discussion board. Post your question there and we will help all we can. I know members will help, too, if they can. That's a very specific question and we'd want to get it right and have it in writing for you. So, good question.

CHRIS HILL:

A lot of moving parts to that question.

JEFF FISCHER:

Exactly.

CHRIS HILL:

A question from Karen. I did the last hedge. It was a bought put in an IRA account. Now I'm realizing that was probably a mistake. If I had put it in a taxable account, I would have been able to write off the loss value. Do I have that correct? Lesson learned for next time.

JEFF FISCHER:

Karen, yes, that's a great lesson. A great lesson for everyone and a great segue, too, into hedging. A hedge will lose money any time the market stays flat or goes up, generally speaking. A hedge is like you're buying insurance for your portfolio. So, if the market goes down, that insurance will pay you and your hedge will have become used. You collected on it. But in most cases, the hedge will expire unused and as a loss, so for that reason, putting the hedge in a taxable account is a great idea because in most cases, it will become a tax loss.

And hedging — we don't have a hedge in this portfolio-positioning report, even though we're working on one. We're working on two things — a market hedge, to bring our exposure down from [approximately] 80% back to [around] 70%, which is where we've averaged over time. We're working on that, and we probably will have it soon. And we're working on direct company shorts, as well, to lower our exposure, too. So, we're comfortable with where we are right now, but we are working on a new hedge, as that one expired a couple of weeks ago, now, in November.

CHRIS HILL:

A question from screen name FlyInTheWest. When Jeff says options are "expensive" or not, how is the relative expense of an option determined? When would we know they're reasonably priced or inexpensive?

JEFF FISCHER:

That's a great question. Mostly you want to look at how much you think the stock will move compared to how much of that is already priced into the option. Unfortunately, there's no formula that you can apply across all companies, of course, but you have to look at individual volatility. Intel, for example, [is] not in the Pro portfolio right now, but is historically a fairly nonvolatile stock, so its options should be fairly inexpensive.

If the options were priced much more than you thought Intel would move over that given time to expiration, then you would say the option looks expensive and we might sell it to collect the premium. There's interest rate that goes into it. The higher interest rates are, the higher option premiums usually are.

But discounting that, it's how much do you think the stock will move in a given time period and that should tell you where you think the option should be priced. And at times, options are priced far more than the stock will ultimately move, and that's a good thing. And when that happens, the VIX is higher and we'll be looking to sell those options to collect the premium. But lately it's been a low VIX environment and most options are not that expensive.

What's interesting is as we work on this hedge right now, we're looking at the S&P 500 to use those as a natural hedge again, and SPY options right now — S&P 500 options — are inflated. It's part of what we're considering and looking at. They really spiked as oil fell and fell. People are trying to assess what this big drop in oil means and while they're assessing it, they're buying put options, I imagine. But I don't want to rush and do that and pay a big price for a SPY put option. So, we'll see how that plays out a bit more.

CHRIS HILL:

You're definitely rooting for more volatility, though.

JEFF FISCHER:

More volatility would be good. It'd be nice if we could get our hedge going first, but either way, we'll be set up to do something about it that we like. Whenever that volatility comes, there are things we want to do to take advantage of it. So, if we're hedged beforehand or not, it won't matter. We'll just adjust what we do next.

CHRIS HILL:

A question from Tom. I have a smaller portfolio and smaller investment sizes. Is it better to reduce my diversity so that I can buy shares in hundred-share blocks and then use them for other investments, like options?

JEFF FISCHER:

Generally speaking, Tom, to a moderate degree you could do that. Buying in 100-share blocks is not that important. We don't use options on our core stocks in Pro that much because we're buying the stocks to own them for years to come and we want you diversified enough to be diversified, which means in Pro probably 15 to 20 of our stocks we want you to own, at least.

So, I wouldn't whittle that down much more than that and I would focus more on owning most of our positions at allocations that are close to us rather than trying to focus on 100 shares. The odds are if you have a smaller portfolio [and] you're adding money to it regularly, too, and over time, it will grow and you'll have more 100-share blocks. But, it's important to get there in a kind of organic, natural way and run the portfolio as close as you can to how we have it and not worry about 100-share increments right yet.

CHRIS HILL:

A question from Sandor. Are you trying to diversify the portfolio stocks? If not, are you just picking stocks individually or have some considerations, based on the other stocks in the portfolio … What are those?

JEFF FISCHER:

Yes, they do play together. We have a whole portfolio that we want to work as a whole and deliver a return as a whole. And we purposely have some things that are higher growth and some that are lower growth, and we actually don't even mind having some positions that are not going anywhere right now. [Two that come to mind are] Wisdom Tree Emerging Markets.

Emerging markets have gone nowhere for a couple of years — and that's perfectly fine, the way we view it, because we know that they cycle. We bought emerging markets and U.S. markets not knowing which would do better, but obviously we thought U.S. would do better. That's mainly where we are invested. And there will come a time when U.S. markets don't do as well and emerging markets do, and that's when that investment will perform for us.

So, we view the whole portfolio as something that will work together over time, but not all of it will work at once. And then what we bring into the portfolio and get out of it — they're all moving parts. They're all pieces of a puzzle, and that's sometimes why it takes us longer to issue a new buy or a new hedge, because it can change other things in the portfolio. It can mean reducing a position or selling something. So, yes, the short answer is it is really, truly a portfolio that we see working as a piece [and] as a whole, and so when anything new comes in or anything goes out of it, that can have reverberations across the portfolio.

CHRIS HILL:

A question from — I love this screen name — JohnnyLovesBeaches.

JEFF FISCHER:

Johnny! He's been a Fool for a long time.

CHRIS HILL:

I recall a comment you made about short S&P 500 ProShares a while back — about not holding it for too long. I've held a position for quite some time. My question is how do you think about exit strategies for short positions, or is it okay to accept the poor performance since the equity positions have been running very nicely?

JEFF FISCHER:

That's a great question and the answer is different depending on what you're short. If you're short an ETF, like that is, and it's an inverse ETF, there may be tracking issues. I haven't looked at the ticker, [which] is SH for members who don't know. It's an inverse S&P 500 ETF, so it's a way to hedge your portfolio by buying this ETF that is short the S&P.

The problem is it won't track directly to how the S&P does. There's some error there, so the short may even perform worse than the S&P, itself, going up does. We have traditionally shorted flawed ETFs like FAZ and SRS, which is now too small to short, and we wouldn't want to own a flawed ETF, for the long haul, for that tracking reason.

With other shorts, we do try to limit the loss to a reasonable amount of say a percent or two of the portfolio, at the most. If something's running against you that far and it's eating into your portfolio, you may be wrong. Something may be wrong with your thesis or your allocation and you may just want to cut it off at the knees because it's doing the opposite of what you want. It's compounding against you, and you definitely want to avoid that.

A rough rule on shorts is to close a direct short when it's 20% against us and our confidence is gone or waning, or if we are losing 1% or more of the portfolio value, we really have to reassess whether we want to stay in that short.

CHRIS HILL:

A question from David. Speaking of options, might they be expensive for a reason, such as insider types know something that we don't?

JEFF FISCHER:

Sometimes they are, especially put options or call options. Some possible news or rumors can inflate the prices. People are speculating on a buyout, say, or on a bad earnings report. If you watch them long enough, you'll notice that that option is out of line. Something's not right. And that can be reason sometimes. But it doesn't play into our long-term investing decisions or performance.

CHRIS HILL:

A question from Suneel. You just mentioned that you expect volatility to increase. Your latest recommendation to buy SVXY, I understand, will go down if volatility increases. Can you explain the logic behind the recommendation of SVXY?

JEFF FISCHER:

Yes, definitely. Volatility — I don't know that I said I expect it to increase, although the odds are…

CHRIS HILL:

You'd like it to.

JEFF FISCHER:

Yes, we'd like it to. We did say we'd like it to. And the odds that the market will be more challenging in the next couple of years than it has been makes sense. That said, none of us know for certain. But this position we started very small last week at 1.35% and we want to put a stake in the ground and have it in the portfolio and be ready to buy more when and if it does decline.

That said, we also know it may keep going up. Volatility in the market may increase a little bit, but the futures on this ETF that we're buying are still a headwind to the ETF. But lately, when we recommended this, the VIX was [approximately] 14 and the futures two months out were 16, so that's a pretty big premium. So, unless volatility increases more than that, this ETF will work in our favor. So, what we're really shorting, with this ETF, are volatility futures even more than volatility itself, and we're confident that the futures will continue to be higher-priced than the current volatility. Let's start small.

CHRIS HILL:

Let's stick with the future, for a second, because we don't make market calls at The Motley Fool, but I want to build on something you just alluded to which is that the last couple of years have really been great for investors. The next couple — I don't want to say they're going to be bad — but you used the word "challenging." I think that's probably spot-on. I do think the next couple of years — even if we have rising markets in 2015, 2016, and beyond — I think it's reasonable to expect they'll be more challenging.

JEFF FISCHER:

All of the stats, all of the odds say so. To go this long without a 20% decline is very unusual. So, yes, when you look at the numbers, we're bound to see more declines in the next couple of years than we have in the last five years. But, that said, will the market rebound as quickly as it has now?

We still remain, ultimately in a bull market, and there are a lot of things that suggest we could, because interest rates are bound to remain low. The economy is just starting to really pick up, and Europe and now China are trying to stimulate their own economies, as well. And companies have underinvested for years, and started to, the last couple of years, finally invest in the business a bit more, and I think we're starting to see the results as revenue starts to grow now at the same time that unemployment is declining.

Odds are it will be a more challenging couple of years ahead, but we would welcome that because that just mean opportunities. Volatility does lead to opportunities if you're ready for it.

CHRIS HILL:

A question from Sergio. Hello from the Canary Islands in Spain.

JEFF FISCHER:

Nice.

CHRIS HILL:

Boy. He just had to rub that in.

JEFF FISCHER:

Yes, no kidding. It's cool there.

CHRIS HILL:

Since I'm living in the Eurozone, is it necessary for me to sell short the Currency Shares Euro Trust? Once I gradually build my Pro portfolio of stocks, hedges, shorts, and options, when would it be time to hedge a weakening dollar if it comes in the future? Thanks, that was a great question.

JEFF FISCHER:

That is a great question. So, you live in Europe and I imagine a lot of your assets are in Euros, so it may, indeed, make sense to short the Euro as a hedge to many of your assets. And I don't know that you'd want to short the dollar, in the future, because you're already shorting the dollar by having so many assets in Euros. [That is] my assumption on your situation.

That said, our short Euro position is very small [at] 2.4%, so it's almost optional, because as a short of currency, we're not going to make a huge amount on that trade unless something went horribly wrong in Europe and it's not core to the portfolio. So, I would manage your currency exposure to the Euro and the dollar in whatever way makes you most comfortable given your particular situation.

CHRIS HILL:

At least we're past the debate that was rising a few years ago of whether or not the Euro would last as a currency.

JEFF FISCHER:

Yes. That was a very real debate and part of our reason for shorting the Euro was [we thought about] how much can we possibly lose shorting the Euro? Not much. But how much can we gain if something goes really badly? It hasn't gone badly, and that's good, but we still think the Euro can fall to the dollar, and so that's why we're keeping that short for now.

CHRIS HILL:

A question from Dave. Since you are looking at volatility, are you considering using the VIX for a hedge?

JEFF FISCHER:

We have used the VIX as a hedge in the past, and we do look at it regularly as a possible hedge, because when the VIX is so low, (at 12 right now), and it averages 19 over the long term, we could buy call options on the VIX to gain if the VIX spikes. That said, you're buying call options on the VIX futures. It's pricey, and the odds are still stacked against you. But now that we are short VIX futures, the odds of going long VIX futures, as a hedge increase, because the two positions can weigh each other out, and in the long run, the short VIX futures should produce a very good gain for us over the long haul. It gives us more room to buy VIX contracts, as a hedge, as well. So, it's a good situation.

CHRIS HILL:

I'm not suggesting that you have the hard data on this, but I am curious just anecdotally. As you go to member events, you meet Pro members. Do people share how long it takes them to build up to shorting and hedging? Obviously, everyone is different, but I would think that the average Pro member, once they get started, it takes at least a little while before they're executing shorts and hedges.

JEFF FISCHER:

That's a great question, Chris, and a great comment. And [with] many people, we do talk about it. For many members, it takes a year until they're comfortable using options on their own or even with us. And many don't short. They just haven't shorted. It's not in their comfort zone. So, some have been with Pro five years and haven't shorted anything or even hedged anything and that's fine. The portfolio is built to perform as a traditional long-only portfolio over time very well, we believe. It has so far, and that's without hedging or shorting or options.

But for those who want to use these strategies, it's usually within a few months that they're ready to start. Dip their toe in the water and then over six months to a year, they really start to grasp it and enjoy it. Especially the options part. Like we write in today's positioning report, options are such a great tool, Chris, as you know from our many conversations and especially for income, but also for hedging. So, to not use those, I feel, you're missing out in the long run because all of us, ultimately, will want steady income to complement our stocks.

CHRIS HILL:

Question from Mr. Bill. I'm in the process of constructing the Pro portfolio core stocks over the next month or two by converting an existing portfolio of stocks and bonds. I've already bought the five stocks in your first report and a couple more whose prices were near fair value. In what order should I buy the remaining? Shall I buy them in the order in which they appear in your reports, or should I buy those first whose price or fair value is lowest?

JEFF FISCHER:

Good question, and it speaks to the portfolio, as a whole. We don't know, of course, which companies will do best in the next several months as you're building up your portfolio. So, all our stocks are rated Buy or Buy First right now, except for one which we'll have a decision on within days. I would buy the Buy First first, if you haven't yet, and then just go through the Buys, in order, and quite honestly, go with the ones that you're most comfortable with buying first … the one that makes the most sense to you given your existing positions and your comfort level with that business and its price and average in that way.

But the overall point is that it is a whole portfolio. We don't know which ones will be the best ones the next year or two, so we recommend them all together. That said, at the same time, you can take your time to get there, because we believe in each company individually, as well.

CHRIS HILL:

Another member question. Do you think we can get a better buy price on GNTX? I hate chasing.

JEFF FISCHER:

Gentex. Yes, it was in the mid-$20s maybe a month ago, and now it's mid-$30s. They had another good earnings report…

CHRIS HILL:

Damn them…

JEFF FISCHER:

…margins are expanding them. Yes, Gentex, stop making car mirrors so well. They make the auto mirrors, the rearview mirrors that dim automatically when headlights hit them and they make rear camera display images in the mirror, too. Cameras in the mirror, as well. And they're the leading company. They're really well managed. Really strong management.

The shares, traditionally, have not been volatile. They've been very steady, until the last couple of years, where they hit some bumps, and that's where we bought shares. Maybe we'll get another opportunity, but the shares are rated a buy. We believe they represent a good value now. If you don't want to chase it, maybe take a partial position, so it's on your radar and it's in your portfolio more importantly. And then if we get a dip, you can buy shares or if you're selling puts and can buy at least 100 shares, then sell to open a put option on Gentex to target a lower buy price and get paid while you wait.

CHRIS HILL:

A question from David. I know you should think long term, and timing the market is impossible, but I still fear, as a new member, that I will buy into the Pro stocks and six months from now, the market will be down 25% and I will feel like a "f" Fool. Any thoughts?

JEFF FISCHER:

That's a very rational fear and new members have had it. All the new members that have joined, since probably 2010, have felt that way, and rationally so. You see prices rising. You feel that you're getting there right before that shoe drops.

We do believe all of our companies are priced in a way that they will generate the returns we want over the next three years, though. Now I say three years, so that does mean you should have some time to average in. So, if you are concerned — and we all are [as] this is our money [and it's] important to us — average in over time. Even if the market doesn't fall, some stocks that we have will, and you'll get a better price by averaging in.

I would say take your time and be comfortable with what you're doing. And keep in mind we're going to get to a point where we're 70% net long, maybe less. So, right now we're [approximately] 80%, which still leaves room for taking advantage of a drop. And once we're at 70% again — which should happen soon [and] then even further if the market falls — we have 30% we can put to work still and that's a good percentage to put to work. I know it's probably not the most satisfying answer, but take your time and be comfortable with what you're doing.

CHRIS HILL:

A related question from Ken. If the market did begin to collapse again, as it did in 2008, not knowing how much longer the fall would continue, how would you know whether to invest more in hedges or invest in new long positions?

JEFF FISCHER:

Very easily. For new long positions, we look at the business and we look at its valuation compared to its earnings power. And if a business that we know and like looks underpriced, we'll want to buy it. As far as hedging, again, that's an insurance policy that we can start in an instant. If we want to hedge a lot of the portfolio, we could short or buy puts on the S&P in a large amount tomorrow and be market neutral just like that, if we wanted to. So, if something were happening that we wanted to do that, we could and the worst case is we have a fairly flat portfolio for a while. So, what?

So, the answer to your question is it will be a case-by-case basis. If there's some reason we feel we should suddenly hedge out our exposure, we can do that quickly, but at the same time, we want cash and we have cash to buy companies that are underpriced.

What we don't want to do is sell out of our positions that we own, because that creates commissions and taxes and then you have to try to get back in and people are not good at timing. So the great thing about hedging with market hedges is you can keep all of your core stocks. When we buy a company, we're buying it. We want to keep it. We can keep them and yet hedge out our risk with a hedge if we want to do that.

CHRIS HILL:

A question from JimsAFool. As a retired investor who will be adding little, if any funds to my Pro portfolio, should I consider allocations any different from the ones Pro recommends?

JEFF FISCHER:

I would love to know how much money you're taking out of your portfolio. If you depend on it for living, then you should keep any money you need in the next three years out of stocks. Don't invest them in the stock market. Don't invest that money in the stock market. That aside, I would put the 70% that you're going to keep in the market at least three years and follow our allocations closely. The one standout is AmTrust Financial, which keeps growing faster than we expect. It's 7.5% of the portfolio now. You might want to put that down to like 5% — more in line with the other positions in the portfolio — if you have any near-term concerns about your money.

CHRIS HILL:

Another member question. My observation is the Pro portfolio leans heavily on financials and tech. Does sector allocation play any part in choices for the Pro portfolio or more specifically my attempt to replicate it over the next year?

JEFF FISCHER:

Yes, that's a great observation and it's certainly true. We have been more invested in tech and financials almost since the beginning and for the very reason that they look the most promising. They were, and I think still are, among the most undervalued or attractively valued sectors and they still have a lot of things going in their favor. So, we consciously went to those areas because they presented a lot of opportunities and the companies in them are strong and attractively priced.

We have avoided, thankfully so far, energy because they're assuming more sources of energy coming online. We thought energy prices would decline and we didn't want to invest there. If companies don't have pricing power, we don't usually want to own them. So, commodities we have avoided. Energy. And we've leaned on financials and tech which still look attractive. As that changes over time, we'll change. We'll find opportunities in other sectors as they emerge and our sector allocation may evolve. But right now we're happy where we are.

CHRIS HILL:

You mentioned pricing power. If I'm not mistaken, that is the business quality Warren Buffett has said is number one on his list that he likes to see in a company — their ability to raise prices time and time again.

JEFF FISCHER:

And that makes such great sense. It tells you so much about a business that can consistently raise prices. It means they have a competitive moat protecting their business. Protecting their profits. They have some advantage that others can't take away. Because if you didn't have that advantage, your profit margins would go down over time because competitors will come and nip away at your profits and that becomes a constant headwind. So, the very best investments are the ones that can raise prices and get away with it.

CHRIS HILL:

A very specific question. EXPD — is that Expedia?

JEFF FISCHER:

It is Expeditors International.

CHRIS HILL:

Oh, that's right. Expeditors International moved higher right after the recommendation. Would you move the strikes of the strangle a notch higher?

JEFF FISCHER:

If you haven't set up the strangle yet, I would still set up the $43-45 as long as the stock is around $45 something. If the stock is at $46 or above, then I would move the strangle to $44 or $46. So, right now it still stands where it was [the] last I looked. And members should know — especially new members — for any option position we have, and the shorts, we'll issue updates in the Pro Catch-Up Trades any Monday that they look attractive. It will be in that Monday Memo email. We can say, "Here. Pro members who don't have this position yet, here's the catch-up trade to catch up, because it looks good right now."

CHRIS HILL:

We've just got a minute or two left. Any final thoughts as we wrap up not just this event, but as we look to wrap up 2014?

JEFF FISCHER:

Well, it's going to be, I think, a great time to be an investor the next three years, because we own so many companies that are doing better than ever, and not just financially, but management-wise, too. It's been interesting to see the last 12-14 years, or so, how management has evolved to run their businesses better at these leading companies. And the focus on shareholder value, I think, has never been more acute than it is right now.

But what I really love seeing is the convergence between serving all shareholders well — customers, shareholders, the greater good — and we see that with Gilead as it offers its hepatitis C drug to [90 countries in] emerging markets in a cheap, generic version, and yet the company is still set up to make record profits overall.

So, here we are. We're about 80% invested, Chris, in companies we really love. We're looking at a hedge that will take us to 70% — maybe even 65% long — so I think we'll go into the next year strong and ready to take advantage of whatever comes our way, whether it's more upside or some volatility up and down. Sideways. That would be great, too. We think we own a lot of stocks that are going to do well, even if the market doesn't do that well, and we have lists of things we want to do when those opportunities do come up and we're also building more short positions into the portfolio over time.

So, I like where we're at and it's surprising to say this now. But I like where we're at about as much as I ever have when I look ahead the next couple of years and I think as long as all members remember that's why we're here — is to make money the next two or three years on an ongoing basis — and take the volatility that we do see, if we do, as an opportunity, then we'll be in a great position because we really believe in what we own and that's why it's rated a Buy or a Buy First.

Yes, I feel good about where we're at. I appreciate the Pro membership base. So many, now, have been with us since we started in 2008 and the new ones that joined last year. We just opened once last year and so many of them are still with us and now we just opened once this year, and we have these new members and I hope they'll be with us a year from now again, because that's how we all succeed together is having the right time frame.

CHRIS HILL:

And, as Jeff said, this is a full-portfolio service, so by all means, keep the questions coming on the Pro boards [and] and the help desk. Make Pro fit for you.

JEFF FISCHER:

Yes. And I'll jump into the chat version for the last ten minutes right now, too. And then we'll see you on the boards.

CHRIS HILL:

We'll see you on the boards. For Jeff Fischer, I'm Chris Hill. Thanks for watching. Fool on!

[End]

The Buckle Plods Along

Published Nov 25, 2014 at 11:53AM

The Buckle's (NYSE: BKE) third-quarter results continued the trend set forth by the prior two: not great, but not horrible either given the current retail environment. The company continues to plod along with its controlled expansion plans and hold steady on pricing even as competitors offer promotion after promotion after promotion.

Fiscal Q3		change
Sales	$292.2 million	↑ 1.3%
Operating margin	22.1%	↓ 20 bps
Net income	$40.6 million	–
Diluted EPS	$0.85	↓ $0.01
Comparable store sales		↓ 0.3%
Online sales	$22.8 million	↑ 3.8%
Year to date		
Sales	$799.6 million	↑ 1.3%
Operating margin	20.3%	↓ 30 bps
Net income	$102.4 million	↓ 0.9%
Diluted EPS	$2.13	↓ $0.02
Comparable store sales		↓ 0.5%
Online sales	$61.4 million	↑ 2.8%

Updated Guidance: Buy (no change)

Recommended Allocation: 2.5%

Fair-Value Estimate: $53 (no change)

CAM Price: $37 (no change)

Current Valuation	
P/S	2.2
P/E	15.6
P/FCF	23.2
EV/S	2.0
EV/EBIT	8.9
EV/EBITDA	8.1
EV/FCF	21.1
Dividend Yield	4.1%

The Results

Top-line growth was muted because of weak store performance, though this really didn't come as a surprise; the company releases monthly comp figures. Online sales were up 3.8% and continue to account for between 7% and 8% of total sales. Sales per square foot were up sequentially but essentially flat year-over-year at $115. Store traffic continues to be a weak point; units per transaction rose 2% and contributed to the 5% rise in the average transaction cost. Weak store performance also put pressure on margins, though cost controls were able to mitigate the impact to a loss of around 30 bps for most metrics.

The dichotomy between merchandise sales for men and women continued. Sales of men's merchandise was up approximately 8% in Q3 and now accounts for 41.5% of sales, up 250 bps from last year. Women's merchandise sales fell 1.5%, but average price point actually increased 2% to $51.80. Private-label sales held steady at 35% of the total.

The company opened five new stores this past quarter and also remodeled eight, which brought the percentage of total stores that are using its newest formant up to 79%. With the addition of two more openings and one remodeling since the quarter ended, the company has now opened 16 stores year-to-date and remodeled 18. Management is forecasting for unsurprisingly modest expansion in 2015 — six or so new stores and 10 substantial remodels.

Inventory rose by almost 15% to $147.2 million as the company continued preparing for the holiday quarter, but this was only a $0.9 million increase over last year's Q3 inventory level. The company now has approximately $5.22 in cash and investments on a per-share basis, so even though management has yet to announce a special dividend, one seems likely given the modest expansion plans for 2015.

Our Thesis

The Buckle offers retail exposure with low fashion risk — jeans and tops accounted for 46.5% and 31% of sales in Q3, respectively. Its management team is properly incentivized, has meaningful ownership, and runs the business wonderfully well. We expect measured growth from store openings, online expansion, and an expanded merchandise assortment (including footwear and children's clothes). We are not expecting dramatic operational improvements, but we believe in-house brand penetration and an improved online experience are opportunities. The Buckle should increase its earnings and pay a regular dividend, and we expect it to pay out excess cash distributions more years than not.

Pro's Take

Generally speaking, results this year for companies in the apparel industry have been tepid -- especially for those like The Buckle who are reliant upon physical locations for most of their sales.

But hope springs eternal this time of year, and forecasts for the holiday shopping season have received an added boost recently with the decline in gas prices. The company probably won't shoot the lights out next quarter, but given its current valuation, it doesn't have to. Just as one bad quarter doesn't break our investment thesis, one great quarter won't make it.

Buy ProShares Short VIX Short-Term Futures ETF

Published Nov 25, 2014 at 10:19AM

Is this for you? This recommendation is for *Motley Fool Pro* members who are comfortable owning a small stake in a volatile position that we plan to add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can do them and wish to. But this position will be especially volatile, so only follow it if you're comfortable with high volatility.

How You Participate

- **Action:** Buy **ProShares Short VIX Short-Term Futures ETF** (NYSEMKT: SVXY).
- **Allocation:** 1.35% (*Pro* will buy about 400 shares, or $1,350 worth for every $100,000 managed.) Do not over-allocate! We plan to buy more on sharp drops.
- **Scorecard Status:** Buy
- **Fair-Value Estimate:** N/A
- **Recent Price:** $76
- **Price Guidance:** Use a **limit order** to buy at the price available as you enter your order.

What We're Thinking

With China and Europe acting last week to shore up slowing economies, and with the U.S. economy stable, it's possible 2015 will be another year of lower-than-average volatility for stocks. Government backstops appear to be the new normal, suggesting that any further economic weakness may bring more fiscal support from federal bodies, whether it's in China, Europe, or here again in the United States. We don't believe monetary support like this can persist indefinitely, but it could continue for several more years.

Enter the **ProShares Short VIX Short-Term Futures ETF** (NYSEMKT: SVXY) — and say that 10 times fast! This vehicle increases in value when stock market volatility, as measured by the CBOE Volatility Index (or VIX), goes down or is rangebound. How so? This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless volatility in the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit and the ETF goes up in value.

Helping further, VIX futures contracts are historically in a state of "contango" up to 90% of the time. This means future-month contracts are increasingly more expensive than earlier months and than the current VIX level itself (much like a call option has a premium above the current stock price). The VIX is measured as a number, rather than in dollars. A VIX of 12 suggests that 12% *annualized* volatility is expected in the S&P 500 index over the next 30 days. If the VIX itself is 14 (for example), its futures contracts for the next two months may be 15 and 16 (as they were recently). That's a 6.6% and 14.2% premium, respectively, to the current VIX level. The VIX needs to go up enough to make its futures prices increase even more than the current premiums, otherwise short sellers (such as ourselves through this short ETF) benefit.

In the past two years, this ETF has gained approximately 98% while the VIX has declined about 18%. But we don't need the VIX to decline to ultimately see the ETF go up. A flat VIX should lead to gains as well, thanks to contango. If some of this explanation has you feeling like you've already eaten a lot of turkey and want to sleep it off, don't worry; we'll discuss the position further on the new discussion board we have for this ETF, and in our Dec. 3 Portfolio Positioning Event.

Now, the downside risk? When volatility spikes, and it will when the market falls, the value of this ETF can fall *fast and sharply*. October's 100%-plus spike in the VIX level sent this ETF down 39% . At extremes like that and worse, we'll want to add to our position and wait for volatility to revert back down, restoring the ETF price. Since the long-term contango math works in our favor, as does volatility's reversion from spikes, the key to this position is *long-term staying power.* We'll start with a small position, and we're ready (at whatever point) to see it decline in price by half or even more when market volatility spikes. When it does, we plan to add to the position. As the position gains in value over long stretches, we will trim it if it becomes too large — a good problem we hope to have years down the road.

Since its debut in October 2011, the ETF has gained more than 550%. But that's not to say we've missed anything — its "valuation" is not inflated since it has no underlying valuation. Its past appreciation is simply the value created by repeatedly shorting monthly futures contracts that, most times, end with less value. The ETF rolls this strategy forward every month, ultimately collecting more proceeds as long as volatility doesn't gain much ground. When volatility does rise sharply, we'll need to wait through a falling ETF price and consider buying more shares at lower prices.

How It Fits Into *Pro*

Pro has been profiting by shorting ETFs over the past few years, selling short the **Direxion Daily Financial Bear 3X ETF** (NYSEMKT: FAZ), and the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). Both are difficult to borrow and expensive to short now, but the ETF we're buying has had similar or better returns than these shorts, and has moved in price similar to them. Now that those two shorts have shrunk from a 3.5% position in *Pro* to only 0.9% in exposure, and they are not easy to short any longer, we have room to add to our exposure in an ultimately similar vehicle. Adding 1.35% in SVXY increases our exposure to this "basket" to 2.25% total — leaving room to add much more if desired later.

Some things I appreciate about buying SVXY instead of shorting more flawed ETFs or shorting this ETF's opposite, the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETF, include:

- We don't need to borrow shares (which can be difficult) and pay shorting fees, though SVXY does have a 0.95% annual management fee.
- We don't risk being called out of the position at the worst time, as you do with a short.
- As shorts decline in value, they reward you less. The more correct you are on a short, the smaller your future reward. You can attempt to short more shares, but that's not always easy. Buying SVXY is the opposite: The more right we are, the more it will compound over time.
- Our potential loss is limited to the capital invested (so we always know our risk), while a short can of course balloon well beyond your starting risk.
- As SVXY declines against us, it grows smaller in value, making it easier for us to commit more capital to it — which we want to do on downturns (taking a positive action in a negative market). Shorts are the opposite: The more they work against you, the larger they become in your portfolio, making it harder to commit more to the position; they can handcuff you.
- If we own SVXY for more than one year, we should be able to claim a long-term capital gain when we sell it (though do note that we're not professing to give tax advice). In contrast, all shorts are considered short-term gains or losses. That said, because it's set up as a partnership, **SVXY does issue a yearly Schedule K-1 form in March** to owners, so you will likely have small gains or losses to report annually. If this is off-putting to you, consider skipping the investment, and again please note that we can't be tax advisors!
- SVXY is now more than three years old and has tracked its objective very well. There's no reason to suspect it won't continue to do so, because it uses a regimented formula to short the same VIX futures in the same rolling percentages every month (the same formula other similar VIX products use).
- Finally, it bears repeating that, in contrast to a short, we can manage this position's size in a way that's logically beneficial to us: We can comfortably add more when it declines, and sell some when it grows.

This is a *Pro* type of position. It's not something you're likely to find recommended in many traditional places. If you participate, you'll need to commit to it for the *long haul* given that volatility will at times send this position's value much lower. You also need to assume that, like any stock, it could lose all or virtually all its value.

Over the long term, though, the odds are stacked strongly in our favor because spikes in volatility revert to lower levels over long periods, and because contango (like writing options) benefits a short seller over time. This ETF has existed more than 700 trading days, and has returned 568% over that time. But over 30-day and 90-day periods, its maximum drawdown or decline has been 40%. Over any 250-day trading period, its maximum fall has been 3%. Every period longer than that has been positive. We need to commit to the long haul.

ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

- **Inception:** Oct. 3, 2011
- **Assets:** $506 million (as of 11/21/14)
- **Annual management fee:** 0.95%
- **Average daily trading volume:** 1.9 million shares
- **ETF's beta to the VIX:** 0.64 (moves 64% as much as the VIX, since 2009 based on tracking index)
- **ETF's correlation to the S&P 500:** (0.74)(inverse relationship correlated 74% to the S&P 500, since 2009 based on tracking index)
- **More Info:** Fact Sheet (link opens PDF)
- **Structure:** Partnership, so owners will receive Schedule K-1 IRS forms each year

The Foolish Bottom Line

Members should realize this is *not* a hedge — it's the opposite. This is an investment that benefits from a *lack* of volatility, and its price will rapidly move against us when volatility increases, let alone spikes, when stock prices decline. So, we're actually inviting a bit more volatility into the *Pro* portfolio with this position. We're willing to do so because we believe the long-term rewards will be well worth it, and with this vehicle we should be able to manage the position sustainably whatever comes our way. Should volatility soar, we'll be ready to add shares at much lower prices. Over the years, the position could appreciate enough that we'll want to sell some shares during periods of low volatility (freeing us to buy more at lower prices again). And so forth. The key is to start small, so we can add more when desired — and then be ready to hold the position for years.

Alternative Trades

- **Already short VXX?** Then you already have exposure identical to owning SVXY. Keep your exposure reasonable; don't buy SVXY if that would increase your total exposure beyond our recommended level. If you want to swap your short VXX for long SVXY, realize that at times VXX loses more than SVXY gains. But keep in mind that SVXY can compound while VXX is gaining an ever-smaller sum for short sellers, even if it declines more on a percentage basis than SVXY gains at times. If you want to swap, consider the tax consequences of closing your VXX short. They can be large.
- **Only want to potentially buy SVXY lower?** Consider selling to open any puts — sell one put for every 100 shares of SVXY you would buy lower.
- **We're not offering more alternatives.** This recommendation — buying shares — is simple enough for anyone, and should be relatively easy to manage with additions and subtractions over time as desired.

Pro Can Help

Pro Guidance Changes

- **Apple** (NASDAQ: AAPL): Fair value estimate increases to $110. Shares remain a Buy, with a 4.6% allocation. See our new earnings review.
- **Gilead Sciences** (NASDAQ: GILD): Fair value estimate increases to $120. Shares move up to Buy First, with a 4% allocation. See our latest earnings review.
- **MasterCard** (NYSE: MA): Fair value estimate increases to $75, and shares remain a Buy at a 4.5% allocation. We explain our conservative fair value in our earnings update.
- **Medtronic** (NYSE: MDT): Fair value estimate increases to $66. Shares remain a Buy with a 3.2% allocation. See our earnings review.

Dear *Pro* member,

As we take time this week to enjoy the Thanksgiving holiday, it's a Foolish chance to remind ourselves that the values that we treasure in life are appreciated — and beneficial! — in how we approach investing, too.

Namely, thoughtfulness; good planning; sticking to strategies that work to reach long-term goals; a sense of humor; modesty; a willingness to keep learning, to know you can always improve. And an acceptance of mistakes, whether it's an overcooked turkey or a stock that went south. That's part of the journey, so we better take it with levity.

Overall, those who are able to invest in a calm, reasoned, and cheerful manner through thick and thin are likely to enjoy life more, too. Both investing and life can, for the most part, run smoothly for years, and then suddenly be visited by hardship. How will you react? What you do will influence how strongly you emerge from a challenge, and how much you grow afterward. Will you continue to reach new highs in your life, even after setbacks? Does your portfolio do the same?

We enjoy investing, and we believe this helps us enjoy life more, too. Whether you're new to *Pro* or have been here since the beginning, we hope you revel in your investing with us — and approach it gradually and calmly, taking a long view, just as we do in life. No one can build a complete life in mere months or even a decade. It also takes years to build an investment portfolio that will give you more than you need, financially, for the rest of your days. It will be sweet when you get there, but enjoy the process, rather than just waiting for the outcome.

Heading into the holiday, we're delighted to offer you Tom Gardner's recent talk to *Motley Fool One* members in Austin, Texas. Kicking off a day of Foolish festivities, Tom spoke about three steps investors should take to improve their investing results — for life. Simply click here, and you'll get the transcript, too. Enjoy it!

We'll be back tomorrow with our fourth Portfolio Building Report. After that, have an excellent Thanksgiving! Remember to stop by *Pro*'s site next week for our Dec. 3 live Portfolio Positioning Event.

Thank you for being a Fool with us. We're grateful for your trust and for our shared community of excellent investors (and life enjoyers!).

Fool on!

— Jeff (TMFFischer)

***Pro* Completed Trades**

- **Expeditors International** (NASDAQ: EXPD): We rolled our November 2014 $43 short calls to February 2015 $45 short calls for a $0.05 debit. And we sold February $43 puts for $1.05 in credit as our November 2014 $39 puts expired as income.

Tom Gardner on Your 3 Biggest Investing Risks

Published Nov 24, 2014 at 10:00AM

Watch as Tom Gardner digs into the three biggest risks of investing -- and how The Motley Fool aims to help you position yourself to combat them. Recorded at the November 2014 *Fool One* member event in Austin, Texas.

{%video%}

Transcript

Chris Hill: Please welcome Tom Gardner.

Tom Gardner: Thanks, Chris. Thank you. Good morning! Awesome. Awesome answer. I won't say that twice.

We have been in business for 21 years, and in a way we may have had a better front-row seat at observing the behavior of investors than any organization in the world, by virtue of the fact that we're seeing, online, what's happening with investors in different market environments.

One of the things I've learned to do is, when the market is down to emphasize opportunity, and when the market is up to emphasize risk. The market is up, so I'm going to talk a little bit about risk in my opening remarks, just so we're seeing clearly together how to make sure we've set up our portfolio for every environment.

Again, we've been watching the behavior out in the community message folders, talking to people, the financial planners in Motley Fool Wealth Management, and learning how you're doing what you're doing.

I would like to emphasize three different types of risk that I see, in rank order for me, as the greatest risks that you face in using The Motley Fool for your investment and financial needs.

The first risk is time horizon risk.

Time horizon risk. That is the number of people over the 21 years that have used our service with a time horizon that is simply too short to get the value out of the work that we're doing. The average holding period for a "professional" -- and I intentionally put quotation marks around that word -- investor is less than a year. The average holding period for an individual investor is about 185 days. That's not going to work with The Motley Fool.

I'm probably preaching to the choir on this one, but it's important for everyone in the room to know that what we've set up across our services, and if we talk specifically about the Everlasting Portfolio, which we will later today, we mandate a five-year holding period in the Everlasting Portfolio, as you know. We do that primarily for behavioral reasons.

I think the data will show that that is the best way to get great long-term returns. I think you may be able to squeeze slightly better returns out if you find a few opportunities to sell in certain situations with less than a five-year holding period, but you may have seen David Gardner's video on Stock Advisor and his side of the scorecard; he has utterly obliterated both the market and his younger brother!

What he and his team on his side of the scorecard found is that, had they never sold a stock since 2002 in Stock Advisor, their returns would be better ... had they never sold.

That data, and the data provided by the investment performance of Shelby Davis, whom I'm sure many of you have read about in the book *The Davis Dynasty*, a man who bought stocks, essentially never sold, rarely sold, died with 1,200 stocks in his portfolio. Started with $50,000, and 40 years later had $900 million in his portfolio. Did not add much money at all, along the way; he got 24% annualized returns.

The one thing he did that we don't do at The Motley Fool is he used margin, but I won't go into that. You don't need 24% annualized returns to have more money than you'll ever need.

The key lesson from Shelby Davis' life is he basically said, "Why sell? If I focus myself on finding great organizations, I'll just ride them. I'll have a certain number of losers and they won't matter to the overall performance of the portfolio."

And that's exactly what's happened in Stock Advisor, so my action on Risk Number One is, align yourself with the work that we're doing, which is seriously consider making investments that you'll hold for at least three years, ideally five years.

Of the six largest holdings of Warren Buffett's, one of them, **IBM**, was bought in the last couple years. The other five, the average holding period for Buffett of those companies is north of 20 years. North of 20 years.

The evidence is everywhere, for us and for our families, for the future generations of your family, that if they can learn to find great businesses and ride along with them, their chances of success go way, way up.

That's the first, and I think the greatest risk that anyone faces in using The Motley Fool. The number of people that come into the Fool and buy some stocks with us, and then six months later say, "It's not really working," they're missing an opportunity to build wealth in the way that the evidence demonstrates it is built, using the public markets.

The second risk is diversification risk. Diversification risk; having enough stocks in your portfolio so that, in any environment, when some go down you're OK because you can look in your portfolio and see that there are a couple at least -- when markets are really down, it's nice to see one green mark in your portfolio!

There's a lot that goes into the emotions of being an investor, and diversification really gives you a number of benefits. One of them is, of course, you see a number of stocks across a number of industries, so you're able to get some sense of what's happening. You don't feel as isolated as if you have five stocks in your portfolio.

Now, there are some great investors like Buffett who have said if everybody had a punch-card with 8 or 10 holes that you could punch, and those were the only stocks you ever bought in your entire life, the average person would do better.

I think that that's probably true for somebody who spends their life investing and really digs deeply into companies, but for the majority of stock investors, I think holding a minimum of 30 stocks is a very good idea.

I would look at your portfolio and see, "Do I have more than 30 stocks?" If you don't have more than 30 stocks, then I would say you hopefully are spending a good deal of time on your investments, and have deliberately made the decision to have fewer than 30. If somebody in the room has six stocks, great -- if you have deliberately and intentionally made that decision. Otherwise, 30 or more stocks.

The second factor I'd put in diversification risk is to have no position larger than 15% in your portfolio.

Now, those are guidelines but I observe, again, in looking at the data and working with investors for 21 years, that the top two mistakes that people make when they come in to work with The Motley Fool is their time horizon is too short, and they're hoping for success from too few investments.

I can pretty much stop there in my opening remarks and say that if everyone in the room and everyone across the world that uses The Motley Fool simply said, "Okay, I'm going to buy more than 30 stocks and I'm going to hold them for more than five years," I'd feel very, very good about their success, relying on the research that we're doing as a company and all of us as a community, following businesses together.

The third risk I'll just say is the risk of market extremes. That is the risk of getting extremely excited when all of your stocks are up and the market's up 20% a year for a couple years in a row, and then getting completely dejected to the point of never wanting to invest again when the market is down.

Now, the data shows that the market rises two out of three years, and that the stock market rises on average somewhere in the range of 9-10% a year, historically. That means that actually, you probably don't need to spend too much time trying to manage your emotions when the market is rising, because that's typically what it does, so I wouldn't get too worried when the market hits highs.

But I would definitely want to position yourself to be happy when the market declines. I probably say this at each member event; it's because it's one of my favorite Motley Fool concepts ever, and it's from Jeff Fischer.

Jeff says you need to put your portfolio in position to be able to take a positive action in a negative market. That is so important to human nature. The data shows that most people are buying stocks with enthusiasm when the market's rising, and selling them in distress when the market's falling. We should at least flip one of those two, and that's we should be buying when the market is declining.

As you know, to close -- or maybe not everyone in the room knows -- I made a bet with our Motley Fool One member base on January 1 of this year, that the market would fall 10% at least one point during the year.

It maybe would rise 70% -- that would be absurd and it hasn't happened -- but at some point in the year there will be a 10% decline. The reason I did that is I wanted to prepare us all for the reality that this is going to happen. Morgan Housel's great research in Motley Fool One shows that the market has fallen 10%, on average, every 11 months going back 100 years, and that's pretty evenly distributed.

There are some periods where you don't get a 10% decline; for example, the one that we're in right now, unfortunately! The market has not fallen 10% for three years, I believe; a little bit more than three years. It has fallen 9.86%, which just feels so incredibly unfair!

In order for me to win the bet, the S&P 500 had to get to 1,817. That was the target. We were on a retreat in Maryland, and I was refreshing the S&P 500 quote every six seconds; something I never thought I would ever do in my life! It got to 1,820, and then turned around.

Thankfully, because of Morgan's work, because of our commitment to some of the principles I mentioned, because of some of the things that we'll learn together today, and that we're learning together in Motley Fool One, there we were right in the middle of October, using our Wildcard Round in the Everlasting Portfolio and saying, "Why not?"

Mathematically, if the market goes up on average 9-10% per year, and has one 10% decline on average, every 11 months, for long-term investors with a diversified portfolio, what a mathematically awesome moment in time to buy.

Every 11 months -- obviously there are multi-year periods where it doesn't happen -- but whereas most of the market is getting worried and the headlines are absurd and extreme, we as Fools are using that as an opportunity to pick up some great investments.

We'll talk about that Wildcard Round but that, to me, is one of the most delightful things that has happened in our Motley Fool One work, going back a number of years, and that is to really use all the data and research we're doing to go contrary to the market and take advantage of some beautiful prices, which I think we got together in mid-October.

There is a look at three significant risks.

I think if you -- in your portfolio, your family's portfolio, with your children, grandchildren; with anyone you talk to about investing -- can teach them, "You should hold your investments for more than five years. You should have more than 30 of them in your portfolio, and you should set your portfolio up to be able to take a positive action in a negative market," I think those are three ingredients to beating the market, something that still so many academics think can't be done, and that we know can be done. We believe we've demonstrated with you that it can be done for many years.

Thank you all for coming. You're going to get probably too much of me today, at different points through the day, but you will now get Bill Mann and Tim Hanson. But before that, we have a video with some tips on how to use Motley Fool One.

Giant Gilead Grows Greatly

Published Nov 24, 2014 at 9:36AM

Gilead Sciences (NASDAQ: GILD) reported record results even as doctors put off orders of its Hepatitis C drug, Sovaldi (Sovaldi revenue fell 20% from Q2). Doctors were waiting for Gilead's new single-pill solution, Harvoni, which was approved in October and is off to a very strong start. Our fair value estimate increases to $120 and the stock returns to Buy First from Buy. To see our full report and post questions, just click through, Fool!

Medtronic Stays Healthy

Published Nov 24, 2014 at 9:29AM

Medtronic (NYSE: MDT) pleased investors with better growth and a steady outlook for more on the way. The company expects gross margin to improve sequentially, and expects multiple benefits (savings, growth, and much more cash available to it) from its pending merger with **Covidien** (NYSE: COV). Shares in this leading medical device maker remain a Buy, and our fair value estimate ticks up. See our full report and ask questions by clicking here.

Apple Connects Again

Published Nov 24, 2014 at 9:22AM

Apple (NASDAQ: AAPL) shared an outstanding quarter and excellent guidance, with healthy growth, stable margins, and giant revenue and cash flow numbers. The most valuable company in the world is on track to become larger still -- nearing $200 billion in annual revenue. The stock remains a Buy and our estimated fair value increases. To get our full report, click here.

MasterCard Remains in Charge

Published Nov 24, 2014 at 9:16AM

MasterCard (NYSE: MA) reported results that showed strong year-over-year growth even in a difficult environment, and shares ascended to a new high. Our fair value estimate increases, and we explain why it looks conservative. When the economy around the world is stronger, profits are poised to balloon, and still most transactions are done in cash. To see our full report and ask any questions, click here.

Reset Your Short Strangle on Expeditors International

Published Nov 18, 2014 at 12:18PM

Is this for you? This is for *Pro* members who manage at least $250,000, are seeking an income position, and can sell puts. Members with our existing position can follow this "re-up" trade exactly, and newcomers can jump on board now, too. If it's not possible for you to make some part of this trade, consider the Alternative Trades at the end of this recommendation. **If you're new to options, this trade may be too complex**; in that case, you should wait, make simpler trades instead as we offer them, and join in this extra income trade later.

How You Participate (If You Already Have a Position)

- **Trade One:** Roll your November 2014 $43 calls on **Expeditors International** (NASDAQ: EXPD) to February 2015 $45 calls. (Leave your November 2014 $39 puts alone.)
  - **Use a rolling order:** Buy to close your November 2014 $43 calls, and simultaneously sell to open an equal number of February 2015 $45 calls.
  - **Price guidance:** Aim to roll for a zero to $0.05 net debit.
- **Trade Two:** Sell to open February 2015 $43 puts to complete your strangle. Our November $39 puts expire Friday; we will wait at least until that day to write new puts.
  - **Price guidance:** Lately, use a **limit order** to be paid $1.30 for each put you write, or 3% in nearly three months.

How You Participate (If You're New to the Position)

- **Trade One — set up a synthetic long:** Sell to open January 2016 $42 puts, and buy to open an equal number of January 2016 $42 calls.
- **Trade Two — sell a strangle:** Then use a strangle order to sell to open February 2015 $43 puts and sell to open February 2015 $45 calls, same as above, selling one each for every synthetic long you set up.
- **Price guidance:** Aim to pay approximately $1.60 or less to set up the synthetic long, and receive at least $2.30 to sell the strangle. Realize the synthetic long price will change as the share price moves, and the strangle credit will go down over time.
- **Allocation:** Approximately 1.8% exposure on the synthetic long if turned to stock, and another 1.7% exposure through your short puts in the strangle if turned to stock, for 3.5% total exposure. Each new syn long combined with a written put represents about $8,700 in exposure to the stock. So, for 3.5% exposure, set up one synthetic covered strangle (one each of all four options) for approximately every $250,000 you manage. *Pro* used 10 contracts of each option.

- **Recent Prices:**
  - Stock: $44.10.
  - November 2014 $39 put/$43 call strangle (combined bid/ask)(buy to close): $1/$1.25

- February 2015 $43 put/$45 call strangle (combined bid/ask)(sell to open): $2.35/$2.55
- **In sum:** Your account will begin with $2.35-$2.45 in credits on the new February 2015 $43 put/$45 call strangle. Members already in the trade who close the November $43 calls first will net a total credit of around $1.10-$1.20.

What We're Thinking

We have a gain on the synthetic long we set up in August on Expeditors International, and we've made some income on our short strangle, too. We're continuing this income strategy by setting up a new strangle that expires in February.

More That Matters

- **Maximum loss:** The same as owning 200 shares of stock (per synthetic covered strangle), minus the option premiums received.
- **Maximum gain:** The current strangle caps the upside on our synthetic long at $45, plus the new premiums received.
- **Follow-up:** The plan is to keep writing strangles at various strikes to earn income. Ideally, we'd also like our synthetic long to continue to tick up in value, too, though that's of secondary importance.

Alternative Trades

- **IRA-friendly:** If you're unable or unwilling to write puts (even cash-secured), then you can consider using a buy/write order to buy at least 100 shares of stock and sell to open the February 2015 $45 covered calls. Start about a 1.8% allocation and be ready to add more if the stock falls and we accept more shares; or, start a 3.5% allocation and don't plan to add later.
- **Traditional covered strangle:** Rather than using a synthetic long, if you prefer you could simply buy shares in round lots of 100 and then sell the same short strangle we are.
- **Managing less than $250,000?** You can consider just buying 100 to 200 shares to write the covered calls on them, as long as it keeps your allocation below 3.5% (which means your portfolio is at least $126,000, because $126,000 x 0.035% allocation = $4,410 as a stock purchase, or exactly 100 shares).
- **Already wrote covered calls?** You can roll those just as we are above.

Pro Can Help

- **Want more on this strategy?** Dust off our guide to covered strangles, and synthetic longs, too. We're just combining the two into a synthetic covered strangle.
- **Questions?** Visit our revitalized Expeditors board.

Investing for 2015 and Beyond

Published Nov 17, 2014 at 2:26PM

Pro Guidance Changes

- **Skyworks Solutions** (NASDAQ: SWKS): Fair value moves up to $66. Shares remain a Buy First, with a 3.4% allocation.
- **OpenText** (NASDAQ: OTEX): Fair value moves up to $55. Shares remain a Buy, with a 3.7% allocation.
- **Tupperware** (NYSE: TUP): Fair value moves down to $80. Shares remain a Buy First, with a 2.7% allocation.
- **AmTrust Financial Services** (NASDAQ: AFSI): Fair value moves up to $43. Shares remain a Buy, lately at a 7.7% allocation. Given its size, this one in particular you may want to buy in thirds or halves over time. Or you may want to begin by buying only 5% or so to start, as we may eventually trim the position (and if we don't, you can add more later).

Dear *Pro* members,

The team and I are analyzing recent earnings reports, SEC filings, and conference calls from our companies. As you can tell from the links in today's *Pro* Monday Memo email, we've gone through several companies in recent days, publishing our takeaways and updated guidance (summarized above).

The good news is that a majority of our companies are growing more rapidly than we or the market expected. Meanwhile, the few that are hitting bumps in the road don't expect the bumps to last. When managing a portfolio, you always expect some positions will be going through rough patches at any given time; as long as worthwhile promise lies ahead, it's not a lasting concern.

Veteran members know that after earnings coverage, we typically make some moves in the portfolio -- adding to a position or sometimes selling one, using options, or adding a whole new company to the fold. We tend to make these changes in small batches, because we invest -- and think -- in terms of the *whole portfolio* and how it works together. Many investors begin with just a stock or two and consider themselves investing, but in reality, that's closer to gambling. When you start to think in terms of a diverse portfolio, instead of a few "stock picks," you set yourself up for lasting success.

A well-constructed portfolio is like a tall building with multiple safeguards. If it gets hit by a tornado, or a 100-year flood, it will withstand the assault. Meanwhile, it increases in value.

New *Pro* members are advised to steadily build a *Pro* portfolio by following our (appropriately named) Portfolio Building Reports. Part one and part two recommended 10 *Pro* stocks to buy, adding up to about a 36% allocation. Our subsequent reports will outline the rest of the *Pro* stocks we believe you should invest in; after that, since you'll be largely invested, we'll have a Portfolio Positioning Report (and accompanying live chat) for those who want to short, hedge, and use options. With these tools, you can manage your market exposure for upside and downside.

Common questions include:

- **How do I meld *Pro* stocks with my existing stocks?** One approach is to treat *Pro* as a sleeve of your total assets, and with that sleeve follow the whole portfolio as closely as possible. Some members do like to mix *Pro* stocks with other positions. If this is you, we still recommend that you eventually own as many *Pro* stocks as you are happy to own. Our portfolio is meant to work as a whole. If you're selling some stocks to get there, first sell your least favorites -- ones you believe in least -- to add *Pro* stocks. And realize you can take your time. We don't want you racking up giant tax bills by selling winning stocks you love. Taxes are a real cost. You can follow our portfolio and apply our hedging strategies to your own portfolio, while gradually moving into more *Pro* stocks over time. You can ask related questions on our "Making *Pro* Fit You" discussion board.
- **Should I buy a full allocation of each stock today?** We're advising that you mirror our current allocation. We make certain we like how our portfolio is constructed, and to guide you over the years, we can only know what your allocations are if you follow our own. That said, many members average into positions over time. If we recommend 4% in a stock, some of you may buy 2% to start, and 2% later. That's fine, and would be beneficial if prices slip -- as long as you finish the job later. Experienced options users sometimes "sell to open" puts to target lower buy prices on some of their shares.

- **Some stocks are above fair value. Should I buy anyway?** If they're rated a Buy, we believe they will still perform well over our time frame, meeting or beating our goals. Fair value is an estimate, and it's the price *from which* we expect our desired rate of return. If a stock is a bit above our estimate, it doesn't mean its promise is gone.
- **How long will I own these stocks?** The Motley Fool has always said that you shouldn't invest money in stocks for anything less than three years. That's smart advice. We view all of our core stocks with a rolling three-year time frame.
- **Do I need to hedge, short, and use options?** The short answer is no. Many investors do perfectly well by just owning stocks -- our stocks alone should lead to success. But for those who want to use these dynamic tools, we'll help you incorporate them into your *Pro* portfolio starting with our Portfolio Positioning Report on Dec. 3.
- **How do I use *Motley Fool Options* alongside *Pro*?** *Pro* members receive *Motley Fool Options* free for the life of their *Pro* membership. *MF Options* provides individual options ideas and education. For members who want *additional* options positions in their portfolio, these are a perfect portfolio complement and return enhancer.

For other common questions, see our welcome note from last week. And as you go through our Guidebook, enjoy the process! Investing is a marathon, never a sprint. If you make a little progress each week, you're headed toward the long-term success that is compounding, which can only happen over many years. Already, we're analyzing investments with 2015 and beyond in mind. Never do you invest for "today." You invest for a more rewarding tomorrow.

To veteran members, thank you for so kindly welcoming new *Pro* members to the service! Our reopen last week was the first time in a year that we opened to new members, and it's fun to see new names here and in *Motley Fool Options*. To everyone, we expect a series of recommendations (in both services) as we go through the rest of the year. In *Pro*, we like to use the end of the calendar year to reassess and make adjustments. We have this in mind already as we guide new members. I also like to get new, desired positions into the portfolio as the year ends, looking ahead to 2015 and its possibilities (including higher interest rates).

But always think "marathon," never "sprint." Any money you can make in a day or week won't be enough to matter. The money you make over many years, by being invested, is what makes all the difference.

Fool on!

— Jeff (TMFFischer)

Nov. 22 Expirations

- **Expeditors International** (NASDAQ: EXPD): We plan to let our $39 puts expire as income, and write new ones. We'll roll our $43 calls. So, we'll keep a covered strangle going on these shares for income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our $200 puts are on track to expire without value. If we can get some value, we'll sell by Friday with a trade alert. This hedge quickly became worthless as the index rapidly recovered. But our portfolio went on to new highs regardless. We are considering new hedges.

OpenText Keeps Growing

Published Nov 17, 2014 at 10:56AM

Guidance Update on OpenText (NASDAQ: OTEX)

• Fair Value Estimate increases to $55 (from $52)
• Remains a Buy, at our 3.7% allocation

Summary: First quarter 2015 new license sales rose 6% in a slow environment as the new software that debuted early this year gains traction; separately, the GXS acquisition is going well. Management projects continued strength given its new product lineup and industry growth of around 10%. Little else changed in the business the last 90 days, but year-over-year growth is strong thanks in part to acquisitions, and profitability is up strongly the past year.

========================
Q1 2015 Results
========================
• Revenue: +40%
• Diluted EPS: +41%
• License Revenue: +6%
• Oper cash flow: +73%
========================
========================

OpenText (NASDAQ: OTEX) sells enterprise information management (EIM) software via cloud and license to help customers organize and manage electronic content, business processes, regulatory and other data. It also conducts, invoices, and manages business transactions through its GXS acquisition. The company's sales are spread across industries, governments, and geographies.

Pro's thesis: The enterprise information management (EIM) software industry will grow by about 10% annualized, and OpenText will grow stronger than the industry. In addition, OpenText will be a leader in business exchange transactions, and recurring, fee-based revenue will grow. As long as shares are reasonably valued, they'll compound for us.

Guidance: Shares remain a Buy at a 3.7% allocation. If you're using options, you can also write puts to potentially buy (some of your) shares or target income.

To see our full review, please visit the OTEX board.

Coca-Cola Carries On

Published Nov 17, 2014 at 10:47AM

Pro Guidance

o No *Pro* guidance change on Coca-Cola (NYSE: KO)

o Not to be confused with *MF Options*, *MF Pro* has a January 2016 synthetic long with a 3% look-through allocation. Here's our original recommendation.

o Newcomers should wait for our Dec. 3 report, but those with experience could set up a January 2017 synthetic long, lately at the $42 strikes. Each syn long is worth $4,200 in stock, so you would set up one syn long (sell one put, buy one call) for every $140K you manage. Assuming no changes, we'll have this guidance in our **Portfolio Positioning** report on December 3.

Key takeaways:

- Coca-Cola is refocusing the business by market segment and geography to perform better.
- The company is streamlining operations for cost savings and margin improvements by 2017 to 2019, with $3 billion in annualized savings planned by 2019.
- They still target long-term sales growth of 4%-6% and high single-digit EPS growth.
- 2015 will be a transition year for the business as Coca-Cola works to lower costs and increase return on investment over the long haul.

In summary, expectations are low for Coca-Cola, and shares are reasonably priced such that any business improvement could push the stock (and our syn long) higher. Now that Wall Street is starting to focus on the company's cost savings plan, management may have just lowered the bar a bit. Investors will likely be happy if margins increase and sales volume holds up.

We may eventually write calls on our syn long to target income during a transitional 2015.

For our full review, please see the board.

Tupperware Parties Less

Published Nov 17, 2014 at 10:37AM

Pro Guidance on Tupperware (NYSE: TUP):

• Buy First (no change)
• Our Fair Value estimate declines from $85 to $80 on low growth
• Members lacking a 2.9% allocation should buy; or, those who wish can write puts ($60s or $65s) to target a lower price for some shares, though today's price looks attractive already for the long haul.

Summary

Tupperware failed to execute again, falling short of expectations with emerging market sales up 8% and developed markets down 4% (goals are 10%+ and flat-ish).

Currency headwinds, a 2% drop in the *active* sales force, and recent problem areas like Venezuela dragged down results. That said, earnings per share came in at recent guidance, even as spending was elevated. Higher spending should ultimately lead to greater sales as the company is investing to grow its infrastructure. Emerging markets could return to 10% sales growth as soon as this quarter. However, management did not lay out any bold new plans; it just needs better execution and a more active sales force.

Tupperware remains a choppy business because it's rare that all markets do well any given quarter. As long as the business as a whole is moving forward, we should ultimately be rewarded. Over the last 5 years, sales have grown at a 5.5% CAGR, operating earnings at 7.2%, and EPS at 11.8% annualized. Dividends have grown 24.8% annualized. But now we need to see increased spending start to result in stronger sales, even if it takes another few years. Overall, I believe the odds still favor a pleasing North Star return with moderate risk.

How it Fits Into Pro

In the *Pro* portfolio, we like that Tupperware provides non-tech exposure and consumer retail exposure in large emerging markets (70% of sales), while trading at a reasonable price (P/E of 14) with a strong 4.2% yield. It doesn't face the same retail risk (or costs, or limitations) as a bricks and mortar retailer. It pays no retail rent and doesn't advertise. The meta-thesis is Tupperware can grow free cash flow and EPS -- in a choppy fashion -- strongly enough to top the North Star, including the dividend, annualized over the next 3-10 years as the salesforce grows from 2.9 million to potentially 5 million long term.

Projections

- 2014 FCF of $220-$230 million, down from $250M
- 2014 sales in local currency up 4% to 5%
- 2014 EPS of $5.21 to $5.26 -- up modestly

- Long term, they're still aiming for 6% to 8% annualized revenue growth in local currency, comprised of about 10% emerging market growth and small moves in established markets. But for 2015, modeling for 4% to 6% revenue growth because that looks more likely.

New Quarter, Same Old Story at AmTrust

Published Nov 12, 2014 at 2:52PM

AmTrust Financial Services' (NASDAQ: AFSI) third-quarter results for fiscal 2014 continued the precedent set in prior quarters. Acquisitions and organic growth drove impressive top-line results, while favorable loss development and prudent cost management ensured that bottom-line metrics were equally impressive. AmTrust is currently *Pro*'s largest holding, but it didn't start out that way; strong operating results have lead to outsized returns for shareholders over the past few years. This quarter served as a great reminder of why our initial investment has increased fivefold.

AmTrust Financial Services Q3 2014

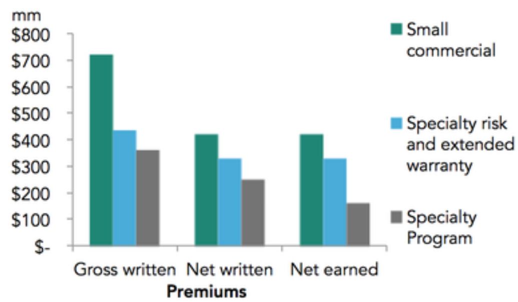
Consolidated Results

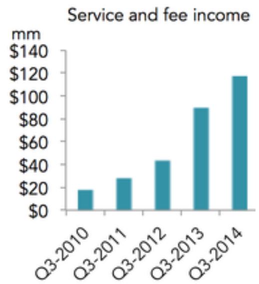
		change
Gross written premium	$1.5 billion	41%
Net earned premium	$914.4 million	49%
Operating diluted EPS	$1.70	205%

Insurance ratios	
Loss Ratio	66.6%
Expense Ratio	24.7%
Combined	91.3%

Rolling returns	
ROE	29.4%
ROA	4.6%

Segment Results





Updated Guidance and Valuation

Updated guidance: Buy (no change)

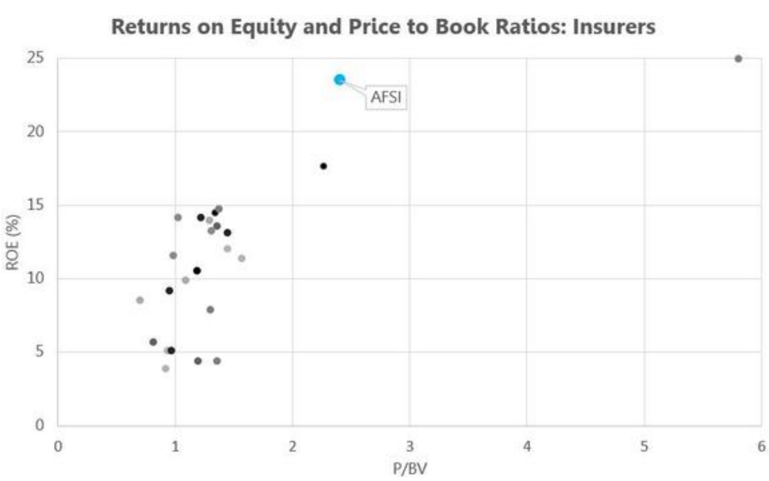
Recommended allocation: 7.3%

Fair-value estimate: $43 (up from $40)

CAM price: $30 (up from $28)

Current Multiples	
P/BV	2.4x
P/Tangible BV	4.31x

Dividend Yield 2%



For an insurer, 2.4 times book value definitely isn't cheap, but as the chart above illustrates, AFSI is no ordinary insurer. Not only is it one of the fastest-growing around, it also has some of the highest returns in its peer group.

Comin' Out Swinging

With all the drama surrounding the recent acquisition of Tower Group's commercial lines (click here if you want to read what the kerfuffle was about), CEO Barry Zyskind decided to break from tradition and discuss the deal as soon as the legal niceties were finished. The transaction was reviewed by nine separate regulators, scrutinizing every facet of AmTrust's business. The New York State Department of Financial Services (DFS) alone made more than 65 requests. Though some claim this level of scrutiny is a sign that regulators are becoming increasingly concerned with AmTrust's complexity and the speed of its growth, we see things in a different light: Regulators may have attached conditions to the deal, but they still gave AmTrust their vote of confidence. In particular, the New York DFS — having already been burned by Tower Group — should have good reason to make sure the deal doesn't backfire. That organization considers two factors when making an approval determination: the financial condition of the acquirer and the insurer, and the trustworthiness of the acquirer or any of its officers and directors. AmTrust was approved on both counts, and every regulator signed off on the deal.

Division Results

Gross written premiums in the small commercial business division were up an impressive 72% to $723 million. These results were driven primarily by two factors: strong growth in the company's workers' compensation product and the renewal rights from the Tower transaction. Workers' comp policy accounts increased by 55% as

California, Florida, and New York continued to be pockets of strength. Rapid policy growth when pricing favors the insuree often results in trouble down the line for insurers, but pricing continues to hold up in AmTrust's largest markets. For example, the average third-quarter rate increase in California and New York was 10% and 8.5%, respectively. Tower's commercial line renewal rights contributed $125 million of premiums during the quarter. Management now believes that this deal will likely add north of $500 million in premiums on an annualized basis (the original estimate was $350 million to $500 million), which would make this one of the most accretive transactions in AmTrust's history. To put the size of the deal in perspective, gross written premiums for the entire small commercial business division were $1.6 billion in fiscal 2013.

Results for the specialty risk and extended warranty business were impressive, even with a sizable currency headwind. Gross written premiums were up by 24% to $437 million, driven primarily by strong international results (up $71 million). The specialty program division, the smallest of the three insurance divisions, saw premiums increase by 24% as well, benefiting from many of the factors that boosted the small commercial business division.

Loss ratios remained favorable, but a shift in business mix in the small commercial and specialty risk and extended warranty divisions meant higher expenses, driving the consolidated combined ratio higher for the quarter. Even with the increase, AmTrust's combined ratio continues to be one of the best in the industry. The big differentiator for the company is its expense ratio. And while the shift in business will likely put pressure on this ratio going forward, the biggest advantage for the company from an expense perspective — its proprietary operating platforms — will continue to be exactly that. Mix may pull the ratio a little higher in the coming quarters, but I don't foresee it being much of an issue. Tower's commercial business is actually a great example of the savings AmTrust is able to realize immediately just by moving an acquired business onto its platform — it was running on six different platforms before the acquisition.

Revenue growth for the service and fee business rose by $27.6 million (31%) to $117.6 million. As is common for AmTrust, growth here was driven primarily by businesses that have been acquired over the past few years. Management has been willing to pay up for businesses that were folded into this division — they actually account for the majority of the goodwill on AmTrust's books. But the economic value here is far in excess of what is currently being recorded, and it's part of the reason investors are so willing to pay such a high P/BV multiple for the stock. EBITDA margins continue to be strong for this segment at around 25% and should expand as the company leverages its existing platform and workforce with each new deal.

Pro's Take

The shrewd and opportunistic management team at *Pro*'s largest holding continues to impress us. They're also great at timing buybacks. The company repurchased 843,000 shares during the quarter at an average price of $39.85 — only 3% higher than the quarterly low, and 20% below recent levels. Book value per share was up 6.8% this quarter and 27.2% over the first three quarters of fiscal 2014. Given that pricing is still holding up and AmTrust is still relatively new to its largest markets (and therefore doesn't have to deal with legacy losses from prior years), the company still has a lot of operational flexibility — it can charge as much as competitors and make more in profits or undercut the competition on price in a bid to take market share. But the devil is always in the details when it comes to insurers, so I'll be combing through the 10-Q that was just filed in the coming days and will get back to you if I find anything.

Welcome, New Pro Members!

Published Nov 10, 2014 at 3:47PM

Dear *Pro* member,

To those who just joined *Pro*, the team and I welcome you! Thank you for putting your trust in us.

We know you signed up for *Pro* with high expectations, and we're working hard to meet and ideally exceed them. But of course some of your success will depend on you. Now that you've made the commitment to join this special portfolio service, here are some of the best ways you can guarantee your success:

1. **Have the right time frame.** We buy all of our stocks with a minimum three-year outlook, and that's how we need to value businesses, as well. We assume certain growth rates, which lead to value estimates, which suggest stock appreciation. Right now, we want all of our stocks to return at least 10% annualized, to meet or beat our North Star goal.
2. **Take your time.** Don't rush. We want you to be 100% comfortable with our approach. We do the research for you, but we still want you to enjoy owning the businesses you buy. As you get up to speed, consider averaging into all of our Buy and Buy First stocks over time (you'll get our Portfolio Building Reports one by one). Slowly putting your money to work over several months, even a year, is *not* a long time in the grand scheme of your investing life -- and it could offer you some more attractive price opportunities along the way.
3. **Ask questions.** Like *Motley Fool Options*, which you receive free for the life of your *Pro* membership, *Pro* enjoys an outstanding community of successful investors. Take some time to learn how to navigate the discussion boards. They're a great resource, and we aim to leave no question unanswered.
4. **Enjoy the process.** Enough said. We've been investing for years, and we've enjoyed it. This makes it all the sweeter: We're earning great returns, and enjoying it together.

Between our Portfolio Building Reports, our upcoming live chat (in which we'll cover hedging, shorting and options), our regular emails and more, we know there's a lot to take in. Take your time. Take one step at a time, focusing on the big picture and the goal we share with you: to have an outstanding portfolio built to handle turbulence and provide returns.

Meanwhile, here are some common questions and answers:

- **Do I buy the Buys?** Yes, all of our Buy First and Buy-rated stocks are buys today, at the allocation shown on the Recommendations page. Our Portfolio Building Reports will help you get up to speed with them over the course of the month, as well -- and as noted, you can average in over weeks or months if desired. If you have some options experience, you can sell puts to try to target some shares at lower prices, if you wish, and get income while you wait. (If you don't have options experience, you can follow along on the discussion board with members who do!)
- **What does "fair value" mean in *Pro*?** Fair value is a price *from which* we expect our desired rate of return, generally 10% a year or more. It's an estimate, and a growing business is always adding value, so there is leeway and flexibility to this price. Remember, fair value is a fair price estimate for a seller *or a buyer*. Fair-value estimates go up as a business grows, so we update ours often.
- **What is the "Consider Adding More" price?** This is a low price at which *Pro* will consider adding more to a position we own. Within 30 days of when the stock hits that price, we'll review the position and consider increasing (or decreasing) it. If we decide to act, we'll let you know with a trade alert in your email.
- **When are new recommendations issued?** Anytime! We email recommendation reports as soon as they're ready for you. As you know, they can be new stock buys, shorts, hedges, or options. That said ...
- **... Do I need to use shorts, hedges, and options?** You don't need to, no. Some members don't use any of these, and that's fine. But for those who want versatility in all markets, they can be great tools.
- **Can you explain your exposure table?** On the bottom right side of the Recommendations page, we show you how we're invested -- our long, short and hedged exposure. Lately, we've been 65% net long, or net invested. This lower exposure decreases our risk and should help our volatility in down markets.

We know you're here to earn strong returns with less risk in various market environments. We will work to get you there step by step this month. Beyond that, we're here to help you become a better investor for life, using and teaching simple strategies that you can always use to become stronger and more confident in your skills. (And if you just want to follow everything we do to a T, you have that option, too!) We don't have to tell you that hedges, shorts, and options are great tools -- you're here because you've shown an interest in them. We look forward to helping you use them profitably and enjoyably.

To new members, welcome to *Pro*!

To our amazing veteran members, thank you for all of your help on the discussion boards and for being part of the *Pro* community.

Forward we go, Foolishly!

-- Jeff (TMFFischer)

Earnings News From 4 Core Holdings

Published Nov 10, 2014 at 2:30PM

Dear *Pro* member,

It's been a busy earnings season for us here at *Pro* as we welcome new members (speaking of which: Welcome, new members!) and work to translate companies' reports into news Fools can use. This was my first quarter of coverage for four *Pro* companies: **Broadridge** (NYSE: BR), **Gentex** (NASDAQ: GNTX), **Parexel** (NASDAQ: PRXL), and **Papa John's** (NASDAQ: PZZA). In the same vein as Jeff's Memo two weeks ago, I thought I'd give a quick overview of each of these companies, summarizing earnings and recapping our investment thesis now that I've had a chance to dig into the numbers and monitor business progress. **All four positions remain Buys on our scorecard for new and veteran members alike.**

The Results

This leading provider of investor communications management and securities processing delivered a solid start to its fiscal 2015, posting record first-quarter recurring revenue closed sales (RRCS) of $32 million. This metric represents anticipated annual revenue for new client contracts signed during the period, and it's up from $15 million in the first quarter of 2014 and $14 million in Q1 2013.

Once Broadridge's customers are on board, high switching costs discourage them from changing providers; revenue recurs at stratospheric rates of 97% to 98%. Thus, tracking RRCS gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings. I'm pleased to see strong growth in RRCS, and management is optimistic about continued progress, citing a "robust and growing" sales pipeline that provided an "unusually strong start" to the company's sales goals for the fiscal year. This bodes well for the coming quarters, as Q1 is typically the slowest; the company is well ahead of schedule on achieving its full-year guidance of $110 million to $150 million in RRCS.

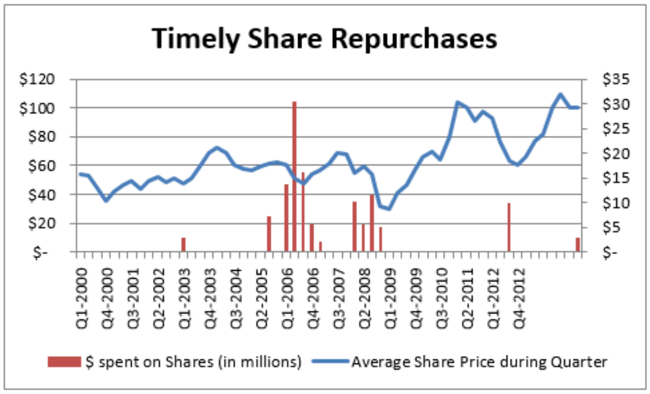
Gross margins for trailing-12-month (TTM) fee revenue were up 290 basis points to 44.2%, and operating margins rose 10 basis points to 22.4% compared with the year-ago TTM period. (Because Broadridge is a seasonal business — activity spikes in the company's fiscal fourth quarter as clients file proxy materials and annual reports — we prefer to look at TTM margins to smooth out quarterly fluctuations.) The difference between gross and operating margin trends primarily reflects higher spending on staffing and marketing as the company focuses on increasing its sales capabilities, and as we can see from RRCS trends, this investment is already paying off. I expect margins to hold steady or decline slightly in coming quarters as the company plans strategic growth investments to be executed in the second half of the fiscal year; in the meantime, I'm satisfied with this quarter's margin progress.

Broadridge continues to benefit from a trend toward increased regulatory compliance and digital communication, and management's capital allocation skills and investments in growth should lead to stronger sales performance and reinforced competitive advantages over time. Although the stock is trading slightly above our (relatively conservative) fair-value estimate of $43 per share, it should continue to be a steady, risk-adjusted outperformer. **New members should feel comfortable initiating or adding to their position at current prices.**

Our mirror maker had an excellent third quarter, with 22% year-over-year net revenue growth, 29% EPS growth, total mirror unit growth (interior and exterior) of 10%, and an improved exterior attach rate of 38%. The exterior attach rate shows how many of Gentex's interior mirror systems come with exterior mirrors "attached" as well; because exterior mirrors are both more complex and more profitable, higher is better, and this was the highest rate in more than three years. IHS forecasts suggest worldwide auto production was up only 3% in the quarter, so these figures imply healthy market-share gains, which is exactly what we want to see. Management expects sales growth of between 10% and 15% in the fourth quarter of 2014 despite the IHS forecast of a 1% decline in auto production, suggesting the trend will continue.

Gross margin was down slightly year-over-year to 39.5%, but management's guidance implies stable to improving margins for the fourth quarter. Like the improved exterior attach rate, this guidance demonstrates Gentex's continued commitment to lowering production costs and fighting automaker-imposed price reductions by continually adding features and pursuing effective research and development.

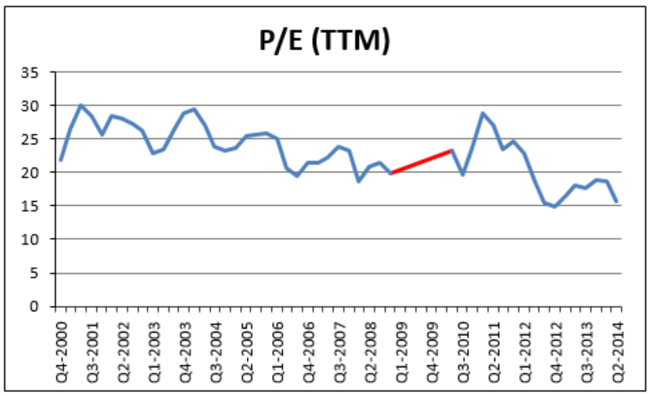
Interestingly, the company repurchased $10 million of shares in the quarter at an average price of $28.44. Gentex is incredibly selective with its share buybacks, and in past periods, such buybacks have been very well timed, showing strong capital allocation skills from management and the board:



Source: Company filings, S&P Capital IQ

This quarter's round of share buybacks was no different; shares are already trading 17% above the company's average purchase price. Such buybacks are a major signal that management felt shares were undervalued, but they also add significant shareholder value when they're executed effectively, as Gentex has been able to do throughout its history.

The buybacks, along with strong revenue, EPS, and unit growth and healthy fourth-quarter guidance, made the market happy; the stock price was up almost 9% on the day of the release. And despite approaching all-time highs, the stock is actually still pretty cheap when compared to its historical P/E range:



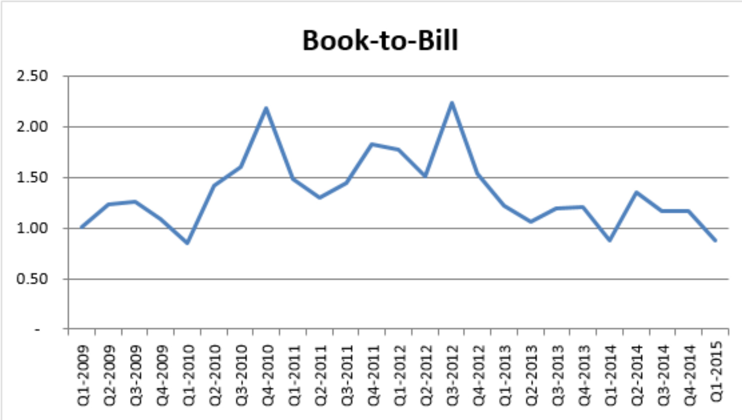
Source: Company filings, S&P Capital IQ. Red line represents omitted outlier P/Es that correspond to recession-depressed earnings.

For a strong compounder like Gentex, where business fundamentals are advancing faster than the stock price, a higher price can actually correspond to a better value. **As with Broadridge, new members can feel comfortable initiating or adding to their Gentex position at current prices.** Because of its strong business performance, I'll be revisiting my growth assumptions in the coming weeks to see if my valuation model is due for an update.

PAREXEL®

Pro's biopharmaceutical outsourcing company was the black sheep among the companies I covered this quarter. Despite a 9% increase in service revenue, improved operating margins (10.9% vs. 9.3% in the year-ago period), and 49% year-over-year EPS growth, the market hammered Parexel's stock to the tune of a 16% drop on the day of the earnings release. Analysts on the call harped on the low net book-to-bill ratio of 0.88 (a book-to-bill ratio higher than 1 generally implies strong demand and vice versa) and management comments that seemed to suggest a further slowdown. Management also lowered fiscal 2015 guidance on revenue, but increased guidance on EPS.

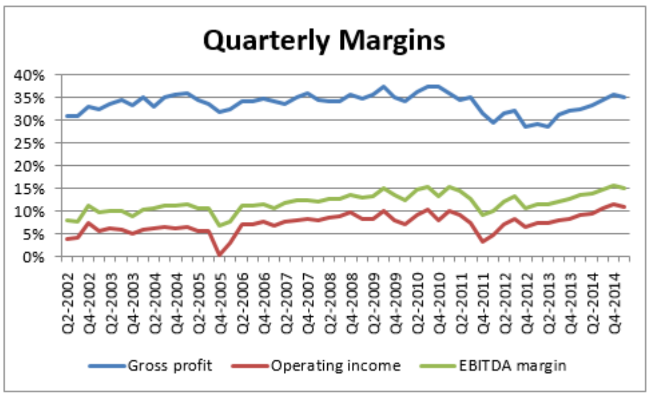
The declining book-to-bill ratio is a bit worrisome, as management noted that slower-than-expected sales to its strategic partners were the culprit. Since continued adoption of the partnership model between biopharmas and and contract research organizations (CROs) is critical to our investment thesis, we want to see this trend reverse. Management comments on the call suggest that the weakness resulted from non-recurring issues of timing. And the company's book-to-bill ratio has been volatile in the past:



Source: Company filings

... but has generally bounced back pretty quickly after dipping below 1. I'll be watching to make sure backlog and market penetration trends progress as we expect in the quarters ahead.

On the positive side, margin performance was sound despite weak revenue growth affecting sequential comparisons:



Company gross margins were up 270 basis points year-over-year to 35.2%, and gross margins expanded across all three business segments. This trend should continue, as the company expects further margin expansion, although aggressive price competition from smaller competitors and the slowing pace of converting its backlog may put a lid on improvements.

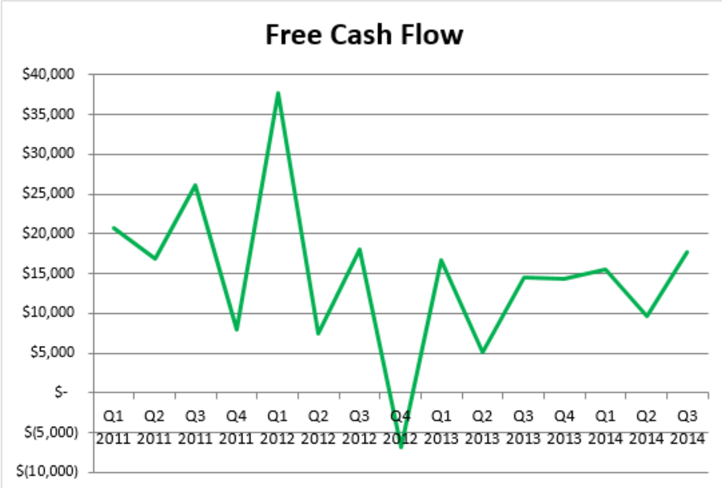
So long as this quarter's sales trends are an anomaly rather than a new normal (and I believe they are), **the current price is a reasonable entry point for new investors or those who wish to fill out their allocation.** The stock is about 5% below our fair-value estimate and should outperform so long as the company can deliver on our low-double-digit expectations for revenue growth. I'll be keeping a close eye on the competitive environment over the next few quarters to make sure our thesis is still intact.

PIZZA PAPA JOHN's

Tasty! Our international pizza slinger continues to post impressive comparable-store sales: North American restaurants increased comps by 7.4% and international restaurants did so by 5.5%. Papa John's is on track for its 11th consecutive year of positive or flat comps — incredible consistency throughout a volatile economic period. The increase in sales was driven by limited-time offers and continued migration to digital ordering (now just less than 50% of domestic sales). Since the domestic and international pizza markets are increasing at about 1.5% and 3% per year respectively, Papa John's comps suggest continued market-share gains at the expense of smaller rivals. More new restaurants (241 more than in the third quarter of 2013, up about 6% year-over-year) added more growth to the top line; total revenue was up 13%.

Elevated expenses, including higher cheese and meat prices and continued spending on implementation of the FOCUS point-of-sale system, continued to eat into operating margins. But an easy comparison to a weak year-ago period led to 17% year-over-year growth in operating profit and 13% in net income as debt-fueled share buybacks boosted EPS. Papa John's continues to carry out its strategy well (as evidenced by the systemwide comp sales), and recent investments are starting to pay off as comps accelerate; free cash flow was up 22% year over year. When commodity costs and investment spending normalize (the FOCUS rollout should be completed by Q1 2015), I expect margins to improve.

The company's focus on supporting franchisees and investing in growth has led to lumpy business results:



Source: Company filings ($in thousands). Cash from ops minus purchase of PP&E net of acquisitions/divestitures.

It's also meant some stock-price volatility; the stock reached a high of $55 in March, then retreated to a low around $37 in September before recovering to its current price around $50. Because much of Papa John's value lies in its hard-to-predict international growth opportunities, the market isn't sure what it wants to pay for the company's future earnings stream. However, if Papa continues to perform as it has in recent quarters, paying up for that growth may be justified. Its price is almost 10% higher than our reasonable fair-value estimate of $46, making me a bit more cautious with Papa John's than with the other companies in this recap. But a few more quarters of strong comps and improved margins may prove my estimates to be too conservative. **Papa John's is a Buy at current prices, but of all the stocks on this list, it might be the last one I'd add to.**

The *Pro* Bottom Line

Each of these four companies remains a Buy on our scorecard, with no changes to our recently updated fair-value estimates. Performance ranged from excellent (Gentex) to steady (Broadridge) to volatile (Papa John's) to disappointing (Parexel). Despite the market gyrations, we maintain our long-term view and believe that each company will deliver North Star-beating returns (lately around 8% to 9% annualized) over the next rolling three-year period.

If you have any questions about this Memo, feel free to stop by the appropriate company's discussion boards:

- Broadridge
- Gentex
- Parexel
- Papa John's

Fool on!

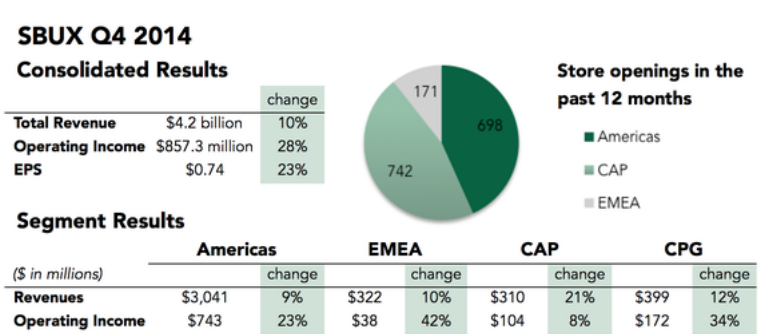
Sit Down, Relax, Have a Cup of Starbucks

Published Nov 7, 2014 at 7:47PM

One week ago, **Starbucks** (NASDAQ: SBUX) reported results that missed analyst expectations and sent the stock lower by almost 3%. This will probably come as a surprise if you're just tuning in since the stock has already recovered all of its post-earnings losses (and then some). This delayed reaction fits better with our assessment of the quarterly results -- that they highlight the strength of the Starbucks brand in the face of a less-than-ideal retail environment and what CEO Howard Schultz refers to as a "cultural shift in consumer behavior" away from brick-and-mortar shopping.



SBUX Q4 2014

Consolidated Results

Investment Thesis

Starbucks offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, channel development, just to name a few) and cost reduction opportunities (payment innovation, European restructuring, consumer product margin expansion). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new dayparts and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

Taking control of the remaining stores in Japan will result in near-term margin pressure, but the we believe that the long-term impact of this move is a positive one. Morning traffic still accounts for over 45% of total traffic, but the company is seeing strong growth in other segments of the day and recent investments have already begun bearing fruit. Don't let the fact that this is a coffee company fool you; Starbucks is one of the most innovative companies around and poised to serve up North Star-like returns going forward.

Segment Results

Comps	**Q4 2014**			**Fiscal 2014**		
	Sales Growth	Change in transactions	Change in ticket	Sales Growth	Change in transactions	Change in ticket
Consolidated	5%	1%	4%	6%	3%	3%
Americas	5%	1%	4%	6%	2%	3%
CAP	5%	2%	2%	5%	3%	2%
EMEA	5%	6%	-1%	7%	6%	0%

Q4 marked the 19th consecutive quarter Starbucks achieved comparable (comp) store sales growth of at least 5%. Comp growth slowed from both an annual and quarterly perspective, but these results were admirable considering they were on the back of strong 2013 results. Some analysts may have not been thrilled with the numbers, but as CEO Howard Shultz put it:

When I look at the results, and this is not on the script, when I look at the results of this year, the stunning accomplishments on so many levels, I hear somebody be disappointed with a 5% comp on a base of over 7,500 stores, I just got to ask myself, "Is there any company in your universe putting up these kinds of numbers?" And the answer is no.

Americas

Some may like to joke that there's a Starbucks on every street corner, but the question of when the company will saturate the U.S. market is serious business for shareholders. The Americas segment is by far the biggest in terms of revenue (73%) and profitability (71% of operating income), and Q4 results reaffirmed our belief that the company hasn't reached the end of the runway just yet.

New stores continue to drive incremental traffic and set record levels for new store performance, suggesting untapped demand. Ticket growth in Q4 was the strongest it's been over the past few years. Only one percentage point of this growth came from increasing prices, suggesting that product mix and new offerings are resonating with customers. A great example of this was the addition of Teavana Shaken Iced Teas, which were the single most profitable addition to Starbucks menu last year. Performance at company owned drive-thru stores continued to be robust, as this segment accounted for 55% of profit in the Americas even though it only makes up 42% of the store portfolio.

Europe, Middle East, and Africa (EMEA)

The smallest geographic segment for the company (8% of sales), EMEA results suggest the measures taken by management to improve lackluster performance continue to take hold. Licensed store comps came in above the 5% reported by the company-owned stores as results from the UK and Germany, markets where others have struggled, were encouraging. This segment also benefited from favorable foreign currency exchange in Q4.

China Asia Pacific (CAP)

Total net revenue was up 21% in Q4, marking the 17th consecutive quarter it exceeded 20%. Transaction growth continued to be strong, but ticket size actually contracted one percentage point as fewer seasonal items were sold. The company opened an average of one new store per day in China, and management only expects this pace to quicken as time goes on.

It's important to note that the company will be taking ownership of the remainder of their Japanese joint venture stores next year. The difference in accounting treatment will result in the appearance of margin pressure, but Japanese Starbucks stores actually have some of the highest operating margins in the company's international portfolio. Management claims that this conversion of the remaining 1,000-plus stores will enable them to increase the pace of new store openings and provide the company with many new opportunities. The ready-to-drink (RTD) market is a perfect example of this. Japan has one of the largest and most penetrated RTD markets in the world, but Starbucks' current share in that market is a fraction of what it is in the U.S.

Consumer Product Goods (CPG)

Revenue growth came in at 12% but operating income grew 34% as the company saw a more favorable sales mix and benefited from various cost cutting measures. In particular, K-Cup sales grew 26% as the company shipped 750 million K-Cups in fiscal 2015. And 1.5 million of the 8 million My Starbucks Rewards (MSR) members earned Stars through the grocery channel.

Plans for the Holiday Quarter

Management has every intention of continuing the momentum from last holiday quarter. "Meet Me At Starbucks," the company's first global television advertising campaign, launched last month. With pumpkin spice lattes becoming ubiquitous, Starbucks will attempt to differentiate itself once again by offering a Chestnut Praline Latte. Roughly 1 in 8 Americans received a Starbucks gift card during the 2013 holiday quarter, and the cumulative amount loaded on those cards was an impressive $1.4 billion. This year Starbucks will up their game even further by offering 100 unique designs and greet customers with freestanding card walls in stores. But the biggest draw is likely to be their "Starbucks for Life" giveaway. Every customer who uses a gift card or their MSR account this holiday season has a chance to win one of almost 500,000 food and beverage prizes, and 13 lucky cardholders here in the U.S. will win Starbucks for the rest of their life.

Plans for 2015 and Beyond

Starbucks will continue to expand its super-premium coffee offerings with its sub-brand, Starbucks Reserve. The company is currently targeting 100+ Reserve stores around the world as well as several Starbucks Roasteries. In addition to being storefronts, these roasteries will enable the company to double the number of regular stores that offer Starbucks Reserve coffees by the end of fiscal 2015.

Looking to further cement its position as a leader in mobile payment, the company will be rolling out mobile order and pay next year. This not only has the potential to increase customer satisfaction by reducing or eliminating wait times, but it will also increase store profitability. Regarding the importance of mobile, Schultz noted that:

In 2013, payment for purchases by use of all mobile devices in the U.S. totaled $1.3 billion. That was the entire market. Now listen to this. With over 90% of those purchases taking place in a Starbucks store, that means we had 90% share of mobile payments in 2013, while bricks-and-mortar commerce in 2013 totaled more than $4.2 trillion... Already close to 7 million transactions per week, 16% of all transactions conducted in U.S. Starbucks stores occurs via a customer's use of a mobile device. No company and no retail store domestically or internationally even comes close. And while that figure has been growing by almost 50% per year, the real growth is yet to come.

In a move that caught most off guard, Schultz also revealed what he referred to as "e-commerce on steroids." Starting in the second half of 2015, Starbucks will begin offering food and beverage delivery in select markets.

2015 Estimates

Revenue – Forecasting for growth of 16% to 18%, $1 billion of which will come from the Japan acquisition. Ex-Japan the company should still be able to hit its 10%+ per year target.

Margins – Flat to slightly lower due to the Starbucks Japan acquisition.

EPS – $3.42 to $3.54 on a GAAP basis. Similar to revenue, if you exclude the impact of the change in accounting for Japan, the company is guiding toward the middle of its long-term goal of 15% – 20% growth.

Stability and Focus at AIG

Published Nov 5, 2014 at 6:15PM

What?

($in millions)	**Q3 2014**	**Q3 2013**	**Change Y-o-Y**
Total Revenue	16,654	14,826	12.3%
After-tax Operating Income	1,745	1,421	22.8%
Net Income	2,192	2,170	1%
EPS	$1.52	$1.46	4.1%
Book Value Per Share	$77.35	$67.10	15.3%
P&C:			
Pre-tax Op. Income	1,096	1,126	-2.7%
Accident Year Combined Ratio	95.6	98.0	
Accident Year Loss Ratio	61.3	63.7	
Expense Ratio	34.3	34.3	
Life & Retirement:			
Pre-tax Op. Income	1,348	1,144	17.8%
Mortgage Guaranty:			
Pre-tax Op. Income	135	43	214%

CEO Peter Hancock:

> "The solid third quarter results were driven by consistent performance across our businesses.While no one quarter is a trend, our risk-adjusted return focus could be seen in various metrics including improved accident year loss ratios, modest net spread compression, and continued capital management. In the quarter and through early October, we repurchased $1.5 billion of AIG Common Stock and completed over $4.0 billion in liability management, excluding DIB activities. As a result of our strong capital position and a positive outlook for our businesses, the Board has authorized additional share repurchases of $1.5 billion."

So What?

After looking over the financials, I don't feel much different than I did when I glanced at the headline numbers right after earnings were released (here). This was another solid quarter from **AIG** (NYSE: AIG), with continued signs of operational improvement that provide evidence that the company is more stable and focused than it's been in a long time.

With the CEO transition from Bob Benmosche to Peter Hancock now in the rear view mirror, the investment community wanted to see what Hancock was able to deliver in his first full quarter as CEO, and he didn't disappoint. Hancock has been very clear on how he plans to manage AIG with his "value over volume" approach, and here are some quotes from this quarter's conference call that provide more insight into his management style:

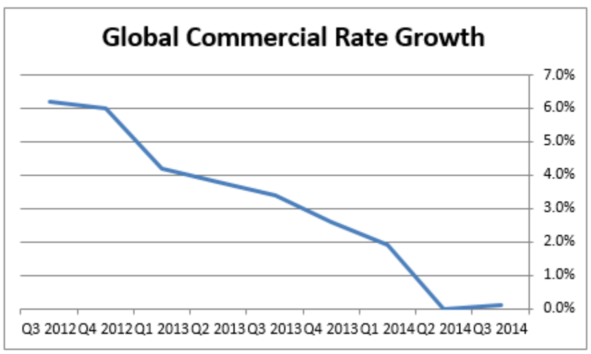
> "*We're looking to improve operating efficiency and decision making by eliminating layers in the organization*."
>
> "*You've heard me discuss science and technology to drive problem-solving and to reduce claims costs. Science is already paying dividends to us and is working across our businesses to provide critical insights and further data segmentation. Our one claim technology provides more enriched and consistent data to science, actuarial and others to drive better decision-making*."
>
> "*...going forward, you can expect a broader implementation of value-based metrics at AIG*."
>
> "*A framework of assessing the economic value of all our products won't result in dramatic changes to our business mix, but is an important discipline for us to continue -- to continually access the highest return on our capital, taking into account risk and sustainable growth*."

Hancock continues to impress me with his temperament and focus, and I am hopeful that his imprint on the company will lead to further improvement in financial metrics.

One of the most important metrics we watch for AIG is the Property and Casualty (P&C) Segment combined ratio. Pro members following AIG should know by now that a combined ratio consists of the expense ratio (overhead as a percent of premiums) and the loss ratio (claims paid as a percent of premiums). A combined ratio below 100% means that the company is earning an underwriting profit.

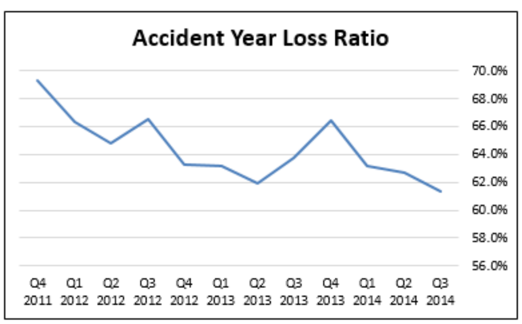
The accident year combined ratio (which is adjusted for catastrophes and prior year developments) came in at 95.6%, which is the lowest its been since I've been covering the company. This is an encouraging result given that the company continues to make investments in technology that are elevating the expense ratio, and that global commercial insurance rates were again flat compared to the year-ago period (rate increases make insurance companies more profitable, all else equal).

Last quarter, I noted that the rate of pricing increases has been decelerating, which hurts year-over-year combined ratio comparisons. It's harder to generate improved underwriting margins when you can't increase prices as much as you could in the quarter you're comparing to. This quarter it appears that the pricing trend has moderated, a good sign, and hopefully rates will act as a contributor rather than a detractor from results in the quarters ahead.



Source: AIG Earnings Presentations

The accident year loss ratio also continued its trend of improvement, which is encouraging and shows that the recent investments in technology and the focus on risk-adjusted profitability are paying off. It bears repeating that improvements here will be lumpy (as you can see in the graph), but the long-term trend is encouraging:



Source: Company filings

The rest of the business outside of the P&C segment performed well too, with the Life and Retirement segment posting an 18% increase in pre-tax income (driven by a 15% increase in policy fees) and the small Mortgage Guaranty segment (~5% of AIG's pre-tax operating income) growing its own pre-tax income by an impressive 214%.

Book value grew 15.3% year-over-year to $77.35 per share, after-tax operating income grew 23%, ROE came in at an acceptable 8.1% (and 9% ex-AOCI), and value-accretive share buybacks continued ($1.5 billion of shares repurchased in the quarter, retiring 1.5% of shares outstanding).

Our investment thesis remains intact and is summarized as follows: we believe that underwriting profitability will improve and that AIG should be able to earn an ROE of 10% over the long run.

Now What?

- P/B: 0.70
- ROE: 8.1%

- Market Cap: $77.6 billion
- Fair Value: $64
- Consider Adding More: $48
- Allocation: 3.7% in stock and about 0.7% in warrants or LEAPS
- Status: Buy

This quarter's results weren't enough to change our recently updated Fair Value estimate of $64 and Consider Adding More (CAM) price of $48. Shares are a Buy with an allocation of 3.6% in stock and 0.6% or so in warrants or LEAPS.

Barbarians at the Gate

Published Nov 3, 2014 at 3:41PM

Pro Guidance Changes

- **Facebook**'s (NASDAQ: FB): fair value moves up to $67. Shares remain a Buy, with a 4.8% allocation.
- **Gilead Sciences** (NASDAQ: GILD) moves to Buy from Buy First after appreciating 40% for us as of Friday, up to our fair-value estimate of $110. We have a 4.5% allocation.
- **O'Reilly Automotive** (NASDAQ: ORLY) moves to Hold pending a strategy review. The stock is up 77% for us since our 2013 recommendation, and is about 15% above our fair value. Fair value increases $9 to $149. Consider Adding More increases $9 to $119. We have a 4% allocation.
- **Valmont Industries**' (NYSE: VMI) fair value moves down to $160 from $170 as results lag estimates. It remains a Buy at a 2.4% allocation.

Fellow Fools,

"Your activities are mean, shameful and loathsome. They are motivated by appalling avarice and greed, and they will not be permitted to go unanswered."

This quote is from 1998, but I suspect a sizable percentage of the investing public still holds a similar attitude toward short sellers. The author of this gem was a large money manager who was upset with the actions of one Manuel Asensio — a short seller who was one of the first to use the Internet as part of his strategy. Mr. Asensio's position on a company called Avant!'s wasn't very popular, but it was correct. From the date of his initial sell report until Avant!'s was acquired, the company's stock price fell 87%, and management ultimately pleaded no contest to charges of conspiring to steal software.

Short selling is not for everyone. Those without the right skill set and temperament often find the time they spend as short sellers to be rather painful and (*ahem*) short. Since most who aren't cut out for this practice tend to exit in short order, many consider short sellers to be part of the "smart money" crowd. And you know what Wall Street says about smart money: We retail investors should never, ever go against it. Academic research actually tends to support that idea in this case, as portfolios of stocks with high short interest ratios (SIRs) tend to underperform by a statistically significant amount.

Fashionably Late

I like to think of shorting as a game of identifying catalysts. Just like buying stock in a great company can be a poor decision if you pay too much, your ability to profitably short depends on when you act. In fact, I believe timing is even more important when it comes to shorting, because in addition to fighting the natural upward pull of the market, you're paying a fee to borrow shares. That means there's a monetary cost, not just an opportunity cost, associated with waiting for your thesis to play out. But successful shorting doesn't require you to become a market timer in the sense of darting in and out of stocks. Rather, you simply need to be willing to sit on your keister until the stars align in such a way that the risk/reward trade-off skews heavily toward the latter.

This is why I take into consideration the volume and quality of the negative chatter around a stock when hunting for short candidates. I have no interest in being first to the party; I prefer gains over glory. What can go wrong when you're early, you ask? The first foray into short selling by Jim Chanos, perhaps the best-known short seller of our time, is a textbook example. Chanos' first short recommendation was on Baldwin-United Corp., a company that ultimately ended up declaring bankruptcy — but his timing was, as he is fond of saying, nothing short of impeccable. The stock fell a couple of points on the day his recommendation came out. It then proceeded to almost triple.

Just Another Piece of the Puzzle

It is important to remember that a high SIR and a lot of negative chatter may signify a great short opportunity, but they don't guarantee underperformance, so they should not be considered in isolation. While we may know the *number* of shares sold short, we don't know the reason. Perhaps the seller wanted to hedge some type of exposure or engage in arbitrage, neither of which provides any information on expectations regarding the stock itself. In addition, those academic studies I cited above were looking at baskets of stocks. Within those baskets, there were stocks that went to zero, some that underperformed, some that outperformed, and some that absolutely crushed the market.

Take a look at the following chart:

What we have here is a volatile stock (white line with blue fill) that the bears loved to hate, as evidenced by the steadily growing short interest (orange line). The doubters came out of the woodwork as soon as the company IPOed in 2010, and by March of 2013 (the end of the above chart), 32.3 million shares were sold short — a whopping 45% of the company's equity float. So what happened afterward? The arrow on the chart below indicates where the prior chart left off.

For those who couldn't tell, the company in question is **Tesla** (NASDAQ: TSLA). The final chapter for this company has yet to be written, but this "slam dunk" of a short has been anything but. Turns out that "follow the smart money" is just like the other Wall Street maxims in that it's intuitively appealing and works ... unless it doesn't. Never be afraid to think for yourself — sometimes the smart money just isn't that smart.

Foolishly yours,

— JP (TMFYossarian)

Valmont Waits for Better Days

Published Nov 3, 2014 at 11:47AM

Third-quarter results at **Valmont Industries** (NYSE: VMI) were lower than hoped due to continued weakness in the Utility Structures business. CEO Mogens Bay said, "Most of our businesses had a good or decent quarter, the exception being our Utility Structures business, which had a very difficult third quarter." However, significantly higher revenues and operating income should return to Utilities in the current quarter, based on backlog already booked.

- Shares remain a Buy
- 2.5% allocation in *Pro*
- Fair Value Estimate falls to $160 from $170 as results lag estimates

Surprises: The weak utility business has been the big surprise this year. More competitors moved in and pricing has suffered. As shared last quarter, management does not expect operating margins to return to previously high levels in this division, but should return to respectable levels above 10%. Elsewhere, commodity prices have fallen, and crop supplies are up, are both are a drag on the irrigation business. Irrigation had a good quarter, but it sales will decline year-over-year this quarter as farmers put off new purchases. Lower commodity prices also slow Valmont's coatings business in Australia.

Fool's Take: We know this is a cyclical business entering a slower period, which is why the stock was cheap. We should face limited pricing risk as Valmont works through this period, and we should see nice upside when the cycle turns the other way, even if it takes time. As Mogens said, "Every peak of the cycle exceeded the previous one, and every bottom of the cycle was higher than the previous one." He was speaking of irrigation equipment cycles, but might as well be speaking about the entire business. We like owning some stocks that are not rising with the market (counter-intuitive as that seems) because they're more likely to be in favor (as defensive cyclicals that turn up first) when other stocks are not doing as well. We keep Valmont as an exceptionally run, long-term buy.

For financial and conference call details, please see our post.

Way to Go, O'Reilly

Published Nov 3, 2014 at 11:39AM

O'Reilly Automotive (NASDAQ: ORLY) reported another strong quarter, topping expectations and increasing margins, sending shares to a new high. Management remains "very confident" in its long-term growth prospects as cars stay on the road longer (leading to more repairs) and more miles are driven. The company plans to open 205 stores in 2015, on par with 2014. *Pro's* fair value estimate increases to $149, but that's still 15% below the current share price. Our guidance on the stock is under review for 30 days, so it moves to "Hold" for now. Owners need to realize the stock *could* have a flat year or two, all told, given the "bull market" valuation it enjoys.

- Shares move to **Hold** for a 30-day review
- Fair Value increases to $149
- Consider Adding More increases to $119

Surprises: Same-store sales (SSS) grew 6.2% -- more than the top of management's 5% guidance. This was on top of 4.6% growth a year ago, leading to a great "two-year stack" of 10.8%. Costly car repairs continued to help O' Reilly, presumably from damage that began with the harsh 2014 winter. That should subside soon. The company increased its 2014 same-store sales guidance to a range of 5%-6% (up from 3%-5.5%); increased its 2014 EPS guidance to $7.19-$7.23 (up from $7-$7.10). And increased its free cash flow guidance to a range of $675-$725 million (up from $625-%$675M).

Fool's Take: Wall Street likes increased guidance. The stock is up 17% since results, and 77% since our April 2013 purchase. The company has raised the bar still higher, though, and growth comparisons will be tougher in 2015, especially if this winter is mild. The upshot is the results are great, but we're cautious on the valuation after a big 18 month run, so it moves to Hold for a review.

For more numbers and conference call details, please see our board post.

Facebook Banks on the Future

Published Nov 3, 2014 at 11:29AM

Facebook (NASDAQ: FB) reported strong third-quarter results, with revenue up 59%, ad revenue up 64%, and operating costs only up 41%. The company's 3-year plan remains to grow value for users and businesses (it's investing heavily in new ad platforms to do so); the 5-year plan includes monetizing platforms like Messenger, WhatsApp and Instagram. The 10-year plan includes Internet.org initiatives to connect the world.

The stock remains a long-term Buy in *Pro* with a 4.8% allocation. Our fair value estimate moves up to $67.

Surprises: The long-term story has not changed as Facebook works to grow and monetize its world-leading traffic (which keeps growing). But management guided expenses considerably higher in 2015 as the company invests to grow. Much of the cost is in hiring new employees and stock grants related to acquisitions. GAAP expenses including stock compensation should now grow 45% to 50% in 2014 (up from prior guidance), and a big 55% to 75% in 2015. That may dwarf revenue growth, bringing margins considerably lower. But this reminds us of **Google's** (NASDAQ: GOOGL) big investing years early on. That spending looked excessive, too, but the business grew into it. I believe Facebook will, too, and if Wall Street sees that starting to occur, the spending will be accepted.

Fool's Take: The coming year is one of heavy investment at Facebook. This is likely a smart long-term move, but will dampen bottom line and free cash flow results in 2015. Knowing Google as I have, I assumed this would start to happen, so our fair value estimate has reflected a few years of heavy investment. We'll need time to see how the investments pan out, though. We go forward banking on management's abilities. We also know Facebook has major properties and traffic it has not even tried to monetize yet. Upside in those properties should off-set some of the increased spending as soon as later next year.

American Tower Stands Tall in Q3

Published Oct 31, 2014 at 2:43PM

What Happened?

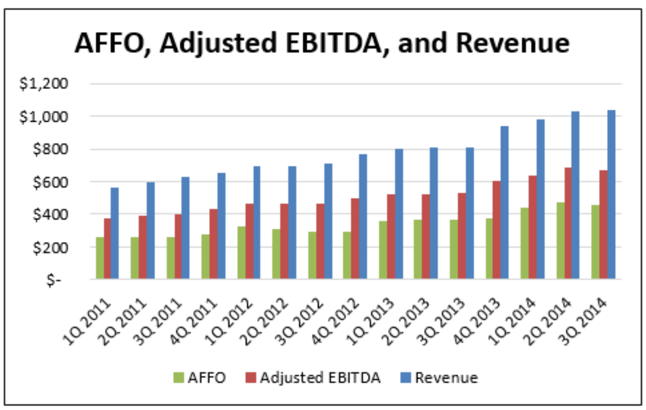
- Total rental and management (R&M) revenue of $1.01 billion (year-over-year core* growth of 31%)
  - Domestic R&M segment revenue of $664 million (Y-o-Y core growth of 28%)
    - Organic** core growth of 9.1%
  - International R&M segment revenue of $348 million (Y-o-Y core growth of 37%)
    - Organic core growth of 18%
- Adjusted EBITDA of $666 million (Y-o-Y core growth of 32%)
- Adjusted funds from operations (AFFO) of $460 million (Y-o-Y core growth of 28%)

*Core growth reflects adjustments for foreign currency exchange rates and prior period one-time items

**Organic growth excludes revenue associated with new properties (acquisitions and new site builds) that have been added to the portfolio within the previous year

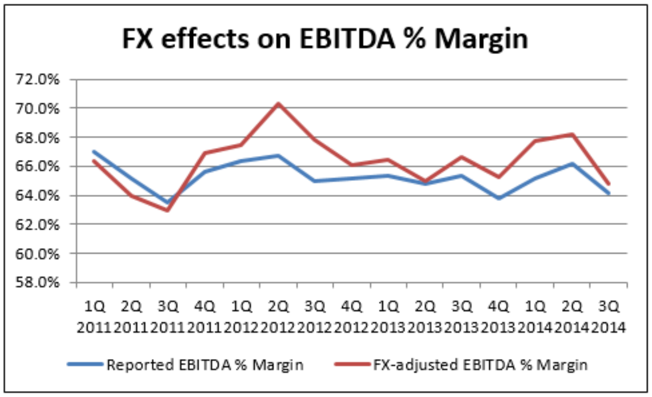
So What?

American Tower (NYSE: AMT) reported yet another strong quarter, prompting management to yet again raise full-year 2014 guidance, even after raising it the past two quarters. The company reported very healthy core growth in revenue (31%), Adjusted EBITDA (32%), and AFFO (28%), the three headline metrics I watch closely. The company's performance on these three metrics has been been admirable, with compound annual growth rates of 19% (in revenue), 18% (in Adjusted EBITDA), and 18% (in AFFO) over the last 3.5 years:



Source: Company filings ($in millions)

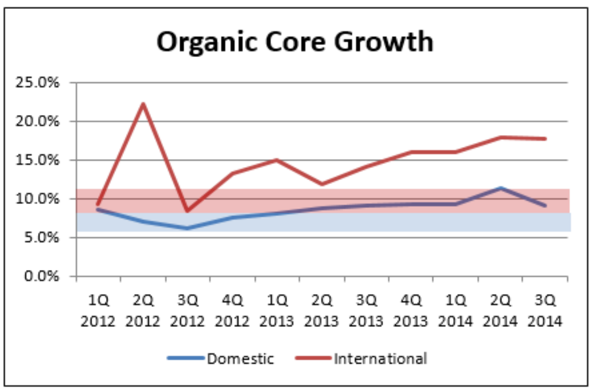
Although ideally I'd like to see growth in Adjusted EBITDA and AFFO outpacing revenue growth (meaning that margins would be expanding), there are a few reasons why we aren't seeing that happening. For one, margins this quarter were affected by more normalized SG&A expenses, after last quarter where SG&A expense as a percent of revenue was the lowest its been since I started covering the company. Additionally, margins are affected by significant acquisitions, since there are one-time integration costs and new assets often have margin profiles that are initially lower than the company's existing portfolio. And finally, because of the company's significant international presence (34% of revenue comes from international operations), the company has faced negative currency effects in every quarter since 4Q 2011, impacting reported margins. In some quarters, the effects have been enough to impact margins by more than 5%. Here's what Adjusted EBITDA looks like when adjusted for negative currency effects:



Source: Company filings and analyst calculations

It's important to understand that these FX (foreign exchange) effects are *unrealized*. This means that until the company converts their international cash flow into dollars, the unrealized currency effects aren't significantly harmful. A currency swing in the other direction will very quickly boost reported results. Additionally, negative international currency swings relative to the US dollar can actually be beneficial to the company, since they can use their now-more-valuable US dollars to build and acquire more assets in international markets, increasing their US-denominated return on investment. Management has demonstrated that they are very capable when it comes to capital allocation across geographies; investing where it makes the most sense depending on currencies, political/economic environments, wireless market dynamics, and strategy.

Organic growth (growth excluding properties that have been in the portfolio for less than a year) took a bit of a breather after an outstanding performance last quarter, coming in at 9.1% domestically (vs. 11.4% last quarter vs. 9% a year ago) and 17.7% internationally (vs. 17.9% last quarter vs. 14% a year ago). Even though organic growth ticked down a bit quarter-over-quarter, the results were still very strong relative to management's long-term expectations (6-8% domestically, and 8-11% internationally) and to competitors (AMT's biggest competitor Crown Castle (NYSE: CCI) yesterday reported 7.5% domestic organic growth). Here's what core growth looks like since Q1 2012 (shaded areas represent management guidance):



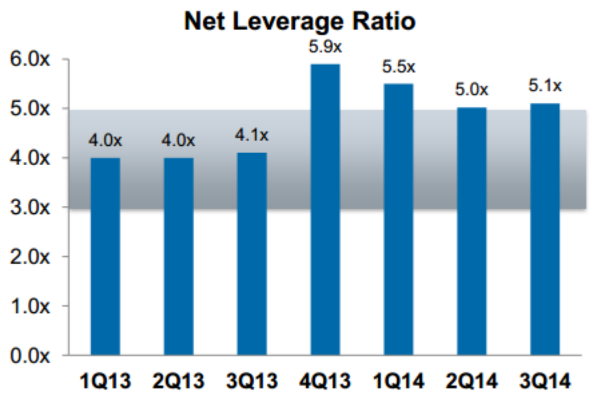
Source: Company filings

As you can see, domestic organic growth has been outpacing management's targets for several quarters, and international growth is absolutely blowing it out of the water. So long as organic growth remains above the midpoint of management's guidance, I'll be happy.

There's a lot of momentum in American Tower's markets, and CEO Jim Taiclet's comments bode well for the prospect of continued strong organic growth:

> "Our combined domestic and diversified international portfolio delivered nearly 12% Organic Core Growth in the third quarter. Consumer adoption of increasingly advanced mobile devices and services, which ultimately drives our organic growth, continues unabated in both the U.S. and in our other served markets.
>
> In our latest analysis of the individual factors that correlate to American Tower's U.S. organic growth rates, the increase in the amount of total mobile data traffic emerged as the number one driver. This, coupled with forecasts that U.S. mobile data usage is expected to double every two years through at least 2018, gives us confidence in the strength of our long-term domestic growth trajectory. Moreover, since nearly all of our international assets are in markets that are three to ten years behind the U.S. in the deployment of mobile broadband services, we continue to believe that these markets will further enhance and lengthen our overall long-term growth trajectory."

As far as leverage is concerned, the leverage ratio (net debt/EBITDA) ticked up a bit to 5.1x. The company is just above its long-term target leverage range (3 times to 5 times):



Source: American Tower Q3 Earnings Presentation

Management expects to get the leverage ratio below 5x by 2015, but if the company sees an acquisition opportunity it likes, I wouldn't be surprised to see them take advantage of their flexibility and change course to pursue it. The company has plenty of liquidity ($3.4 billion in cash and borrowing capacity under its revolvers) to pursue opportunities so long as they are, as CFO Thomas Bartlett said on the conference call, "strategic and make sense for us".

Because of the focus on paying down debt and delevering into the target range, the company's acquisition spending has decreased relative to past years (about $1.5 billion year-to-date vs. $4.5 billion in fiscal 2013). It looks increasingly likely that the company might open up its pocketbooks in 2015 and make another significant acquisition.

Now What?

The market liked American Tower's earnings report, with the closing stock price up 4% compared to the day before the report. I also viewed the earnings report favorably, with continued strong organic growth rates and business momentum across the company's markets.

This quarter's report yet again provides confirming evidence that our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time) continues to play out.

Data and Guidance

- Current Price: $97.67
- Fair Value estimate: $110
- Consider Adding More: $78
- Market Cap: $39.3 billion
- EV/EBITDA (TTM): 20.4

American Tower remains a Buy First, with no change to our recently updated Fair Value estimate of $110 and Consider Adding More price of $78. Those who have yet to initiate or fill out their position in this fast-growing company can feel comfortable doing so with the stock currently at about a 12% discount to our relatively conservative Fair Value estimate.

Fool on!

TD Ameritrade Finishes Strong

Published Oct 30, 2014 at 1:16PM

First off, if you haven't yet, read my primer on **TD Ameritrade**'s (NYSE: AMTD) business here. It's a long read, but it provides a background on the business model and an explanation of a lot of the terminology in this write-up. If you just want a quick summary of the quarter and fiscal year, you can safely skip to the end of this write-up.

What Happened?

- Net Revenues of $795 million (up 12% year-over-year)
  - Transaction-based:
    - Funded accounts grew to 6.3 million (up 5.1% Y-o-Y)
    - Trades per funded account of 4.06 (vs. 4.05 last quarter vs. 4.05 a year ago)
    - Average commissions and fees per trade of $12.97 (vs. $12.55 last quarter vs. $12.61 a year ago)
    - Totals up to:
      - 6,300,000 x 4.06 x $12.97 = $332 million in transaction-based revenue (up 8.5% Y-o-Y)
  - Spread-based:
    - Total spread-based revenue of $367 million (up 15% Y-o-Y)
    - Average spread-based balance of $92.9 billion (up 4.6% Y-o-Y)
    - Thus, Net Interest Margin (NIM) =
      - $367 million / $92.9 billion = 0.395% (quarterly)
      - NIM (annualized) = 0.395% x 4 = 1.58% (vs. 1.54% last quarter vs. 1.44% a year ago)
  - Fee-based:
    - Fee-based revenue of $83 million (up 24% Y-o-Y)
    - Record average fee-based balance of $144 billion (up 18% Y-o-Y)
    - Thus, Investment Product Fee Yield =
      - $83 million / $144 billion = 0.058% (quarterly)

    - Investment Product Fee Yield (annualized) = 0.058% x 4 = 0.231% (vs. 0.228% last quarter vs. 0.219% a year ago)
- Record total client assets of $653.1 billion (up 18% Y-o-Y)
- Net new assets* of $13.4 billion (8.2% annualized growth rate, up 32% Y-o-Y)
- EPS of $0.38 per share (up 6.3% Y-o-Y)
- Trailing twelve months (TTM) average return on equity (ROE) of 17% (up from 14.6% a year ago)
- Capital management:
    - Paid $0.98 per share in cash dividends in 2014 (a 3% yield on the current share price), which included four quarterly dividends of $0.12 per share, and a special dividend of $0.50 per share, paid in December 2013
    - Repurchased approximately 6 million shares of its common stock at a weighted average share price of $31.37 per share
    - Declared a $0.15 per share quarterly cash dividend (up 25% Y-o-Y), payable on Nov. 20, 2014 to all holders of record of common stock as of Nov. 6, 2014.

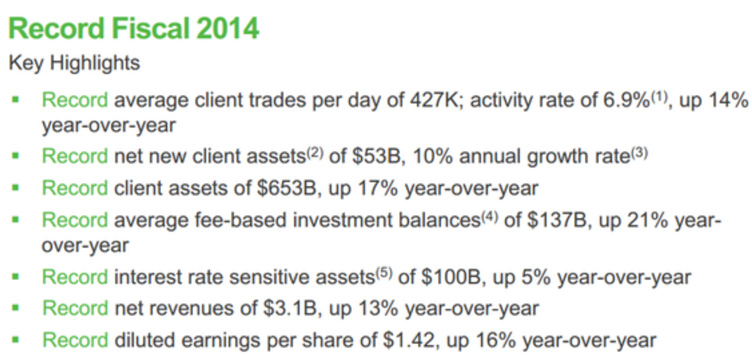
*excludes changes in client assets due to market fluctuations

President and CEO Fred Tomczyk:

> "With improved investor sentiment, retail investors returned to the markets in 2014, increasing engagement across our platforms and boosting trading volumes. Asset gathering remained strong, as we gathered a record $53 billion of net new client assets, our sixth consecutive year of double-digit growth. In fact, over the last five years, we have gathered a total of $219 billion of net new client assets, one-third of our total client assets. We had a strong year and have good momentum as we start 2015. We will continue to adapt and evolve as an organization by optimizing newer technologies like big data, social media and mobile, in order to enhance our clients' investing and trading experience and drive continued strong organic growth."

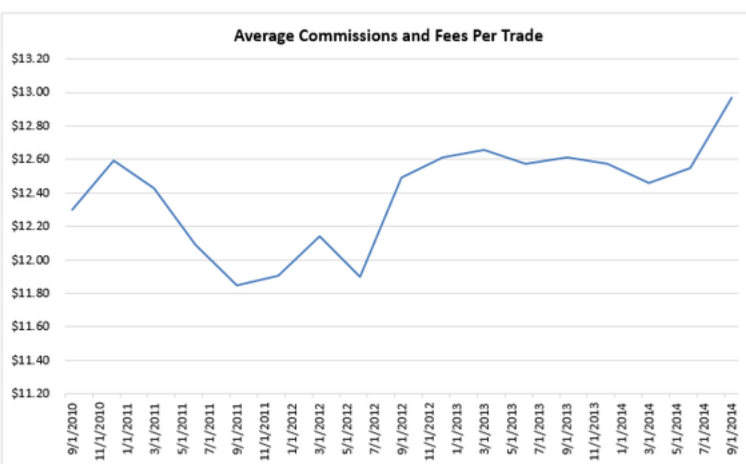
So What?

TD Ameritrade finished out Fiscal 2014 on a strong note, with record performance across several areas of the business:



Source: TD Ameritrade September Quarter 2014 Earnings Presentation

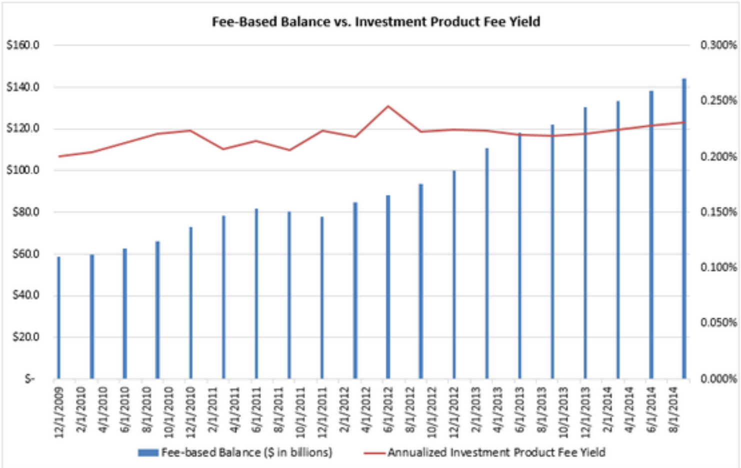
The company continues to excel at gathering client assets, with 17% Y-o-Y growth vs. the prior fiscal year, and 6 consecutive years of double-digit growth. The company also benefited from higher trading activity relative to the prior two years, with higher-margin derivatives comprising a record 41% of trades per day (vs. 39% a year ago), and mobile trades (mobile users are typically higher-activity traders) comprising a record 13% of trades per day. As a result, average commissions and fees per trade showed a very nice increase. If the company can maintain the recent increases in average commissions and fees per trade, that bodes well for transaction-based revenue moving forward:



Source: Company filings and analyst calculations

I am particularly impressed by the fee-based segment, which is the one area of the business that less subject to unpredictable market forces (that is, trading activity for the transaction-based business, and interest rates for the spread-based business).

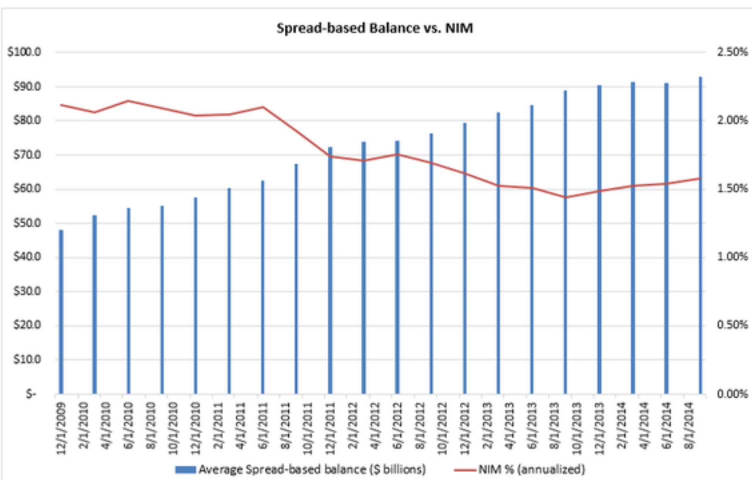
For the fee-based business, which now comprises more than 10% of net revenues, revenue continues to grow very strongly, with 20%+ Y-o-Y growth rates every quarter for the last 10 quarters (this quarter clocked in at 24% Y-o-Y growth). In addition to growing the balance of fee-based client assets at a very high rate (16% compounded over the last 7.5 years), the company has been able to increase the yield (essentially, the management fee) on that balance as well:



Source: Company filings and analyst calculations

TD Ameritrade continues to innovate and provide relevant products and services with this area of the business (see this press release from 10/29 for an example), and I'm expecting continued strong growth from this segment.

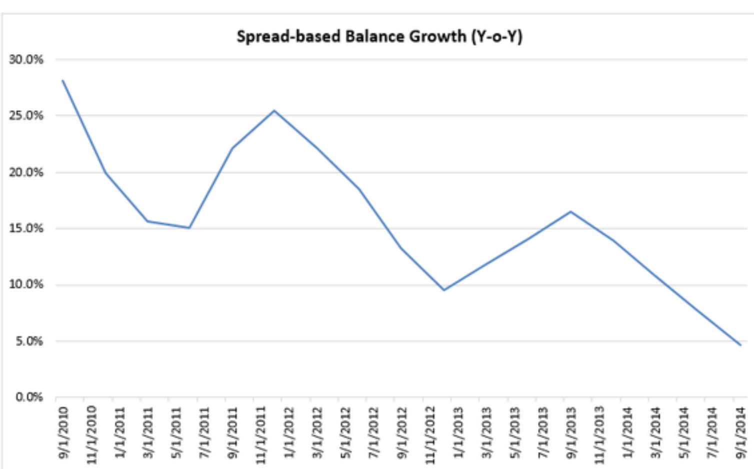
As for the spread-based (i.e. interest rate-sensitive) portion of the business, the spread-based balance grew 4.6% Y-o-Y to $93 billion, and the annualized Net Interest Margin (NIM) ticked up to 1.58% in a quarter where the yield curve was volatile:



Source: Company filings and analyst calculations

This spread-based portion of the business is very sensitive to changes in interest rates, and it will provide a big boost to profitability if and when interest rates rise. The company has guided that a 100 basis point increase in the Fed Funds Rate will increase annual earnings by $0.38 per share in year 1, $0.44 in year 2, and $0.51 in year 3. Given that EPS this year was $1.45 per share, that's some pretty healthy upside (26%, 30%, and 35%, respectively).

Given that information, we want to see that spread-based balance continue to grow at a healthy clip. When interest rates eventually do rise, we want TD Ameritrade to have as many interest rate-sensitive assets as possible. I'm a bit concerned that growth in the spread-based balance has been trending down, and we've seen four straight quarters of decelerating growth:



Source: Company filings and analyst calculations

Although the spread-based balance has grown at a 17% annualized growth rate over 8 years, the above graph shows that growth may be stagnating. My valuation model assumes mid-single digit growth in the spread-based balance, so if TD Ameritrade can't reverse the current trend, I may have to revise my estimates downward.

Now What?

Overall, TD Ameritrade posted a good quarter and had a very solid Fiscal 2014. Although on a nominal basis, EPS was up just 6% year-over-year, once you back out non-recurring gains on investments in both periods, EPS was up an impressive 33%. The market liked the results and bid up shares about 3% on the day of the report. This well-managed company continues to excel at gathering client assets, the transaction-based portion of the business benefited from higher trading activity and higher commissions and fees per trade, and the fee-based portion of the business continues to grow at a rapid, 20%+ clip. TD Ameritrade is still very well-positioned for rising interest rates (who knows when that will happen), and they are doing well at managing the parts of the business that are under their control.

Data and Guidance

- Current Price (per share): $33
- Fair Value (per share): $34
- Consider Adding More (CAM): $25
- Market Cap: $18.2 billion
- P/E (TTM): 22.8x

Due to the volatile nature of TD Ameritrade's business, this quarter's results were not enough to change our FV estimate or CAM price. Share buybacks and strong operating performance were offset by moderated growth assumptions in the valuation model. I'll be watching to make sure that the company can execute on key value drivers (spread-based balance growth, pricing, etc.), and in the meanwhile, we'll continue to benefit from the company's safe (and growing) $0.15 quarterly dividend (good for a 1.8% yield on the current share price). Due to the company's healthy cash position on the balance sheet ($1.5 billion vs. $1.1 billion a year ago), I wouldn't be surprised to see another special dividend before year-end (the company has paid a $0.50 per share special dividend in December each of the last two years).

TD Ameritrade remains a Buy First on our scorecard with a 3% allocation, and those who have yet to initiate or fill out their position should feel comfortable doing so at current prices.

Fool on!

Portfolio Building Report No. 3

Published Oct 29, 2014 at 2:43PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* member,

From the most popular social website in the world to a small-but-great software company you've probably never heard of, from the top manufacturer of "smart" car mirrors to the leading producer of irrigation systems — the six *Pro* stocks we cover in today's report span various industries across the globe. That's especially true when you include the emerging-market ETF that tops off our list today. We believe each of these investments will offer healthy returns over the coming years, with reasonable risk. Along with the other holdings delineated in our first and second reports, adding these is another step toward building your *Pro* portfolio. If you have questions about any of these positions, please visit the company-specific discussion board linked in the report. If you have questions about your portfolio as a whole, visit the Making *Pro* Fit You board.

Enjoy! And Fool on!

— Jeff and the *Pro* team

Download this report as a PDF

Buy: Facebook (NASDAQ: FB)

The world's leading social network — and most-trafficked website, period — is being well managed for long-term growth.

Suggested Allocation: 4.6%

What It Does

More than 1.3 billion people use **Facebook** (NASDAQ: FB) to connect to friends, families, companies, organizations, marketers and celebrities each month. Incredibly, more than 850 million people visit daily. Most traffic arrives through mobile devices, and the company has had great early success monetizing that traffic with ads in its popular mobile news feed. Over the longer term, management wants to make the ads on the site as targeted and relevant to users as are the updates from their friends and family. Meanwhile, Facebook keeps working to stay on the edge of social technology. The company has the equity to acquire competing platforms and then build traffic before monetizing them once it hits critical mass — which in Facebook's opinion is 1 billion users.

How It's Working

For More

- *Pro*'s original recommendation (9/18/12)
- Our most recent earnings coverage (10/31/14)
- Talk about Facebook

Facebook reported strong third-quarter results in October, with revenue up 59%, ad revenue up 64%, and operating costs only up 41%. The company's three-year plan is to increase additional value for users and businesses, so it's investing heavily in the site and in new ad platforms to do so. The five-year plan includes monetizing platforms like Messenger, WhatsApp and Instagram, which intentionally aren't running any ads yet. The 10-year plan includes Internet.org initiatives to connect the world, the majority of which is still not online.

What We Expect

Facebook will greatly increase spending in 2015 as it hires for future growth. Demand for advertising is outpacing Facebook's ability to serve widespread customers adequately, and — like **Google** (NASDAQ: GOOGL) in its early days — it wants to stay ahead of its technological needs with ample hiring and spending. Lately, the stock trades at 40 times expected earnings for the next 12 months, making it reasonable for its growth rate, and attractive for the coming years. We're reminded of when Google went public, and we expect Facebook's increased spending will pay off in higher revenue and earnings, ultimately pleasing investors like us.

Buy: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.4%

What It Does

In 1982, a small company in Zeeland, Mich., called **Gentex** (NASDAQ: GNTX) made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

How It's Working

In 2000, the company sold 6.8 million units; in 2013, it sold 26.2 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option). Gentex has turned these market dynamics into wonderful financial performance. Revenue has risen by nearly 20% annually since 1990, and over the past decade, the company's net margins have bounced around the mid-to-high teens. Those numbers are shockingly good for an auto-parts supplier, showing that its fancy mirrors are showing up in more and more new cars.

What We Expect

For More

- *Pro*'s most recent update (11/10/14)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

Currently, fewer than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange platform drives business transactions.

Suggested Allocation: 3.7%

What It Does

OpenText (NASDAQ: OTEX) is a leading provider of solutions in enterprise information management (EIM). It sells software (both in the cloud and on premises) that lets companies organize their electronic content, and it offers a leading business exchange platform for enterprise commerce. OpenText's products help companies, governments, and universities operate more efficiently and effectively, meet compliance requirements, communicate with colleagues, customers, and partners, and make transactions. Its software helps its customers manage digital information, and its Information Exchange platform lets customers manage their business-to-business communications and transactions. Both units generate strong recurring revenue.

How It's Working

For More

- *Pro*'s original recommendation (8/31/11)

- [Most recent earnings coverage]() (11/16/14)
- [Talk about OpenText]()

OpenText has increased sales and cash from operations by more than 14% annualized over the past three years, and the goal is to continue to grow by at least 10% annualized as its industries expand. Sales were up 40% last quarter, and operating cash flow jumped 73%. Margins have trended higher as growth continues, and OpenText expects recent upgrades to its software to continue to drive demand.

What We Expect

Electronic content management industries served by OpenText should increase top-line demand by at least 10% annualized over the next several years, and OpenText should take market share, too. The company has a long history of steady growth through acquisition, and it enjoys diversified software sales to multiple industries. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, exciting acquisitions in the works, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Buy: Papa John's Pizza (NASDAQ: PZZA)

Deliver a slice of the profit pie right to your doorstep.

Suggested Allocation: 3.9%

What It Does

Papa John's International (NASDAQ: PZZA) operates and franchises more than 4,500 pick-up and carry-out pizza joints in more than 36 countries. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tagline. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract the best franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

How It's Working

For More

- [*Pro*'s most recent update]() (11/10/14)
- [PZZA position review]() (5/23/14)
- [Talk about Papa John's]()

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For 11 consecutive years, the company has recorded positive or even North American comparable-store sales growth. Recently, international comps have been in the 5% to 8% range, offering lip-smacking evidence that Papa John's flavors travel well. It has opened between 200 and 300 restaurants in the past two years, a pace that should continue — expectations are for about 230 new units this year. And because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it is taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management initiated a dividend in 2013 and has consistently bought back stock over the years.

What We Expect

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. We think the brand can easily support 6,600 worldwide locations by 2023. The company should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and the maturation of new markets, we believe 3% same-store growth is sustainable over this period. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: Valmont Industries (NYSE: VMI)

Providing irrigation systems and support structures, this company benefits as agriculture needs increase and countries build infrastructure.

Suggested Allocation: 2.4%

What It Does

Valmont Industries (NYSE: VMI) offers investors a consistent suite of four business divisions, each serving a growing need around the world. Founded in 1946, Valmont's engineered products division supplies steel and aluminum poles to infrastructure projects worldwide, including road and traffic lights; stadium and parking lights; and wireless communications poles and support towers. This division also sells highway safety products including barriers and road grating. In addition, because it sells steel and concrete support structures for the global utilities industry, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot and mechanized irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures only a small percentage of the total market. Overall, the company operates in more than 80 countries and has more than 10,000 employees.

For More

- [*Pro*'s original recommendation]() (11/5/13)
- [Our most recent earnings coverage]() (11/2/2014)
- [Talk about Valmont]()

How It's Working

Valmont's stock has returned 14% annualized since 1993, outperforming the vast majority of stocks on the market, even the likes of **Starbucks** (NASDAQ: SBUX) and **Whole Foods** (NASDAQ: WFM) over the past 10 years. By focusing on strong returns on invested capital, smart acquisitions, new markets, and product-line expansion, Valmont has been able to increase profits as the world economy expands. Yet it's still a relatively small company (at $3.4 billion) with plenty of potential in all business lines, and it trades at valuation multiples below market averages.

What We Expect

With outstanding management and four business divisions that continue to expand around the world, we expect Valmont to grow at more than 11% overall — riding through cyclical bumps — and the stock to ultimately perform admirably in our pursuit of our North Star. As mentioned, we will have to ride through cyclical downturns along the way. But as management says, each low is higher than the previous one, and each high is a record high. We hope to have a long, rewarding relationship with this recent *Pro* stock. It's going to require patience, but that patience should be rewarded.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: 2.3%

What It Does

At *Pro*, we like to invest in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields more than 3%). For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business we couldn't easily buy in another way.

Serving as direct exposure to emerging markets, this ETF gives us an excellent way to invest in unfamiliar companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The diversifying benefits of investing outside our home market are equally important over long periods.

How It's Working

It's no surprise that small-cap companies (even dividend-paying ones) in emerging markets are volatile. We expect DGS to continue to experience higher-than-average volatility. So far, emerging markets have badly lagged U.S. markets. But eventually that will change.

For More

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS

We'd always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we'll sell if we need cash or find a higher-conviction alternative. In the meantime, though, for a low expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund's heavy weighting toward financials, industrials, and the consumer discretionary sector leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

This is a top-notch fund, and you don't have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It's also made Morningstar's list of the top eight funds in its category in each of the past three years, and it's ranked No. 2 when considering five-year performance. We expect these impressive long-term results to accrue to us eventually. In the meantime, the watchword with small caps, emerging markets, and this ETF is: patience.

**Statement may or may not be accurate.*

Portfolio Building Report No. 2

Published Oct 29, 2014 at 2:35PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* Member,

This report marks Part 2 of your *Pro* portfolio-building experience. We recommend that you add capital to these stocks next, as you continue to build your *Pro* portfolio. Once we build your foundation in strong *Pro* stocks, we'll address hedging, shorting, and options for those members who want to use these versatile extra tools — which, as we know, is many of you. For now, we're starting easy as a Sunday morning by introducing you to our stars — our core holdings, which should compound our core capital over the years. Each Portfolio Building Report introduces you to a selection of them one by one and explains why we like owning them, the upside we see, and how much we believe you should allocate to each right now. When you have questions on any company, please visit its discussion board; all of them are linked in the report.

Welcome again to *Pro*! Enjoy the process and ask questions. We're here to help. Fool on!

— Jeff and the *Pro* team

Buy: American International Group (NYSE: AIG)

Time and even average performance should lead to solid returns from this undervalued insurer.

Suggested Allocation: 3.6% stock, 0.7% warrants

Today's **American International Group** (NYSE: AIG) is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate almost all of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are three steadfast and improving insurance businesses.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that the company's insurance operations are stronger than they've been in years and are poised for continued improvement.

For More

- *Pro*'s original recommendation (8/24/12)
- Most recent earnings update (11/5/14)
- Talk about AIG

At Your Broker: AIG Warrants

- eTrade: AIG.WS
- Fidelity: AIG/WS (paste CUSPID 026874156 into the quote page)
- Interactive Brokers: Find AIG; select "warrants" from the drop-down menu
- optionsXpress: AIGwS
- Schwab: AIG/WS
- TD Ameritrade: AIG+
- Vanguard: AIG_t
- OptionsHouse: AIG.WS

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

AIG's insurance offerings consist of three divisions: AIG Property Casualty, AIG Life and Retirement, and Mortgage Guaranty. The first provides casualty, property, financial, and specialty insurance to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. The mortgage guaranty division insures lenders against losses from defaulted mortgage loans. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of improved underwriting discipline.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle. Management continues to repurchase shares and, reflecting the company's remarkable improvement in balance-sheet strength, has paid a dividend (lately $0.125 per share) for the last five quarters.

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. We expect newly installed CEO Peter Hancock to stay laser-focused on improved underwriting and capital allocation, repurchasing shares so long as AIG continues to trade meaningfully below book value and maintaining or increasing the quarterly dividend if business performance supports it.

The *Pro* Bottom Line

We recommend buying 3.6% of AIG stock and 0.7% of AIG warrants (see below for more on those). AIG has cleaned up its business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is steadily growing. And AIG's current share price is right around 0.7 times book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk. That's contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. But it's possible that the warrants could end up as a total loss if AIG's stock price is below the $45 strike price at expiration (even though they're currently in-the-money by a few bucks).

Buy: AmTrust Financial Services (NASDAQ: AFSI)

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 7.4%

What It Does

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** (NASDAQ: AFSI) handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries.

AmTrust focuses on insurance niches (workers' compensation, product warranties, and Italian medical malpractices, just to name a few) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates and predictable cash flow allow it to focus on writing new policies, acquiring new books of business at prices that range from fair to an outright steal, and hunting for obscure investment opportunities.

How It's Working

AmTrust's focus on specific niches, its use of technology to keep its expenses low, and its opportunistic acquisition of policies other insurers struggle to find profitable have all resulted in impressive growth. Gross written premiums have risen from about $1.1 billion in 2008 to more than $4 billion this past year. But AmTrust is no one-trick pony; income from its high-margin and equally sticky service and fee business grew from $29 million to more than $331 million during the same time span. This growth, combined with a laser-like focus on low expenses, has resulted in consistent increases in earnings, dividends, and book value.

What We Expect

For More

- *Pro*'s original recommendation (4/3/09)
- Talk about AmTrust

The insurance market works in cycles, and AmTrust's strategy is built around taking advantage of this. The company targets markets in which pricing has risen as other companies struggle to deal with losses from policies written in prior years. Pricing has remained favorable in AmTrust's largest markets as of late, which means it can do one of two things: either charge as much as its competitors and make more in profit thanks to its lower expense structure, or undercut the competition on price in a bid to take market share, since it isn't dealing with legacy losses. If the economy continues to improve, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

AmTrust stock has consistently traded higher than our estimate of fair value, but we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding and we're happy to let this winner run, expecting to increase our fair-value estimate over time.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.2%

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2014, which ended June 30, its platforms processed more than 80% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller division, securities processing solutions, accounts for 27% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

How It's Working

Both earnings and free cash flow are modestly depressed because mutual funds have been scrimping on investor communications recently and investor skepticism around the global economic recovery has led to low trading volume. Still, in fiscal 2014 Broadridge's sales were up 5%, earnings per share rose 25%, and the company hiked its dividend by 17%. The business is positioned for strong sales and margin performance for years to come. And Broadridge continues to serve its customers masterfully; its 98% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

For More

- *Pro*'s original recommendation (4/27/10)
- Talk about Broadridge

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. We expect modest sales growth to translate to earnings growth of around 10%. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy First: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog semiconductors for smartphones and connected devices is growing sharply.

Suggested Allocation: 3.2%

Skyworks Solutions (NASDAQ: SWKS) makes technology that powers wireless connectivity in a wide variety of products: **Apple** (NASDAQ: AAPL) and Samsung smartphones and tablets, **Medtronic** (NYSE: MDT) medical devices, **Google** (NASDAQ: GOOG) and **General Electric** (NYSE: GE) products, and the list goes on. In what's being called the "Internet of Things," billions of physical objects are being connected to the Internet for the first time -- and Skyworks is uniquely positioned to benefit. Not only does it serve all of the top-tier mobile device makers, the company is also diversified across industries to serve more than 2,000 customers.

What It Does

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by nearly 1,000 patents. The list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as components of a phone or other connected device. Skyworks earns industry-beating operating margins of 30.5% selling specialized solutions to giant customers with growing connectivity needs. Here are just a few examples:

- GE plans to connect all of its industrial products to the Internet -- from jet engines to dishwashers.
- Medtronic will connect many of its medical devices to the Web for monitoring.
- A majority of new automobiles will be connected to the Internet by 2017.
- Smartphone sales are expected to surpass 1 billion by 2016

All told, **Cisco Systems** (NASDAQ: CSCO) expects 50 billion devices will connect to the Internet by 2020.

How It's Working

Skyworks is already reaping some benefits, and it's ready for much more. As CFO Donald Palette said this summer, “We've spent the last decade investing significant resources and leveraging our technology to expand our presence in traditional analog markets like automotive, medical, and industrial. We have established significant traction in these higher-margin growth avenues, and we see tremendous opportunity ahead."

Whatever the device being connected to the Internet, the smaller, more complex, and more efficient the technology needs to be, the more Skyworks benefits. Also, as more data flows through networks and more connection nodes are required, the company's products become even more indispensable. As Palette said in the July conference call, "Complexity for us drives profitability. And there are fewer and fewer people in the space that can do it" -- even as complexity accelerates. Given this, Skyworks expects profit margins to continue to move higher.

What We Expect

We expect continued strong growth, and we think the reasonably-priced stock will ultimately appreciate at rates higher than the market average. CEO David Aldrich recently said, “Skyworks is entering a new and exciting growth phase driven by global wireless proliferation and the Internet of Things. Quite simply, we are capitalizing on the macro trend to connect virtually everyone and everything, all the time." Most significantly, he continued: “Skyworks is setting the pace for analog semiconductor industry growth in terms of both revenue and value creation." In the quarter just ended, revenue jumped 51% year over year, while operating income soared 81%. And for the fiscal 2015 that just began, Skyworks increased first-quarter guidance.

For More

- *Pro*'s original recommendation (8/5/14)
- Talk about Skyworks

CEO Aldrich summed things up on Nov. 6: “Our advanced solutions are at the heart of mobile connectivity and the Internet of Things, and are empowering exciting new applications spanning mobile payments, to streaming music services, to on-demand media. Given our accelerating design win momentum and deep product pipeline, we have never been better positioned to grow demonstrably faster than our addressable markets and in turn, to deliver best-in-class financial returns.” Here at *Pro*, we hope to be owners for many fruitful years — as long as is merited.

Buy: Starbucks (NASDAQ: SBUX)

A global powerhouse devoted to creating experiences stands poised to brew up great returns going forward.

Suggested Allocation: 2.8%

What It Does

You may not realize it, but “**Starbucks**” (NASDAQ: SBUX) is no longer a synonym for “coffee.” In January 2011, the company dropped the word “coffee” from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it’s just a front. We *think* we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America’s eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 21,300 stores in 65-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

How It’s Working

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1.5 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, Teavana tea bars, La Boulange bakeries, Starbucks Reserve) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

Recent results have been robust. Starbucks continues to add stores at a rapid clip, and its same-store sales have been rising by an average of 7% per year over the past five years. Earnings and cash-flow performance have increased even faster, and all of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings.

What We Expect

For More

- [Most recent earnings update](#) (10/30/2014)
- *Pro*'s original recommendation (8/22/2012)
- Talk about Starbucks

Given its very recognizable brand, artfully crafted business, and fanatically loyal customers, we expect Starbucks' diversified growth to continue. We believe the world's coffee and tea drinkers will happily support 30,000 or so stores across the company's various brands, and that products bearing the aspirational Starbucks brand will expand the company's real estate on grocery-store shelves.

The company's scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is also the leader when it comes to incorporating technology into a physical store experience – 90% of mobile payments in the U.S. took place in a Starbucks store in 2013.

At around 29 times trailing earnings, Starbucks might look expensive to some, but the company has been knocking it out of the park since CEO Howard Schultz's return to power in 2008; it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. Starbucks offers a truly unique blend of growth and cost-reduction opportunities that leave it poised to deliver North Star-beating returns going forward. We want to tag along for the caffeinated ride.

Portfolio Building Report No. 1

Published Oct 29, 2014 at 2:31PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* Member,

Pro is a premier service at The Motley Fool not only because it's a portfolio service that incorporates options, shorts, and hedges alongside core stock investments — but because it is a full portfolio solution, period.

Thought goes into each part of the portfolio, the allocation we give to every position, and how the positions all work together. This means that every addition to the portfolio serves a specific purpose. The following report (as well as those to come on Nov. 13 and Nov. 20) outlines our current thinking on all of *Pro*'s positions, as well as suggested allocations and the thesis behind each one.

Welcome to *Pro*. We're glad to have you!

— Jeff Fischer, advisor

Getting Started With *Motley Fool Pro*

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy the *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and wait for our next two reports coming Nov. 13 and Nov. 20. You can always see our latest take on all of our positions on our What We Think Now page. As you explore our recommendations, it's important to remember that a stock's "scorecard status" (Buy First, Buy, or Hold) is the best indicator of how we feel about it. If a stock is listed as a Buy or Buy First on the What We Think Now page, that means we think you can buy it today.

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.9%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Total U.S. mobile data traffic is expected to increase by more than 2,000% between 2012 and 2018, and the number of U.S. mobile lines in service (including smartphones, computing devices, and machine-to-machine applications) is expected to jump from 360 million in 2012 to 648 million in 2018. Communications site operator **American Tower** (NYSE: AMT) is well positioned to benefit from this trend.

What It Does

AMT leases antenna space on more than 69,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 11 different countries outside the U.S., including India, Brazil, Germany, and South Africa, and AMT is intent on expanding its international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and more than 85% of its current leases don't renew until 2019 or later.

What We Expect

Revenue is up 25.3% year-over-year in the most recent trailing-12-month (TTM) period, with the international division up 27.2%, outpacing the domestic side. We expect revenue to roughly double over the next five years through a combination of price escalations, new towers, and upgrades; year-to-date 2014 results suggest that the company is well on its way.

After its 2011 conversion into a real estate investment trust (REIT), AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.44 annually, a 1.5% yield, and management expects to increase the dividend 20% annually over the next five years. (Importantly, only the U.S. business and a small portion of the international business is organized as an REIT. For more, see our original write-up, linked here and in the sidebar.)

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which further reduces taxable income and understates the value of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $110 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.2%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

Combining hardware with boxed software and cloud services, Oracle is a full-service solution, one that's poised to enjoy long-term growth in free cash flow. The business is incredibly sticky — companies don't trust their data to just anyone, and it's tricky and even risky to make a switch. To add to its massive recurring revenue base, Oracle cross-sells new products to existing clients and continues to rope in new customers with its comprehensive software and hardware solutions, whether on site or in the cloud. The company has also been known to make some (read: *many*) acquisitions to propel growth.

How It's Working

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability upon which Oracle grows. Even better, as more customers move to a cloud-based relationship (rather than licensing on-premise software), Oracle enjoys growing, monthly, recurring cloud revenue, even as customers save money because they no longer need to host their own software. For Oracle, economies of scale make hosting inexpensive.

In the quarter that just ended, Oracle's core cloud revenue was up 33%, while total software-plus-cloud sales gained a respectable 6% to $6.6 billion. Following some quarters of slow license sales growth (the increasingly popular cloud contracts bring in revenue more gradually), the stock has dipped, providing a good buying opportunity.

More Resources

- *Pro*'s original recommendation (9/17/09)
- Latest earnings coverage (10/3/14)
- Talk about Oracle

What We Expect

At about $39, Oracle trades at about 13 times free cash flow, well below the S&P 500's average, and management expects more operating leverage ahead and greater overall profits as cloud revenue steadily increases.

The *Pro* Bottom Line

This is a good buying opportunity for a proven business that still has plenty of room to grow. From this valuation, we think the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years.

Buy First: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 3.1%

Entrusted with more than $650 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts around 400,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash.

What It Does

Aside from being a leading discount broker, TD Ameritrade has a partnership with **TD Bank** (NYSE: TD) (which owns 41% of the company), giving it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below- average risk to boot. So, when the current record-low federal funds interest rate (targeted between 0% and 0.25%) increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on increasing client assets and launching more investment products.

But about that federal funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an extra 26% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

How It's Working

TD Ameritrade has increased client assets by at least 10% annualized for the last six years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 (including dividends) has delivered about a 43% total return since 2007, but client assets held at TD Ameritrade are up by 235% over the same period. Operating margins are strong, too, lately in the low-40% range.

Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012 (and reaffirmed that rating in July 2014), which has helped fuel recent dividend increases (the quarterly dividend has grown 44% annualized since Q1 2011). With steady gains in customer accounts, decreasing shares outstanding, and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners — with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock is trading right around its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

For More

- *Pro*'s original recommendation (7/11/13)
- Monday Memo on TD Ameritrade's business model (9/15/14)
- Talk about TD Ameritrade

What We Expect

Management will continue to be excellent stewards of capital, returning profits to shareholders and increasing additional investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and should enjoy healthy returns.

The *Pro* Bottom Line

Our current fair-value estimate on TD Ameritrade is $34. The company's earnings are likely at a cyclical low. Believing as we do that TD Ameritrade's profit potential is much greater than recent results suggest, we think the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump.

Buy First: Tupperware (NYSE: TUP)

This is not your mother's Tupperware.

Suggested Allocation: 2.8%

What It Does

Tupperware Brands (NYSE: TUP) earns 70% of its revenue from giant emerging markets including China and India, where its sales reps are still only scratching the surface of the vast potential markets in dense urban population centers. As these countries, Brazil, Malaysia, and others begin to enjoy disposable income, shoppers able to store food for the first time can afford inexpensive kitchen products offered by Tupperware. In addition, Tupperware offers women in these regions steady employment, something that's still tragically hard to find for many women in emerging markets.

Elsewhere in the world, the company's sales through its iconic "Tupperware parties" still thrive in places as erudite as France and as prosperous as Germany, as well as in the good ole U.S.A. Cutting out retailers to focus on direct sales continues to set Tupperware apart from the rest of the pack, and with a sales force of 3 million and new products every year, the company still has plenty of potential ahead.

How It's Working

Tupperware has been increasing sales in key emerging markets by 20%, 30%, even 50% or more year over year, and overall in those regions by 10% or more. Including its legacy businesses in developed markets, the company targets long-term annual sales growth in the mid-single digits and earnings growth higher than that. Today, storage products only account for about 30% of sales, while region-specific kitchen tools have the lead. For example, in China water purification products are top sellers, while Tupperware vegetable steamers do well in France. The company's diverse product line, driven largely by the requests of local sales representatives, gives Tupperware relevance and success across different markets. A significant part of sales come from new products each year, a fact in which management takes pride. Tupperware creates innovative products and then outsources production to keep costs down.

A few quarters of soft sales, partly because of challenges in the Ukraine and South America, have led to a pricing opportunity for new buyers, making the stock a Buy First.

More Resources

- *Pro*'s latest buy recommendation (7/30/14)
- Talk about Tupperware on our discussion board
- Latest earnings coverage coming soon!

What We Expect

The $63.75 stock trades at 14.7 times earnings and yields 4.3% in annual dividends. After a soft year, the company is set up to have much easier year-over-year financial comparisons in 2015, and we expect the stock to handily return more than 11% annualized the next three years as headwinds dissipate. Feisty emerging markets should continue to drive sales, but we expect developed markets to hold steady (and even grow slowly) as well.

The *Pro* Bottom Line

You don't have to attend a party in someone's living room to enjoy the benefits Tupperware can bring to your portfolio (though you can if you want to). The company's innovative approach to products and sales continue to set it apart, and the future looks bright.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 4.1%

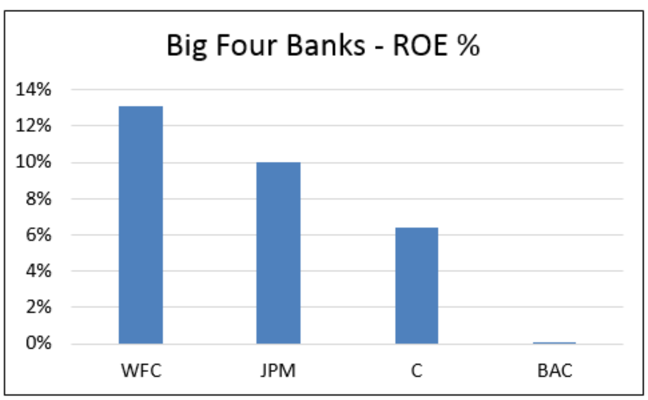
What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,800 branches and 12,700 ATMs. It's the fourth-largest bank in America, it has a reputation for high customer loyalty and satisfaction, and it's the leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Working

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for the most recent quarter (Q3 2014) were rock-solid, at 1.4% and 13.1% respectively — great results given the low interest-rate environment and new regulations that require higher liquidity levels (i.e., less leverage) than before the financial crisis. A look at ROE figures for the other three big banks shows how Wells Fargo is best in breed:



Source: Q3 2014 company filings (figures represent return on common equity)

Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to higher earnings than before the financial crisis. Deposit growth has been tremendous (coming in at almost 10% in the third quarter of 2014), and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is impressive and continues to improve. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with the aforementioned capital regulation requirements well ahead of schedule.

What We Expect

For More

- *Pro*'s original recommendation (12/10/10)
- *Pro*'s recent "Buy More" recommendation (7/29/14)
- Talk about Wells Fargo

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In the current low-interest-rate environment, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy picks up, interest rates rise, and loan demand resumes, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

Shares are trading at less than fair value, and they yield a growing 2.6% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 4.1% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Jeff's Take on Earnings From 4 Pro Companies

Published Oct 27, 2014 at 3:26PM

Dear *Pro* member:

This is the last time we'll see earnings reports from our companies in 2014. Management from **Coca-Cola** (NYSE: KO) to **Tupperware** (NYSE: TUP) is already talking about 2015, a year that (to me) still sounds futuristic and distant (by 2015, I want a flying robot to pour me coffee, wash the dishes, and teleport me to the office). As *Pro* companies report results, we're seeing pleasing growth at several and a slowdown at others — but all of our companies offer us healthy free cash flow and a stable, solid foundation upon which to grow. We could conceivably leave our long portfolio alone for years and come out well ahead.

We mainly do these quarterly reviews to stay 100% current on our companies, make sure we're not missing key factors, and reevaluate our fair-value estimate and growth expectations. We want to see healthy growth — or the likelihood of it — in our businesses, because lacking that, it's hard to imagine a stock ultimately rising along with our North Star. At the same time, we know growth is not linear. Every company has slow periods. Two of the four we touch on today are cases in point.

Four Earnings Results

Coca-Cola: The beverage giant is like your rich uncle who drives a Rolls-Royce and apologizes for not driving something faster. The world's leading beverage producer, with the planet's largest distribution network, has been on its heels the past few years as it struggles to increase unit volume sales. As thirsty as the world's growing population is, Coca-Cola is struggling to drum up enough new sales in young markets to offset soft soda sales in developed markets. If everything has a season, sugary soda may be experiencing its autumn in the Western world, though it will remain a cash cow for years.

The company has 15 $1 billion brands, including Dasani water, but its total volume was up only 1% in the third quarter, leading to flat revenue. Results were soft enough to make management lower its full-year guidance, and that sent shares down about 5%. Coca-Cola views 2015 as a major transition year. The company is cutting costs deeper than ever, looking for $2 billion in annualized savings by 2017 and $3 billion by 2019. Don't view the company's defensive posture as a surrender, though. Management plans to invest savings in marketing and branding in order to grow. Coca-Cola has such strong assets that we believe the long-term odds remain in its favor. Meanwhile, we're considering writing diagonal calls to earn income on our synthetic long, even though the calls don't pay richly.

OpenText (NASDAQ: OTEX): This enterprise information management (EIM) software company is another story. The need for its services is rising as digital content soars, sending shares 81% higher in the three years we've been owners. Including its business exchange acquisition, GXS, revenue was up 40% last quarter to $454 million. The stock sold off initially because new software license revenue rose "only" 6%, a slowdown compared to recent quarters, although it's still excellent in light of the struggles at competitors **IBM** (NYSE: IBM) and **Oracle** (NYSE: ORCL). (Oracle remains a Buy First for *Pro*. We believe it will emerge strong.)

OpenText has increased its license revenue by 11.9% year-over-year over the past 12 months, even as its cloud revenue rises sharply, too. It argues that customers want their software both on the premises (licensed software) *and* in the cloud. Oracle voices a similar argument, although it's struggling to increase license revenue. OpenText shares remain reasonably priced, and with its industry expected to grow by at least 10% annualized, we believe the stock should continue to outperform over the long haul.

O'Reilly Automotive (NASDAQ: ORLY): Perhaps understandably, the auto-parts retailer inspired the most yawns of any new *Pro* buy in recent years, yet the stock has gained a stellar 73% since the April 2013 *Pro* recommendation (which seems like yesterday). Surprisingly, that buy advice also brought the stock into the Fool universe for the first time. I say "surprisingly" because O'Reilly has been a strong business for a long time: Same-store sales jumped 6% last quarter, and earnings per share soared 22%, marking the 23rd consecutive quarter of at least 15% EPS growth. With locations everywhere across the country doing well, O'Reilly benefits as cars stay on the road longer, miles driven go up, and (now) the workforce grows. Management remains "very confident" in its future opportunities.

What's its secret sauce? It sounds cliched, but O'Reilly credits much of its repeat business to its superior customer service and ability to provide hard-to-find parts. In this business, the sales staff needs to know what they're talking about — which part you actually need — and must have it available quickly. O'Reilly prides itself on being able to deliver on both counts. The stock has revved above our fair-value estimate, but we're taking a fresh look at the financials to see if an update is in order. It may be, because management increased guidance last week, and it now outstrips our own estimates. Meanwhile, as with every stock we own, we still estimate an annualized North Star-type performance over our rolling three-year time frame.

Tupperware: The kitchen tool and storage company is our most notable loser this year; the stock is down 33% year-to-date, putting *our* position down 22%. It may be worth noting that we've made money on Tupperware overall in *Pro,* via our previous position and options; that's not an excuse, but a bit of context when we say we believe we'll make money on *this* position eventually, too. The company's results are more volatile than most partly because sales come from Tupperware parties. If sales reps aren't throwing enough parties, sales suffer. And let's face it: The typical rep waxes and wanes, throwing more parties around new product launches and fewer during holidays (Ramadan lowered results in many countries this quarter).

Tupperware has also been plagued by currency and political turmoil in Venezuela and the Ukraine as well as weakness in India, all of which led to lower sales in these countries. Still, total sales were up 4% as emerging markets — now 70% of revenue — rose by 8%. Tupperware management expects emerging markets to return to higher-than-10% sales growth soon. Both Coca-Cola and Tupperware spent valuable conference-call time describing less confident consumers in emerging markets of late, and that shows up in Tupperware's struggling share price as the stock yields 4.2% and trades at 14.7 times earnings.

We're keeping an eye on Tupperware's debt structure. Although the dividend is safe (the company's payout ratio is around 50%), the dividend won't likely increase this year because cash flow is stagnant. Also, Tupperware's share buyback program is much smaller this year — at much cheaper share prices! — because it, too, is tied to cash-flow generation. That construct all but guarantees the company will buy back more shares at higher prices, and fewer at lower prices, so it's an issue we want to discuss with management when we get them on the horn.

Summed Up

Enjoy today, but of course think longer-term for money you've invested.

In summary, all four stocks remain Buy-rated here at *Pro*. We believe they will increase shareholder value by at least 10% annualized over the time frame that matters to us, a rolling three years. We also know that won't happen without bumps along the way, and in some cases, we'll want to add options to the mix to increase our odds of success. We'll publish valuation updates as they're ready. If you have questions today, please visit us on the Memo Musings board.

Invest on! And Fool on!

— Jeff (TMFFischer)

Anonymous Investing

Published Oct 20, 2014 at 3:11PM

Fellow Fools,

There are people in this world — educated, intelligent people — who believe investors would be better off not knowing the names of the stocks they own. If you're anything like me, your first response to this idea is "That's crazy!" But what if I told you this is part and parcel of a strategy that was used to achieve an average return of 25% a year over the past 12 years and 67% in 2013 alone?

No, this is not an April Fools' joke six months too late. The company responsible for those returns is AthenaInvest, and its co-founder, C. Thomas Howard, is helping spearhead the behavioral portfolio management movement. Howard believes that in order to outperform, investors must "release their emotional brakes," or drive emotion out of their investment decision-making process. Something as simple as a company name can be emotionally laden enough to affect an investor's decisions, preventing them from maximizing their returns. For the same reason, Howard also believes investors should remain blissfully unaware of a position's cost basis if possible. He suggests identifying the few key aspects of your investing strategy and forgetting or ignoring the rest. And he does mean *all* the rest.

The approach may sound extreme, but I believe the underlying rationale is sound. Is there anyone out there who believes investors are better off letting emotion drive their decision-making process? From myopic loss aversion to buying a stock based on a fanciful story that ends up lacking in substance, our emotions can compel us to make some ... *interesting* ... investing decisions. These choices often turn out to be obvious mistakes in hindsight, but seem irresistible at the time thanks to the pull of our emotions. Pets.com, Webvan.com, Flooz.com — the list of firms that went from darling to dud is rather lengthy (and, unsurprisingly, includes quite a few with ".com" at the end of their names).

Cater to the Crowd

Here's the kicker: Even though most people know that mixing emotions with investing creates a dangerous cocktail, very few do anything to keep the two separate. And many aspects of our industry actually exacerbate the problem. Quarterly evaluations of a company's performance, an unhealthy fascination with volatility, constant media coverage of market darlings, real-time quotes that are just a swipe away on our smartphones — these are just a few examples of how our world caters to the emotional investor.

But there is a silver lining. All of this catering to the "cult of emotion" ensures no shortage of opportunities for Foolish investors to construct a portfolio that outperforms their benchmark. In the world of behavioral portfolio management, the emotional crowd dominates the market, not rational investors. This gives rise to behavioral price distortions that are strategy and style agnostic. According to Howard, it doesn't matter if you're a top-down or bottom-up investor, if you're into deep value or high growth, because active investors are all seeking the same thing: Market prices that have become dislodged from reality, often thanks to emotion. Not every road leads to Rome, but there are more than a few that do when it comes to investing.

Consistency, Consistency, Consistency

This means we don't have to adopt AthenaInvest's approach in order to be successful (and it sure would be hard to send you recommendations if we did!). Since everyone is hard-wired differently, they key is to develop a strategy and style that works for you and then stick to it. *Pro*'s are based on the cumulative experience of current and prior team members; they help us figure out what to buy and what to sell, and they prevent us from focusing on the unnecessary and spinning our wheels. Having these two aspects of our investment process so clearly laid out does not result in complacency. Rather, it forces us to demonstrate that any potential modifications will lead to improvements. There are many places where change for change's sake is actually a good thing, but I believe your portfolio is not one of them.

Foolishly yours,

— JP (TMFYossarian)

Pro Completed Trades (see all trade alerts)

- **SPDR S&P 500** (NYSEMKT: SPY): *Pro* bought 17 Nov. 22, 2014, $200 puts for $11.17 each, for a 15% look-through allocation as a hedge.

Pro's Take: Wells Fargo Q3 2014

Published Oct 17, 2014 at 2:38PM

Wells Fargo (NYSE: WFC) posted yet another solid quarter in Q3 2014. The results were typical of what I've now come to expect – excellent credit performance, continued focus on efficiency gains, and steady performance as a result from the company's diversified business model. The company is executing very well in a difficult environment of uneven economic growth and low interest rates, and management continues to take steps to position the company for earnings growth in more favorable environments. In the meanwhile, the company is still incredibly profitable and generates returns (ROE/ROA) that are the envy of its big bank peers.

What Happened?

- Diluted EPS of $1.02 per share (up 3% from Q3 2013)
- Revenue of $21.2 billion (up 3.4% from Q3 2013)
- Efficiency ratio decreased to 57.7% (vs. 59.1% in 3Q 2013)
- ROA of 1.40% (vs. 1.53% in 3Q 2013)
- ROE of 13.10% (vs. 14.07% 3Q 2013

Continued increases in loan/deposit growth and credit quality:

- Record core* loans of $775.8 billion (up 7% from 3Q 2013)
- Record average deposits of $1.13 trillion (up 9.9% from 3Q 2013)
- Net charge-offs as a % of total loans down to 0.32% (vs. 0.48% in 3Q 2013)
- $300 million reserve release** (vs. ~$900 million 3Q 2013)

Capital allocation:

- Share buyback activity continued (diluted share count declined 40.4 million, or 0.8% of total shares outstanding, from last quarter), with more buyback activity expected to settle in Q4
- Quarterly common stock dividend of $0.35 per share (vs. $0.35 last quarter, no change)

Operating segments:

- Community Banking: Net income of $3.5 billion (up 4% from 3Q 2013)
- Wholesale Banking: Net income of $1.9 billion (down 3% from 3Q 2013)
- Wealth, Brokerage, and Retirement: Net income of $550 million (up 22% from 3Q 2013)

*"Core" loans excludes the impact of the non-strategic/liquidating loan portfolio

**Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

CFO John Shrewsberry:

> "This was a strong quarter for Wells Fargo and again demonstrated the benefits of our diversified business model. Despite the low interest rate environment, revenue and pre-tax pre-provision profit increased linked quarter, and we continued to operate within our target ranges for ROA, ROE, efficiency ratio, and capital return to shareholders. We also remain well positioned to benefit from higher rates in the future, and our balance sheet has never been stronger, with higher levels of capital and liquidity, and improved asset quality."

So What?

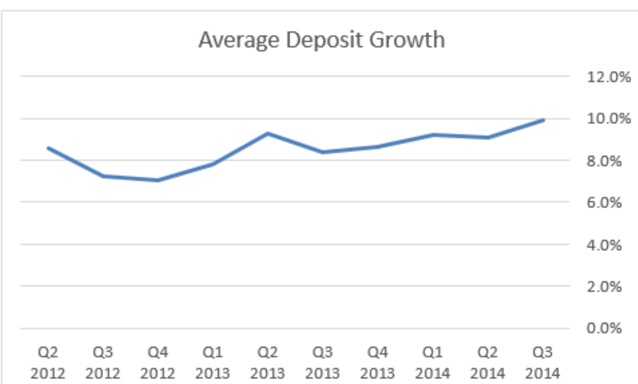
The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits

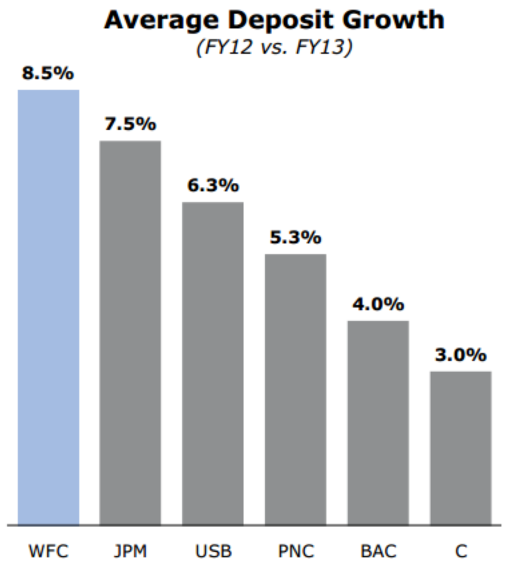
Core loan growth for the quarter came in at 7% year-over-year. This is a very solid figure given the uncertain economic environment, low interest rates, and Wells' continued focus on credit quality, which inherently reduces the pool of potential loanees. When long-term rates rise (who knows when that'll happen), I expect loan growth to really pick up. In the meantime, if the company can keep its loan growth stable or generate modest growth, I'll be happy. Here's a board post with some more info on loan growth this quarter.

As for deposits, Wells again demonstrated its outstanding deposit franchise, with 2.3% quarter-over-quarter growth and 10% year-over-year growth. Funding costs were stable at a rock-bottom rate of 0.10%. If they're only paying 0.10% on deposits, they should be gathering as many deposits as they can, and that's what they're doing. Deposit growth is accelerating in recent quarters:



Source: Company filings, analyst calculations

and is best in class (old data, but demonstrates Wells proficiency in gathering assets):



Source: Wells Fargo 2014 Investor Day Presentation

Wells has been able to leverage its dominant, nationwide branch network presence into strong, low-cost deposit growth. This is perhaps one of Wells' biggest competitive advantages.

Since deposit growth again exceeded loan growth, compression of the net interest margin (NIM) continued, coming in at 3.2% (down from 3.27% last quarter and 3.48% a year ago). I've written about net interest margin compression here. Quick summary is, it's not a big deal and we will likely see NIM compress until rates rise and loan growth picks up.

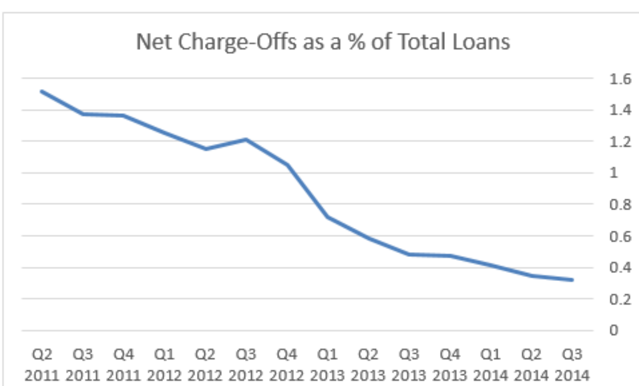
2) Trends in credit quality

Credit quality continued to increase, with net charge-offs as a % of average total loans down to 0.32% (from 0.35% last quarter). Two quarters ago, I wrote:

> "It's impressive how management continues to wring out improvements in credit quality, and it is a testament to WFC's conservative underwriting (one of the many reasons I think WFC is the best-run big bank)"

and that quote still applies now. Quoting myself again (and updating for this quarter's numbers):

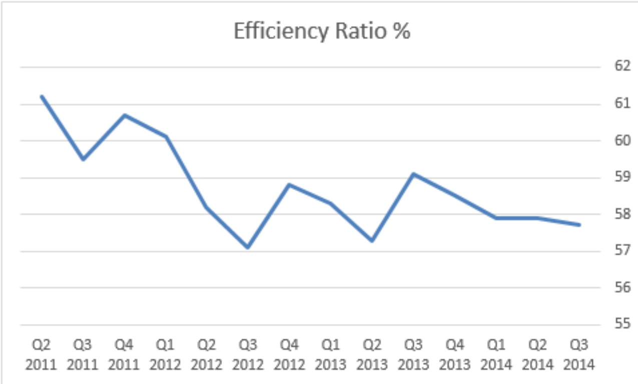
> "Improvements in credit quality are starting to level off (as well they should-the trend in this figure has been unsustainable, as charge-offs can't possibly decline below zero)":



> *Source: Company filings*
>
> "Credit quality improvements should continue to level off in the coming quarters and Wells Fargo will need to find other ways to drive profit growth. The [$300] million reserve release represents about [5%] of Wells Fargo's earnings this quarter (down from [$500 million and roughly 9%] last quarter). See the thread beginning with Dom's question here for some more color regarding reserve releases if you are interested."

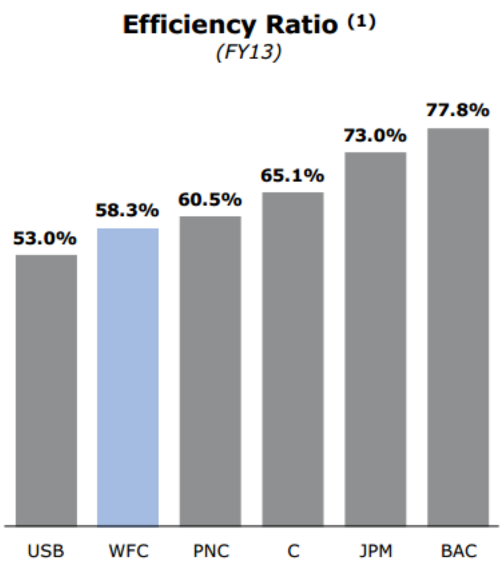
3) Trends in the efficiency ratio

This quarter showed continued improvements in efficiency, with the efficiency ratio (a measure of the bank's overhead costs as a % of its revenue) declining to 57.7% from 57.9% last quarter. Management continues to impress me with their consistency and ability to deliver as they promise with regards to efficiency. Management has stated that their goal is to ultimately get the efficiency ratio down to 55%. I'm confident in management's ability to steadily drive this figure lower over time, although the improvement won't always be linear:



Source: Company filings

Like deposit growth, the efficiency ratio is also very strong when compared to peers (again, old data from FY 2013 but still relevant):



Source: Wells Fargo 2014 Investor Day Presentation

Now What?

I'll quote myself again:

> "Not much different from last quarter (or the quarters before for that matter). Wells Fargo continues to execute its strategy and boast admirable consistency despite a fluctuating and uncertain macroeconomic environment. The company's performance is a testament to its diverse operating model. The company has so many levers to pull that if one segment falls (e.g. mortgage originations) others pick up the slack."

The market wasn't particularly pleased with this quarter's results, with shares trading down over 2% on the day of the earnings release (10/14). Some investors might look at the 3% year-over-year EPS growth and declines in ROE/ROA and be concerned, but I'm not. Consider this – in last year's 3rd quarter, the reserve release (what some might consider a non-recurring item) was ~$900 M vs. $300 M this quarter. If you strip out that $600 M difference in the reserve release, EPS grew 15%. The underlying business results remain strong and the core earnings power of the business remains intact and is poised for eventual improvement.

Data and Guidance

- Current Price (per share): $48.69
- Fair Value (per share): $56
- Consider Adding More (CAM): $44.00
- Market Cap 253.4 B
- P/B 1.54

This quarter's results weren't enough to warrant a change to our $56 Fair Value estimate (representing a 1.77x P/B multiple) or the $44 CAM (1.39x P/B). In the valuation model, increases in book value were offset by slightly tempered ROE assumptions based upon the reduced likelihood of rising interest rates.

Wells Fargo remains a Buy First on our scorecard with a 3.9% allocation, and those who have yet to fill out their position should feel comfortable doing so, especially given the recent decline in the share price.

Fool on!

Billy

Keeping Your Wings Level

Published Oct 13, 2014 at 3:56PM

Dear *Pro* member,

If you've been with us awhile, you might know that I like to compare portfolio management to piloting a plane. True, I've never actually piloted a plane, but I still think the metaphor is pleasing. To fly, you load up your cargo, go through your checklists, fire up the engines, and lift into the air. To manage a portfolio, you open a brokerage account, fund it with cash, learn what you're doing, and start to invest for growth.

If you've been investing for many years, you may be close to fully invested -- in our metaphor, that puts you at cruising speed, perhaps even on autopilot much of the time. It's rare that you'll want to make large adjustments once you get to this state, but every once in a while, you do.

For example: If you know the right input (say, hedging with a market index), you can lower your market exposure with one easy trade (like the one we recommended today). Similarly, you can simply dial down your altitude in a plane (or so I'm told). Once at a new altitude, you'll get a feel for your new flight path, and adjust again later if you wish. Perhaps you'll want to throttle the engines again with some new buys, or perhaps you'll want to go even softer on the engines by adding to your new hedge. (Yes, I'm enjoying this metaphor a bit.)

Your decision probably depends on whether you're comfortable going through turbulence, or whether you want to try to avoid at least some of it. And this decision must be weighed against the opportunities and risks you see moving past your windshield or on your computer screen.

In flight or in investing, we can't know what our next risk will be. The risks seem to come from nowhere. The goal, then, is to have your portfolio (or your plane) positioned so that it will sail through risk without a dangerous outcome. Nobody can avoid every market decline, but some can fly through them much better than others. They are the pilots who have the highest-quality cargo (the best companies) and whose equipment (portfolio exposure) is tuned to take turbulence.

Enough now with the airplane metaphor. ("Whew," you say!)

On a Hedge and a Prayer (or a Short)

A portfolio is always evolving. In *Pro*, we're working to build our "short book" -- a sub-portfolio of direct company shorts -- so we're able to ride the ups and downs of the market more smoothly, and ideally have gains in both directions.

Beyond company shorts, hedging with market indexes assures that we'll have at least one position (the hedge) making money when the indexes fall. Index hedges also have long shelf lives and (comparatively speaking) limited upside risk compared with shorting stocks. In contrast, direct shorts on companies don't usually last that long. Your gains (or large losses) may occur within months, and then you're often inclined to close the short.

This makes selling companies short a time-intensive endeavor, requiring a lot of jockeying positions, and getting it wrong can be costly. We use our "Buzzard Bait" approach to shorting, outlined two weeks ago, to try to mitigate risk.

So, expect us to continue to both sell short companies *and* hedge indexes, because both offer advantages. In a market meltdown, most of our company shorts should cooperate (because most stocks fall in a meltdown). But in a market downturn of just, say, 10% to 15%, our company shorts may or may not help us -- the stocks may hold up as **Five Below** (NASDAQ: FIVE) has so far. If we have an index hedge, however, that hedge could help us in a smaller market decline. So, by combining index hedges and company shorts, we're better able to cover our bases for both modest market falls and large ones.

If It's for You

You don't need to short or hedge to succeed in investing with *Pro*. By far the most important thing we do here is choose our long-term, core holdings. The stocks we buy to compound our dollars over many years represent the fuel that keeps lifting us ever higher (OK, so I fibbed about the metaphors being over). But as a long/short portfolio, we'll continue to add company shorts and use index hedges, too, to try to soften or avoid the turbulence the market periodically throws our way -- and to enable us to own more core holdings without feeling too exposed.

When severe turbulence knocks other planes down 4,000 feet in a matter of moments, and we dip only 1,500 feet: That's when all the extra work is worth it.

Pro Catch-Up Trades: Oct. 13, 2014

Published Oct 13, 2014 at 2:59PM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking, or on trades where price guidance was due for an update*.

- **MasterCard** (NYSE: MA): The money transaction giant has declined to trade near our $70 fair value estimate. Shares remain a "Buy" with a 4% allocation in *Pro*. Average in over time if you want to spread out your purchases to get to 4%, or sell to open puts for every 100 shares you could buy.
- **Skyworks Solutions** (NASDAQ: SWKS): Volatility in chips has sent Skyworks for a loop. The volatile stock remains a "Buy First" at a 2.6% allocation. You can also consider selling to open puts if you want to target lower buy prices.
- **Tupperware** (NYSE: TUP): Has been cooked and cracked! But it remains a "Buy" at a 3.2% allocation. If you're targeting income and don't mind more exposure, you could consider selling to open January 2015 $65 puts, lately for around $2 each with the stock at $68 (where it yields a 4% dividend).

Buy Puts on the SPDR S&P 500 ETF

Published Oct 13, 2014 at 11:55AM

Is this for you? This is for *Pro* members who have exposure to the market of at least 80%, and who want to lower that exposure with a hedge. You don't need to hedge to succeed long-term, but *Pro's* mission often leads us to hedge to lessen downside risk.

How You Participate

- **Trade:** Buy to open Nov. 22, 2014, $200 puts on the **SPDR S&P 500 ETF Trust** (NYSEMKT: SPY).
- **Allocation:** 15%. With a net start price of about $189.50, each put equates to a nearly $19,000 short of SPY, so buy one put for approximately every $127,000 you manage. *Pro* will buy 16 to 17 contracts.
- **Price Guidance:** Pay time value of about $0.50 or less. If SPY trades at $190, you would aim to pay $10.50 or less for the $200 puts.
- **Recent Prices (11 a.m.):** SPY: $190; Nov. 22, 2014, $200 puts (bid/ask): $10.40/$10.60. (So in this case, until prices change, aim to pay $10.50 or so — meaning $0.50 in time value.)
- **Closest Stock Equivalent:** Short SPY (as a hedge).

What We're Thinking

As of Friday, the S&P 500 was 5.6% below its all-time high. That's an example of the standard volatility that can — and usually does — happen a few times per year. In *Pro*, we generally hedge against larger declines; today's recommendation will start us on that path, see us through earnings season, and be in place during the Federal Reserve's October meeting, when the stimulus is finally likely to be withdrawn.

Elsewhere in the world, concerns exist, as they always do, and they're fairly widespread at the moment. Europe's economy remains hamstrung, and fighting in the Ukraine isn't helping; the Middle East has several hot spots of growing instability; and West Africa is suffering the worst Ebola outbreak in history, with no end in sight and more cases likely around the world. Could any of these affect worldwide GDP growth? Of course. Will they? We don't know yet. However, we can inexpensively lower our exposure to the stock market, keep our long-term investments in place, and be ready to buy great companies at better prices if stocks continue to decline.

How It Fits Into *Pro*

S&P 500 companies earn a majority of revenue overseas, and many *Pro* companies are large multinationals, both of which make us want to use SPY as a hedge this time. The resurgent U.S. dollar may weaken overseas profits and future outlooks for S&P 500 companies, too, further increasing the index as a "reasoned" hedge.

But why purchase in-the-money puts on SPY expiring in just 40 days? A quick glance at the option chain shows you that SPY puts near-the-money are expensive, carrying a lot of time value. This is almost always the case, since there's high demand to hedge with SPY. But we don't want to pay a lot of time value and dilute the effectiveness of our hedge in the process. We would rather buy puts deep in-the-money, pay little time value, and have a hedge that responds to swings in the underlying index quickly and nearly in kind.

As of Friday, the $200 puts have a delta of 0.85, meaning they'll move $0.85 for every $1 change in SPY. In comparison, the at-the-money $190 puts only have a 0.51 delta, offering us a $0.51 move for every $1 change in SPY. That will improve if and when SPY declines, but it will take several dollars in movement to get there. We want something responsive from the start, and with a net short price close to the current index level.

In summary, we want:

- A hedge that is responsive from the start
- One that doesn't require us to to pay much time value

- One that leaves us free to close the trade on any large decline without hindrance (so a bear put spread, for example, is out of the question right now; that said, we may write puts later)
- Capped risk, even if it's $10 per share of risk
- To be forced to revisit the position by expiration just more than one month from now
- Bonus: Buying puts is possible in retirement and regular accounts alike

As of last week, the *Pro* port was 80.1% net long, after years of averaging around 70%. We've been spending our time seeking out direct shorts, but while we work on that, this hedge can help bridge the gap. After adding this position, our net exposure (on a look-through basis) will decline to about 65%. We'll still have about 15% cash that we're able to invest in new longs, and if SPY declines, we can sell our puts for a profit and have even more cash to invest. Meanwhile, we plan to add more direct shorts as we have them.

Finally, in addition, we may manage this hedge incrementally as we go along, adding to it if we add more longs to the portfolio, reducing it if we add more direct shorts, and so forth.

More That Matters

Maximum Reward: Minus any waning time value, the value of these puts will grow indefinitely as SPY declines.

Maximum Risk: The full cost of the puts. If SPY rises about 5.2% to above our strike price by expiration, the puts end without value.

Follow-Up: We'll assess whether we want to keep hedging this way before expiration, and if we want to, we'll effectively "roll" the puts to a later month and potentially different strike price.

Alternative Trades

- **Short SPY directly?** You may if you prefer. We're buying puts instead because it caps our risk at about a 5.2% move higher in the index, and the expiration forces a sincere reassessment soon.
- **Use later expiration months?** You may if you wish; we still recommend buying deep in-the-money puts to avoid paying high time value.
- **Mini-SPY options?** "Non-standard" or mini options exist on SPY, each representing just 10 shares (or $1,900 at the $190 strike) rather than 100 shares. If you're managing less than $127,000, consider using the mini options, buying one mini-put for every $12,700 you manage. Just make sure you want to spend precious capital to hedge.

Pro Can Help

Correlation, Diversification, and Risk

Published Oct 6, 2014 at 3:11PM

Fellow Fools,

"Diversification" is a common investing buzzword — and an intuitively appealing concept. To diversify means to minimize nonsystematic (idiosyncratic) risk by increasing the number of unique investments in your portfolio. Worried about the results of a Phase III trial for one or your favorite biopharma companies? How about the ability of a tech firm to develop the next big (or little) doohickey that leaves people waiting in lines for days? If your answer to either is "yes," then it sounds like you could benefit from diversification. By increasing the number of assets you hold that are not perfectly positively correlated, you can greatly minimize these company-specific risks.

But the focus of this particular Memo is not to talk about what diversification can do. Rather, I want to remind *Pro* Fools that diversification is *not* a panacea for all kinds of risk in our portfolio. Diversification does not remove what is referred to as systematic, or market, risk. This type of risk will remain regardless of how many assets we add to our portfolio, and it has a nasty habit of taking control during the most inopportune of times.

Before we continue, let's take a moment to provide a brief refresher on correlation for anyone who needs it. In the world of investing, correlation refers to the historical tendency of two investments to act in a similar fashion. The correlation coefficient of two assets can range from +1.0 to -1.0. If they move *together* 100% of the time, the result is a coefficient of +1.0; if they move in the *opposite direction* 100% of the time, the result is a coefficient of -1.0; and if there is *no relationship*, the result is a coefficient of 0.

Now, many consider correlation to be one of the primary building blocks of portfolio construction. This is because, in theory, by combining investments that are not perfectly positively correlated (anything less than +1.0), one can often reduce a portfolio's expected volatility *without* significantly affecting returns. But (and I'm sure you knew there had to be a "but" coming!) correlation is a backward-looking measure, and volatility is dynamic. There's no rule that says historical correlations must hold going forward, and the shorter your time horizon, the greater the likelihood that the realized correlation will differ from its historical value. During times of crisis or acute market stress, historical correlations tend to move toward 1.0 (sometimes sharply so) as systematic risk takes control and the benefits of diversification start to lessen as prices fall in unison.

Consider the following two correlation matrices. The first presents the correlation coefficients for various S&P 500 sectors from October 2000 until the start of the bear market in October 2007. The latter does the exact same thing for the start of the bear market until its bottom in March 2009. As you can see, 32 out of the 36 correlation coefficients increased during the most recent bear market. And two sectors that sound like perfect candidates for diversification — technology and materials — actually saw their correlation coefficients increase more than sevenfold to +.95!

Correlation Matrix: 2000 — Start of the Bear Market

Sector	Consumer Discretionary	Consumer Staples	Energy	Financials	Health Care	Industrials	Materials	Tech.	Utilities
Consumer Discretionary	1.00	0.49	0.85	0.92	0.90	0.84	0.95	0.13	0.71

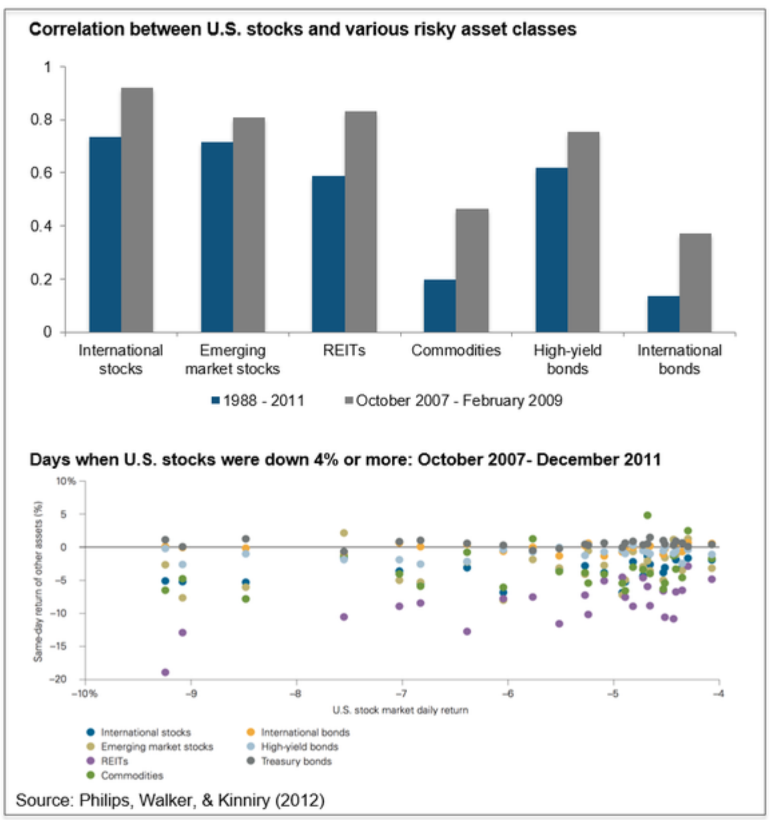
Tech.								1.00	0.97
Utilities									1.00

Sources: S&P Capital IQ, author's calculations.

But let's take a step back and expand our analysis horizon a little. After all, some might argue that diversification among U.S. equities really isn't diversification at all. As the following two charts illustrate, the correlation between US. equities and multiple other risky asset classes also increased during the recent bear market.



Technology and globalization have enabled (forced?) our financial markets to become intertwined to the point where financial contagion is no longer a rare phenomenon. There will always be a few asset classes that do well during bear markets. But Neal Soss (an economist at Credit Suisse) cut straight to the heart of the matter by noting that when you need to sell, "you don't sell what you should. You sell what you can." During times of acute market stress, everything is fair game.

All this doesn't mean we should ignore the benefits of diversification. We simply need to realize that diversification can only take us so far in our quest to continually outpace our North Star target over rolling three-year periods. This is one of the reasons we are constantly on the lookout for attractive hedging opportunities here at *Pro*. Effective hedging not only serves to reduce the volatility of our portfolio, it also puts us in a better position to take advantage of situations where prices have become detached from reality. Remember, a portfolio that falls by 25% has to rise by 33⅓% before it can start setting new highs, while a portfolio that falls 15% only has to rise a little over 17½%. And the latter result gives the investor far more capital at his or her disposal to take advantage of attractive opportunities during market pullbacks.

Foolishly yours,

— JP (TMFYossarian)

Pro Completed Trades: Oct. 6, 2014

Published Oct 6, 2014 at 2:03PM

Pro's recent completed trades:

- **Expeditors International** (NASDAQ: EXPD): Per our recent Catch-Up Trade, we completed the second half of our synthetic long strangle. We sold five more January 2016 $40 puts, and bought five more January 2016 $40 calls, for a net debit of $0.40, bringing our total synthetic long to 10 contracts of each with an average net cost of $0.55. We then sold five more November 2014 $39 puts and five more November 2014 $43 calls, for a combined credit of $1.20. In total, we wrote 10 strangles at an average credit of $1.45. Overall, we set up the whole position for a $0.90 credit, close to the $1 credit suggested on day one. (Today, members can do even better. You can get a $0.10 credit (lately) to set up the synthetic long, and a $1.20 credit to write the strangle, for $1.30 in combined credits. See today's Catch-Up Trades.)
- **Caesars Entertainment** (NASDAQ: CZR): We sold short a 2% position, per last week's trade alert, at $12.02.

Pro Catch-Up Trades: Oct. 6, 2014

Published Oct 6, 2014 at 1:36PM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking, or on trades where price guidance was due for an update.*

- **Caesars Entertainment** (NASDAQ: CZR): In our trade alert last week, we said to initially sell short the casino operate at $12 or above. Our "short around" price remains $12. With the stock now $11.80, that is still an acceptable level to short at; it is still "around" $12.
- **Expeditors International** (NASDAQ: EXPD): You can set up your January 2016 $40 put, $40 call synthetic long for no cost to a net *credit* of $0.10 lately. And then write (sell to open) a November 2014 strangle, selling $39 puts and $43 calls, for a combined credit of $1.20. Sell one of each November option for every synthetic long you set up, up to 3.5% total exposure. For more on this strategy, but with older pricing, please see our original alert.

Sell Short Caesars Entertainment

Published Oct 1, 2014 at 10:55AM

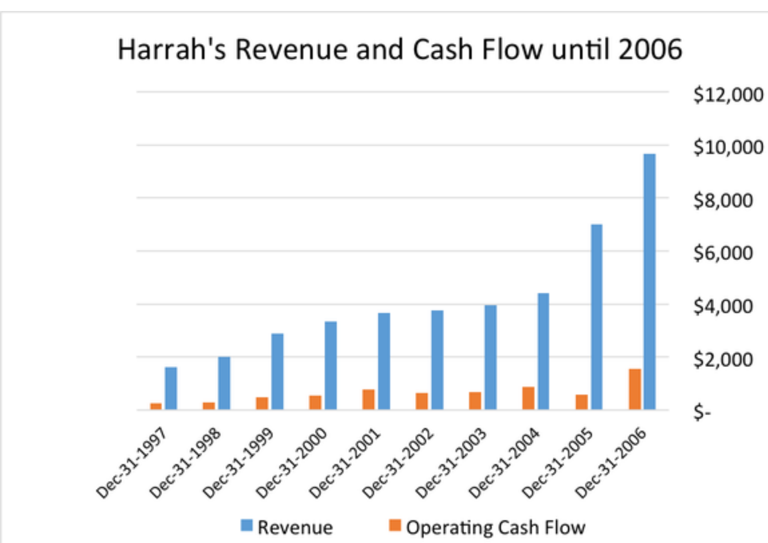
Is this for you? This is for Fools with a margin account and who can locate shares to short with their broker. Prior to releasing this alert, Interactive Brokers had shares available to short (TD Ameritrade requested that an individual inquires with them). Check with your broker to locate shares and inquire about fees involved. Alternative trades at the end of this report suggest using 2016 options. Either way, this trade is only for Fools who don't mind volatility and the special stresses of shorting — this could be a bumpy ride. Remember, shorting isn't necessary to succeed as an investor.

How You Participate

- **Trade:** Sell Short **Caesars Entertainment** (NASDAQ: CZR)
- **Allocation:** 2%
- **Price Guidance:** Use a limit order at going prices. Initially, only short above $12.
- **Recent Price:** $12.65
- **Availability at Interactive Brokers (Sept. 30):** 450,000 shares
- **Current annualized shorting fee (Sept. 30):** 2.375%
- **Percentage of float already shorted (Sept. 30 per S&P Capital IQ):** 29%

What We're Thinking

The saga of U.S.-based casino operator Caesars Entertainment begins during the Age of the Mega Buyout. In December 2006, private equity firms TPG Capital and **Apollo Management** (NYSE: APO) agreed to take Caesars (then known as Harrah's) private in one of the largest leveraged buyouts (LBOs) in stock market history, for a total consideration of almost $30 billion. At the time, Harrah's was the world's largest gaming company by revenue, and business was booming. Harrah's 10-year chart of revenue and cash flow looked like this:



Source: S&P Capital IQ.

In an LBO, the idea is that the private-equity sponsors pony up a small amount of equity (i.e., their own cash) and finance a much larger portion of the purchase with debt, using the target company's cash flows as collateral to secure and repay that debt. The appeal of LBOs is that the private equity companies can use other people's money to earn massive, "levered" returns on their small equity investments, so long as the company's cash flows remain strong enough to pay down their debt.

With a chart that looks like the one above, what could possibly go wrong? Well, you know what comes next. Shortly before the deal closed in January 2008, the financial system started its epic freefall and nearly collapsed, and the economy sank into the Great Recession. What looked like a brilliant idea in 2006 became a fight to pay off creditors and stay afloat.

The same casinos that were once rolling in cash and experiencing never-ending increases in demand were suddenly no longer profitable. When revenue began to drop precipitously, the casino's significant fixed costs remained and the company began to burn cash. Compounding the problem, Caesars was unable to crack into the lucrative Macau gambling market, which has been a big boon to competitors **Las Vegas Sands** (NYSE: LVS) and **Wynn Resorts** (NASDAQ: WYNN) as a way to stem losses from the anemic U.S. gaming market.

With stagnating revenue, massive amounts of leverage due to the LBO, and mounting losses driven by interest expense, the company is in a crippling financial position. As of the most recent quarterly filing, Caesars had only $3.4 billion in cash, more than $24 billion in debt, and greater than $2 billion of annual interest expense. At the current burn rate, the company is set to run out of cash as early as 2015. In its most recent annual SEC filing, the company admits that it can't service its long-term debt on its cash flow alone, so it will ultimately need to take action in some form (including restructuring or refinancing).

With its high-powered private equity backers determined to protect their investment, Caesars is hell-bent on avoiding bankruptcy. As of a May 2014 *Wall Street Journal* article, since the LBO, Caesars has raised new debt or refinanced 18 times, asked lenders to ease terms six times, sold new stock five times, and swapped or bought back debt at a discount 16 times. In our view, this tenacity may finally give way to exhaustion, or the company may run out of options.

Even now, the company is embroiled in legal battles with creditors who allege that Caesars is engaging in illegal asset transfers in order to shield its valuable assets from bankruptcy claims. All the while, the operating business (the casinos) continues to suffer under increased competition, and the sky-high interest expense on Caesars' mammoth debt load persists in crippling the company's financial flexibility.

To a trained eye (or even a blind one), a debt restructuring or eventual liquidation appear as likely outcomes, unless the casino business can somehow find a way to dramatically increase revenue or substantially decrease operating costs in order to improve profitability. Or, unless debtors throw Caesars a lifeline at their own expense, but it seems doubtful that most bondholders would agree to that. With operating earnings (adjusted for one-time items) showing no signs of improvement, we think it's likely that the equity — the lowest tier of capital in the ownership hierarchy — will continue to decline in value.

Buzzard Bait Rundown

Let's run this bait through our 20 criteria. Numbers first:

- **Average daily dollar volume of at least $20 million:** Trade volume has been lower than $15 million per day lately. That's a bit shy as the stock goes down and perhaps trading interest wanes.
- **Market capitalization value of at least $1 billion:** $1.88 billion.
- **Shares short ratio no higher than 35%:** 29%.
- **Increasing diluted shares outstanding the past three years:** Yes, from 125 million shares at the end of 2011, to 144 million last quarter, up 15%.
- **Debt of at least 8 times cash, investments, and equivalents:** Just about. As of June 30, Caesars had cash and equivalents of $3.4 billion, and liabilities of $29.6 billion — $24.4 billion of which was long-term debt.
- **Total liabilities greater than total assets:** Yes. The company is saddled with more than $29 billion in liabilities against $27 billion in assets, the majority of which is property.
- **Interest expense that's 10% or more of revenue:** In the past year to June 30, interest expense was $2.3 billion compared to revenue of $8.3 billion, or 27.7% of sales.
- **At least 350,000 shares available for shorting from Interactive Brokers:** 450,000.
- **A current annualized fee of 5% or less to short:** 2.375%.
- **Relative strength (measured by *Investor's Business Daily*) of 15 or lower:** It's only 5.

Now let's consider the business:

- **Little competitive advantage:** Increasing competition is crimping Caesars' style as more states legalize casinos. Atlantic City is suffering a severe blow from lost Pennsylvanian traffic now that casinos have opened in the fracking mecca. With 52 locations at the start of this year (mostly in North America and England), Caesars has venues and brands that are a draw, including Caesar's Palace, Bally's Las Vegas, and Paris Las Vegas, but many of its second-tier venues are a drag, and competition (including online) is spreading.
- **No pricing power:** Try increasing room rates or (somehow) the cost of gambling, and see how that goes.
- **Little or no recurring revenue:** A casino is making its best customers poorer, and the more the casino cleans up, the more discouraged the customer becomes. That said, Vegas is a popular repeat-visit destination.
- **Negative free cash flow:** Yes, since 2008 — and to the tune of negative $1.4 billion the past 12 months.
- **A weak balance sheet:** $24 billion in mostly high-interest debt against just $3.4 billion in cash and $16 billion in property that may be inflated on the balance sheet.
- **Little optionality in the business:** Atlantic City has dreams of turning itself in a beachfront shopping destination, but the change will be years in the making. And Vegas is Vegas. Caesars can keep opening new riverboats and casinos around the country, but competitors are doing the same.
- **A limited customer base:** In its current form, Caesars mostly depends on big-ticket gamblers and steady visitors to Las Vegas and Atlantic City.
- **Unattractive acquisitive value to other companies:** We believe most of its properties aren't new or lucrative enough to merit buying out the whole business in today's environment. The best properties may be sold to raise cash, though, leaving shareholders with the weakest.
- **A dated brand or way of doing business:** Caesars still has a decent brand, but the whole industry is starting to feel a bit "last century" to us. It could use another refresh, which is expensive.
- **Non-founder management who own little of the stock:** Due to its leveraged buyout, insiders with least 5% equity own about 50% of the stock, with Apollo Management owning 18% and Paulson & Company owning 9%. Rather than being founders of this 1937 company, they're recent investors (levered with others' money). It's gutsy to invest against big firms, but their highly leveraged 2008 gamble could either go well or not, and we believe it will continue to suffer. Their timing may prove too poor to rectify.

How It Fits Into *Pro*

Shorting 2% in what we hope is a Buzzard Bait stock will initially lower our net long exposure by the same percentage, but it's no guarantee that it'll improve our returns in a weak market. Only time will tell. That said, if the economy weakens, so should Caesars' business. We would look to close the short if Caesars meaningfully refinances its debt or can turn profitable again. Barring that, if the buzzards keep circling, we may hold out for a brutal end. We intend to build a basket of direct short positions over time, and this should be just one of several eventually.

Alternative Trades

- **January 2016 Synthetic Short:** We don't want to unnecessarily send you all into the same options, affecting pricing. If you're an advanced options investor, you can set up a 2016 synthetic short using any of strike prices you like. Sell calls, and buy puts at the same strike price, in equal amounts, to mirror shorting. You will start at a deficit to account for the fees of shorting. Keep your look-through allocation to 2%.
- **IRA Friendly?** You can't sell short or use synthetic shorts in an IRA, but you could set up bear put spreads.* Buy higher strike January 2016 puts, and sell to open an equal number of lower strike puts. Your profit potential is the difference between the strike prices, minus the cost to set up the trade. Only risk what you can afford to lose.

Pro Can Help

- Questions? Come on over, high roller, to the Caesars Entertainment board.

**An earlier version of this trade alert incorrectly said "bull put spreads." We regret the error.*

Q&A With William Thorndike, Author of The Outsiders

Published Sep 30, 2014 at 11:04AM

Joe Magyer, the advisor of Inside Value *and* Motley Fool Pro *in Australia, recently interviewed William Thorndike, author of* The Outsiders: Eight Unconventional CEOs and Their Radically Rational Blueprint for Success, *often hailed as the best investing book in years. They discussed what makes for a stellar CEO, which CEOs may be poised for outsize success now, and how investors can spot successes-in-the-making. Read on!*

JOE MAGYER:

Hi, Fools. This is Joe Magyer, and I'm here today with Will Thorndike, the founder of Housatonic Partners and the author of *The Outsiders*. *The Outsiders* is a book that all the cool investing kids are talking about, and in all seriousness, it's the best and most original investing book I've read in years.

Unlike most investing books that focus on either how to get rich quick or how to pick stocks, *The Outsiders* is more focused on a group of super successful, iconoclastic CEOs that delivered huge returns, not just over one, three, five years, but over a span of decades. And for a sense of the scale of research that went into this book, Will's team did more than 100 interviews and studied more than 1,000 company years' worth of financial data while researching this book. So, thanks very much for joining me and talking to us about the book today, Will.

WILLIAM THORNDIKE:

Thanks, Joe, for having me.

JOE MAGYER:

I appreciate your taking the time. I guess a logical place to start would be to talk about Henry Singleton — who the guy is and why he's the best CEO of the past century.

WILLIAM THORNDIKE:

Yes. Henry Singleton had a unique background for a CEO. He was trained as an engineer and scientist. He got his undergraduate degree, master's, and a Ph.D. from MIT in electrical engineering, and for his doctoral thesis, he programmed the first computer at MIT. He subsequently went on to develop a degaussing technology that allowed naval ships to avoid radar detection during the Second World War. He ended up working for one of the pioneering conglomerates in the 1950s, Litton Industries. While he was there, he developed an inertial guidance system that's still in use in military and commercial aircraft.

He was a super-talented engineer. When he was an undergraduate, he won something called the Putnam Medal, which is awarded to the top mathematician in the country. Later in his career, at the age of 43, he founded his own company, **Teledyne** (NYSE: TDY), which grew to be one of the most successful of the '60s-era conglomerates, and in running that business over almost 30 years, he generated exceptional returns: 20% compounded over 28 years.

It roughly doubled the rate of return for his conglomerate peers. In doing that, he developed a whole range of varied, unusual, idiosyncratic practices, including pioneering stock buybacks, never selling his stock, and doing a whole range of things that were unheard of at the time. He was a remarkable figure and the first in this series of chapters in the research project.

JOE MAGYER:

Why is it that despite what is an incredible track record, only a small group of investing nerds actually know who this guy is?

WILLIAM THORNDIKE:

Yes, it is remarkable. He is still relatively unknown. Part of that stemmed from his personality type. He disdained the limelight and was very reticent to spend time with the business press and with Wall Street analysts. In his day, he gave no earnings guidance. He never appeared in Wall Street sell-side conferences and that sort of thing. He preferred to stay apart and focus on building value in his company over time.

JOE MAGYER:

Yes. A pretty big contrast to the CEOs that most people could name.

WILLIAM THORNDIKE:

He would not have been on *Squawk Box*.

JOE MAGYER:

Yes. How did you go about choosing this group? Part of the reason I ask is I know the obvious answer might be the equity returns over a long time horizon, but you're careful to point out, early in the book, that you're focused on folks who were, through the different processes, citizens of Graham-and-Doddsville, and not ideally just being the levered-up survivors of a series of coin flips.

WILLIAM THORNDIKE:

Yes, that's right. Each of the CEOs had to meet two classes. There's an absolute returns test, which says they had to have better returns relative to the S&P over their tenure than Jack Welch had during his 20 years at **General Electric** (NYSE: GE) at the helm. And then they had to materially outperform their peer group.

And in looking at the specific actions that led to that higher performance, by definition, these CEOs were doing things very differently than their peers, but it turned out that the specific actions were remarkably similar across the group. They centered around things relating to capital allocation and more broadly resource allocation.

JOE MAGYER:

I see a lot of *Outsider* tools being used today. Share buybacks. All sorts of creative tax minimization or deferment. One thing I feel I don't see a lot of — but I'm curious about your thoughts on this — is a lot of the underlying principles that made some of these folks so successful. Two of the big ones that spring to mind are frugality and decentralization. Is that just because frugality isn't fun as a CEO?

WILLIAM THORNDIKE:

Yes, and I think those two things, honestly, go together. I think an ethos of frugality in a corporation — usually stemming from a CEO at the top — it infuses a culture and it naturally leads to a bias toward decentralization: the hallmark of decentralization being lean corporate headquarters staffing and often, relatedly, non-fancy corporate headquarters buildings.

I think that in corporate America, there is a natural tendency to want to grow your business. Have the business be bigger. More prestigious. Have a larger corporate headquarters building. Have it designed by a leading architect. Surround yourself by MBAs and generally engage in the behavior that's commonly associated with CEO-ness. This group pretty actively disdained that.

JOE MAGYER:

We have something I jokingly call the Lobby Test where we'll go into the office of a new company we're researching, and if there is a waterfront view from the lobby, we're immediately concerned about the cost management. And it's a surprising number of companies.

In contrast, we're invested in **Sky Network Television** (ASX: SKT), which is the dominant pay-TV company in New Zealand, and it's run by John Fellet, who formerly worked with John Malone. And when we went out to visit with them, we took a cab and keep driving and driving and driving.

We're out in the suburbs and we're surrounded by houses. I'm starting to get angry with the cabdriver. We finally stopped and turned into what looked like a driveway. It turns out Fellet built this office and these massive satellite dishes right out in suburbia, surrounded by homes sitting right next to these massive dishes.

WILLIAM THORNDIKE:

Oh, that's great. I love that. I have a similar story. I grew up around Boston. Of all the CEOs in the book, only one of them is from Boston. It's a guy named Dick Smith who ran a company called General Cinema. And when I grew up as a kid, I went to the movies at one of his movie theaters in a local suburban strip mall.

I went in and out of that movie theater probably 100 times in my youth, and I never realized that the nondescript door to a back office to the right of the theater I used to go to was actually the door to the corporate headquarters for General Cinema. And General Cinema, at that point in time — behind that nondescript door — was the headquarters for a company that controlled the largest **PepsiCo** (NYSE: PEP) bottler in the country, the Neiman Marcus legion of retail stores, and Harcourt Brace, the largest educational publisher in the U.S. The same thing — just extraordinarily nondescript was the headquarters. So, yes. I love that.

JOE MAGYER:

Who are the younger CEOs you see out there today who are succeeding with Outsider-style leadership and capital allocation?

WILLIAM THORNDIKE:

I think there are a number of CEOs who are currently following this path. It would include the Rales brothers of **Danaher** (NYSE: DHR) and **Colfax** (NYSE: CFX). Nick Howley of **TransDigm** (NYSE: TDG), which is a wonderful aviation components company that I know you guys are familiar with. The guy who runs a software company in Canada called **Constellation Software** (NASDAQOTH: CNSWF). The CEO's name is Mark Leonard.

I know you know a group of insurance companies that follow these sort of Buffett principles and are very close to this whole approach: **Markel** (NYSE: MKL) and **Fairfax** (NASDAQOTH: FRFHF) and **White Mountains** (NYSE: WTM). There's a home builder called **NVR** (NYSE: NVR). There's a reinsurance company called **Arch Re** (NASDAQ: ACGL). I recently came across a utility business called **Calpine** (NYSE: CPN) that's doing some interesting things. There are definitely current exemplars out there. We were following this to different degrees. It's been fun to watch that.

By the way, **Valeant Pharmaceuticals** (NYSE: VRX) is a really interesting case as to whether or not the CEO there, Mike Pearson, is an Outsider. Of course, being very much in the news with the **Allergan** (NYSE: AGN) bid.

JOE MAGYER:

One of the funny things about the style of management is that it's easy to look back at a single instance and say, "Well, this was clearly brilliant, and it clearly worked." But at the time, these guys were totally either ignored or they were ignoring other people. As you look at some of these, like the Valeant situation today, there are a lot of people who have strong opinions about whether or not its approach is working. I think you could look at other names like Jeff Bezos of **Amazon** (NASDAQ: AMZN), which a lot of value investors wouldn't consider, but there's a lot of Sam Walton and John Malone there.

I guess what I'm getting at is if you're in the moment of looking for the qualities that you have as an outsider CEO, how do everyday investors go about identifying those kinds of CEO leaders in the here and now? A lot of times they're off the grid or their style is so unconventional that they'd never show up on a screen and you wouldn't see them on television.

WILLIAM THORNDIKE:

That's a good question. And by the way, I do think that the current reaction to the Valeant-Allergan side and sort of the bear case is very similar to concerns that were heard across John Malone's entire career at TCI. There are very interesting similarities there, I think, to the reactions and concerns being raised.

I think, over time, you can assess a CEO's fit with this approach by their actions: by the acquisitions they make, by the stock repurchases. And I think over time what they do, ultimately, is sort of the key guide to whether or not they're following this approach and whether or not they're CEOs that you want to invest with. A marker of this that could be quite predictive is the way they describe — or they think about and describe — their business I think can be very revealing.

And specifically, if they have developed idiosyncratic metrics that they are optimizing the business around, I think that can be a very strong signal of the presence of this sort of worldview, specifically to the degree they're talking about the cash economics of the business as opposed to the broader accounting conventions and expressing those on a per-share basis. Those are the two key hallmarks, I think.

JOE MAGYER:

I love a good, clear, intrinsic value-oriented shareholder letter. They're few and far between, but they're nice to find.

WILLIAM THORNDIKE:

Yes, and I would agree with you. I think Bezos is a very interesting case. I think he is the most Outsider-like by a wide margin of the sort of visionary tech CEO. His letters are great reading and they are very revealing of a highly rational, analytical mind-set.

JOE MAGYER:

Well, as an Amazon shareholder, I love hearing your confirmation.

WILLIAM THORNDIKE:

Yes.

JOE MAGYER:

I have a screen that I run looking for Outsider companies. In a way, it's a waste of time, because the qualities that you're looking for don't as readily show up on the screen. I don't know if TCI would have shown up on the screen. But anyway, we're typically looking for something like shrinking share count and growth in book value per share, just as a rough guide. In the U.S., I'll find 200-plus names and that's great, but when I do the same screen in Australia, I get zero names.

It's not that there aren't any savvy capital allocators in Australia, just that different tax laws have a big impact on how companies go about returning cash to shareholders. Adding the local layer of complexity makes screening for Outsiders feel that much more futile. This all leads to my noticing that there are no international CEOs featured in the book. Was the difficulty in identifying some of these Outsiders who were successful locally but less known in the States part of the reason there weren't any international CEOs featured in the book?

WILLIAM THORNDIKE:

It's a good question, Joe. I would love to include an international name in the book. The reason that I didn't is just data availability. I worked with a group of HBS students in researching the book, and through them I had access to the incredible Baker Library of the Harvard Business School. Unfortunately, the databases there are heavily focused on the domestic U.S. market. So, I think it's something that would be a very interesting exercise. I do think there are examples internationally, and I also think these ideas are much less developed outside the U.S. So there's an even greater, longer-term opportunity over time. I think that's exciting.

JOE MAGYER:

Thinking about either an international version or a second edition where we might see an international name leader pop up, one group that springs to mind is 3G Capital. They've done amazing work with some of their acquisitions. Organic growth, cost cutting, incredibly smart use of leverage. I've really been impressed by those. I'm curious if you've spent any time studying 3G and have any thoughts on them.

WILLIAM THORNDIKE:

Yes. I have spent a little bit of time studying them, and I agree that they share these traits. They remind me a lot of, from the book, Capital Cities. I think there are some very interesting similarities there, and it will be interesting to see, over long periods of time, whether they add the share repurchase arrow to their quiver the way Capital Cities did. But I think they're a very interesting international example. Yes.

JOE MAGYER:

I'm curious. There are Buffett, Malone, and Stiritz who are also out there applying their trade. I'm curious. Do you have any money with the three of them?

WILLIAM THORNDIKE:

I own a bunch of the Malone entities and have for some time. Then I do own **Berkshire Hathaway** (NYSE: BRK-B) shares. I do not own any of Bill Stiritz's shares currently, although I have enormous regard for him. But two out of the three I do own actively.

JOE MAGYER:

Got you. Last one. I noticed in the epilogue that you thanked Charlie Munger for his early encouragement and insights. How much fun was it talking shop and old stories with Uncle Charlie?

WILLIAM THORNDIKE:

Oh, my gosh. That was great. Charlie Munger is such an amazing individual and unbelievably insightful. He was very supportive of this project from very early on. I spent a fair amount of time with him — all of the chapters where he had first-hand experience with the companies. That was really fun. And then after the book came out, I had a chance to breakfast with him in L.A. What a wonderful, gracious, and talented man. That was a really fun part of the project.

JOE MAGYER:

Well, going to the Berkshire meeting every year is a favorite pastime of mine, so I can only imagine sitting down with him. We'll call it there. Will, I really appreciate your taking the time, and I encourage everybody reading ... to simply check out the book. It's a wonderful read. It's the first investing book I nudge people to read these days. Thanks again, Will, and thanks everybody. ... Fool on!

WILLIAM THORNDIKE:

Thank you, Joe. Take care.

Bring Out Your Buzzard Bait!

Published Sep 29, 2014 at 3:56PM

Dear *Pro* member,

In the 1990s, David Gardner offered the term "Buzzard Bait" to describe the type of short-selling candidates we were hunting in the original *Rule Breakers* portfolio. These dismal creatures of Wall Street were stumbling over dusty, barren terrain while a committee of buzzards perched on dead branches overhead, just waiting for a thud on the earth and a last breath. The stocks we wanted to short were Buzzard Bait. The term and the shorting strategy have staying power, and today we're bringing them back to life in *Pro*!

What Is Buzzard Bait?

The biggest defining factor of a Buzzard Bait stock has always been its crippling debt load. We originally defined this as "lower current assets than current liabilities and long-term debt." Today, we'll quantify it further.

Other than that, we sought to sell short stocks (and buy them back later at a lower price to earn our profit) that carried enough market value and daily trading volume to be liquid; and, to give us better odds at success, stocks that sported relative strength of 10 or lower, putting them among the 10% of weakest equities on the market.

Let's add several more qualitative factors today, and refine the quantitative factors. Using the following criteria as guidelines, we seek stocks that we should be comfortable and happy to sell short for a profit when they or the market falls. In fact, I expect we'll recommend our first official Buzzard Bait shorts in *Pro* this week.

Buzzard Bait Qualities

To learn, invert. In a *Motley Fool Pro* core investment, we seek seven qualities: A sustainable competitive advantage; pricing power; significant recurring revenue (typically at least 30% of sales); increasing free cash flow; a strong balance sheet; expanding product possibilities; and a diverse customer base. In seeking a short, we want to get as close to the *opposite* of these qualities as possible:

- Little competitive advantage
- No pricing power
- Little or no recurring revenue
- Negative free cash flow
- A weak balance sheet
- Little optionality in the business
- A limited customer base
- Unattractive acquisitive value to other companies
- A dated brand or way of doing business
- Non-founder management who own little of the stock

Examples that might roll off your tongue could include **Sears Holdings** (NASDAQ: SHLD), which meets most guidelines above. However, given how many people are short that stock already (58% of the float is sold short), and that it lately costs 15% to 25% in annual fees to short it, it would not meet all of our next guidelines — some of which are aimed at protecting us against short squeezes:

Buzzard Bait Numbers

- Average daily dollar volume of at least $20 million
- Market capitalization value of at least $1 billion
- Shares short ratio no higher than 35%
- Increasing diluted shares outstanding the past three years
- Debt of at least 8 times cash, investments, and equivalents
- Total liabilities greater than total assets
- Interest expense that's 10% or more of revenue
- At least 350,000 shares available for shorting from Interactive Brokers
- A current annualized fee of 5% or less to short
- Relative strength (measured by *Investor's Business Daily*) of 15 or lower

Guidelines, Not Rules

The 20 criteria above won't typically *all* be met on any short, but the *more* met, the better. These are guidelines for finding hunched over, tongue-dragging businesses that we should be able to sell short and — the real test — be able to *stay* short through volatility. In the past, criteria less sweeping than these were used to successfully sell short Trump Hotels & Casino Resorts (which went bankrupt after we covered it), Sirius Satellite Radio (which we covered at a profit; it's now **Sirius XM** (NASDAQ: SIRI)), and Movie Gallery (which was shorted to bankruptcy), among others. What will be next on our list? Watch your inbox.

You Don't Need to Short

Before new short recommendations roll out in *Pro*, it's well worth repeating that *you don't need to short to be a successful investor* — just as you don't need to use options, either. You can succeed by owning Foolish long-term stocks alone, such as *Pro*'s core holdings. Those are a portfolio unto themselves. But for those who are comfortable shorting, we aim to populate the portfolio with a *basket* of shorts that net us profits as a whole. This basket will likely come to be dominated by Buzzard Bait shorts, along with others based on criteria we'll also spell out for you.

Pro Catch-Up Trades: Sept. 29, 2014

Published Sep 29, 2014 at 12:12PM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking, or on trades where price guidance was due for an update.*

- **Expeditors International** (NASDAQ: EXPD): You can complete your January 2016 $40 put, $40 call synthetic long for a net debit of $0.40 to $0.50 as of today. And then write (sell to open) a November 2014 strangle, selling $39 puts and $43 calls. Sell one of each November option for every synthetic long you set up. Now, you can accept a combined credit on the November strangle of $1.20. For more on this strategy, but with older pricing, please see our original alert.
- **Tupperware** (NYSE: TUP): Shares continue to decline, and remain a "Buy First" with a 3.2% allocation. We have the long term in mind (as always, rolling three years).

Pro Catch-Up Trade: Sept. 26, 2014

Published Sep 26, 2014 at 2:15PM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking, or on trades where price guidance was due for an update*.

- **Expeditors International** (NASDAQ: EXPD): You can complete your January 2016 $40 put, $40 call synthetic long for a net debit of $0.40 to $0.50 as of today. And then write (sell to open) a November 2014 strangle, selling $39 puts and $43 calls. Sell one of each November option for every synthetic long you set up and have not yet covered. Now, you can accept a credit on the strangle of $1.20 or higher. For more, but with older pricing, see our original alert.

A Note From Jeff About Pro's Monday Memo Emails

Published Sep 22, 2014 at 4:49PM

Dear *Pro* members,

You've probably noticed that your Foolish inbox has more color, photos, coverage, and links lately.

That's because our Monday Memo-branded email now includes everything we've published in *Pro* in the past week, including the analysis our team shares with you — day in and day out — on our discussion boards.

That's right, we're liberating our best boards analysis and publishing it simultaneously as articles on the *Pro* website. Sharing this analysis with you on the boards *as well as* in articles helps us also share it with you in our Monday Memo emails. It also helps us archive it for you, so you can easily find all of our thoughts about earnings or guidance changes, for example, in one place on our site.

As part of this archiving project, we're phasing out the phrase "Monday Memo" in our article headlines — because the Memo, as our Monday email communication with you, is much bigger than a single article ... it's *all* of them from the past week!

Overall, our Monday Memo emails aim to bring you more content from *Pro*, of greater variety, with a more timely than ever focus on investing.

We hope you enjoy them!

Foolish best,
Jeff (TMFFischer)

---

6 Points on the Pro Portfolio

Published Sep 22, 2014 at 4:21PM

Dear *Pro* member,

Briefly, I wanted to share a few quick thoughts about where our portfolio stands today and how we want to direct it in the future:

- We've done well this year so far, despite none of our hedges helping us. Expirations have irked us, coming up just before bigger market moves like Monday's.
- We've done well since inception, despite being more cautious than most, as we're only about 70% net long. (Well, short-sighted hedge funds aside, which were *very* cautiously buying gold while great businesses had cash flow yields of 7% and higher — ouch!).
- Our returns as of August 31 are 14.1% annualized, while the North Star (which is going to be more relevant when the stock market goes nowhere or down) is up 8.6% annualized.
- We don't want to be greedy and don't want to chase prices that look risky, where those exist.
- In sum, we want to hedge and short more, and leave our longs — that we really like — alone to keep growing over time.
- We want to be really comfortable with our direct shorts and to hedge in a way that doesn't drag on our returns much (or at all, where possible).

So, we need to get to our shorts and hedges now. We've been working on shorts for a long time (and prices are starting to suggest more shorting now), and we've hedged all year (except for now, as our last one just rolled off; we seek a new one).

Finally, regarding our core investments: We always do this, but the last quarter of the year is a good time to go through our positions one by one and make sure we're 100% committed to each. We'll consider whether we want to sell any by year-end for any reason.

Fool on!
-Jeff (TMFFischer)

Five Below's Lukewarm Quarter

Published Sep 22, 2014 at 2:36PM

It was a bit of a ho-hum quarter for **Five Below** (NASDAQ: FIVE). Before Monday's sell-off, the stock was essentially flat compared with where it closed before earnings, and this wasn't all that surprising — the good didn't make us want to run for the hills, while the bad didn't leave us itching to double down on our short position. Let's take a look as some of the notable aspects, shall we?

Stores and Distribution

- Opened 30 in this quarter (49 in the first half of the year) and still targeting 62 stores for the year
- Eight stores were in Houston (a new market), "very strong, similar to Dallas and Houston"
  - Now 26 stores in Texas; still targeting 100 in total
- Signed a lease to build for a new Northeast distribution center
  - 700,000 square feet initially, could be up to 1 million; the location is close to the current center

  - $4 million of the estimated $20 million will be spent in 2014
  - The company's two new facilities together should be able to support about 750 stores

Inventory

- Total inventory on a per-store basis was essentially flat year over year (YoY) and quarter over quarter (QoQ)
- Days inventory outstanding ticked down slightly (1 day) on a YoY basis and fell six days QoQ
- Inventory/total assets was also down YoY and QoQ, though this is still high compared with others in the space
- Management expects inventory on a per-store basis to increase in the double-digit range next quarter

Performance

- 3.2% comparable-store sales growth was driven by the number of transactions (as is almost always the case for Five Below)
  - Weakness was concentrated at the start of the quarter and got better in June and July
  - Comp drivers were sports, games, and technology items
- Forecasting for flat to slightly positive comps for the third quarter compared with 9% comps last year
  - Still forecasting for 4% comps for the year, so that calls for 5% to 6% comps in the fourth quarter on the back of 0.3% in 2013
- The performance of the company's new stores was the reason behind the raise in top-line guidance
- Net sales increased 30.2%, to $152.5 million; adjusted operating income rose 37%, to $13.3 million; and EPS came in at $0.15 — all of which were essentially in line with estimates

A Few Notable Q&A Responses From the Conference Call Q&A

(Head over to our FIVE board to see them all.)

Q: How did the comps trend during the quarter, and why it was weaker than expected?

A: I think part of it we actually planned summer conservatively not aggressively. And if you recall last year, not that I want to go that far back, but with some of the weather issues, etc. that we had coming out of last year, I think its fair to say we planned parts of our summer business a bit conservative.

Q: Why won't the company disclose more about segment variability?

A: Here is what I'd say as far as really being very consistent about our message. We have in the past and we will continue to have variability among category; that's a good thing. This flexibility around the eight category worlds is what makes us special. So when one underperforms, the other steps in because it could be a preference that the kids are choosing to make. It could be product that's changing, and I think it's what speaks to the consistency and performance as you've seen over the last 33 quarters. ... But I will tell you there is nothing that I see in the overall mix of a business and the category/world performances that I'd say is in anyway inconsistent with our performance in the past or that I see anything that I'd conclude or draw a conclusion against future performance. That I think is something we really need to make sure, and really, I welcome your suggestion, because that's part of the reason why I choose at times not to comment on categories because I think it actually may confuse the issue. We love when our customers shift, because that tells us that today's category that maybe is underperforming is a great opportunity the next time the customer comes in or maybe even next year. And trends don't happen in specific categories. They change all the time, and it's that variety of offering, that excitement, and the breadth of offering that gives us the leverage and the engagement that we have with our customer, which drives consistent traffic and drives performance through transactions and traffic.

Q: Regarding store density ...

A: In every one of our states that we were in, we believe there is densification opportunity. Pennsylvania was the first state that we were in. We continue to densify that market still and we will be doing that. I think there is an opportunity to densify across all markets and we really don't get what I'm going to be report a breakout numbers externally, but identification opportunity by market we have the numbers out there and still a potential over the long haul in the 2000 range.

Q: Will the new distribution facility accelerate growth?

A: I will tell you our growth to date I think has served us really well. It's been aggressive enough that we really have, I think, delivered a very good return for our shareholders, for customers that look toward to have more stores in the marketplace. Will there be capacity in the distribution center to handle more stores? Absolutely, and that's why we're building it. I think for now, though, our goal is to continue to manage our growth in the way that we have to date. To continue to manage our performance, remember we could open more stores if we chose to, even to date.

The Foolish Bottom Line

So where does this all leave us? First and foremost this gives me and Jeff more time to take an even deeper dive into the company and its competitive positioning. Extra time is always nice.

Because we're dealing with a high beta stock, the road forward could get quite bumpy. But it's important to try to identify which bumps are because of company fundamentals versus the market movements or investor sentiment. Fundamentals and sentiment have to line up in the long run, but they often become unhinged at various points. That being said, we're always on the lookout for an attractive way to hedge our position because it would be (lowercase "f") foolish to end up in a situation in which we're forced to cover early at a loss because of market sentiment when the fundamentals are really starting to deteriorate.

Sell to Close Your Long Puts on IWM

Published Sep 17, 2014 at 2:01PM

Is this for you? *Pro* members who *own* September 2014 $115 puts (or other strikes, if you deviated) on the **iShares Russell 2000** (NYSEMKT: IWM) ETF should consider this closing trade by sometime Friday.

How You Participate

- **Trade:** Sell to close your Sept. 20, 2014, $115 puts. (We're letting our $105 puts expire, doing nothing with those.)
- **Price Guidance:** With expiration nigh, take what the market is paying thee by Friday.

- **Recent Prices:** IWM, $114.86; September 2014 $115 puts (bid/ask): $0.80/$0.81.
- **Stock-Equivalent Rating:** Short IWM (as a hedge).

What We're Thinking

As luck would have it, the Russell 2000 ETF is flirting with our $115 strike price as expiration approaches Friday after the market closes. This means the puts we own as a hedge are right at-the-money, and their value is fluctuating considerably as IWM shares bounce above and below $115. This will continue into Friday unless IWM makes a decisive move in either direction.

Should shares of IWM decline sharply, our puts will balloon some in value, replacing their current time value with intrinsic value. Should IWM appreciate and stay above $115, our puts will deflate and ultimately end without value. In the teeth of this uncertainty, all we can really say is: Sell to close these puts for what you can get before expiration, whether you opt to do so today, tomorrow, or Friday.

Two things to keep in mind:

If Scotland votes tomorrow to leave the U.K. on the dance floor all by itself, markets may trip down the stairs on Thursday and possibly Friday. *Pro* personally can't close these puts until 24 hours after this alert goes out, so the Scots' decision will be out by then. If there's a negative surprise, our puts should benefit. If you want to wait and see, wait a day, too.

Second, we're simply letting our short $105 puts expire. However, once you sell your $115 puts, the $105 puts we wrote as part of this spread are no longer "covered," and should IWM decline nearly 10% to below $105, those puts will start to show a loss and become an obligation to buy shares of IWM unless you close them. The odds of the index falling 10% in a few days appears low — but you never do know, do you? So, it may make sense to only sell your $115 puts on Friday, when all is clear, even if that means collecting less for them. Or, use a spread order and buy to close the $105 puts for pennies (just to be safe) when you sell to close your $115 puts.

How It Fits Into *Pro*

You don't need to hedge or sell short to succeed in the stock market over the years (quite the contrary, if you have the resolve to stay invested and buy more during large drops). *Pro* has an absolute-returns goal, though, so it's important that we manage our market exposure. If we're 100% long, we enjoy few to no advantages when the market declines. Given this, we are seeking new hedges (and direct shorts) to keep the portfolio both long *and* short, giving us the resultant market exposure we desire at the time. This is an ongoing work in progress, as always. As this hedge expires, we're on the heels of another one, which will be announced as soon as decided.

Alternative Trades

- **Shorting IWM directly?** Most brokers do *not* have shares of IWM available for shorting, but If you're short IWM, you could choose to stay short as your hedge. We are very likely to use IWM (or its options) in our next hedge, too, and that should be soon.
- **Used different strikes?** You should still sell to close your long IWM puts by Friday, to capture any value they offer.
- **Used later expiration months?** Let the hedge ride as long as you're fine keeping it.

Pro Can Help

Monday Memo: Reviewing Pro's TD Ameritrade Position

Published Sep 15, 2014 at 3:55PM

This Memo is long and involved, but we love this sort of stuff at Pro, and we know you do, too. But if you don't want to read — really, study *— this whole detailed update on TD Ameritrade, then just know that our thesis remains in place, our Fair Value estimate remains $34, and the Earth continues to spin. Now, into the breach we go!*

Dear *Pro* Fools,

After picking up coverage of **TD Ameritrade** (NYSE: AMTD) from Jeff a few months back, I wanted to take some time to familiarize myself with the business and learn its key value drivers. Now that two quarters have passed and I've spent quite a bit of time researching the company, I'm finally at a point where I'm comfortable with the valuation framework that helps guide our Fair Value estimate and Consider Adding More price. I'll use this article to talk about TD Ameritrade's business model, the valuation framework and its key inputs, and thoughts on how I see this position going forward.

The Business

Jeff summed it up well in our original buy report last year:

"Entrusted with $517 billion in assets from retail investors and registered investment advisors (RIAs), discount broker TD Ameritrade hosts 378,000 stock, options, and futures trades on an average day. ... At the same time, TD Ameritrade's partnership with **TD Bank** (NYSE: TD) (which owns 45% of the company) gives it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below-average risk to boot. So, when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: Grow client assets, and launch more investment products."

TD Ameritrade now has over $665 billion in client assets, trading activity has picked up (average trades per day over the last year is about 425,000), and the company continues to pile up interest rate-sensitive assets (up to $94 billion from $88 billion last year) that will boost revenue and earnings once interest rates rise. Along the way, the TD Ameritrade increased its regular quarterly dividend by 33% to $0.12 per share, and used excess cash to pay a $0.50 special dividend at the end of fiscal 2013. The increased trading activity along with higher client asset balances have fueled solid revenue and profit growth, with a current revenue run rate of $3.1 billion for FY 2014 vs. $2.8 billion in FY 2013 (about 11% growth). The company now boasts an EPS run rate of $1.41 per share for FY 2014 vs. $1.26 per share in FY 2013 (around 12% growth). This business performance has led to the market bidding up TD Ameritrade's shares over the last year, with the stock price over $33, compared to $25.60 when *Pro* first issued our buy alert last year (good for a 29% absolute price return, not including the $1.07 per share in regular and special dividends we've received).

How TD Ameritrade Makes Money

TD Ameritrade has three main revenue drivers. The first is transaction-based revenue, primarily consisting of commissions and clearing fees on trades. The second is spread-based revenue, which is driven by interest earned on client margin balances, securities lending and borrowing, and insured deposit accounts. This is the portion of revenue that's sensitive to interest rate changes — more on that later. The third driver is fee-based revenue, which is based upon fees earned on company investment products. These three revenue sources make up about 95% to 99% of TD Ameritrade's revenue. Here's the revenue breakout over the last few years, and then I'll dive into each one individually (fiscal year 2014 is year to date, and numbers are as a percentage of total revenue).

	FY 2014	FY 2013	FY 2012	FY 2011	FY 2010
Transaction-Based Revenue	44%	42%	41%	44%	47%
Spread-Based Revenue	44%	46%	43%	45%	43%
Fee-Based Revenue	10%	9%	7%	6%	5%

Source: Company filings.

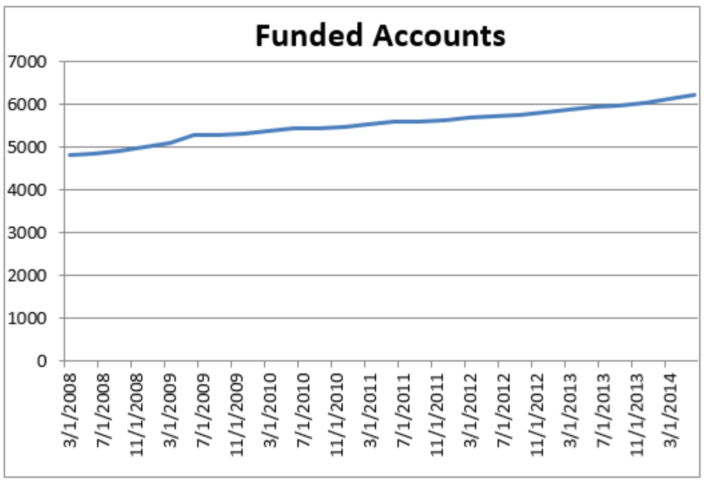
Transaction-Based Revenue

There are three major components that go into transaction-based revenue: the number of funded accounts (open client accounts with a liquidation value greater than zero), trades per funded account, and average commissions and fees per trade. When you multiply those together, you get total transaction-based revenue. Here's what it looks like for the most recent quarter (June quarter for fiscal 2014):

- Funded accounts: 6.24 million
- Trades per funded account: 4.05
- Average commissions and fees per trade: $12.55

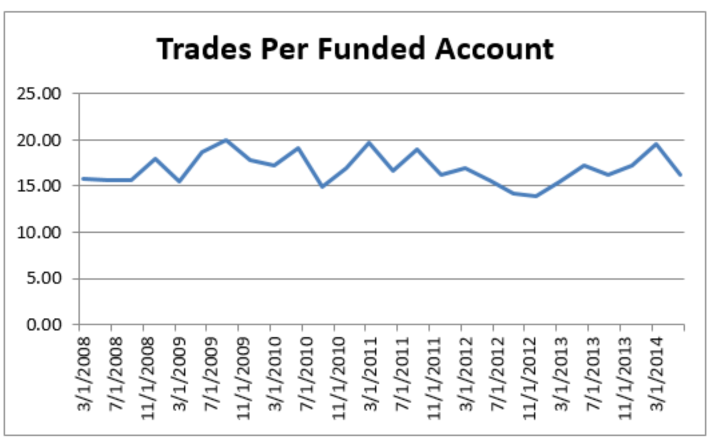
6,240,000 x 4.05 x $12.55 = $317 million

Each component of transaction-based revenue has followed its own trend over time. Funded accounts have grown steadily as TD Ameritrade has continued to attract new customers and retain assets:



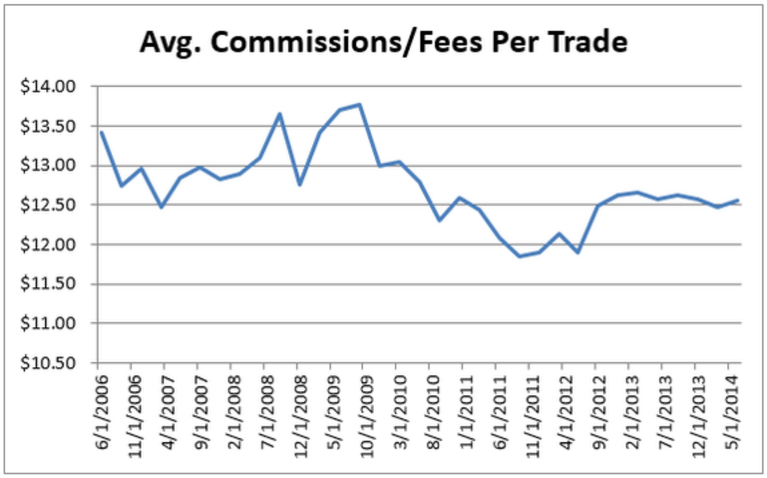
Source: Company filings (numbers in thousands).

Trades per funded account has fluctuated between 15-20 trades (this number is annualized — multiplied by 4 —compared to the quarterly number used in the above example) as investor activity has waxed and waned:



Source: Company filings and analyst calculations.

And average commissions and fees per trade has declined since 2006 as low-cost discount brokers have competed on price, but this has recently stabilized as higher-fee derivatives trading has become a larger portion of trading activity and broker consolidation has mitigated pricing pressure:



Source: Company filings and analyst calculations.

Spread-Based Revenue

This interest-rate-sensitive portion of revenue generation is a bit more complicated than transaction-based revenue. There are two sources of spread-based revenue: interest-earning assets (or IEAs) and insured deposit accounts (or IDAs). The revenue from these sources, taken together, is TD Ameritrade's total spread-based revenue.

Interest-Earning Assets

IEAs consist primarily of client margin balances, regulation-mandated segregated cash, and securities borrowing/lending balances. The predominant source of IEA revenue is client margin interest. If you've ever borrowed money from your broker and bought stock on margin, then you've paid margin interest. In the most recent quarter, client margin interest accounted for about 70% of IEA revenue.

The revenue from IEAs depends on the total balance of the IEAs and the interest yield on that balance. Both of those sources are variable. When bullish sentiment predominates, investors tend to borrow more on margin, which boosts the IEA balance. And the interest yield on IEAs depends on the interest rate environment — when rates are low, the yield is lower, and when rates rise, the yield is higher.

The total revenue earned on IEAs is calculated as follows (numbers from most recent quarter):

Average IEA balance ($18.8 billion) x IEA quarterly yield (0.73%) = IEA revenue ($149 million)

Insured Deposit Accounts

The IDAs are where TD Ameritrade's relationship with TD Bank comes into play. Under the IDA agreement (which can be read here for those who enjoy finance jargon), TD Ameritrade funnels client cash balances to TD Bank and receives an interest-rate-dependent "marketing fee" in return. Generally, the higher interest rates go, the more money TD Ameritrade earns on its IDA assets. The IDA agreement is a win-win for all parties — TD Ameritrade earns low-risk IDA fees on client cash balances, clients have their cash held by an FDIC-insured bank, and TD Bank receives a low-cost source of funds.

The total revenue earned on IDAs is calculated as follows (the numbers are from most recent quarter):

Average IDA balance ($72.4 billion) x IDA annualized yield (0.28%) = IDA revenue $202 million

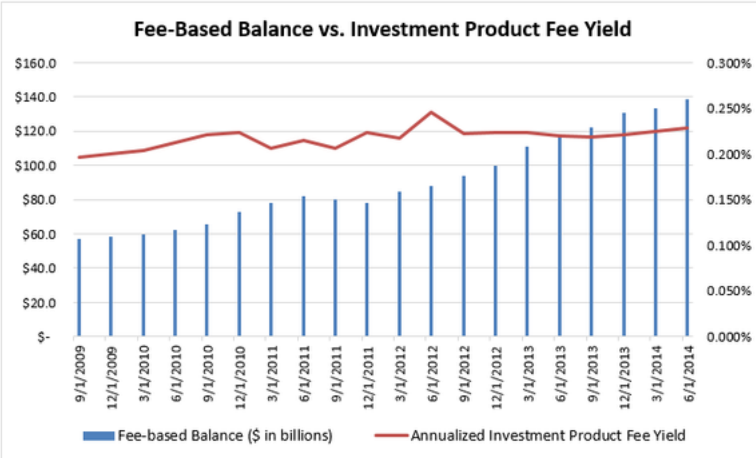
Spread-Based Revenue and Net Interest Margin

Putting it all together, when you combine IEA revenue with IDA revenue, you get the total interest rate-sensitive portion of TD Ameritrade's revenue, or spread-based Revenue. Then, when you blend together the yields on the IEAs and the IDAs, you get a metric called net interest margin, or NIM. When interest rates are higher, NIM is higher. You can calculate NIM as follows (again, numbers from the most recent quarter):

Spread-based revenue ($351 million) / Average spread-based balance ($91.2 billion) = Net interest margin, quarterly (0.385%)

Fee-Based Revenue

The third method of revenue generation is through fees earned on money market mutual funds, other mutual funds, and through company investment products such as AdvisorDirect and Amerivest. Fee-based revenue depends on fee-based investment balances and investment product fee yield. TD Ameritrade has done a good job growing this segment of the business recently, as the average fee-based balance (blue bars in the chart) has increased from less than $60 billion in late 2009 to more than $135 billion today (almost 20% annualized growth), while the average fee yield (red line in the chart) has grown slightly:

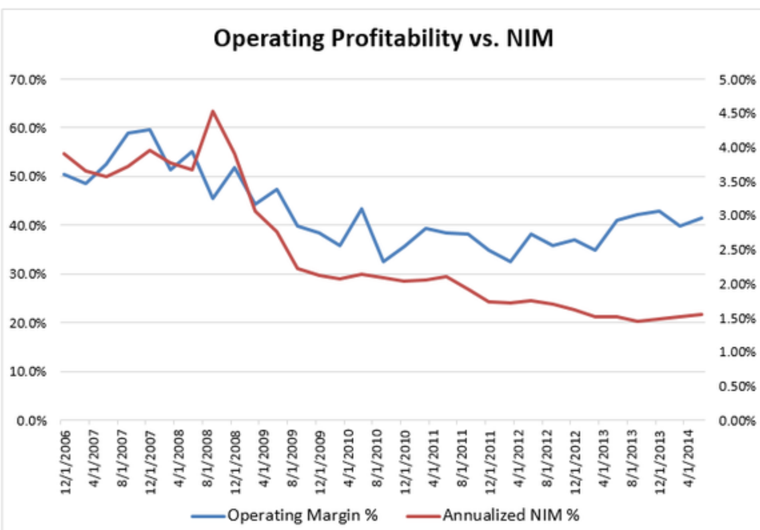


Source: Company filings and analyst calculations.

Valuation

Now, let's talk valuation. Once you understand TD Ameritrade's revenue drivers, coming up with a valuation model isn't terribly difficult, since the company's cost structure is relatively fixed and predictable. We like to say companies like these exhibit operating leverage, and TD Ameritrade is a good example. As revenue increases, costs increase at a slower rate and the company becomes more profitable. Conversely, when revenue decreases, costs stay the same or increase, and the company becomes less profitable.

This is where TD Ameritrade's interest-rate sensitivity comes in. Since the company incurs no incremental expenses in collecting interest from clients and from its IDAs with TD Bank, any growth in spread-based revenue is virtually 100% profit. And since TD Ameritrade's NIM (and thus spread-based revenue) grows quickly when interest rates rise, operating leverage starts to kick in and the company becomes much more profitable. Take a look at TD Ameritrade's operating profitability compared to its NIM since 2007:



Source: Company filings and analyst calculations.

There is a clear relationship between the NIM and profitability. When interest rates are high, TD Ameritrade's NIM is elevated, and its profitability grows. TD Ameritrade achieved peak operating margins of nearly 60% in late 2007, when short-term interest rates hovered between 3% to 5%. When short-term rates fell off a cliff to the current near-zero interest rate environment, NIM fell and operating margins followed suit.

Given the historically low interest rate environment, our investment thesis depends on rising interest rates. As Jeff wrote in our original buy alert, "TD Ameritrade's earnings are very likely at a cyclical low. Believing as we do that the company's profit potential is much greater than recent results suggest, the stock is a compelling buy in anticipation of higher interest rates."

Our valuation model's main assumptions (base case):

- NIM grows from the current 1.54% to a peak of nearly 3% in 2017 as rates rise and then declines to 2% in perpetuity (for context, TD Ameritrade's peak NIM was 4.5% in 2008).
- Operating margins expand from the current 44% to nearly 55% in 10 years (peak operating margins were 60% in 2007).

A 10.5% cost of capital and a 2.5% terminal growth rate in free cash flow gets us to a valuation of $34 per share.

Including some sensitivity analysis, if we assume rates never rise and NIM stays permanently at current levels near 1.5%, all else equal, I get a valuation of nearly $25 per share (which is, not coincidentally, our Consider Adding More price). And finally, if we assume that NIM steadily climbs to 4% over 10 years, then I get a valuation of more than $50 per share. The main lever with this investment is interest rates, and that's the metric we should be watching with respect to our long-term investment thesis.

Of course, as investors, we know the futility of false precision and we can't expect the financials to play out exactly as we assume in our models. But as Jeff likes to say, it's better to be generally right than precisely wrong. So long as the most important variable plays out as we expect (that rates will eventually rise and unlock TD

Ameritrade's latent earnings power), we should be amply rewarded. In the meanwhile, we're happy to patiently benefit from owning a highly profitable, well-managed business that rewards shareholders with regular and special dividends and stock buybacks.

The *Pro* Bottom Line

TD Ameritrade is an interesting component of the *Pro* portfolio. Given the company's interest-rate sensitivity and revenue/earnings volatility, it's a bit of an odd duck among our portfolio of predictable, compounding-machine-like [core stocks](). Nonetheless, in owning TD Ameritrade, we gain exposure to a profitable, shareholder-friendly company that benefits disproportionately from rising interest rates.

If you have any questions, stop by the [TD Ameritrade board]().

Fool on!

Pro Catch-Up Trades and Expirations: Sept. 15, 2014

Published Sep 15, 2014 at 11:39AM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking*.

Pro Catch-Up Trades

- **Expeditors International** (NASDAQ: EXPD): We have filled half of our position and continue to target a $0.70 debit or lower, as guided, to set up the rest of our synthetic long. Once we have the rest of the synthetic long in place, we'll sell a strangle on it at the going strangle prices.

Pro September 2014 Expirations

- **Five Below** (NASDAQ: FIVE): Our protective $45 calls are on track to expire without value, with the stock lately at $43. Owners are able to sell for a nominal amount, and should do so if they wish — if it's deemed worthwhile. It appears unlikely, but Five Below's stock could still climb above $45 by Friday. Anything is possible.
- **iShares Russell 2000** (NYSEMKT: IWM): Our put ratio spread expires Friday; right now, our long $115 puts are in the money and have some value. We'll issue a trade alert this week to close and very likely guide to set up a new hedge right on its heels.

Pro Live Chat, September 2014

Apple Unveils a Bigger Phone, a Watch, and a Payment System

Published Sep 9, 2014 at 5:14PM

I'm sure you've heard plenty about what **Apple** (NASDAQ: AAPL) announced at its release event today, so I'll keep this brief. In short, the iPhone got bigger, the iWatch is real and isn't called the iWatch, and a digital payment service will be available.

iPhone

The iPhone 6 and 6 Plus, as they're called, will have a 4.7- and 5.5-inch screen, respectively. The smaller screen is a 0.7 inch-increase from the existing 5S model. The larger exceeds the Galaxy S5 by 0.4 inches. In addition, the phones will offer improved battery life, camera performance, and display.

Apple Watch

The anticipation for a new product has been relieved by a smart watch. The Apple Watch will allow users to communicate directly from their device and comes in various versions, including 18-karat gold. It will also act as a fitness device. Consumers will have to wait until early 2015 to get their hands (err, wrists) on the watch, which is expected to start at $349. Customers will also need an iPhone (5 or newer) for the watch to work.

Apple Pay

This is Apple's first attempt at a mobile payment platform that could displace the traditional credit or debit card using magnetic strip technology. The payment platform will work on near-field communication technology, which lets a device send a radio signal to a receiver. The service will be able to store credit cards from all the major processing companies. Each transaction is said to be encrypted and secure — an extremely important factor the company will have to ensure. Several major merchants will be able to accept payment via Apple's digital wallet, and the service will be compatible with several apps that are used to accept payment. Each transaction will generate a small fee for Apple, so volume will be the key metric to follow.

The Foolish Bottom Line

I'll start by saying the watch doesn't excite me all that much — especially at $350. However, this is Apple's first advance into wearable technology, so we'll see where this takes the company. We will know more when this thing hits the market and customers can provide their feedback. As for the iPhone, increasing the screen size was a necessary move. I'm a fan of the two sizes, too. The fact is some smartphone users want a bigger screen, and despite the value of Apple's ecosystem, some moved to competing products. With this model, Apple has introduced an opportunity to keep customers who may have been on the fence about screen size — and to win back customers who may have moved along because of the screen. This is a solid move that could help drive market-share gains. I'd also say this slightly extends the phone's market opportunity to those who will only purchase devices with larger screens.

Apple Pay is exciting — if they get it right. This could be a completely new source of revenue for the company. Merchant adoption will be important, but the company has announced that 220,000 can already accept payment, including several big names like Macy's (NYSE: M) and **McDonald's** (NYSE: MCD). Consumers are different, and Apple will have to convince them the process is simple and secure. We are all very accustomed to swiping our cards for payment, and change can be difficult. I see this being a solid opportunity, but they've got to get it right.

Buy Protective Calls on Your Five Below Short

Published Sep 9, 2014 at 11:00AM

Is this for you? This trade is only for members who have a direct short position on shares on **Five Below** (NASDAQ: FIVE). All others should ignore this recommendation, or bring your questions to the Five Below board.

How You Participate

- **Trade:** Buy to open September 2014 $45 calls.
- **Allocation:** Buy one call for every 100 shares of FIVE that you're short; if you're short less than 100 shares, buy one call, assuming you're fine with the $95 cost.
- **Price Guidance:** Initially, use a limit order of $0.95 or lower. If necessary, we'll pay more to trade by Wednesday's close.
- **Recent Prices:** Stock: $42; September $45 calls (bid/ask): $0.90/$1.05
- **Special Notice:** Five Below reports earnings after market close on Wednesday, Sept. 10, so we want to buy this protection before then.

What We're Thinking

Change can be good, sure -- but when it works against us, it's like sand in our water glass. Five Below has been kicking up sand almost since the day we shorted shares in July, with two big events conspiring to drive its stock price higher.

First, **Dollar Tree** (NASDAQ: DLTR) and **Dollar General** (NYSE: DG) have escalated a bidding war to acquire **Family Dollar** (NYSE: FDO). Despite lacking the word "dollar" in its name, Five Below operates in the same low-cost arena (its goods are all priced at $5 or less), so it has been caught up in the news cycle that goes something like this: "If Dollar General is willing to pay $9.1 billion for Family Dollar, what might Five Below be worth?" That's enough to push a stock price higher in a bull market.

Second, Five Below has typically benefited -- as you would imagine -- when shopping center sales increase, and recent reports suggest shoppers are starting to loosen their purse strings. Same-store sales for retail in general grew 4.5% in August, based on the Thomson Reuters index. Discount retailers saw a 6.8% increase, and although teen retailer sales climbed a measly 1.7% in August, Five Below has lately experienced leveraged results above the general trend. That may suggest the company will meet its 3% to 4% guidance for the quarter.

July and August are important months, too, because students are out of school, presumably free to shop, and there are back-to-school sales. Of course, we don't know if Five Below will report pleasing results Wednesday night, but we can cap our risk on the short today and still be positioned to benefit if the company disappoints. Given our 18% loss so far on this volatile, highly shorted IPO, being defensive ahead of results makes sense.

How This Fits Into *Pro*

This small, direct short position entered the *Pro* portfolio with a longer-term thesis. We believe the stock price is rich, competition is growing, and there are some red flags among management and the financials. Additionally, Five Below represents our desired start to build a portfolio of direct shorts to hedge our longs.

However, we're entering a pivotal near-term point for the Five Below bear thesis already, and we're not interested in suffering a ballooning loss. If Five Below reports strong results and healthy guidance on Wednesday, the giddy holiday season isn't far away, and investors may already start to lick their lips in anticipation. Rather than see if that happens and be forced to make a tough decision at a potentially much higher share price after earnings, we'll set up our defense ahead of time and give ourselves more than a week after earnings to decide our next move. The money we'll spend to cap our risk is about 0.04% of the portfolio.

More That Matters

- **Maximum Loss:** On this trade, we only risk what we pay to buy the calls, which end without value if FIVE remains below $45. We also risk further losses in our FIVE short, up to $45.
- **Maximum Gain:** These calls will go up along with FIVE shares, capping our risk at $45 plus our cost to buy them.
- **Follow-Up:** After earnings, we'll decide whether to use our calls to cover our short if FIVE is above $45, or if we want to keep our short (and perhaps hedge it again) if shares remain below $45.

Alternative Trades

- **None.**

Is this the #1 stock across the entire Motley Fool universe right now?

Published Sep 8, 2014 at 2:53PM

Motley Fool co-founder David Gardner has recommended this stock three times in *Rule Breakers*... and his *Supernova* team has even put our company's own money behind it for their Odyssey 1 mission.

Meanwhile, former hedge fund manager Ron Gross has over $75,000 invested in it for *Million Dollar Portfolio* — and recently named it a "Buy First" stock.

But that's nothing compared to our Chief Digital Officer, Jeremy Phillips — who's so blown away by this company's "triple threat" business model that he's personally scooped up $117,238 worth of shares over the past few years.

And not only has Motley Fool co-founder and CEO Tom Gardner recommended this stock to *Stock Advisor* members and bought shares for the Everlasting Portfolio he runs inside our premier, all-access *Motley Fool ONE* service on *four separate occasions*, **but it's actually his *second-largest personal stock holding*.**

In fact, Tom and Jeremy recently sat down to discuss what's got everyone here at Fool HQ so excited about this stock, and as a *Motley Fool Pro* member you're cordially invited to listen in on everything they had to say (simply click the image below to watch their brief "executive summary" now).

Better yet, Tom Gardner and his *Motley Fool ONE* team have offered to give loyal *Motley Fool Pro* members like you access to *an entire week's worth* of in-depth coverage on this stock (and two of Tom's other top holdings) — *at absolutely no cost to you*. All they ask in return is that you simply follow this link and answer a few quick questions.

Cows Are More Expensive Now, Too

Published Sep 8, 2014 at 2:16PM

Pro Guidance Changes

- **AmTrust Financial Services** (NASDAQ: AFSI): Our fair value estimate increases to $40, while the stock remains a Buy. We have a 6.5% allocation.
- **Broadridge Financial Services** (NYSE: BR): Our fair value estimate increases to $43; shares remain a Buy with a 4.2% allocation.
- **O'Reilly Automotive** (NASDAQ: ORLY): Our fair value estimate increases to $140, and the stock remains at a Buy at a 3.6% allocation.

Dear *Pro* member:

Whether it's the worst moment of your 2-week vacation (say, dropping your iPhone in the ocean), or the best moment of your wedding day (that first magical glimpse of the bride... or groom), it's life's highs and lows that often burn into our brains, creating reference points. But one place where giving weight to extremes makes little sense is the stock market. Here, we're not dealing with a living being or a story with a beginning, middle, and end; the stock market is simply a place for buyers and sellers to set prices and make an exchange. Over its history, the market has been incredibly predictable if you merely broaden your scope, climbing steadily over many decades as GDP and earnings have grown.

The market has no end in sight, so referencing market prices -- let alone the extremes --- of yesteryear is nearly as relevant as quoting the price of milk in 1995 to your local grocer. So much has changed; even the cows themselves cost more than they did back then. On a much grander scale, the same is true with the stock market. In the year 2000, **Johnson & Johnson** (NYSE: JNJ) earned $5.2 billion in free cash flow. Over the past 12 months, it has earned $15.8 billion. Of course the business is more valuable today, and unless free cash flow dwindles, why would the stock return to earlier levels?

A Heavy Anchor

In today's market commentary, many are keen on measuring how much stocks have gone up since the March 2009 low, exclaiming we're due for a large drop as a consequence. The intraday market low on March 6 five years ago drums up the most dramatic number the media can use, but never do you hear the context surrounding it. During this time, the S&P 500's earnings were taking a massive nosedive, from nearly $100 per share to less than $15 per share, mainly because financial companies suffered giant losses. The S&P 500 is up 200% since hitting 667 in March 2009, but earnings are up much more, now above $100 per share.

Sensationalism aside, why measure returns from the panic-driven low, as if that capitulation by unfortunate sellers should limit the market's ascent to follow? After all, if you dial back to Sept. 5, 2007, the S&P 500 is up just 36% in the past seven years, well less than average.

Let's play more silly number games.

If you go back to the tumultuous start of this millennium, measuring from Jan. 3, 2000, the S&P 500 is only up 38% in the past 14 years. On this argument, we should be ready for a giant rally!

Or should we? That 38% gain neatly mirrors how much U.S. GDP has grown since the end of 1999: We've seen 30% U.S. GDP growth from 1999 to 2013 (inflation adjusted, using 2009 dollars), and the S&P 500 is 38% more valuable over the same period. The S&P's advantage likely comes from additional international growth and improving margins -- or simply from reinvested dividends.

At any rate, those who are anchoring to March 2009 are on pins and needles waiting for a market decline. In fact, many have not invested at all. And they're right in one sense. We will see a market drop, and odds are, soon. Anytime. But "anytime" could end up being next month, next year, or two years from now. And from what price level to what new price level, we don't know -- but it's hard to suggest another tech implosion like we had in 2000, or a financial debacle like in 2008, when average earnings plummeted. Still, it's easy to be edgy after witnessing 2000 and 2008, and because we live in a world of hyper news.

Valuations Today

So let's rationally step back and look at valuations today. The S&P 500 index trades at 17 times "normalized" expected earnings for this year, and 15.6 times expected 2015 earnings; it yields 1.9%; by comparison, the 10-year treasury yields 2.5%. The index's P/E has enjoyed a long-term average of 14 to 16 since 1900, depending on how you measure it. It has averaged slightly higher during "modern history" (itself an oxymoron, but I digress). In other words, the valuation of the index based on expected 2014 results is not much different from its long-term average. Still, perhaps the market (and many of our stocks) will trade sideways, ultimately, for a year or so, until earnings "catch up" -- that is, unless earnings grow more than expected, or if investors continue to favor stocks due to record-low yields obtainable elsewhere.

In 2000, the 10-year treasury yielded 6.6%, and in 2007, it yielded 4.8%, compared to today's mere 2.5%. Given how little you get paid to park money elsewhere, stocks are the most attractive alternative for anyone who can handle some risk, and since interest rates are not likely to climb much soon, that may remain the case for some years more.

Pockets of Frothiness

Today's missive isn't meant to give stocks a pass. Many do look generously priced, and I see people everywhere making excuses for that (even this column, perhaps?). Analysts are writing to justify free cash flow multiples in the high 20s and up, while we would all be more comfortable if they were in the teens. Some stocks look as rich as whipping cream, though in many cases, those stocks have for years. In *Pro*, we work to make sure that we want to own everything we own, and we seek unique businesses that should do well the coming years whatever the economy does. Recent buys of **Gilead Sciences** (NASDAQ: GILD) and **Skyworks Solutions** (NASDAQ: SWKS) are two examples.

You know *Pro*. We'll also keep hedging and have cash for opportunities. As Billy reminded the team in our *Pro* meeting last week, it's not just how we perform in a downturn that matters, but how we perform throughout an entire market cycle. There are many ways we can take advantage before, during, and after a decline, whenever we're able -- and it's our job to help you do just that.

See you on the Memo Musings board. Fool on!

-Jeff (TMFFischer)

AmTrust Is Movin' On Up

Published Sep 3, 2014 at 5:29PM

The time is finally upon us! Today, *Pro* is finally updating our Fair Value estimate for **AmTrust Financial Services** (NASDAQ: AFSI).

Status: Buy

Allocation: 6.7%

Fair Value Estimate: $40 (up from $30.45)

Consider Adding More Price: $28 (up from $22.27)

Since this equates to a 31% increase in our FV estimate, we thought it might be best to spend a little time discussing everything that went on behind the scenes. Also, if you'd like to know more about my thoughts on my recent call with management and what I think about the future prospects for the company, make sure you check out the AmTrust board for my latest post.

There are two things we would like you to keep in mind when thinking about this dramatic increase in our estimate. The first is that quite some time has passed since we last updated our estimate for AmTrust. When a company continues to at least meet expectations (and it is definitely safe to say that AmTrust has done that), its fair value will increase over time due to the time value of money. The second, and perhaps more significant, reason is that we are now using what I would consider to be a "better mousetrap" to value the business. I use the word "better" instead of "different" because the framework that *Pro* now uses includes much of Bryan's original work in its foundation.

As some Fools may recall, Bryan previously mentioned on the boards that he wasn't completely satisfied with his approach to valuing AmTrust. Soon after my return to the Fool at the end of June, I began having regular meetings with him where the topic du jour was always AmTrust. Though I had been valuing the company on my own, I was uncomfortable with using my framework as the primary method for *Pro* because — to be perfectly frank — I felt that our members deserved far better. In no time at all I was spending the vast majority of my time in and out of the office letting my thoughts be consumed by all things AmTrust related. I even had dreams about valuing AmTrust.

Seriously. *I had dreams about building a model to value AmTrust*. Feel free to make suggestions on the Social Banter board as to what this says about my psyche.

Unsurprisingly, Bryan was eager to lend a helping hand throughout this process and in time we were able to build what I believe to be a better framework for understanding and valuing the company. Though the current market price is still above *Pro*'s new estimate of fair value, we have no immediate plans to change our guidance, as we believe that the company can still achieve North Star-like returns over the coming years from these levels. My tendency as far as valuing a company has always been to err on the side of conservatism when it comes to valuation, because I find it far more pleasing to have my surprises be to the upside.

But don't let the phrase "better mousetrap" confuse you; even though we have made meaningful strides in providing members with a Fair Value estimate that better encapsulates our current beliefs about the company, I will never be completely satisfied with our approach. I am, however, hopeful that we have reached the point where Jeff, Bryan, Billy, the Karfunkel brothers, Barry Zyskind, and GeoInvesting will no longer hold round table discussions in my dreams.

Foolishly yours,

— JP (TMFYossarian)

O'Reilly Automotive Keeps Rolling

Published Aug 28, 2014 at 4:27PM

Greetings,

O'Reilly Automotive (Nasday:ORLY) is reaching new highs as earnings-per-share growth continues to draw in new investors and keeps existing shareholders from selling. We need to keep thinking long term, though, because like most stocks, shares carry a "bull market" valuation (ORLY has long enjoyed a premium) -- but aren't so expensive that we want to sell. Additionally, it's unclear how long ORLY can keep growing EPS as such a faster rate than revenue, although its share buy-back plan shows no signs of abating, and margins can continue to tick higher -- let alone if employment and consumer strength grows. Our allocation is such that we'd be inclined to add on a steep decline. As management summed up, "We remain very confident in the long-term outlook for our industry as we expect to see better engineered and manufactured vehicles stay on the road longer."

=========================
***Pro* Guidance**
=========================

- **Status:** Buy (and/or write puts if wished)(no change)
- **Allocation:** 3.6%
- **Fair Value Est.:** $140 (up from $138)
- **Consider Adding More:** $110 (no change)

=========================

Key Q2 Stats

- Revenue: +7.7%
- Same-Store Sales: +5.1%
- Gross Profit Growth: +9%
- Operating Income Gth:+14%
- Net Income: +16%
- Earnings Per Share: +21%

Results Summary & Notable Changes: O'Reilly continued to benefit from the harsh winter, which continued to drive more repairs in Q2. They're cautious on the summer months, though, which have been mild so far, leading to fewer A/C and other heat-related repairs (although "July was fine.") Guidance increased for the year only on the heels of the strong first half. No notable changes to the strategy, store opening plans, distribution center buildout, long-term opportunities, or outlook.

Management Full-Year 2014 Guidance

- Same-store sales gain of 3% to 5.5%
- Gross margin of 50.9% to 51.4%
- Operating profit of 17.1% to 17.5%
- EPS of $7 to $7.10 (up from $6.82 to $6.92)(excludes more share repurchases)(at $156, the stock fetches 22x guidance)
- Free cash flow of $625 to $675 (up from $580 million to $620 million, but just more in line with our estimate)
- Q3 EPS guidance is $1.91 to $1.95

=========================
Stats

=========================

Conference Call Notes

o ORLY opened 41 net new stores, for 91 net so far this year, still on track to open 200 by year-end.

o From a macro standpoint, they look forward to the next 18 months. The biggest driver is going to be the health of the consumer, miles driven, and how many people go back to work and start commuting. They'd also like to see a little bit of price inflation (that's good, as we think we will) to help drive top-line sales and more gross margin dollars.

o Renegotiations with vendors are mostly complete and ORLY is happy with the results.

o Margins should continue to tick higher, though not be the big gains of recent years. This is driven by new distribution centers, higher volumes, more efficiencies, price optimization opportunities, and acquisitions.

o Saw modest gains in miles driven as unemployment "very gradually" improves.

o Q2 operating profit grew 94 basis points to 18.2%, a record, but it will mitigate a bit as high-ticket winter repair sales wane.

o Professional customers were again the bigger driver of same-store sales growth, although DIY was strong, too, and ORLY is pleased with its market share gains in both. Overall, the sales mix is at about 42% professional and 58% do-it-yourself.

o Average ticket continues to trend higher due to increased parts complexity and higher costs of repairs; and as the vehicle population continues to age (as cars stay on the road longer), they're selling more parts for older vehicles.

o The company has an adjusted debt-to-EBITDA ratio of 1.81x, while they target a leverage range of 2 to 2.25x. They'll move into this leverage over time.

o They bought back 2.6 million shares at $149 on average, for $389 million.

===================

What We Think Now (unchanged): *With exceptional management in the driver's seat, O'Reilly Automotive will grow impressively by adding new auto parts stores, acquiring others, controlling costs, and growing same-store sales.*

MasterCard Charged Up to Grow

Published Aug 28, 2014 at 2:19PM

Greetings,

MasterCard (NYSE: MA) reported results that generally pleased investors; shares have trended higher since. More important, results suggest MasterCard remains on a long-term path to attractive value creation.

Pro Guidance
=========================
Status: Buy (and/or write puts if wished)(no change)
Fair Value Est: $70 (no change)(21x FCF)
Current Allocation: 4.2%
=========================

Key Q2 Stats

Net Revenue: +13%
Operating Expense: +14% (acquisition related increase)
Earnings Per Share: +14%
WW Gross $Volume: +13% (local currency basis)
U.S. GDV: +9%
Volume Growth X-US: +16% (local currency)
Cross-border Volume: +16% (")
Processed Trnsactns: +12% to 10.6 billion
Card Growth: +8% to more than 2 billion

Results Summary & Notable Changes: The company still sees a soft worldwide economy, and August started soft. Still, net revenue grew 13% and the company continues to target at least mid-teens growth. Management is investing in acquisitions and this added three percentage points to operating expense growth this quarter. This will moderate. MasterPass, the company's digital acceptance platform connecting consumers and merchants, should be in all major markets in two years. Making it simple to use MasterCard online is important as digital payment competition grows.

========================

Conference Call Notes

o Q2 SpendingPulse data showed U.S. Retail sales (ex-automobiles) grew 3.8%, up from 2.3% in Q1. However, the trend slowed as the quarter went on (partly on lower fuel sales) and MasterCard still thinks "the U.S. economic recovery is very much a work in progress."

o European volume growth was in the low teens, with transaction growth in the high teens, with growth driven by Russia, Turkey, Sweden, Italy. Latin America remains soft, and Asia Pacific, Middle East and Africa continue to do well, with processed transaction growth remaining about 30% and GDV growth in the high teens.

o Mobile is "one of the most significant changes in our space," as consumers shift from physical (card based) to digital payments. Along with working with Samsung and other mobile-point providers to integrate MasterCard-branded digital payments, MasterPass is now running in 10 markets and should be in all markets that represent about 75% of MA's total volume in two years. MasterPass geographically is well ahead of Visa's comparable technology so far.

o In the last two years, MA has launched more than 100 new programs to bring access to more than 350 million people who lacked financial products like prepaid cards and mobile payments -- this is MasterCard's "financial inclusion" initiative.

o U.S. Debit growth was 9%; and U.S. credit had strong volume growth of 10%. Outside the U.S., double-digit growth in transactions continues in most regions.

o Europe remains "an enormous opportunity" given that, outside of the Nordics, so many transactions are done in cash.

o This is less relevant now as 2015 approaches, but it suggests better growth directly ahead: MasterCard still believes that it will deliver 11% to 14% net revenue CAGR growth and at least 20% EPS CAGR between 2013 to 2015. We're half-way through this time period, and EPS growth will need to strengthen a bit.

o Recent acquisitions include DataCash, Access Prepaid, and the five done this year alone: Provus, C-SAM, ECS, Pinpoint and HomeSend. MasterCard usually partners with other companies for years, and only acquires them later once they find value in the product. These acquisitions largely target mobile and digital growth. The latest five will dilute EPS by about $0.06 to $0.08 this year. That's already in guidance. There are other possible deals in the hopper. Dilution in 2015 should be about half as much.

o MasterCard is growing rapidly in emerging markets, but there are different yield structures in many of them. You have to align your pricing structure with the local scenario. First, newcomers to cards use ATMs most (withdrawing cash to go make purchases); those are lower-yield transactions for MA. These users migrate later toward debit card and then credit card use. Right now, MA is still in the lower-yield phase of many emerging markets.

o The U.S. Chase account continues to roll off to Visa, and should continue to be a headwind the next few quarters, but that's already in guidance and estimates.

o MasterCard's main goal is to grow the franchise and grow revenue. They want to grow usage and they'll provide rebates -- pricing benefits -- to do so. (It sounds like they're being less strict on rebate levels in order to grow market share -- a long-term approach we don't disagree with; MasterCard has plenty of margin strength to share, but we will watch that margins hold up as they help the shares afford the premium valuation they enjoy on Wall Street.)

o CEO Ajaypal Banga's closing words: "There's no shortage of growth opportunities in our business, frankly. And while our investments are having an impact on our (operating expenses) right now, we believe that we are investing in a thoughtful way that ensures continued top-line growth and good long-term returns for all of you who invest in our stock."

What We Think Now *(unchanged): MasterCard's global network is a financial toll road that takes a small slice of each transaction. Though there are many established and upstart competitors, the world leader is cash with 85% market share, representing plenty of room for MasterCard to grow by offering a more convenient alternative.*

To discuss, please visit our MasterCard board.

Best,

Jeff

The Buckle Is Hangin' Tough

Published Aug 26, 2014 at 12:34PM

Pro's Take: BKE Q2-2014 Earnings

The Buckle (NYSE: BKE)

Quarter Quick Take

While The Buckle's year-to-date results are uninspiring in an absolute sense, the company continues to perform dramatically better than its mall-based, teen retailer peers thanks to its better operational execution, middle-of-the-road fashion assortment, and more loyal customer base. The Buckle grew net sales +1% due to a net six new stores during the quarter and a +2% rise in online sales. Store-level performance remains resilient: same store sales declined only -0.5% and merchandise margins held steady. Fewer shoppers are coming into Buckle stores, but the ones who are purchased more and higher priced items, which contributed to the respectable sales per store performance and down-tick in average inventory per store. While the ramping contribution from footwear and accessories appears to have matured, the next multi-year leg of growth we are monitoring is expanding youth merchandise. On a positive note, management commented that development of a digital rewards program continues and it should be rolled out next year.

....

Q2-2014

Revenue growth: +1%

Operating profit margin: -50 bps to 16.4%

EPS growth: -3%

....

Guidance Update

The Buckle's results were very respectable given the current apparel retail environment. Our expectations for the company over the next decade are modest, so a year or two of challenging industry or macro headwinds doesn't throw our estimate of value into a tizzy. The Buckle is a Buy and is Pro's smallest holding at 2.5%. I believe shares are worth $53 and are undervalued. With about $4.75 in extra cash per share, I suspect the board could elect to pay a $1-$2 special dividend, which we will likely hear about in September.

Updated guidance: Buy (no change)

Recommended Allocation: 2.5%

Fair Value estimate: $53 (no change)

End of Fiscal Year expected FV estimate: $55

CAM price: $37 (no change)

Shares normally trade in a range of 6-9x EBITDA (currently 7.4x) and I'd look to write puts for an effective buy price around 6x, which is our CAM price.

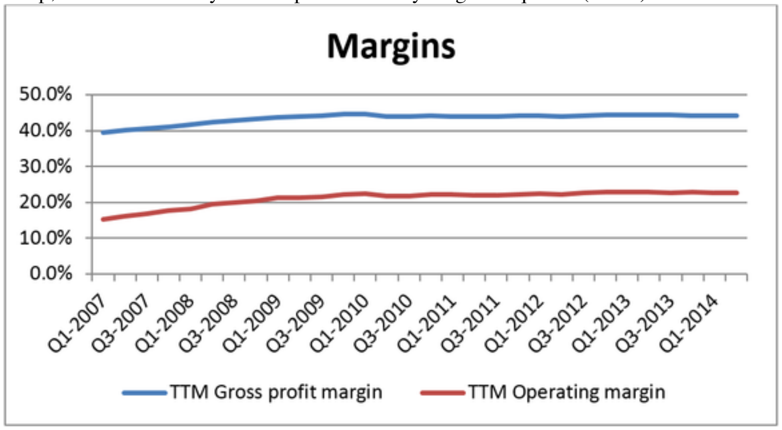
Our Thesis

The Buckle offers retail exposure with low fashion risk (jeans and tops). Its management team is properly incentivized, has meaningful ownership, and run the business wonderfully well. We expect measured growth from store openings, online expansion, and expanded merchandise assortment (footwear and children's clothes). We are not expecting dramatic operational improvements, but we believe in-house brand penetration and an improved online experience are opportunities. The Buckle should grow its earnings, pay a regular dividend, and we expect it to pay out excess cash distributions (more years than not).

The Most Important Things

1. ***Store Performance***: Same store sales, sales per square foot, store sales per store, and invested capital per store are all worthwhile metrics to assess store performance. The reason The Buckle has generated so much value over the years is because it has been able to sell more (profitably) through each store without having to invest much more. And while same store sales growth is noisy, it is consistently positive. On a trailing twelve month basis, store sales per average store (excludes online sales) declined marginally. This marks the fifth consecutive trailing twelve month decline in this key metric. While the trend is negative, it isn't a surprise given the current operating environment, and the absolute decline is only -4% -- and that is off of the highest mark ever. A revival in traffic is the most likely cure for reversing the ebb in sales per store.

2. ***Operational Acumen (margins and inventory):*** Retailer gross margins and inventory levels expose whether or not merchandise selection is on the mark: if you've got items nobody wants you either have to put it on sale (which will ding gross margins) or let it sit on your shelves (which will ding inventory turnover). Historically, The Buckle has merchandised well, and margins have risen steadily. In Q2-2014, gross and operating margins declined slightly, but on a trailing twelve months basis remain above 44% and 22% (respectively -- see the chart below). Margins remain steady but further improvements will be tough to come by. Inventory days ticked up, but remain healthy. The surprise inventory bulge last quarter (+13%) was corrected without sacrificing gross margin – a testament to operational acumen.



WWTN

The Buckle is holding steady in a difficult apparel retailing environment. Even at lower per-store sales and profitability we think opening new stores still makes sense for The Buckle. The company's modest valuation and still-small store base, combined with brilliant operational execution point to upside in the shares. With almost $5 per share in cash and investments and the biggest cash generating quarters still to come, another special dividend is likely.

Conference Call Notes

- On sales: Sales were up +1% in Q2 and up +1% in 1H. SSS held up, with a -0.5% mark in Q2 and a -0.7% mark in 1H. Men's sales outperformed women's and growth in footwear and accessories moderated. Online sales were up just a bit and have risen +2% so far this year. Still, online sales represent <10% of Buckle's total sales.
- On expenses: Merchandise margins held steady, but the decline in SSS hurt gross margins a bit. Selling expenses were up just a touch, but G&A largely offset that.
- On inventory: Inventory was down -4% year-over-year and inventory per average store was just about flat.
- On CapEx: CapEx for the 1H was $23 million, with $17 million going toward new stores construction, store remodels, and store technology upgrades, with the remaining $6 million going to corporate and the build of a new office building. For the full year, capital expenses should come in at $48 to $53 million. At the end of the quarter, 356 of 456 stores are in the newest format.
- On transactions: UPTs increased +2%, the average transaction value increased +4%, and the average unit retail increased +2%. Seeing this next to the SSS and net sales performance suggests that fewer shoppers are coming to the stores, but the ones who are coming, are buying a bit more.
- On denim: Average denim prices rose a bit for men's and women's.
- On private label: As a percentage of sales, it was flat, at 32%.
- On expansion plans: The strategy continues as it always has: look for the best opportunities without artificially setting a goal number of new stores or desired location – let the opportunities dictate the pace and location of growth. CEO Dennis Nelson said: "*We will continue our strategy of looking at the opportunities and what makes sense for us and where we see the retail markets going in the future to decide new stores, and not set a planned number of stores and then work to high that number.*"
- On the current environment: CEO Dennis Nelson: "*I think the promotional environment continues to be pretty much the same as we've seen it for a while. Maybe even a little more. That's why we work with our exclusive and developing our own brands and really having fashion and details that other people – the way we see a lot of them is that they're just trying to hit the lowest price and sell by price. And we're looking at the total idea of fashion, style, comfort, and to give the exclusive product. And we also work with our brands as well to develop exclusive product that is special and gives the guest a reason to want to buy.*"

Pro's Historical Performance With the Brand New vs. the Tried and True

Published Aug 25, 2014 at 4:07PM

Pro Guidance Changes

- We raised **Gilead Science**'s (NASDAQ: GILD) Fair Value estimate from $105 to $110 after reviewing second-quarter 2014 results.

Dear *Pro* Fools,

A few days ago, Jeff wrote that as a portfolio grows, your new positions must be larger in order to maintain the same position sizing. In other words, a 3% position for a $1 million portfolio is $30,000, but a 3% position for a $2 million portfolio is $60,000. Your stakes (in dollars) get higher, but your return profile on a percentage basis stays the same. "So," as Jeff put it, "your new ideas better be good."

Jeff's post reminded me a bit of an oft-quoted Peter Lynch investing principle. Lynch ran the Fidelity Magellan fund from 1977 to 1990 and earned a 29% annual return over that period, and one of his principles was "The best stock to buy may be the one you already own."

Enjoy Labor Day, Fools! The Monday Memo will be taking the day off next week. Stay tuned for our next Memo on Sept. 8!

Lynch's popular principle, Jeff's board post, and *Pro*'s recent new position in **Skyworks Solutions** (NASDAQ: SWKS) made me wonder: What is *Pro*'s historical performance on brand-new buys compared to *Pro*'s historical performance when it adds to existing positions?

The Experiment

I decided to run an analysis on *Pro*'s historical stock purchase activity using data beginning with *Pro*'s inception in October 2008.

The fine print: I only included simple stock purchases and sales in the data set, and I did not include any stock buys that were associated with options strategies for income (e.g., covered calls or strangles) at the outset. I also excluded any active stock positions that have been in place for less than a year (to eliminate noise from calculating annualized returns on short-term positions) and I excluded any positions that were outside of the equity asset class (e.g. ETFs).

Before running the analysis, I hypothesized that *Pro*'s performance was likely better when it was adding to existing positions. I reasoned that *Pro* is better able to leverage existing knowledge on positions it has followed and analyzed for some time.

After inserting the data and crunching the numbers, here's what I found.

The Results

	n =	Average CAGR*	Average Holding Period (Years)
All Buys (New and Add More)	54	25%	2.1
New Buys	39	22%	2.2
Add More	15	33%	1.8

*CAGR = compound annual growth rate.

As I expected, it turns out that *Pro*'s performance when adding to existing positions is indeed better than when *Pro* initiates a brand-new position. Since inception, *Pro* has made 54 equity purchases, averaging an impressive 25% annualized return while holding those positions for an average of two years. But when we drill down further, we can see that on our 39 brand-new buys, the average annualized return is 22%, while on our 15 purchases where we added to existing positions, our average annualized return is an astounding 33%.

The Even Finer Print

Although this analysis is interesting, it's important to view the results in context. The calculated returns are simple averages and do not account for portfolio weighting/position size. Since *Pro* is a real-money service, a purchase with an allocation of 5% has a much greater impact on the portfolio than a purchase with an allocation of 1%. This analysis disregards the impact of position sizing, so it distorts the true impact on the *Pro* portfolio's actual returns.

Additionally, *Pro* often employs options strategies (e.g., written puts, covered calls, strangles, etc.) on positions that were initially established as simple stock purchases. This data ignores the effects of options strategies on position-level returns. In reality, *Pro* manages its positions with an eye on both simple stock returns *and* accompanying options activity. Interpreting only the stock portion of position-level returns misrepresents the way *Pro* actually works.

Nonetheless, this analysis can serve as a simple barometer for how good *Pro* is at starting new positions compared to adding to existing positions. As I hypothesized, one likely reason for the outperformance of "Add More" purchases is that *Pro* is able to use existing knowledge on active positions and can react to market conditions with greater confidence.

On existing positions, the analyst or advisor is likely already familiar with management, the competitive environment, typical trading ranges and valuation multiples, as well as any other criteria that might help decide when adding to a position is attractive. With more subtlety and nuance embedded in the decision-making process, those picks have a higher likelihood of outperformance. In contrast, for new positions, the analyst or advisor likely doesn't have the benefit of having followed a company closely for several quarters, as they would if it were an active recommendation.

As an example, let's look at the case of **Gentex** (NASDAQ: GNTX). Gentex was brought into the *Pro* portfolio in [May 2012](). If you bought shares that day, you were able to buy at a dividend-adjusted price of about $21.88. At today's pre-market price of $29.22, that's good for about a 34% absolute return in 2.2 years, or about 14% annualized, handily topping our North Star.

However, in late July 2012, just a few months after the initial purchase, Gentex shares got slammed after releasing bad news during earnings, declining 29% in one day. After [thoroughly analyzing the market's reaction](), *Pro* recognized that the stock price decline was likely too harsh. Shortly thereafter, *Pro* officially added more to its Gentex position, issuing an alert in early [August 2012](). If you bought in that day, you were able to buy at a dividend-adjusted price of around $15.18. At today's pre-market price of $29.22, that Add More purchase has an absolute return of 92% in 2.1 years, or about 37% (!) annualized. Gentex is a great example of how adding to an existing position at an opportune time can lead to very strong outperformance.

The Foolish Bottom Line

This analysis shows the benefit of leveraging existing knowledge when adding more to an already-active position. It's very easy to be tempted by the fresh recommendations that offer novelty and the excitement of learning about a new company. However, in *Pro*'s history, although we're pretty good at initiating brand-new positions (averaging 22% annualized returns), we're *even better* at adding to existing positions (averaging 33% annualized returns). So the next time *Pro* decides to Add More, the numbers strongly suggest you should be paying close attention.

Fool on!

— Billy (TMFTailwind)

Pro Completed Trades (see all [trade alerts]())

- **Expeditors International** (NASDAQ: EXPD): We were able to set up five of our 10 $40 synthetic long contracts at a net debit of $0.70 per contract. We will continue this week to try to fill the last five of our contracts at our guided price of $0.70, and then we will write our short strangle once the synthetic long is complete.

Broadridge: Delivering Today and Investing for Tomorrow

Published Aug 25, 2014 at 3:55PM

Pro's Take: BR Q4-2014 Earnings

Broadridge Financial Solutions (NYSE: BR)

Quarter Quick Take

Broadridge closed out fiscal 2014 with a strong Q4, headlined by a large closed sale with Fidelity Investments covering investor communications outsourcing. Remember, such closed sales represent future revenue that will come on-line over time; the value they provide today is confirmation that the company's products and services are in demand and that Broadridge remains the partner of choice for outsourcing mission-critical but noncore activities. For the year, recurring fee revenue registered +9% growth (+11% in ICS and +5% in SPS) and had a positive impact on operating leverage and profit growth. While there were modest tailwinds out of the company's control, recurring revenue closed sale growth of +5% and continued operating margin expansion suggest that Broadridge is performing well in the areas of its business it can control.

....

Q4-2014 | FY-2014

Total recurring fee revenue growth: +7% | +9%

TTM Operating profit margin*: +529 bps to 25.6%

EPS growth: +4% GAAP | +25% GAAP, +20% non-GAAP

*Operating profit / Fee revenue

This removes the impact of distribution revenue, which is a pass-through, and distorts the true economics of the business

....

Guidance Update

Management's initial FY-2015 guidance looks achievable and even a bit conservative: recurring revenue growth of +5% to +7%, EPS growth of +8% to +13%, recurring revenue closed sales of $110-$150 million, and FCF of $320-$370 million. The free cash flow number looks especially impressive in conjunction with the announcement of another round of accelerated investment in growth – so last year's $330 million and next year's $350 million (at the midpoint) of FCF both understate the true cash generating abilities of the business. Provided the investments result in sustainable organic growth, and management has a good track record of this, we are happy to make that trade-off.

Business is tracking well against our thesis, and Broadridge appears more in control of its business and future than at any time in its public history. Recently, the board announced a 29% (not a misprint) increase in the dividend to $1.08 per share. A sensible valuation (15x slightly depressed FCF), this 2.6% dividend yield, and very achievable 8% EPS growth (at the low end) are a formula for greater than North Star returns over time.

Updated guidance: Buy (no change)

Recommended Allocation: 4.1%

Fair Value estimate: $43 (up from $42)

End of Fiscal Year expected FV estimate: $46

CAM price: $35 (up from $34)

I'm happy with our 4.1% allocation to Broadridge. The company's business lies at the nexus of Pro's largest sector bets (technology and financials) and its business results are as consistent as we have in the portfolio. Members lacking a (full) position should feel comfortable purchasing shares today – they trade at a slight discount to our estimate of Fair Value. If the market presents the opportunity, I'd entertain written puts or buying shares to bring the position up to 5% allocation, or an outright resizing if shares fall near CAM territory.

Our Thesis

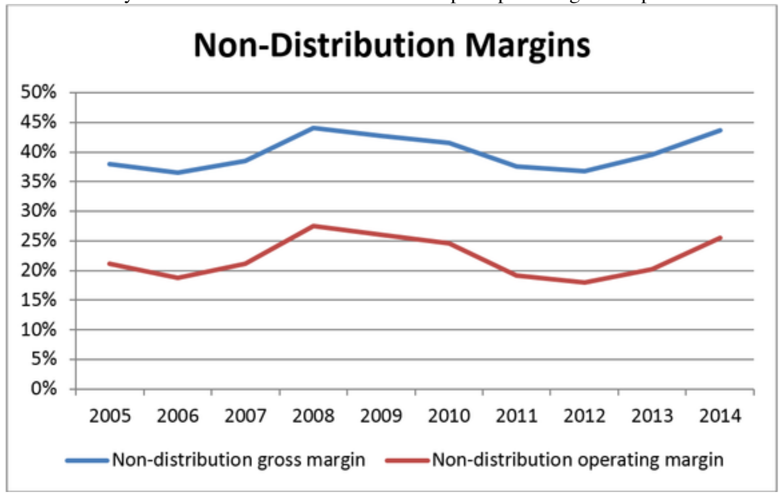
Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

The Most Important Things

1. ***Recurring Revenue Closed Sales:*** RRCS amount to an estimate of the annualized new business won during the period. Given the nature of the company's business, the revenue should recur at extremely high rates (we're talking 98%). Tracking this metric gives us insight into future sales, how new products are resonating with customers, and the degree to which customers are partnering with Broadridge. After failing to grow in fiscal 2013, RRCS were up +5% in fiscal 2014. These sales, which have a long cycle, are lumpy, so we look for progress over time. Comments from management suggest the pipeline and Emerging and Acquired (E&A) products are being well-received by customers. I expect 2015 to begin to show some fruits internationally as the company's partnership with Accenture matures. Fiscal 2015 guidance for RRCS of $110-$150 million suggests growth in the range of -13% to +18%.

2. ***Fee Revenue Margin Performance:*** Broadridge maintains a technology platform upon which its business operates. As it brings more business (volumes) on board, it should benefit from low variable costs and increasing margins. I track gross and operating profits as a percentage of fee revenue, which ignores distribution revenue and costs, and makes my numbers differ from what you might read in the press release. Broadridge achieved fee revenue gross margins of 43.6% during FY-2014, up from 39.6% a year ago and the second highest level on record. Fee revenue operating margin for FY-2014 was 25.6% up from 20.3% a year ago.

Operating margin should have further room to expand given the company's natural operating leverage, the fact that FY-2014 included non-recurring growth investments, and that FY-2015 will include additional growth expenses in SG&A. My base case model assumes no further pickup in margins – a potential source of upside provided the bulk of recent investment is in fact non-recurring.



3. ***Capital Allocation:*** Although BR is a slow-grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 45% payout ratio, then looks for bolt-on acquisitions that can achieve a 20% IRR, or it looks to repurchase shares. Over the past five years, Broadridge has only had to reinvest 13% of profits to grow fee revenue by 35% (a 6% CAGR) and profits by 38% (a 7% CAGR). Much of that reinvestment was in building new products and acquiring companies that should grow faster than the company's legacy business as their products are sold through existing Broadridge relationships. I believe the stage is set for continued modest growth with even less capital intensity, which should allow for further dividend increases (which the board has granted each year since it initiated its dividend – seven years running) and share repurchases (share count is down -14% over the last five years). Broadridge management gets high marks for capital allocation and stewardship in my book.

WWTN

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Conference Call Notes

- On FY-2015 guidance: Recurring revenue growth should be in the range of +5% to +7%, and 60% of revenue should convert from closed sales. EPS growth of +8% to +12% should be driven by net new business – the source of growth most under management's control. CEO Rich Daly said: *"Big picture, I view our fiscal year 2015 plan as the strongest plan we have ever compiled. Our plan strikes the right balance between earnings growth and an appropriate level of investment into the future and does not depend upon market-based activities for growth. As a result, Broadridge is well positioned to achieve its guidance."*
- On continued investment: $40 million of additional growth investment (in addition to the $34 million of incremental spend in 2014) may occur in FY-2015. CEO Rich Daly always notes that it is difficult to spend money well, so while this level of spending has been earmarked, it will only be spent if the business opportunities are in place and the company is confident in the returns.
- On RRCS: The strong momentum has carried over into Q1 – BR signed another large deal already. The deal is with a major global bank to provide BPO and outsourcing services. Management did announce it no longer intends to communicate which deals are large and which aren't, instead, it will focus on when closed sales will convert to revenue.
- New CFO Jim Young: This was new CFO Jim Young's first conference call. He joined BR from Visa, and he had some interesting things to say. "***To start, I would like to offer a few thoughts on the business. Before taking this job, I did a lot of due diligence on the Company, and my first six weeks have affirmed many of the special attributes that drew me to Broadridge. First, leadership position. Broadridge is a trusted and vital partner to many of the largest financial services firms in the world. Second, importance. This is a business whose core products and services are woven into the fabric of the capital markets and their mission-critical processes. Third, opportunity. Broadridge's brand and track record give it permissions to expand the sets of services and products it offers. And the company is successfully doing this today through a series of focused and carefully calibrated investments. And finally, as a result of all of this, strong and resilient free cash flow. The combination of growing and predictable recurring revenue and low capital intensity has enabled the business to demonstrate a clear capacity to generate stable and significant free cash flow.***"
- On internal growth: Internal growth (primarily stock record growth) outpaced expectations and helped BR achieve its great results. This source of growth is probably unsustainable and it is out of management's control, so we shouldn't count on it in the future. Management's forecast does not assume further contribution from internal growth.
- On the target payout ratio: Management raised its target payout ratio to 45% of trailing earnings from 40%. It assured call participants that this does not inhibit the company's ability to invest for growth.

Gilead's Healthy Results

Published Aug 21, 2014 at 9:44AM

Greetings Fools,

Guidance Update: **Gilead Sciences'** (NASDAQ: GILD) fair value estimate increases from our $105 valuation that came with our April buy report, to $110 today, as the business grows in a quarter (and grows a bit more than expected). It remains a Buy First at a 4.2% allocation today.

Summary: Gilead reported second-quarter revenue growth of 141%, to $6.4 billion; $3.5 billion in sales came from Hep C cure, Sovaldi. Earnings grew 378% to $2.20 per share. For the year, GILD expects revenue to about double to $22 billion. Here's the press release.

What We Think Now: *Biotech Gilead Sciences offers a great investing trifecta: size, growth and value, all in one. Its HIV franchise is stronger than ever, and its liver franchise is taking off. Targeting deadly diseases with novel treatments, Gilead is working to improve lives.*

Notable Changes?: Nothing has changed since our April thesis, except Sovaldi sales are a little bit stronger out of the gate than we estimated (and much stronger than Wall Street estimated). That's happening even as some doctors are waiting to prescribe Sovaldi ("warehousing" it) until the single-drug regimen comes out, which is expected this fall. This may affect current quarter results a bit. Sovaldi continues to gain regulatory approval outside the U.S. Meanwhile, Gilead's drug pipeline continues to move forward positively, with no negative surprises so far.

Looking Ahead: What matters most the coming few years are Sovaldi sales -- how long is the tail here? Since the drug cures patients, its revenue growth won't be linear. Sales will subside eventually, leaving a sizable headwind for year-over-year growth comparisons for quite some time. But we expect sales will be healthy for longer than is generally estimated, past 2018, as ever more patients are treated and pricing for this cure (from Gilead and competitors) remains rational.

Conference Call Notes

Sovaldi:

o More than 70,000 U.S. patients and about 10,000 EU patients had been treated (as of June 30)

o The single-tablet Sovaldi regiment for genotype 1 should have a PDUFA from the FDA on October 10, and EU approval is expected later this year

o Q2 Sovaldi sales of $3.5 billion; $3 billion were U.S. and most of the remaining $500 million were from Germany and France -- where both governments gave Sovaldi high marks for being an innovative, new solution worth reimbursement. Gilead is still working on pricing with France even as the drug is offered to severe patients. We should hear from Germany soon on final pricing.

o Scotland gave Sovaldi a positive initial review -- it's moving forward

o Australia approved Sovaldi and discussions for pricing and reimbursement are ongoing

o Patients have been treated with Sovaldi in 34 countries; the number keeps increasing

o Some doctors are delaying treatment, waiting for the single-tablet regimen this fall -- namely in the U.S.

o Gilead expects pricing in the EU, as a whole, to be a bit below the U.S. The U.S. is expected to be a slightly bigger market, as a result, and have sales that are more spread out over time than Europe.

Oncology and HIV

o Zydelig/idelalisib (with break-through status on one indication) was approved July 24th for 3 B-Cell malignancies: chronic lymphocytic leukemia, follicular B-cell lymphoma and small lymphocytic lymphoma. This is Gilead's first oncology drug, and is an oral medicine. Gilead is exciting to keep working to help oncology patients with new medicines.

o In HIV, GILD's new single-tablet regimen is in a number of studies with filing for U.S. and European approval in the first quarter of 2015 expected.

o Prescription volume continued to grow on GILD's HIV products, with 9 of 10 new HIV patients prescribed a Gilead medicine.

General

o Gilead repurchased 15.2 million shares for $1.2 billion ($78.94 average price). They plan to spend $1.7 billion more this quarter, to complete an old authorization. They have a new $5 billion share repurchase authorization to start after that. This $6.7 billion represents about 4.8% of existing shares.

o Project 2014 sales of $21 to $23 billion. Risks to this include the October 10, 2014 PDUFA date for single-tablet Sovaldi, and warehousing before that date, as well as ongoing pricing discussions with various countries, and how those play out. As well as new competitive risks on the horizon. So, risks to Sovaldi do remain.

o Single tablet regimens "are the way ahead in our opinion," in any treatment where possible.

o "We've never had so many things going forward as we do today, and we feel very, very confident in the pipeline that we have today." So, they may target very selective acquisitions that augment their pipeline.

Our Best Days Are Ahead

Published Aug 18, 2014 at 4:03PM

Pro Guidance Changes

- Last week we moved **Skyworks Solutions** (NASDAQ: SWKS), **Tupperware Brands** (NYSE: TUP), and **Wells Fargo** (NYSE: WFC) to Buy First. Read more here.
- We raised **Parexel International**'s (NASDAQ: PRXL) Fair Value estimate to $57 after reviewing fiscal 2014 results.
- **Apple**'s (NASDAQ: AAPL) Fair Value estimate increased to $102 on business growth.

Dear *Pro* family,

We have a policy around these parts of ripping the Band-Aid off quickly. It's my sad duty to report that this is my final Memo. In a few weeks I'll be leaving the *Pro* team to pursue an exciting opportunity with our affiliate, Motley Fool Asset Management, LLC. While the dive into uncharted waters is nerve-wracking for me, I have the utmost confidence the *Pro* ship will continue on sailing swiftly. Jeff remains at the helm and the course, guided by our North Star, has never been clearer. Thankfully, my duties as director of The Motley Fool's Analyst Development Program afforded me the unique ability to literally hand-select Jeff's first mates, Billy and JP. Our ship retains its nimbleness by housing a small crew, but pound for pound these sailors are hearty and able. For more on my transition, please see the More Awkward Goodbyes section at the end of the Memo. And now, because I'm fresh out of sailing vocabulary, let's tack back on course (OK, one more!) and discuss why our best days are ahead.

Investing Is Science *and* Art

It doesn't take very long for investors to realize that investing isn't all science. Just when we think we've applied the appropriate business-school frameworks and spreadsheet kung fu to uncover a wildly undervalued opportunity, we watch it plummet in price and never recover. I was reminded of the shortcomings of a purely science-focused approach in a recent book club session of our Analyst Development Program. We were discussing John Train's 1980 book *The Money Masters*, which profiles nine of the greatest investors of that era, and what quickly becomes apparent is that the super-investors have wildly different, and sometimes opposite, approaches to investing. The takeaway is that there is no one right way to invest, so embrace the motley style that works for you and master it. It is critical, of course, to understand and borrow from the science of classical finance and investing training — all the masters did this — but there has to be something else. My belief is that Train's subjects are abnormally creative, and they found a way to use that to set themselves apart from the thousands of also-ran investors of that era.

Learning From the Creatives

In search of a better understanding of creatives, I came upon a paper by Carnegie Mellon Professor John R. Hayes published for the Center for the Study of Writing in 1990. The paper surveys academic research going back to the 1920s to characterize creative and non-creative people (PDF here). Academic literature claims there are four traits that differentiate the more creative from less creative: devotion to work, independence, a drive for originality, and flexibility. This rubric fits the nine investors Train highlights perfectly — heck, it fits the investors profiled in Train's two follow-up *Masters*' books, too.

These four traits are largely intrinsic, but Hayes goes on to analyze cognitive processes involved in everyday thought and action that creatives embrace. Three that are heavily emphasized in *Pro*'s philosophy and process are preparation, goal-setting, and representation.

- Preparation is largely tied to the effort invested to acquire the knowledge and skills relevant to the creative act. Studying those businesses? Speaking with management teams? Questioning one another's assumptions? Check, check, and check.
- Goal-setting refers to the identification and formulation of a unique problem. Our goal is to double our portfolio's real purchasing power each decade, achieved by making steady progress every rolling three-year period. That goal is shepherded by our North Star focus.
- Representation is how we frame the job at hand. *Pro*'s embrace of a broad strategy (options, shorts, ETFs, and more) is evidence of a different representation of the task of achieving acceptable risk-adjusted returns than what you find in most plain-vanilla investment programs.

Our Best Days Are Ahead

If investing is a creative endeavor, I have some good news — *Pro* is just getting started. Hayes provides evidence that the most notable composers require years of preparation before they produce their best, most creative, work. He surveyed all the composers listed in Harold Schonberg's *The Lives of the Great Composers* where clear data was available regarding when they got serious about their craft (there were 76). He then looked at their body of work and determined the most notable compositions (based on current-day recordings), of which there were 500. Shockingly, only three were composed before the 10th year an the artist's career, and those three were composed in years eight and nine. The time of maximum creativity for composers happens in years 10-25 of their careers. Similar studies have been performed on other creatives and revealed similar results; painters hit their stride six years into getting serious and poets five years in.

I can't say when we as investors might reach our peak creativity, but Charlie Munger believes Warren Buffett is a better investor now (more than six decades into his investing life) than he was when his physical self was in its prime. It seems like *Pro*, at 5.5 years, is only getting better, too — a few more gray hairs on our end, but better nonetheless. I truly believe our best and most creative thinking lies ahead.

More Awkward Goodbyes

I joined the *Pro* family in early 2010. Philosophically, my transition was easy — my entire eclectic investing career up to that point had built a perfect foundation for the *Pro* way of investing. What was much less certain was how I was going to fit into the close-knit *Pro* community. I was, and am still, blown away by how warm and accepting our Fools are. I've loved getting to know so many of you, sharing jokes, educating and being educated, and working together to achieve financial freedom. It has truly been an honor to work for you and with the *Pro* team. I'm very excited about the new opportunity in front of me and believe it will provide an incredible platform to help impact a great number of Fools. I will always consider myself a *Pro* Fool, and I look forward to seeing the even better future you all and the *Pro* team create.

Onward,

— Bryan (TMF42)

P.S. Please join us in congratulating Bryan on his exciting step forward and thanking him for his 4.5 years on the *Pro* and *Options* teams. Bryan was tirelessly diligent, thorough, curious, calm and reasoned in his investing roles here in your services — all the things you want to be as you invest. Bryan also brought a great attitude and sense of humor to his endeavors — qualities you definitely want in life. We'll miss Bryan, but we're excited for his future. Fools haven't seen the last of him! — Jeff (TMFFischer)

Apple Creates Value Each Day

Published Aug 18, 2014 at 8:22AM

Hi Fools,

Guidance Update: Apple's fair value estimate increases from a long-standing $94 to $102 as the business grows. From that price we target North Star-like returns, although much depends on new product popularity.

Apple (NASDAQ: AAPL) reported third-quarter revenue growth of 6%, to $37.4 billion; 12% profit growth to $7.7 billion; and 20% EPS growth to $1.28. iPhone unit sales gained 13% despite the lack of a new model, and Mac sales rose 18%. iPad sales were lighter than hoped. This was attributed to lower channel inventory and a 5% decline in the U.S. tablet market and weak tablet sales in Europe (this will be interesting to watch).

What We Think Now: Apple is the leader in mobile computing products, and the number of people buying into its ecosystem continues to grow — yet the stock is cheaper than it has been in years. (That's our 2012 statement; still relevant today, although the valuation multiples are now much higher).

Notable Changes?: Nothing negative has happened to challenge our thesis, which is that mobile computing will continue to grow and Apple will continue to lead in value share. Apple's now-stable margins further support our thesis. What Apple really offers is a familiar, powerful operating system (now 7 years old); its hardware houses it, and gets all the attention, but it's the O/S that tie people into the ecosystem most. As we become more reliant on our mobile devices, and as they do more, the relationship strengthens.

Looking Ahead: Still, what matters most in the immediate are Apple's new product releases. iPhone models with larger screens are expected to be announced on Sept. 9, and Apple is expected to introduce a new product category this fall.

Best,

Valmont in a Shallow Valley

Published Aug 18, 2014 at 12:00AM

Greetings,

Guidance Summary: The company remains a Buy at 2.7%, and fair value remains unchanged at $170.

Second-quarter results at **Valmont Industries** (NYSE: VMI) softened compared to record sales and earnings one year ago, as irrigation volume in North America slows on lower commodity prices, and the utility industry conducts far fewer large projects (mostly just small ones). Both sectors should improve eventually. Shares remain inexpensive while we wait.

What We Think Now: Selling light and traffic poles, irrigation systems for farms, towers and platforms for utilities and telecom, and offering steel and aluminum galvanizing for third parties, Valmont has consistently and strongly grown profits over the long term. Countless opportunities continue around the world, and we believe long-term owners of this well-managed company will do well.

Notable Changes: Although it doesn't threaten our long-term thesis, the most notable challenge from this quarter comes from the revelation that operating margins in the utility business may not return to the 17% to 19% range recently achieved. Given extra capacity in the industry, mid-teens margins are more likely, management says. They will work to improve on that with a focus on costs. This change to one-quarter of the business is not enough to harm the long-term valuation or thesis by a meaningful amount, but likely by a small bit.

=========================
ttm = trailing twelve months

Conference Call main points

o The company maintains a positive outlook for the utility business; volume was flat in the sector, but there were fewer large projects, and small projects have smaller margins. Fewer companies can serve large projects, so VMI favors those, and they have better pricing. Many large transmission projects are in the works over the next few years.

o Irrigation sales grew in international markets, led by Brazil, the Middle East and Asia, and operating income was a strong 19% of sales, despite a revenue decline led by North America. It's too early to know how the next ordering season will go in N.A., but softer corn prices are one concern. For now, though, Valmont expects results about even with last year when looking ahead the next two quarters.

o For the year, Valmont sees EPS of $9.35 to $9.65 (before any shares are bought back), putting the stock at about 15x earnings. This guidance was lowered by about $1 per share on weaker first-half results in three of four divisions.

o Looking ahead at the rest of 2014: Engineered Infrastructure Products should grow organically with improved profitability compared to 2013; Utility Support Structures should have revenue similar to last year's second half, but at lower profitability; Irrigation could be similar to last year's second half, although it hinges on U.S. farm purchases; in the Coatings segment, results should be similar to last year's second half.

o Incentive bonuses will be smaller this year due to lower earnings growth (or no earnings growth).

o Priorities for cash remain: organic growth; complementary acquisitions; dividends or buybacks.

Foolish Bottom Line

Priced inexpensively below 8x EBITDA (and well below the 9.3x average the stock has held since 2004), Valmont remains a value stock that has also been an excellent growth stock over the years. Believing in management and its business lines, we believe growth will resume and be healthy in coming years. Valmont offers us diversification in several growing areas (infrastructure *writ large*, and agriculture) with management who knows how to execute, and ride the ups and downs. This is an investment that really requires patience, though.

After earnings fall about 14% this year (from a record year last year), we currently estimate a double-digit rebound next year; that hinges on good revenue gains in utilities and irrigation.

Best,

Jeff

Set Up a Synthetic Covered Strangle on Expeditors International

Published Aug 15, 2014 at 11:44AM

Is this for you? This is for *Pro* members seeking an income position, managing at least $200,000, and who can sell puts. If some of that doesn't describe you, consider Alternative Trades at the end of this recommendation.

How You Participate

Actions on Expeditors International (NASDAQ: EXPD):

1. **Set up a Synthetic Long:** Sell to open January 2016 $40 puts, and buy to open an equal number of January 2016 $40 calls.
2. **Sell a Short Strangle:** Then use a strangle order to sell to open November 2014 $39 puts and sell to open November 2014 $43 calls, one each for every synthetic long you set up.

- **Allocation:** Approximately 1.8% exposure on the synthetic long, and another 1.7% exposure through your short puts in the strangle, for 3.5% total exposure. Each synthetic covered strangle represents $7,900 in exposure to the stock. So, for 3.5% exposure, set up one synthetic covered strangle (one each of all four options) for approximately every $200,000 you manage. *Pro* will use 10 contracts of each option.
- **Recent Trade Prices:** Approximate $0.20 to $0.30 net debit to set up the synthetic long. Approximate $1.95 to $2 credit to sell the short strangle.
- **Price Guidance:** Initially, target the above prices using a limit order for both trades. As prices change, accept no lower than $1.70 on the short strangle. The synthetic long price will change as the share price moves, but even in the days ahead aim to pay no more than a $0.70 debit.
- **Recent Stock Price:** $40.70
- **Fair Value Estimate:** $44

What We're Thinking

Expeditors International was first recommended by *Pro* in [2009](), so we're not strangers to this time-tested business. An innovator in global shipping logistics, Expeditors doesn't own any airplanes, trucks, or ships — instead, it buys space on carriers at wholesale prices, portions it out, and resells it at higher prices. The company also provides services to make moving goods much easier for customers, including custom brokering, cargo insurance, and distribution management. With nearly 200 full-service offices around the world, Expeditors helps companies move their products nearly everywhere, but Asia-Pacific and North America account for a majority of its $6.2 billion in annual revenue, with Europe a distant third.

- **HQ:** Seattle, Wash.
- **Founded:** 1979
- **Employees:** 13,910
- **Market Value:** $8 billion
- **TTM Revenue:** $6.2 billion
- **TTM Net Income:** $351 million
- **TTM Free Cash Flow**: $332 million
- **P/FCF:** 24

As trade grows, Expeditors has more opportunity to grow. When trade slows, such as during a recession, Expeditors is equipped to endure it while maintaining profitability, even when revenue declines (profits remained strong in 2009 as revenue dropped sharply). Lately, competitive pricing has kept a lid on operatingprofit growth, and the stock has traded in a tight range (mostly $40 to $45) since mid-2011. As we've done in the past, we're entering the position looking to earn income on a stable business. In this case, we're looking for leveraged income. Our synthetic long requires no cash outlay (just equity to hold the puts open), and the short strangle pays us well — starting with the potential for 5% in income on a blended $39.50 put obligation (our $40 puts and our $39 puts) between now and the November expiration for the $39 puts.

Whether the stock goes up or down, we'll seek to roll our short strangle in future months, to keep earning income, unless we decide (on a decline) that we want to take physical shares instead. But for now, view Expeditors as a *Pro* income position with long-term upside potential with our synthetic long.

Initially, if we obtain a $2 credit (on our short strangle alone; the syn long is separate), our break-even points on our $39/$43 short strangle are $37 and $45, respectively. Ideally, the stock will stay between our strangle strike prices, so we earn full income. Over time, if the stock slowly rises, we should be able to keep strangling it for more income and earn gains in our synthetic long, too, by rolling our strikes higher. That's the ideal.

More That Matters

- **Maximum Loss:** The same as owning 200 shares of stock, minus the option premiums received.
- **Maximum Gain:** The initial short strangle caps upside on our synthetic long to $43, plus the $2 in premiums received. The most this first short strangle can pay us is $2 per share.

- **Breakeven**: The synthetic long mirrors stock ownership starting a bit below today's share price, while the short strangle has break-even points at $37 and $45 (although at higher prices than today's, our synthetic long will be making money even if the short strangle is break-even).
- **Follow-up:** The plan is to keep writing strangles, at various strikes, to earn income, and ideally see our synthetic long tick up in value, too.

Alternative Trades

- **IRA friendly:** If you're unable or unwilling to write puts (even cash-secured), then you can consider using a buy/write order to buy at least 100 shares of stock and sell to open the November 2014 $43 calls. Start about a 1.8% allocation and be ready to add more if the stock falls and we accept more shares; or, start a 3.5% allocation and don't plan to add later.
- **Traditional covered strangle:** Rather than use a synthetic long, if you prefer you could simply buy shares in 100 round lots and then sell the same short strangle we are. The benefit is you get the dividend (although that is imputed in the options prices) and it may present a more favorable tax situation if you own shares for more than a year.
- **Managing less than $200,000?** You can consider just buying 100 shares to write the covered calls on them, as long a it keeps your allocation below 3.5%.

Pro Can Help

- **Want more on this strategy?** Dust off our guide to covered strangles, and synthetic longs, too. We're just combining the two into a synthetic covered strangle.
- **Questions?** Visit our revitalized Expeditors board.

Guidance Changes: Skyworks, Tupperware, and Wells Fargo

Published Aug 14, 2014 at 1:02PM

Greetings, *Pro* members.

You might suspect we're just making small guidance changes to the stocks that are at the *end* of our portfolio's list of names alphabetically (S, T, W). In fact, we're moving these Buy stocks up to Buy First simply to reflect the reality that we recently bought shares in all three, and analyzing our portfolio, we *still* would buy shares of these three first today, along with our other Buy Firsts. So, they belong in that group. We also want to round out our Buy First "portfolio," if you will, into more industries.

So, these three companies are moving from Buy to Buy First today:

- **Skyworks Solutions** (NASDAQ: SWKS)
- **Tupperware** (NYSE: TUP)
- **Wells Fargo** (NYSE: WFC)

They join **American Tower** (NYSE: AMT), **Gilead Sciences** (NASDAQ: GILD), **Oracle** (NYSE: ORCL), and **TD Ameritrade** (NYSE: AMTD) as our seven Buy First stocks.

We believe our Buy First stocks represent an attractive risk-to-reward prospect. We're not suggesting that they'll provide the biggest gains, but simply that their potential comes with especially reasonable risk. If you're first starting to invest, you want to invest your money in stable places as you slowly build to a full portfolio. Thus, that's how we think about our Buy First stocks.

For allocation guidance and more, see our Recommendations page (and there, click any ticker to get to its snapshot page).

Parexel's Ps: Performance, Profits, Partnerships

Published Aug 12, 2014 at 2:14PM

Pro's Take: PRXL Q4-2014 Earnings

Parexel International (NASDAQ: PRXL)

Quarter Quick Take

Parexel ended its fiscal 2014 with a bang. Backlog finished over $5 billion and cancellation rates are continuing to trend down, both of which bolster our belief that the partnership model between large pharma and select CROs is gaining traction. In fact, Parexel announced it won a new partnership via competitive negotiation during Q4, but it didn't spill the beans on who it is. The company's financial model played out beautifully: 10% revenue growth and meaningful (+320 bps) operating margin expansion resulted in 30% earnings growth. This business momentum prompted management to raise the low end of its FY-2015 revenue and EPS guidance.

....

Q4-2014 | FY-2014

Sales growth: +10% | +12%

Operating profit margin: +320 bps to 11.4% | +248 bps to 10.3%

EPS growth: +30% | +28%

....

Guidance Update

Business continues to track well against our thesis. Parexel's largest business segment, CRS, is leading the way in growth and operating improvement. The company's Consulting and Informatics segments continue to grow, but at more modest rates. Longer term, these businesses should be meaningful contributors to results too.

Accounting for the quarter's performance and the time value of money, I'm raising the estimate of fair value to $57 and keeping CAM at $40. Once the 10-K is filed, I adjust any assumptions as necessary and provide a FY-2015 year-end expected FV estimate.

Updated guidance: Buy (no change)

Recommended Allocation: 3.5%

Fair Value estimate: $57 (up from $54)

End of Fiscal Year expected FV estimate: To be updated once 10-K is available

CAM price: $40 (no change)

Members lacking a (full) position should feel comfortable purchasing shares today. If you've been paying attention, you know Parexel shares have been volatile so far. Customer concentration and a high multiple make this likely to continue, so we may look to be opportunistic with put writes. Our September 2014 $45 put options appear set to expire, at which point we will reassess.

Our Thesis

Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing market pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

The Most Important Things

1. ***Penetration and Backlog***: Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and provides evidence that the biopharma/CRO partnership model is winning. We'll check in on this driver annually, when the best data becomes available. In the interim, we'll monitor backlog trends to ensure Parexel is filling the pantry with future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth. Backlog's ability to explain future sales is influenced by conversion rates and cancellation rates, so we monitor this, too. Backlog grew 2% sequentially and 9% year over year. It has grown sequentially for five consecutive quarters now. The trailing book-to-bill is 1.16, a bit below the 1.20 goal, but strong enough to support 10% revenue growth going forward, and acceptable given the rising conversion rate trend (declining cancellation rates mean Parexel is converting more of its backlog into revenue). Parexel also announced a new partner (not named), which lends credence to our thesis that the partnership model will be adopted over time.

2. ***Margin Performance***: (I remove pass through revenue to more clearly track the business, so my numbers may be different from what is reported in the press.) Company gross margin expanded 133 bps sequentially and 369 bps year over year. The impressive improvement was driven by gross margin expansion in all three business segments. We expect this trend to continue, although not to this magnitude, with CRS and PI leading the way. The how is also important; much of the improvement appears to have life remaining – the only source of improvement that appears maxed out is the benefit from using fewer contract workers. I expect the next step higher to come from increased productivity of recent hires. SG&A is temporarily elevated due to important investments in the business, but company operating margins increased to 11.4%. This reflects 86 bps improvement over last quarter and 319 bps improvement over last year. Improved margins and SG&A leverage remain key to our thesis.

3. ***PI Business Trends:*** Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PC segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits. Revenue continues to grow (+7% during the quarter), and with a longer sales cycle we expect this growth to exhibit some lumpiness. New business awards and the pipeline for new business appear strong. Gross margin expanded sequentially (to 46.8%), and continues on its ascent toward 50%. The biggest contributors to this margin expansion have been scale and the shift of activities to low-cost countries. I expect PI to achieve 55% gross margins in seven years given its current product mix – performance is tracking nicely.

WWTN

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments pay off and continued growth of the Parexel Informatics technology segment.

Conference Call Notes

- On operating margins: The full-year adjusted operating margin (10.3%) was a record, and up 250 bps over FY-2013. Improved gross margins in each segment, controlled spending, and moderating headcount growth drove operating margins higher.
- On CRS: Q4 revenue growth was 12.3% and for the year was 11.6%. Gross margins expanded for the sixth straight quarter and management expects this trend to continue.
- On PC: Revenue grew 1.7% in the quarter and 6.7% for the year. Removing the HERON acquisition, PC actually declined a touch during Q4. Gross margins expanded nicely. Management is actively engaged in returning growth to this segment.
- On PI: Revenue grew 6.7% in the quarter and 17.3% for the year. Gross margins expanded. "*MyTrials basically is a platform that we have created where we can put our applications, but also competitive applications, or even legacy or internal applications can be put on. This is getting, I'd say, slow traction. And I say slowly – it's a relatively long sales cycle. We are finding out companies are really carefully evaluating whether they want to go with this platform, because once you make a commitment, this is a long – has a long future and it's not so easy to get off it. But it's gaining traction, and we're basically happy with the positioning, and feel it's obviously a great product from a technical point of view.*"
- On headcount: Parexel grew headcount by 5.9% during the year and now has 15,560 employees globally. The company is investing in training and development programs to ramp productivity and prepare for changing staffing needs.
- On cancellation rate: For the quarter, cancellations were 2.9% of beginning backlog. The rolling four quarter average cancellation rate was 3.7%, at the low end of the 3.5%-5% comfort zone.

- On the new partnership: CEO Joe Von Rickenbach said: "*I'm pleased to report that we recently were selected as a strategic partner to another of the world's leading pharmaceutical companies*." We don't know who it is yet, but Von Rickenbach noted it is a company Parexel has worked with for years. It also represents a competitive negotiation and highlights the strengths of Parexel as a partner relative to competitors. He went on to say "over time, you'll probably see more and more of these types of customers adopt some form of partnership or another. And this is an important one, of course, for us; and we're pleased that we won it, and also feel that there are some out there that we are still pursuing."
- On debt: Net debt was $77 million, up a bit as the company used its line of credit to repurchase some shares.
- On guidance: Due to the strong business momentum, management raised the low end of its revenue and EPS expectations for FY-2015. It now expects revenue of $2.13 b to $2.15 b and EPS of $2.57 to $2.75, about 15-20% growth and putting shares at ~20x EPS.

Pro's Earnings Lift Us to New Highs

Published Aug 11, 2014 at 4:02PM

Dear *Pro* member,

Another quarter of earnings is wrapping up, and we like what we've seen from *Pro* companies. We see consistent management. We see clear business strategies. We see prudent use of capital with growing returns. We see more opportunities ahead. We don't hear many excuses.

Only a handful of *Pro* companies have yet to report:

- **Medtronic** (NYSE: MDT), due Aug. 19
- **The Buckle** (NYSE: BKE), due Aug. 21
- **Five Below** (NASDAQ: FIVE), due Sept. 8 (estimated)
- **Oracle** (NYSE: ORCL), due Sept. 15 (estimated)

The rest have already been to the rooftop to shout out results. Highlights include:

- **AIG** (NYSE: AIG) showed profitability in its underwriting business, and the new CEO wants to maintain the path of improvement AIG is already on. We like his steady approach and lack of bravado.
- **AmTrust Financial** (NASDAQ: AFSI) grew book value to a new high as fee income increased and insurance profitability remains strong.
- **Facebook** (NASDAQ: FB) grew revenue, margins, and earnings more than expected as mobile ads continue to gain traction and please customers, who are willing to pay more. Even though Facebook predicts higher spending in order to grow — much as a young **Google** (Nasdaq: GOOGL) always increased its spending — growth may swamp its costs.
- **MasterCard** (NYSE: MA) grew net revenue 13% and earnings per share 14% even as spending around the world remains tepid. The company is taking market share from paper money, and when economies get stronger, MasterCard should grow even more.
- **OpenText** (NASDAQ: OTEX) grew new license sales 27%, a great initial showing for its new suite of products.
- **O'Reilly Automotive** (NASDAQ: ORLY) grew same-store sales 5.1%, continuing its incredibly long streak on this metric and so many others. It sees plenty of room to keep adding new stores.
- **Papa John's International** (NASDAQ: PZZA) cooked up more pizzas than ever before in the most recent quarter, and even though Wall Street was disappointed with earnings because the company is spending for future growth, we agree with the strategy, and we view it as upside just waiting to be capitalized on.

And on our list goes.

In cases where companies hit an earnings snag and a stock declines, we may have a chance to step in and buy more. I believe we obtained an attractive price on the additional shares of **Tupperware** (NYSE: TUP) we recently purchased, at $72.90 with a 3.7% dividend yield, as well as our newest **Wells Fargo** (NYSE: WFC) purchase.

You can see full earnings coverage of our companies in our weekly email sent to you today with this Memo, or by visiting the *Pro* site. Overall, as well as our companies are performing, many are trading at value multiples that reflect this strength. In a weaker market, any could fall 10% and we wouldn't be surprised. We can't reasonably trade around that possibility, so we would wait it out, or we'll hedge if we see reasonable opportunities.

The Portfolio

On the whole, the portfolio is reaching new highs today even though the major market indexes are still decently below theirs. That's great for us, because our North Star is always making new highs, too, and even in a strong market you can see how difficult it is to keep up with our goal — our aspirational North Star. We're doing so this year, barely, as our year-to-date numbers show:

	Annualized		
	Since Inception	Rolling 3-Year	YTD
***Pro* Portfolio**	**13.6%**	**12.1%**	**6.6%**
North Star	**8.6%**	**9%**	**6.6%**
S&P 500 Total Return	13.3%	16.8%	5.7%
MSCI World	8.4%	9.5%	3.2%
*Start close of 10/6/08.			

Performance as of 7/31/14.

Since our inception nearly six years ago, we've generated a very healthy annualized cushion above our North Star, but we may need that the next time the market takes a tumble (assuming we're net long, not net short). You can always see our annualized returns at the bottom of the Recommendations page, updated monthly using our brokerage statement.

The exceptional news behind our approach is that we have been, and remain, only about 70% exposed to the market on a look-through basis. We're 72% net long right now, and have only been about 70% net long most of this year, and the past five years, yet we're doing better than the indexes. Here's the breakdown:

Exposure

Long	86.6%
Short	14.4%

Net Long	72.2%
Hedged Out	0%
True Long	72.2%
Cash Ex-Shorts	14.9%
Short Puts	5.6%
Free Cash	9.3%

As of 8/7/14.

That table, too, is at the bottom of the Recommendations page. We often celebrate our returns in the context of our exposure because these results are extremely rare in the world of funds — whether it's a mutual fund (most of which are 98% long all the time, and still trail the S&P 500), or a hedge fund (which on average are doing terribly, on a relative basis *or* absolute basis, since 2009).

Earning strong returns with less risk is the best of investing, at least for those who dislike extreme roller-coaster rides, or who know they might react poorly to steep losses.

Our work is always ahead of us, though, rather than behind us. We need to keep our eye on our positions, our hedges, our big-picture strategy and goals, and always keep learning and thinking — and adjusting to stay on the course we believe is best. That's much more possible when you keep your eyes on the horizon.

I hope you're enjoying August. Fool on!

— Jeff (TMFFischer)

Pro Completed Trades (see all trade alerts)

- **Skyworks Solutions** (NASDAQ: SWKS): We bought a 3% stake (1,300 shares) at $51.42.
- **Intel** (NASDAQ: INTC): All of our shares were called away. For those who kept shares, we recommend continuing to own them if they fit into your portfolio well and you want to avoid taxes. Alternatively, reduce your approximate 6% stake in Intel to 3% to make room for a 3% stake in Skyworks. To match us, though, you would sell your entire stake. Just realize that we may target Intel for put writing later down the road, so selling may prove unnecessary. We don't know.

Pro's Take: AIG Q2 2014

Published Aug 8, 2014 at 11:17AM

What?

- Fair Value estimate increases from $62 to $64 (representing 0.85x book value)
- Consider Adding More increases from $46 to $48 (representing 0.61x book value)

($ in millions)	Q2 2014	Q2 2013	Change Y-o-Y
Total Revenue	16,105	17,315	-7%
After-tax Operating Income	1,833	1,781	10.8%
Net Income	3,073	2,731	12.5%
EPS	$2.10	$1.84	14.1%
Book Value Per Share	$75.71	$66.02	14.7%
P&C:			
Pre-tax Op. Income	1,355	1,205	12.4%
Combined Ratio	98.8	102.6	
Loss Ratio	64.6	68.0	
Expense Ratio	34.2	34.6	
Life & Retirement:			
Pre-tax Op. Income	1,180	1,151	2.5%
Mortgage Guaranty:			
Pre-tax Op. Income	210	73	187.7%

CEO Bob Benmosche: "*AIG's results in the second quarter were solid. Overall, our businesses demonstrated our continued discipline and resilience, underscoring our focus on improving the results of our core insurance businesses. In many ways, this quarter, my last as President and CEO of AIG, was punctuated by two significant milestones: the completion of our sale of ILFC to AerCap, which marks the last disposition of AIG's non-core businesses, and the appointment of Peter Hancock to succeed me as AIG's next President and Chief Executive Officer.*

We are pleased with the strong performance across all of our Property Casualty, Life and Retirement and Mortgage Guaranty businesses. Our operating results demonstrate our continued progress, and it was another very active quarter for capital management activities. As we look toward the future, I have every confidence that Peter will lead AIG to even more sustainable prosperity in the days and years ahead. Under Peter's leadership, I have no doubt that we will continue advancing our core strategies and priorities with integrity and a profound sense of the responsibility that AIG exceed the expectations – financial, regulatory, and community – of all of our stakeholders."

So What?

This was a strong quarter for AIG (NYSE: AIG), with good (but not spectacular) operating results aided by the benefit of some non-operating items (to be discussed in the following paragraphs). After recently moving AIG to "Buy" from "Buy First" (alert here and more discussion here), I was very happy to see the strong performance in this transitional quarter, as the company closed its final divestiture of a non-core business (ILFC, the aircraft leasing business) and CEO Bob Benmosche retired, setting the stage for the next era of AIG under new CEO Peter Hancock.

As for Hancock, I was very curious to hear his comments on the call in order to assess his management style and temperament, and I was not disappointed. Although not as brash as Benmosche, Hancock came off as intelligent, measured, and capable. Here are a few candid quotes from Hancock that bolster my confidence in his leadership:

> *"There's 3 points I'd make. One is that there will be no abrupt change in strategy. This is clearly a vote for continuity. We're on the right track. We're in execution mode. Second, I remain very committed to focusing on value versus simply bulking up the volume of the company. And third, I will not be replacing myself with a Head of Property Casualty sector."*

I like the comment about value versus volume. In insurance, disciplined underwriting means being willing to forgo revenue growth in order to maintain profitability. I like Hancock's thought process here.

> *"While we have said that no one quarter marks a trend..."*

> *"Our focus remains on balancing growth, risk and profitability right across AIG."*

> *"We continue to expect the accident year loss ratio to decline for the remainder of the year but at a slower pace than we've seen in the last couple of years."*

> *"Commercial Insurance net premiums written declined slightly from the same period in the prior year, primarily from our decision to walk away from certain risks."*

> *"And at this point, to speculate on the exact pace is to speculate on the market cycle."*

All of these comments demonstrated frankness, a willingness to admit obstacles in the road, and a measured and cautious approach. All of these characteristics are very important in insurance, where over-aggressiveness and carelessness can blow up in your face (as AIG itself knows!).

Overall, Hancock seems like a very grounded leader that knows what he has to do to continue AIG's improvement. He also provided some insight on the investments AIG is making to improve its underwriting and insurance operations:

> *"...we are very focused on making the whole company more -- flatter in the hierarchy. And so we want to minimize the layers of management between the CEO and the trenches to improve our responsiveness to customers and markets."*

> *" we are diversifying our book of business, so we're less subject to the cycle and are focusing on subsegmentation at a more and more granular level so that we have greater confidence in these trends in a more sustained way."*

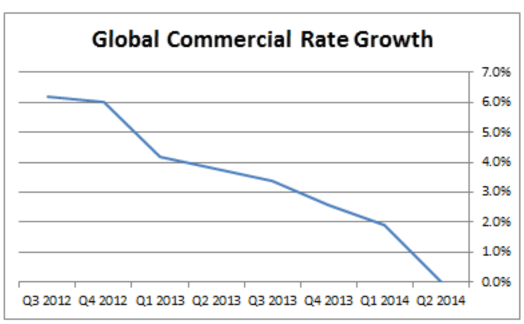
> *"So an enormous reunderwriting of the book over the last 4 or 5 years, a quite considerable change in our claims practices. And so the emergence of loss trends has a fair amount of noise in it. So our actuaries are being quite cautious in recognizing improvements. And we are always on the lookout for any emerging threats."*

> *"While overall rate trends are a metric that we and others disclose, we believe it is the granularity and agility of our pricing strategy that has the greatest impact on our margins."*

> *"Commercial Insurance net premiums written declined slightly from the same period in the prior year, primarily from our decision to walk away from certain risks."*

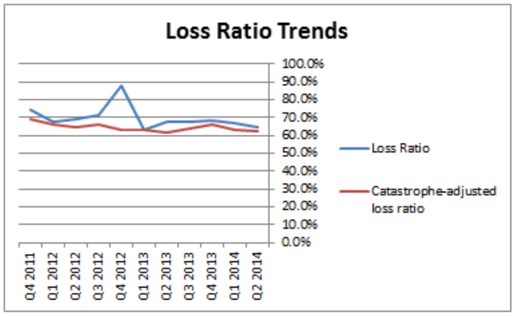
Some pretty encouraging remarks from the new CEO that, along with this quarter's improved performance, suggest continued improvements on the horizon.

Regarding this quarter's improved performance, the key metric we watch is the P&C Segment combined ratio. Pro members following AIG should know by now that a combined ratio below 100% means that the company is earning an underwriting profit. At 98.8%, this quarter's performance was very good, especially in the context of the fact that the combined ratio has been above 100% for the prior 4 quarters. Global commercial insurance rates were flat compared to the year-ago period, making this quarter's performance even more impressive (rate increases make insurance companies more profitable, all else equal). I wrote last quarter that *"the rate of pricing rate increases has been slowing (decelerating from over 6% growth in late 2012 to just below 2% this quarter), which will act as a headwind to combined ratio improvements if the trend continues"*. Now that commercial rate growth was flat, I suspect that quote will continue to come into play in the quarters ahead:



Source: AIG Earnings Presentations

The loss ratio (claims paid/premiums collected) also continued its trend of improvement, although it's important to note that AIG experienced a significantly lower rate of catastrophe losses than it has in prior quarters, so there may be some noise here and we can expect continued lumpiness. But nonetheless the trend is encouraging, and Hancock's comments on underwriting discipline suggest that we might be seeing more improvement when we zoom out and look long-term (again, short-term will be volatile and lumpy, as you can see in the graph):



Source: Company filings

As I mentioned above, the net of some non-operating items added significantly to EPS, most notably the close of the sale of ILFC. That sale led to a $1.4 B after-tax gain on sale, adding $0.96 per diluted share to EPS. Additionally, AIG spent $1.1 B on share repurchases, a value-accretive move with shares below fair value, adding some juice to the per-share numbers.

Despite the non-operating items, operating performance was still very good, with after-tax operating income up nearly 11% year-over-year, ROE of nearly 12%, book value per share up nearly 15% year-over-year to $75.71, and the small (2-5% of total AIG pre-tax operating income) Mortgage Guaranty business showing a 188% year-over-year increase in pre-tax operating income. Revenue declined 7% year-over-year to just over $16 billion, something I'm fine with as Hancock's focus on value over volume shined through.

Overall, it was a strong quarter and one I've been waiting for – performance that adds some strength to the case for our investment thesis – that underwriting profitability will improve and that AIG should be able to earn an ROE of 10% over the long run. Let's wait a few months and see if the business can keep up its newfound momentum.

Now What?

- P/B: 0.69 (down from 0.74x last quarter)
- ROE: 11.6%
- Market Cap: $76.3 billion
- Fair Value (updated): $64 (up from $62)
- Consider Adding More (updated): $48 (up from $46)
- Allocation: 3.7% in stock and about 0.7% in warrants or LEAPS
- Status: Buy

After recently notching AIG down to Buy from Buy First, this quarter's performance strengthens our investment case. Another quarter of good performance might make us reconsider whether we want to bump AIG back up to Buy First (of course, depending on where the stock price goes). This quarter's performance was enough for us to tick up our Fair Value and Consider Adding More to $64 and $48, respectively (to account for an increase in book value) and we have an allocation of about 3.7% in stock and 0.7% or so in warrants or LEAPS. Members who have yet to match our allocation should feel free to do so at the current valuation.

Fool on!

OpenText Sells More Software

Published Aug 7, 2014 at 3:45PM

Greetings, Fools.

==

Pro Guidance Update

• Fair Value Estimate increases to $52 (up from $44)

• Consider Adding More goes up to $45

• Still a Buy, and we're happy to own 3.6%

Summary: New license sales jumped 27% at **OpenText** (NASDAQ: OTEX) and margins jumped as the new software that debuted a few quarters ago starts to gain traction; separately, the GXS acquisition is starting to integrate. Management projects continued strength given its strong, new product lineup and industry growth of around 10%. Little else changed in the business the last 90 days, but the numbers certainly indicate how strong the financials can be when sales gain ground.

Q4 2014 Results

• Revenue: +42%

• Diluted EPS: +46%

• License Revenue: +27%

• Oper cash flow: +108%

Background

OpenText (NASDAQ: OTEX) sells enterprise information management (EIM) software via cloud and license sales to organize and manage electronic content, business processes, regulatory and other data for customers. It also conducts, invoices, and manages business transactions through its GXS acquisition. The company's sales are spread across industries, governments, and geographies.

Pro's thesis: The enterprise information management (EIM) software industry will grow by about 10% annualized, and OpenText will grow at least that quickly over time. In addition, OpenText will be a leader in business exchange transactions, and recurring, fee-based revenue will grow.

Guidance: Shares remain a Buy at a 3.6% allocation. If you're using options, you can also write puts to potentially buy shares or target income. Looking ahead at the newly merged business with GXS, we should see value ratios back to average or below-market average multiples in about a year (11x EBITDA, 13x EPS).

Overview

- Debt/Equity 80.3% (we'll want to see this trend down; down from 85% last Q)
- Debt/Capital 44.5% (down from 46%)

=========================

Fiscal 2014 Results

• For fiscal 2014, revenue grew 19.2% to $1.62 billion, with 54% of sales in North America.

• License revenue grew a strong 10.6% (almost all of it organic).

• Cloud revenue grew 108% and gross margins jumped to 62.5% from 58.4%.

Q4 Conference Call Notes

• Q4 adjusted operating margin was 32.8%, up from 29.5% the prior quarter

• The company has increased its guidance for non-GAAP operating margin to between 28% to 32%

• Q4 adjusted net income grew 52%

• CEO Barrenechea: "The more we can help our customers simplify, transform and accelerate their information needs, the more successful we will be. Collectively, this is what we call Enterprise Information Management, or EIM. We have never been more aligned with those priorities of our customers, and you can see this in our Q4 and full year results."

• Average deal size grew to $429,000 including 16 deals at $1M+, and 10 cloud bookings over $1M, including wins over IBM. "We win more than we lose."

• The company is in the middle of a strong product cycle with its EIM suites and B2B services both. They'll unveil next gen Blue Carbon in November. It centers on Cloud Services, applications, analytics and will extend naturally from OTEX's current suites (Red Oxygen).

• The company is looking to expand its B2B integration efforts, and is expanding its sales effort.

• OTEX looks to put $3 billion of capital to work over the next few years, looking to acquire and invest to grow.

• Organically, OTEX grew revenue 8% this year while the industry is growing 10% to 11%, so it has more work to do to capture more share.

Fighting Cheese and Taking Share

Published Aug 7, 2014 at 11:15AM

Pro's Take: PZZA Q2-2014 Earnings

Papa John's International (NASDAQ: PZZA)

Quarter Quick Take

Papa John's continues to sling pies at an impressive rate: North American restaurants increased comps by +6% and International restaurants increased comps +9%. Limited time offers and continued migration to digital ordering (which garner higher average tickets) helped drive comps higher. These growth rates suggest continued market share gains at the expense of smaller rivals, and likely other large pizza chains. Modest new unit growth (47 more restaurants than Q1-2014, about +1%) added a bit more growth to the topline. But the growth stopped there; The Company shielded franchisees from rising cheese and prices at the expense of commissary margins and continued spending to roll out the new point of sale system (called FOCUS) ate into profitability – operating profit was flat and net income dipped. Debt fueled buybacks boosted EPS. Overall, Papa John's is carrying out its strategy well (as evidenced by the systemwide comp sales and recent announcement of being voted the highest customer satisfaction among major pizza chain by ACSI for the 13th year out of the last 15) but financial results are lagging business results – a problem that I believe is only temporary.

....

Q2-2014

Total revenue growth: +9%

Operating profit margin: -63 bps to 7%

EPS growth: +3%

....

Guidance Update

Papa John's is currently a Buy. The current headwinds don't give me reason to adjust my longer-term assumptions. Papa John's is doing the right things for long-term success: supporting franchisees during a time of rising commodity costs, investing in technology to drive sales and productivity, and maintaining its focus on quality. There will be more bumps in the road as the company expands internationally, but I believe the long-term economics of the business remain intact and that share are modestly undervalued.

Updated guidance: Buy (no change)

Recommended Allocation: 3.5%

Fair Value estimate: $46 (up from $45)

End of Fiscal Year expected FV estimate: $49

CAM price: $35 (up from $34)

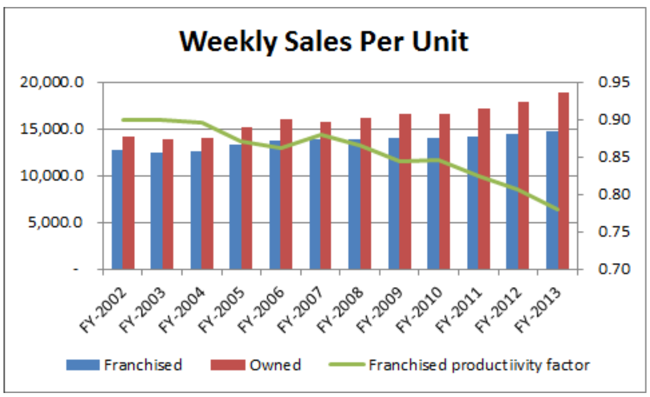
PZZA shares have fallen about -8% this year and about -24% from their high – completely attributed to valuation compression. Shares fell from an EV/EBITDA multiple of 17x to 13x, which is a discount to other prominent franchise operations like **Domino's** (NYSE: DPZ) 15x and **Dunkin' Brands** (NASDAQ: DNKN) 17X. Once Papa John's begins to translate its business success into financial success, we should begin to see that discount narrow. We got a nod from the Board that future cash flows should be strong as indicated by the 12% dividend increase ($0.56 per share, up from $0.50).

Our Thesis

Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main QSR-pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only 1,000 international restaurants the company has a long runway for growth. Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1. ***Store Performance:*** Without healthy franchisees Papa John's has no business. Same store sales offer one look into store performance, but we also track sales per store, store-level profitability, and how all of this translates into the pipeline of committed new franchisees. During Q2-2014, systemwide restaurant sales increased a +10%. Domestic stores experienced strong +6% comp growth while international comps increased +9%. Management raised comp sales guidance for the year to +4% to +6% for North America stores and to +6% to +8% for International stores. This was a disappointment given both domestic and international comps stand at +8% through the first half of the year We won't know more about store-level profitability until the end of the year. Overall, the solid restaurant performance keeps franchisees signing up: PJ opened 265 restaurants (net) in 2013 and expects to open 220-235 (net) in 2014, which was narrowed from 220-250. Its pipeline consists of 300 domestic commitments (to be opened over the next three years) and 1,100 international commitments (to be opened over the next six years).

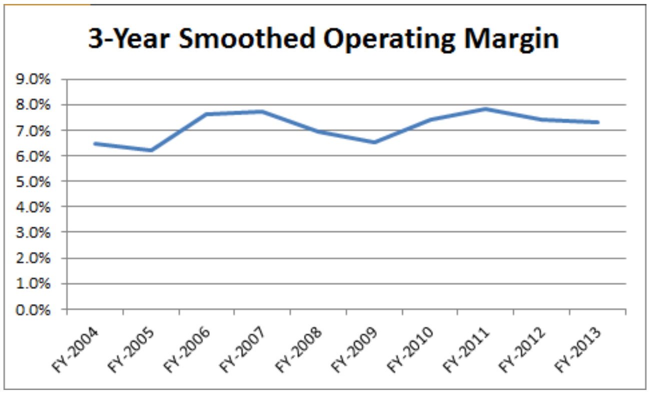


2. ***Brand***: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantaged and higher price per pie. Papa John's domestic outperformance and share gains suggest its brand positioning remains strong. Management is as committed to quality and the "better ingredients, better pizza" mission as ever, as evidenced by: continued drum-beating on conference calls, consistent media messaging, increasing the franchisee marketing spending rate, and the hiring of a new marketing agency to spread the message beyond television. Papa John's continued its winning ways in the ACSI customer satisfaction survey (just released). The company scored the highest among its pizza chain competitors for the 13th year in the past 15, and extending its streak to three.

ACSI Customer Satisfaction Scores

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Papa John's	76.0	77.0	78.0	76.0	76.0	77.0	78.0	79.0	77.0	76.0	75.0	80.0	79.0	83.0	82.0	82.0
Little Caesar	70.0	69.0	70.0	74.0	75.0	74.5	74.0	77.0	75.0	75.0	75.0	78.0	80.0	82.0	82.0	80.0
Domino's Pizza	67.0	69.0	73.0	75.0	75.0	73.0	71.0	75.0	75.0	75.0	77.0	77.0	77.0	77.0	81.0	80.0
Pizza Hut	68.0	70.0	71.0	70.0	75.0	73.0	71.0	76.0	72.0	76.0	74.0	78.0	81.0	78.0	80.0	82.0
Limited-Service Rest. Avg.	69.0	70.0	71.0	71.0	74.0	75.0	76.0	77.0	77.0	78.0	78.0	75.0	79.0	80.0	80.0	80.0
Papa John's	**76.0**	**77.0**	**78.0**	**76.0**	**76.0**	**77.0**	**78.0**	**79.0**	**77.0**	**76.0**	**75.0**	**80.0**	**79.0**	**83.0**	**82.0**	**82.0**
Competitor average	68.3	69.3	71.3	73.0	75.0	73.5	72.0	76.0	74.0	75.3	75.3	77.7	79.3	79.0	81.0	80.7
Gap	7.7	7.7	6.7	3.0	1.0	3.5	6.0	3.0	3.0	0.7	(0.3)	2.3	(0.3)	4.0	1.0	1.3

3. ***Margins***: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. In the near term, we expect Papa John's to continue to spend heavily to support the build-out of its technology platform, new POS system, and international infrastructure. This trend continued in Q2-2014, exacerbated by spiking cheese prices, and operating margins declined by 63 bps to 7%. Eventually, PJ should leverage its buying power and corporate overhead to improve margins and drive cash flow. Although PJ isn't demonstrating operating leverage right now, temporary blips don't mean that the long-term economics of the business won't play out.



WWTN

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near term headwinds (commodity prices and technology investments) should prove temporary and Papa John's should deliver improved financial performance.

Conference Call Notes

- On units: PJ opened 47 net global units during the quarter, with 42 of those international. Management narrowed its expected unit opening range to 220-235 from 220-250. It looks to me like that is more of a timing thing, because at the same time, the pipeline of domestic restaurants expanded from 200 to 300.
- On Papa Rewards: PJ was the first national chain to launch a loyalty program (2010) and it continues to grow in popularity. In fact, Bond Brand Loyalty announced survey results that show Papa Rewards was the highest rated QSR rewards program. Members are "proud" to be in the program (a reason that finished ahead of the actual rewards portion, and was a rarity among programs) and the program received scores higher than Starbucks!
- On Steve Ritchie promotion: After Tony Thompson was poached, PJ promoted from within to fill its COO slot. Schnatter said: "*With all the success we have had, Papa John's has become an example of constant team member advancement and opportunities. A people growing machine, if you will. Over the past quarter, we have made ten management changes with nine leadership promotions, including the promotion of Steve Ritchie to COO. Now, Steve started out as a driver. At $4.50 an hour, more than 18 years ago, and working his way up as director of operations and Vice President of global operations support and training to now COO. Steve is the ideal individual to lead Papa John's to its next stage of growth and is a great example of the opportunities Papa John's is able to provide for hundreds and hundreds of hard working team members who put dignity into their work.*"
- On digital ordering: Domestic digital sales continue to climb well over 45%, and nearly 60% of all delivery sales came through digital channels.
- On the quarter: CEO John Schnatter said: "*In short, from our quality to our digital capabilities to our new marketing creative, we are firing on all cylinders right now and we are gererating a lot of momentum that continues to lead to increased sales and increased market share. But remember, it all starts with quality. And our consistent focus on it continues to resonate with customers. During the quarter, for the 13th time in the past 15 years, consumers recognized us as a leader in customer satisfaction by rating Papa John's number one in the survey.*"
- On Guidance: PJ reaffirmed its 2014 full year EPS guidance ($1.64 to $1.72 – putting shares at 25x earnings at the midpoint). However, it raised domestic comp expectations to +4% to +6% and international to +6% to +8%.
- On future financial performance: "*The market share we are gaining through our strong sales bodes well for higher earnings growth once commodities return to more normalized levels.*"
- On FOCUS: The last system is 18 years old, so all of the hardware is being upgraded. The software is designed to improve order entry (to increase speed and accuracy). It will also have an enhanced graphical driver dispatch system and routing capabilities. It should help franchisees better manage labor, and it introduces biometrics with the intention of helping loss prevention. The roll out will hurt EPS by $0.08 this year, but benefits should begin to show in 2015.
- On commissary: PJ reiterated that it manages commissary margin on an annual basis, so this temporary margin hit will be made up in the back half of the year, hopefully as commodity prices moderate. Taking the hit on margins is designed to smooth out costs for franchisees.
- On Corporate China stores: Sales growth hasn't played out as expected. PJ has 210 stores in China and franchised units are outperforming company-owned units. PJ is stepping up its marketing efforts a bit and trying to learn from the success of its franchise units.

Buy Skyworks Solutions

Published Aug 5, 2014 at 2:09PM

How You Participate

- **Action:** Buy **Skyworks Solutions** (NASDAQ: SWKS).
- **Allocation:** 3% (*Pro* will buy about 1,200 shares).
- **Scorecard Status:** Buy
- **Fair Value Estimate:** $64
- **Recent Price:** $51.55
- **Price Guidance:** Use a limit order and initially aim to pay less than $52.20. As prices change over time, this starting guidance loses relevance, and our guidance remains "**Buy**" until that officially changes.
  .

What We're Thinking

Skyworks Solutions makes technology that powers wireless connectivity in everything from **Apple** (NASDAQ: AAPL) and Samsung smartphones and tablets, **Medtronic** (NYSE: MDT) medical devices, to **Google** (NASDAQ: GOOG) and **General Electric** (NYSE: GE) products. Dubbed the "Internet of Things," the world is starting to connect billions of new objects to the Internet, and Skyworks is uniquely positioned to benefit. Not only does it serve all of the top-tier mobile computing device makers, but Skyworks is also diversified across industries to serve more than 2,000 customers.

The company sells more than 2,500 high-performance analog semiconductors and related products (supported by nearly 1,000 patents), including amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more. They're often sold together into a phone or any connected device. Skyworks earns industry-beating operating margins of 30.5% selling specialized solutions to giant customers with growing connectivity needs. Here are just a few examples:

- GE plans to make all of its industrial products (from jet engines to turbines) Internet-enabled.
- Medtronic will connect many of its medical devices to the Web for monitoring.
- A majority of new automobiles will be connected to the Internet by 2017.
- Smartphone sales are expected to surpass 1 billion units by 2016.
- Plus, wearable technology is likely to come into vogue.

All told, **Cisco Systems** (NASDAQ: CSCO) expects 25 billion devices will connect to the Internet by 2015, and 50 billion by 2020.

Skyworks is already benefiting, and it's ready for much more. As CFO Donald Palette said in July, "We've spent the last decade investing significant resources and leveraging our technology to expand our presence in traditional analog markets like automotive, medical and industrial. We have established significant traction in these higher-margin growth avenues, and we see tremendous opportunity ahead."

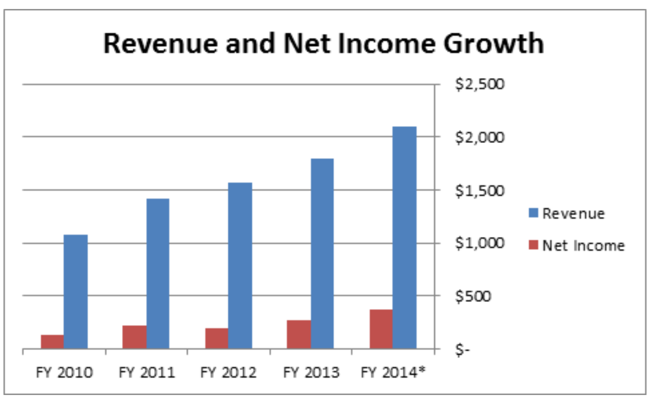
Whatever device is being connected to the Internet, the smaller, more complex, and more efficient the technology needs to be, the more it benefits Skyworks. Not only that, but the more data flowing through networks, and the more connection nodes needed, the more Skyworks products are needed. Palette said in the July conference call, "Complexity for us drives profitability. And there are fewer and fewer people in the space that can do it," even as complexity accelerates. Given this, Skyworks expects profit margins to continue to move higher. It is helped in this regard by having its own manufacturing facilities for many differentiated products, and contracting the rest.

Following the company's most recent earnings report, CEO David Aldrich said, "Skyworks is entering a new and exciting growth phase driven by global wireless proliferation and the Internet of Things. Quite simply, we are capitalizing on the macro trend to connect virtually everyone and everything, all the time." But most significantly, he continued: "Skyworks is setting the pace for analog semiconductor industry growth in terms of both revenue and value creation."

How It Fits Into *Pro*

We seek financially strong companies with growing market opportunities and proven management. We want to see strong growth in free cash flow as revenue grows. That's particularly true (and rare) with semiconductor companies, which too often grow revenue but struggle to balloon profits at the same time. Here, Skyworks stands out. Since 2010, revenue has nearly doubled from just over $1 billion a year to $2 billion the past 12 months. Over the same time, operating income is up 138% to $473 million as margins expand. Net income is up 168% to $367 million. Free cash flow the past 12 months is $565 million, up 322% from fiscal 2010. Finally, the balance sheet is strong, with $893 million in cash and no debt.

Valued around $9.8 billion, the stock trades at 17.3 times free cash flow, and 16.5 times $3.13 in normalized earnings per share expected for the year ending September (right around the corner, and likely in the bag). Conservatively, normalized earnings per share are estimated to grow another 25% by September 2015, putting the stock at 13 times estimates 14 months ahead. In the July conference call, management spoke of hitting $5 per share in earnings before long, as revenue grows and margins float higher.



*On a run-rate basis.

- **HQ:** Woburn, Mass.
- **Founded:** 1962
- **Employees:** 4,750
- **Market Value:** $9.8 billion
- **TTM Revenue:** $2 billion
- **TTM Net Income:** $367 million
- **TTM Free Cash Flow:** $565 million
- **P/FCF:** 17.4
- **Most Recent Quarter Sales Growth:** 35%
- **Most Recent Quarter EPS Growth:** 54%

Yet this is all short term. It's the long term that interests us. Skyworks plans to continue to expand its portfolio, is investing in sensors, and wants to add to its Internet of Things portfolio, perhaps with acquisitions. The company foresees "sustainable above-market growth" as far forward as it can look, and leans conservative with its long-term guidance of annualized *industry* growth rates in the mid-teens. Its gains in market share partly come at the expense of single-component manufacturers, who are getting squeezed by increasing complexity that asks for full, or modular, and specialized solutions like Skyworks provides.

As to our portfolio: As we let our **Intel** (NASDAQ: INTC) shares get sold, we're letting go (for now) of an excellent but slow-growing semiconductor company, one that is far from turning a profit on mobile computing, and that still struggles to have much relevance in smartphones and tablets. We replace it with a business creating strong, growing value in Internet connectivity — and in mobility — for a wide array of objects, and trading at a lower multiple to free cash flow than Intel. Skyworks also complements *Pro*'s investment in cell-tower owner **American Tower** (NYSE: AMT), fitting our thesis that mobile connectivity will grow for years. The riskiest overlap in the portfolio is arguably with Apple, a major customer for Skyworks, but one that is becoming a smaller piece of the revenue pie as the broader Internet of Things grows.

The Foolish Bottom Line

Skyworks' CFO said in July, "We take a very long-term strategic view of our business, and we think we're positioned extremely well. I don't think we've ever been positioned as well as we are today for the long term." We make this investment with solely the long term in mind, too. If management continues to execute, demand should flourish, and it's plausible our investment at least doubles in five or six years. Meanwhile, today's valuation and the company's customer list for the coming year (and longer) should mitigate our risk while we wait. However, expect a bumpy ride. Chip stocks are volatile and cyclical, and technology evolves and always carries extra risk. Overall, though, a large, long-term move toward connectivity favors value creation at Skyworks.

Alternative Trades

- **Only want to target lower buy prices?** You can sell to open puts, one for every 100 shares you would buy at lower prices. Take your pick of options, but realize this is a Buy stock and we're starting with a direct 3% stake.
- **Synthetic long?** You could set up a January 2016 synthetic long instead, but in a taxable account that may not be as tax efficient as simply owning shares for years.

Pro Can Help

- **Feeling an urge to connect?** Ask questions and comment on the new Skyworks board, where we're ready to spark a discussion.

The Battle Between Your Ears

Published Aug 4, 2014 at 3:23PM

Fellow Fools,

It's official: I'm the newest member of the *Pro* and *Options* teams. Only a few short years ago I was a doctoral student in psychology who thought that investing was destined to remain merely my favorite hobby. But following a career-changing epiphany, a very Foolish internship, and an MBA, I now stand before you as a member of the newest Analyst Development Program cohort here at the Fool.

Many faculty members in the Ph.D. program (politely) asked me why I was leaving to study something that had little to do with the subject to which I'd devoted most of my life. My response was simple: These subjects are not disparate and my time spent studying psychology would be put to excellent use in my new field. That belief has only strengthened over time, and I can think of no better topic for my first Memo than some of the psychological traps I'll be working to avoid to help *Pro* continue racking up North Star-beating returns.

Anchoring

Our brains are hardwired to make comparisons. Although this can help simplify and speed up many of our daily activities (who wants to judge the intrinsic value of two different bottles of ketchup, anyway?), it can definitely be a detriment when it comes to investing. It's true that anchoring can lead us to stubbornly hold onto shares — when we really should sell — simply because we bought in at a higher price. But I think it is important to recognize that anchoring can also cause us to miss out on huge gains.

As investors, we need to focus on where the stock is *going*, not where it's been. I can remember more than a few friends proclaiming around July of last year — the time **Facebook** (NASDAQ: FB) finally climbed back up to its IPO price — that the time to buy was when it fell below $20 and now the opportunity had passed them by. As *Pro* members can attest, that type of thinking isn't just flawed; it's downright costly. The stock has climbed over 100% since then.

Sunk Costs

Have you ever spent hours and hours working on something only to realize it was never going to meet your expectations and it was time to move on? How'd it feel? If your response was "not good," don't worry; you're not alone. Our decisions are tainted by the investments (money, time, emotions, you name it) we make, and the more we invest in something, the harder it becomes to abandon. Much to the chagrin of many economists, we are not rational automatons. We fear losses of all kinds, even in the face of a reward that will far outweigh the risk. Or in the case of someone who is unable to objectively value a stock because of the amount of time and effort spent researching the company, we set ourselves up for financial losses because we are unable to treat our efforts as what they truly are — namely, sunk costs. For what it's worth, research has shown that we're not born like this, as children are less prone (link opens PDF) to falling prey to this trap. Perhaps it really does pay to never grow up.

Knowledge Can Be Dangerous

It can sow the seeds of overconfidence. Just ask the principals of the now-defunct Long-Term Capital Management. Its payroll included two of the three minds responsible for creating the most well-known options pricing model, and yet LTCM still managed to bring the global financial market to its knees. The fund-management firm crippled the financial world through its excessive leverage and mind-boggling $1 trillion worth of derivative exposure.

Extensively studying an investment opportunity and poring over various filings may lead you to a better understanding of the risks involved, but doing your homework doesn't make every firm-specific and macro risk magically disappear. Even so, it's only natural for your confidence to grow as the time you spend analyzing an opportunity multiplies. This is why it is imperative that any valuation embeds a margin of safety into the analysis.

And since this is my first Memo, I'll even throw in a bonus: Though knowledge of various psychological traps can give us a sizable leg up over other investors, it (unfortunately) does not make us immune to their influence. Trust me — I almost became a doctor.

Foolishly yours,

JP (TMFYossarian)

P.S. from the *Pro* team: Please stop by the Meet & Greet board and give a hearty welcome to JP!

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking*.

- **Gentex** (NASDAQ: GNTX): With earnings behind it, shares remain a Buy up to a 3% allocation.
- **Tupperware** (NYSE: TUP): Down sharply after earnings, the container guy's new price looks like a good entry point for those lacking a 3.5% stake.
- **Wells Fargo** (NYSE: WFC): Another good earnings report and a tick higher in our fair value estimate. If you lack a 4.1% position, get out your checkbook and buy.

Pro Completed Trades: Week of July 28, 2014

Published Aug 4, 2014 at 12:48PM

In the last week, *Pro* acted on its two most recent "Buy" recommendations.

- **Wells Fargo** (NYSE: WFC): We bought 500 more shares at $51.80, bringing our total stake in the leading bank to 1,700 shares, or 4.1% of the portfolio. The stock currently yields 2.8%.
- **Tupperware** (NYSE: TUP): We bought 300 more shares at $72.90, bringing out total stake in the container company to 1,000 shares, and 3.5% of the portfolio. The stock currently yields 3.7%.

Pro's Take: American Tower Q2 2014

Published Jul 31, 2014 at 9:39AM

What Happened?

- Total rental and management (R&M) revenue of $1.0 billion (the first billion-dollar quarter in the company's history)
- Domestic R&M segment revenue of $660 million (year-over-year core* growth of 30%)
- International R&M segment revenue of $346 million (year-over-year core growth of 39%)
- Adjusted EBITDA of $682 million (year-over-year core growth of 34%)
- Adjusted funds from operations (AFFO) of $474 million (year-over-year core growth of 31.4%)
  - Record per-share growth of 29.3%

*Core growth reflects adjustments for foreign currency exchange rates and prior period one-time items

Remarks From CEO Jim Taiclet

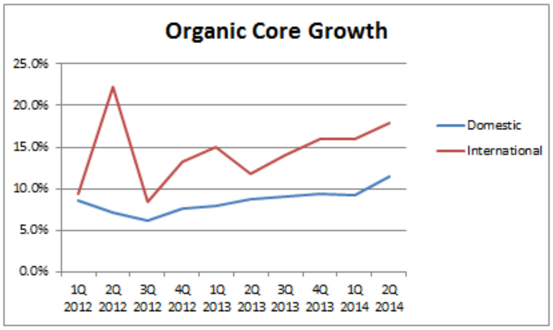
"Our second-quarter 2014 results exceeded our expectations across all key metrics due to strong global demand for our tower space. 4G coverage and densification initiatives by our major tenants drove Organic Core Growth of over 11% in the U.S., and significant investment levels by tenants internationally drove Organic Core Growth of nearly 18%. These strong Organic Core Growth trends, in combination with contributions from new assets, led to record AFFO per share growth in the quarter of over 29%.

We expect favorable leasing demand for communications real estate to continue and accordingly, we are raising our full year outlook for total rental and management revenue, Adjusted EBITDA and AFFO by $45 million, $55 million and $30 million, respectively."

So What?

Another outstanding quarter from **American Tower** (NYSE: AMT) as business results continue to blow past management's (and my) expectations. There's a lot of momentum in American Tower's markets, and management *again* raised its full-year 2014 outlook, even after raising it just last quarter. Growth rates continue to accelerate: organic core growth for the quarter clocked in at 11.4% (vs. 9.2% last quarter and 8.7% for FY 2013) and nearly 18% internationally (vs. 16% last quarter and 13.5% for FY 2013). The weighted average organic growth (U.S./ international blended) was 13.6% (vs. 11.5% last quarter and 11.2% for FY 2013). Organic growth excludes growth from acquisitions and new site builds and is more reflective of the underlying economics of the business.

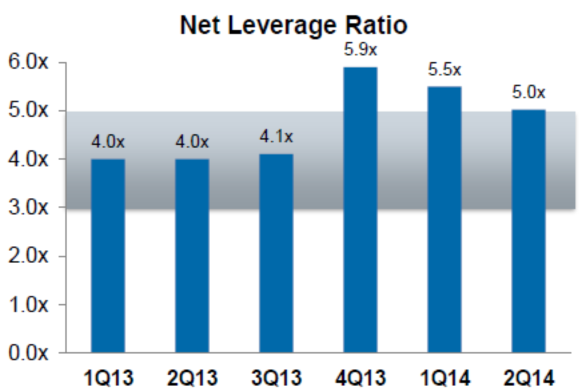
I wrote after Q4 2013: "For 2014, I'm expecting continued strong organic growth, and barring unforeseen macro-economic changes, I'd be surprised if organic growth rates were below the mid-point of guidance (7% in the U.S. and 10.5% internationally)." Including last quarter's strong performance, American Tower continues to blow away those estimates. In the graph below, you can see how organic growth is accelerating. Although international growth is a bit lumpy, due to growing off of a smaller base and due to American Tower's varied international presence, there is a clear upward trend in growth rates since late 2012:



Source: Earnings presentations and analyst calculations.

Although carrier network investment (the key driver of organic growth) happens in cycles and we can't expect this acceleration in growth to continue unabated, it's nice to see and results are better than I projected. Consequently, I've increased the relatively conservative growth assumptions built into my valuation model.

As far as leverage is concerned, American Tower continued to pay down debt with cash flow and reduce its leverage ratio (debt/EBITDA). This was expected, and after two quarters where the company operated above its target leverage ratio, American Tower is now sitting at the high end of its target range (3 times to 5 times):



Source: American Tower Q2 Earnings Presentation.

Last quarter I wrote: "Management expects to get the leverage ratio below 5x by 2015, but if the company sees an acquisition opportunity it likes, I wouldn't be surprised to see them take advantage of their flexibility and change course to pursue it. That would potentially drive the leverage ratio higher again (if another major acquisition does indeed happen – who knows if it will)."

Because of the focus on paying down debt, the company has dialed back on big acquisition spending (around $500 million year to date on acquisitions vs. $4.5 billion in 2013), instead focusing on growing its tower count more slowly through new site builds and minor acquisitions. Despite this, American Tower announced an approximately $1 billion acquisition of Brazilian company BR Towers in June, and that transaction is expected to close in the fourth quarter of 2014. This management team is constantly on the hunt for attractive investment opportunities, and I suspect that we might be looking at another large-scale acquisition sometime soon (maybe in a new market), perhaps once the leverage ratio gets toward the lower end rather than the higher end of management's target range.

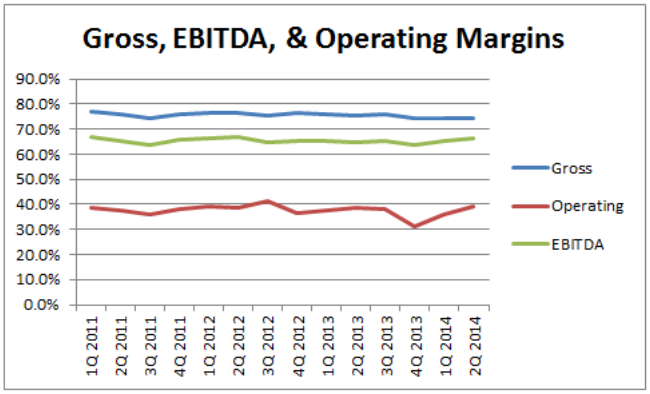
Yearly distribution growth continues to track ahead of management's 20% growth target, coming in at 26% growth ($0.34 per share). 20% annual distribution growth continues to look like a more than reasonable target for 2014 and beyond.

Now What?

The market viewed American Tower's earnings report favorably (I don't blame it), bidding up shares on the day of the report about 4.2% compared to the previous day's closing price. The company's strong results on all of its key metrics support a positive stock price move.

This quarter's report yet again provides confirming evidence that our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time) continues to play out.

Margins continued to tick up nicely as the company integrates its big acquisitions and improves its efficiency (for example, increasing its pass-through revenues in international markets):



Source: Company filings and analyst calculations.

Foreign exchange (FX) effects continued to impact results and projections, with management expecting that FX fluctuations will knock 3.2% off revenue for full-year 2014. Once foreign exchange effects turn the other way, American Tower's results will look that much more impressive.

Data and Guidance

- Current Price: $96.25
- Fair Value estimate (updated): $110
- Consider Adding More (updated): $78
- Market Cap: $38.3 billion
- EV/EBITDA (TTM): 21.2

AMT remains a Buy First, with an **updated Fair Value estimate of $110 per share and an updated Consider Adding More price of $78**, reflecting continued strong results that prompted me to increase my growth forecasts. If you've yet to start a position or didn't add to your stake when we did so in mid-March, don't anchor on the recent positive stock price move. Now is as good a time as any to match our 4.1% allocation in this accelerating business that's selling for about a 14% discount to Fair Value.

Fool on!

Long AMT

Buy Tupperware

Published Jul 30, 2014 at 2:30PM

Is this for you? *Pro* is increasing its allocation to **Tupperware** (NYSE: TUP) by 43%, bringing the stock's percentage of the portfolio to 3.4% (up from a current 2.4%). If you're following our portfolio closely, you should buy more Tupperware with us.

How You Participate

- **Action:** Buy Tupperware
- **Allocation:** Increase your allocation to 3.4%. *Pro* will buy another 300 shares, bringing our total to 1,000.
- **Recent Price:** $72.77
- **Price Guidance:** Use a limit order at current prices, and initially aim to pay less than $73.00.

What We're Thinking

Tupperware operates around the world but remains underrepresented in key markets such as Asia, Latin America, and Central Europe. Large opportunities remain despite 65% of Tupperware's revenue already being generated in emerging markets. Through 1,900 distributors, 93,000 managers, and a sales force of 2.9 million, the company sells consumer kitchen products that are often custom-made for a local market. In China, water purification products are a top seller. In France, it's a microwave steamer. Throughout Asia, rice products sell briskly.

Operating in dozens of countries and relying on citizens themselves to host Tupperware parties means some markets will see weakness in any given quarter. Last quarter, one of Tupperware's historically best-managed countries, Germany, suffered a sudden 29% decline in sales. We expect a recovery as management regroups and more parties are planned. Sales in Indonesia grew 16%, but that was well below the country's recent 25% growth rate. The culprit? Tupperware increased prices in the region due to higher input costs, and there was a presidential election. We've seen politics dampen results in various countries over the years, not to mention conflict doing the same, which is affecting Israel, Ukraine, and Russia — all areas where Tupperware operates.

As a result, Tupperware's quarterly reports are always interesting. When most of its key markets do well, the company usually grows more than expected. But when a few large markets suffer, the stock can tumble, as it has since this month's earnings report. Near $72, shares trade at 13.2 times expected 2014 earnings of about $5.45 per share, and yield a 3.7% dividend. We believe the problems of last quarter will resolve before long, and Tupperware will grow enough in the coming years to challenge our North Star.

How It Fits Into Pro

At an attractive price well below our $85 Fair Value estimate, we're increasing our Tupperware allocation to 3.4%. This leaves us more room to add still more exposure later if we wish. Unique in our portfolio, we appreciate Tupperware's low-cost, direct-sales approach, and its long-term desire to grow its sales force from 2.9 million to 5 million to address opportunities in burgeoning population centers, including India and China. The company has increased its leverage to address opportunities and buy back shares, so we'll be keeping a close eye on its capital-spending decisions.

Stock Info

- **Fair Value Estimate:** $85
- **Consider Adding More:** $75
- **Scorecard Status:** Buy

Alternative Trades

- **Write Puts.** If you would rather sell to open puts to potentially get more shares, consider writing any $70 or $75 puts. Write $75 puts if you're more eager to get shares, as they're in-the-money but still offer decent time value.

Pro: What We Think Now

Published Jul 29, 2014 at 2:12PM

See all our active trades at a glance, including our strategies and high-level thinking. We've highlighted recent changes with icons, and you can click on any column header to sort the table, which is initially sorted by allocation.

Holding	Ticker	Rating	Summary
SPDR S&P 500 ETF	SPY	Option: Put Ratio Spread	We're using low-cost hedge strategies called put ratio spreads to protect against downside in the S&P 500 while not risking anything if the market goes higher.
Facebook	FB	Buy First	Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company, and Facebook's future is in strong hands because management is showing patience and care as it monetizes more of its properties, putting visitor experience first. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook owners) for years to come.
Broadridge	BR	Buy First	Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.
O'Reilly Automotive	ORLY	Buy	With exceptional management in the driver's seat, O'Reilly Automotive will grow impressively by adding new auto parts stores, acquiring others, and growing same-store sales.
AmTrust	AFSI	Buy	Under the radar, AmTrust is a disciplined underwriter of workers' comp and warranty insurance policies that is expanding opportunistically into other low-hazard areas and new geographies. Book value should continue to grow.
MasterCard	MA	Buy First	MasterCard's global network is a financial toll road that takes a small slice of each transaction. Though there are many established and upstart competitors, the leader is cash with 85% market share, representing plenty of room for MasterCard to grow.
Wells Fargo	WFC	Hold Option: Write Partial Covered Calls	Given recent scandal being uncovered at Wells Fargo, the position is on hold while we assess whether we want to go on owning call options on Wells or not. We have to believe there is upside in a few years or we'll sell our calls to get back time value.
American Tower	AMT	1Buy	A U.S.-based global tower operator, this business with excellent returns on incremental capital benefits from exponential growth in worldwide demand for mobile bandwidth. We expect strong growth as international markets continue to invest in wireless technology. We are invested in some LEAPS call options to leverage upside.
Apple	AAPL	Buy	Apple is the leader in mobile computing products, and the number of people buying into its ecosystem continues to grow. Apple capitalizes on this by making its operating system work seamlessly across devices, increasing stickiness. The mobile computing revolution is still in early stages, and Apple still has no equal.
Oracle	ORCL	1Buy	Oracle is an "old guard" tech giant that continues to grow strongly thanks to its expanding database software and hardware sales. It also has room for more margin expansion.
Papa John's	PZZA	Buy	Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near-term headwinds (commodity prices and technology investments) have proved temporary and Papa John's should deliver improved financial performance.
OpenText	OTEX	Buy	Selling software that lets companies and governments manage growing reams of digital information, OpenText should grow steadily for years. Plus, we plan to write options on it for income along the way, as long as the options pay well.
Starbucks	SBUX	Buy	The world's specialty coffee leader will continue its global retail expansion and will leverage its brand to offer consumers more choices — including tea, carbonated beverages, and juice — at more times in more convenient locations. The company has dynamic growth opportunities, operational discipline, and deft management. Starbucks stores and its trusted brand are a powerful platform off of which to introduce locally relevant new products, build relationships with customers, and compound intrinsic value.
Parexel International	PRXL	Buy	Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments and restructuring costs pay off as well as continued growth of the Parexel Informatics technology segment.
Medtronic	MDT	Buy	Medtronic has a sound strategy to deal with the more regulated and costlier health-care environment. We're confident the business remains competitively advantaged, operates in an attractive industry, and is well-positioned to grow, especially in emerging markets. With reasonably-priced shares, we target North Star-type returns.

Holding	Ticker	Rating	Summary
Skyworks Solutions	SWKS	Buy Option: Write Covered Calls	Skyworks Solutions is positioned to keep increasing profits at a healthy clip as more smartphones are sold and connected devices (the Internet of Things) proliferate. Long-term growth rates overall could remain above 10% for many years.
Expeditors International	EXPD	Option: Synthetic Covered Strangle	The shipping logistics leader offers a stable business on which to set up an income position. The *Pro* team is targeting leveraged income with upside.
Gentex	GNTX	Buy First Option: Write Puts	Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time. We're also writing puts for income or to potentially buy more shares lower.
Gilead Sciences	GILD	Buy Option: Write Covered Calls	Gilead Sciences has seen surging free cash flow thanks to its market-leading Hepatitis C treatments, which accounted for nearly 60% of 2015 revenue. As sales growth tapers, the stock is cheap, and we believe management can find future growth opportunities through acquisitions. Meanwhile, Gilead has a large pipeline of drug candidates targeting deadly diseases including cancer, but for the coming few years, it's our belief in a stable Hepatitis C market and good use of its growing capital that makes the stock worth owning in *Pro*.
Visa	V	Buy	Expected to grow earnings per share by at least 14% to 18% annualized for several years, Visa's giant payment network should keep driving results as electronic money replaces cash, affluence increases, and new markets are added.
TD Ameritrade	AMTD	Buy	TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and when interest rates increase, the company is positioned to grow earnings sharply.
FactSet Research Systems	FDS	Buy First	Selling subscription data and analysis tools to investment professionals, FactSet enjoys a 95% contract renewal rate and has 35 consecutive years of sales growth. With high returns on capital, it meets *Pro*'s criteria for a compounder.
Verisk Analytics	VRSK	Buy	Also owned by Buffett but still under the main Wall Street radar, this leading provider of rich data to insurers and other industries has a strong competitive position, recurring revenue, and pricing power. It's a long-term buy we want to own and add to over time.
Domino's Pizza	DPZ	Short	As a paired trade, we are shorting the leading pizza chain only as a way to hedge 2% of our long exposure in Papa John's, since the two stocks have historically moved together. These two positions should be taken together.
Valmont Industries	VMI	Buy Option: Write Covered Calls	Valmont's end markets remain weak and we considered selling to harvest the tax losses, but recent news that Congress is making progress on a new highway funding bill leads us to believe it's worth holding on to this solid business for a bit longer.
WisdomTree Emerging Markets SmallCap Dividend Fund	DGS	Buy	This emerging-markets ETF is a large fund of nearly 500 stocks; its fate is tied to emerging economies (mainly Taiwan, South Korea, Thailand, Malaysia, Brazil, China). The ETF is well-managed and yields more than 3% while owning small, consumer-centric companies. Moved back to Buy 3/28/16 after review.
CurrencyShares Euro Trust	FXE	Short: Hold	The euro is held together by rubber bands and scotch tape (and financial threats). We believe the currency should be worth much less to the dollar. We may manage this short by adding to it when it spikes.
Deere & Company	DE	Short	John Deere should serve *Pro* both as a short with favorable odds of generating a North Star-like return and as a macro hedge to reduce our portfolio's sensitivity to the strength of the global economy.
ProShares Short VIX Short-Term Futures	SVXY	Buy	Over the long term, the futures on the CBOE VIX index should persistently trade at a higher level than the spot VIX level, until they dissipate into expiration. This situation — known as contango — will ultimately make this ETF go up in price, because it sells short the futures, which are a wasting asset. We expect price volatility, though, and we will look to add to the position on large drops. So, keep your allocation small.
Pier 1	PIR	Short: Hold	Coming soon!
Caesars Entertainment	CZR	Short: Hold	With interest on debt consuming all operating profits and then some, Caesars' back is against the wall as competition increases and traffic slows. We believe a restructuring is fairly likely, and equity holders may not end up with snake eyes, but something close to it. So, we're short.
Direxion Daily Financial Bear 3X Shares ETF	FAZ	Short	We believe financial stocks are inexpensive, so we're shorting the bearish financial ETF, which also suffers from compounding flaws that work in the favor of shorts like us.
SRS	SRS	Short: Hold	We're bullish on a real estate recovery, so we're shorting this flawed, leveraged, bearish real estate ETF -- but it has become too small for new investors to short.

See the team's and David and Tom Gardner's holdings here.

Buy Wells Fargo

Published Jul 29, 2014 at 2:12PM

Is this for you? *Pro* is increasing our allocation to **Wells Fargo** (NYSE: WFC) by more than one-third, bringing its percentage of the portfolio to 4.1%. If you're following our portfolio closely, you should do the same.

How You Participate

- **Action:** Buy Wells Fargo
- **Allocation:** Buy shares to bring your allocation up to about 4.1% (up from 2.9%). *Pro* will be buying another 500 shares.
- **Recent Price:** $51.60
- **Price Guidance:** Use a limit order at current prices, but aim to pay less than $52.50.

What We're Thinking

Stock Info

- **Fair-Value Estimate:** $56 (recently raised from $53.50)
- **Consider Adding More:** $44 (but we're adding more anyway)
- **Scorecard Status:** Buy

In late April, *Pro* wrote a covered strangle on Wells Fargo that expired prior to second-quarter earnings, hoping to earn some income in addition to Wells' dividend while waiting for an update on business performance. With the close of our short call in late May and expiration of the short put in June, our strangle strategy concluded successfully, earning a modest net $0.35 per share, but effectively doubling our quarterly yield on the position alongside the payment of our $0.35-per-share dividend on June 1.

After Wells reported second-quarter earnings on July 11, we felt confident enough in management and in current business and economic trends to increase our Fair Value estimate by almost 5%, reflecting more optimistic assumptions on near- and mid-cycle return on equity. Despite a difficult environment, Wells' management has done a remarkable job wringing out efficiency and hitting the high end of its internal performance targets. When we eventually see a rising rate environment, our expectation is that Wells Fargo's earnings power will ultimately increase, possibly even higher than what our reasonably conservative forecasts assume. Additionally, Wells has continued to buy back shares at prices below our Fair Value estimate, a value-accretive move that provides even more upside to our estimates.

In the original strangle trade alert for Wells Fargo, we wrote that "we view the business and the stock favorably. It's a well-run bank with limited downside and steady but unspectacular upside," and "we'd be happy to own more shares of this well-run compounding machine" at a price below our Fair Value estimate. Both of those statements are being reflected in today's trade. Although we've hinted at continuing our strangle strategy on this position, we think current prices provide an asymmetrical risk/reward ratio to the upside, in which case it would not be prudent to continue covering our shares.

As such, we think that increasing our allocation to about 4.1% (from 2.9%) is a smart decision. If you've yet to start a position in Wells Fargo, now is a great time to match our allocation. We expect to benefit from North-Star-beating returns from Wells over the next rolling-three-year period, and we want to make this position a more meaningful contributor to our overall results.

Alternative Trades

- **None** (although members who wish could write puts instead; they don't pay well, though, and we favor owning more shares for the long haul).

Surrendering Intel

Published Jul 28, 2014 at 3:26PM

Dear *Pro* members,

Intel's (NASDAQ: INTC) performance this year — up 31% — reminds *Pro* investors of the rules for writing covered calls:

- Only write covered calls if you're willing to sell the stock.
- Be prepared to miss upside in the shares.

Covered calls provide a limited return while capping the upside (but not the risk) on your capital, so if you're going to use them, we suggest only a few approaches:

1. Set up new buy/write trades in which you buy a stock *specifically* to write covered calls on it for income. Or ...
2. When you're ready (or at least willing) to sell a stock you own, and you don't mind missing upside, write calls on it for income and a higher sell price.
3. Use diagonal calls, in which you buy long-term calls to write calls on them, aiming for income and leveraged upside but realizing that you may miss much of the upside.

After You Write Covered Calls

In many instances, when the stock rises slowly or stays within a range, you're able to roll covered calls to a higher strike price without much or any detriment. But if the price of the underlying stock rises sharply and quickly, your rolling choices will not be attractive.

This is what's happened with Intel. Even though we rolled our calls three times this year, the stock has gained enough ground that we stand to make virtually zero incremental return by rolling our calls higher yet again. Even if we invest considerable extra capital in the position to keep our stock longer, our potential gain would be slight if we roll to new covered calls. Instead, we could simply buy to close our calls for about $8 per share, uncapping our upside again, but then we risk the stock declining. It's not worth it at this point.

Fortunately, we were — and are — willing to let our stock get sold at our strike price. (We just didn't expect this to happen so quickly.) This will occur to our position by Aug. 4 (the ex-dividend date is August 5).

Intel Today

If history is a guide, Intel is not great at predicting its business. In 2012 and 2013, it predicted sales growth on improved PC volume, but both years ended flat. In January, it predicted a flat year, and soon PC sales were rising. Now the company forecasts stronger PC sales through the end of this year and growth in revenue as a result. But many years of following Intel tells us that this outlook could change rapidly; it wouldn't be surprising to see PC sales slow again.

Meanwhile, Intel isn't cheap the way it used to be. Near $34 a share, it's more than 10% above our updated fair value estimate and is trading at 21.6 times free cash flow and 17 times earnings. And for the second year in a row, it appears that Intel won't increase its dividend, a curiosity after years of increases. As a result, the stock yields a relatively modest 2.6%, well below the 3.8% it sported at times last year.

As we prepare for our shares to get called away, we're not happy to miss extra upside, but we agreed to do so the day we wrote covered calls, so we can't be surprised. After years of expecting the PC market to stabilize and tick upward, we took Intel's flat guidance to heart in January and initiated our covered calls for income. It was a calculated risk, but it proved less than ideal. We'll reinvest the capital that's being freed up in new positions — and keep watching Intel for future opportunities. After all, this is the second time in our history that we're having our shares called away.

Your Taxes

Pro doesn't have tax implications to consider as we let our Intel get sold, but you might. If you own Intel in a taxable account and want to avoid a long-term-capital-gains tax bill, you need to buy to close your calls to keep your shares. (There are not any rolls worth entertaining today.) Buy to close your calls and then consider writing new out-of-the-money calls. Just realize that buying to close your calls will cost $8 per share, so that may be more expensive than your long-term tax bill would be if you let your shares get sold.

Going Forward

Pro will to continue to only rarely use covered calls on our existing stocks. Why? Mainly because the risk-to-reward is skewed. For small payments, we forfeit our upside. It's a great income strategy, but we want to continue to use it only in the instances spelled out above: As new buy/write trades, or when we're truly willing to sell. And, we want to set up diagonal calls for income, so there's plenty to look forward to.

Earnings

Meanwhile, we're in the middle of an earnings bonanza! With 229 companies in the S&P 500 reporting so far, *Investor's Business Daily* reports that on average, sales are up 3.5% and earnings have risen 6.5%. Most *Pro* companies are growing much more than that. You can see our earnings coverage as it rolls out in a daily scorecard email if you follow *Pro* tickers in your scorecard — or see it all in our weekly Monday wrap-up of *Pro* coverage, in the same email that brought you this Memo.

See you on the boards! Fool on!

Discount Retailing Landscape Is Shifting

Published Jul 28, 2014 at 3:19PM

Fools,

This morning **Dollar Tree** (NASDAQ: DLTR) announced it was acquiring **Family Dollar Stores** (NYSE: FDO) for $9.2 billion ($74.50 per share), a 23% premium to Family Dollar's previous closing price. This move represents the second and third largest players in the discount retailing space shacking up, and has potential implications for **Five Below** (NASDAQ: FIVE), the bargain-bin tween retailer that we are betting against.

In short, we view the acquisition announcement as further evidence that supports our assessment of the difficult discount retail competitive landscape in which Five Below competes. In the alert, we called out cut throat competition, increasingly overlapping merchandise categories, and the importance of having scale-based sourcing leverage. The logic behind a combined Dollar Tree and Family Dollar seems to support each of these assertions, making this deal one more challenge that Five Below will ultimately face. Below are five takeaways.

1. A Note on Price

Dollar Tree is paying 11.3x EBITDA for Family Dollar. Over the past 10 years, Family Dollar traded, on average, for an EBITDA multiple of 8x, and hasn't traded over 9.7x since 2005. The 11.3x multiple is interesting to us in that it provides a data point on what a fair private market value might be for a retailer in this space, which we can use as a helpful insight into what Five Below might be worth. Now, full disclaimer, Family Dollar and Five Below are very different businesses. Family Dollar serves lower income families and predominantly sells consumables. Still, my argument is that there is some overlap, and that the two stores compete for the time involved in the trip and the marginal dollar of income. Five Below is also growing much more quickly than Family Dollar, which would likely justify a higher EBITDA multiple. But let's see where this gets us...

Over the last twelve months, Five Below earned $70.2 million in EBITDA. Applying the 11.3 multiple to Five's trailing EBITDA suggests a fair enterprise value of $793.3 million. Compared to the Five's current Enterprise Value of $1,903.8 million, shares look 58% overvalued.

Of course, 11.3x ;might not be a fair multiple given Five's growth potential and economics. Perhaps a multiple 50% higher is more appropriate. if we apply a 17x multiple to Five's trailing EBITDA it suggests an enterprise ealue of $1,190, still 37% below Five's current enterprise value.

One obvious risk of shorting a modestly-sized company is that we run the risk of having it acquired. If Dollar Tree's price is at all indicative of the going rate, or at least an anchor off of which to consider pricing an acquisition, it appears an acquirer would have a hard time justifying the price to purchase Five Below.

2. The *Deals* Concept Appears Safe

In the original alert we pointed out that, in an effort to step away from the $1 price ceiling, Dollar Tree created its *Deals* store concept. Dollar Tree is growing that franchise rapidly and the concept appeared to us to be the closest direct competitor to Five Below of any of the discount retail or dollar store formats. On the conference call held to discuss the acquisition, Dollar Tree CEO Bob Sasser was asked several times about the acquisition's impact on *Deals*. Sasser was clear that he and his team are high on the *Deals* concept and that it is quite different than the Family Dollar concept. *Deals* stores have a more discretionary and seasonal product assortment than Family Dollar's. While he stopped short of saying the growth plans would continue as planned, the tone of his comments imply that the *Deals* format is safe and that Dollar Tree intends to grow it.

3. Changing Product Mix at Family Dollar?

Sasser pointed out that the Dollar Tree product assortment of 50% consumables and 50% discretionary/seasonal is likely the optimal mix. Family Dollar's merchandise focus is consumables heavy (72% of sales). Logic, recent successful Family Dollar holiday merchandise efforts, and comments made on the call suggest that Dollar Tree would seek to rebalance Family Dollar's mix a bit toward discretionary/seasonal merchandise given the success it has had with that model. Sasser noted: "We like at Dollar Tree what the seasonal business brings for our customer segment. We like the merchandise energy, we like the ever-changing mix, we like the margins." To the extent that Family Dollar, with the help of Dollar Tree's merchandising team, begins to stock more discretionary and seasonal items in the $1-$5 price piont, Five Below could feel a bit of competitive pressure -- at least on the margin.

4. Large and In Charge; Small and Disadvantaged

The strategic rationale for the acquisition appears to be (1) diversifying the customer base and (2) adding purchasing scale to obtain better merchandise pricing. Family Dollar's lower-income customers complement Dollar Tree's middle-income customers, and the larger combined customer and store base should strengthen the company's purchasing power. In discount retail, where customers are price sensitive and in search of deals, size does matter. This highlights the natural disadvantage of being small and beholden to a single target demographic -- the position Five Below finds itself in.

5. A Cover For Slowing Growth?

In late 2012 I wrote about how growth at discount stores was set to slow -- I proposed that not every discounter can open 10% more locations every year for the next decade (which most planned on trying to do) because they'd run out of profitable real estate locations. Most have continued with these expansion plans, including **Wal-Mart** (NYSE: WMT), which has stepped up expansion of its small-store formats. Family Dollar, on the other hand, announced in April that it would cut its growth plans and actually close 370 under-performing stores. Dollar Tree could be finding growth harder to come by, too, and has turned to this acquisition to keep the growth train on track. That is speculation on my part, but things line up to make it a plausible explanation.

The Foolish Bottom Line

Our short position is a small 1.5%, but we're pleased that the first bit of meaningful news appears to support our research. Even though these competitive threats will likely take a while to have a meaningful impact on Five Below's performance, we expect the mounting evidence to make bullish Five Below investors question the premium valuation they have attached to its shares. We expect second quarter earnings from Five Below in early September.

Onward,

Bryan (TMF42)

Facebook Books Gains

Published Jul 28, 2014 at 1:32PM

Greetings, *Pro* members,

Summary: **Facebook** (NASDAQ: FB) reported excellent second-quarter results, with mobile ad revenue up 151%, total ad revenue growing 67% to $2.68 billion, and earnings per share jumping 121%. The average effective price for an ad increased 123%, driven by more ads in the newsfeed and fewer, less lucrative ads on the desktop sidebar, and by customers willing to bid higher given a healthy return on investment from the ads. Continuing to grow, 1.32 billion people are on Facebook each month, and 63% visit daily. The company is rolling out more free Internet connection services around the world, true to its "connecting the world" goal.

***Pro* Guidance**: The shares remain a buy at a 4.9% allocation. Our fair value estimate increases to $63, but we recognize that there's a lot of room for error in naming a price. Facebook could grow much more than we estimate. We try to estimate on the more conservative side, but in this case I also feel that we're giving the company ample recognition with our valuation. We still face the risk that it's a young social media business, and the staying power of its massive traffic is unproven.

Conference Call Notes

o Facebook has three large goals: Connecting everyone; understanding the connected world; and building the knowledge economy.

o The company will continue to invest heavily. They believe there's much more room to grow. Americans spend around 40 minutes per day on Facebook (more than any other app by far), but more than 9 hours per day engaging with digital media.

o 30 million small businesses use Facebook pages, but only some 1.5 million of them are active marketers (room for growth).

o Facebook believes it's building the world's first ad platform that delivers personalized marketing at scale, but believes "it's still early days."

o More than 1 billion messages are sent on FB per day; more than 200 million monthly active users on both Messenger and Instagram.

o FB is launching more free, basic Internet services in several countries this year.

o More than 1 billion search queries are made on FB each day; the company continues to work on Search. It is also working on Public figure pages. Nearly 800 million people are connected to public figures on Facebook (competing with Twitter).

o More than 80% of the top Apps on iOS and Android use a Facebook login (stickiness).

o Video ads will slowly be rolled out as they're optimized. Ads in general will slowly roll out on Instagram, Messenger and any properties when those communities are ready.

o Nearing $1 billion in an annual run-rate, payments and other fee revenue rose 9% to $234 million.

o Q2 GAAP expenses grew only 22% (showing great leverage in the business model), and GAAP operating expenses rose 33% as employee count gained 36% to 7,185 people.

o In 2015, Facebook expects significant stock-based compensation and amortization expenses. The share count will also rise from 2.6 billion to 2.9 billion by the end of 2014, an 11% increase (due to acquisitions). This is part of what keeps our fair value from rising much right now, of course.

o Year-over-year growth rates will naturally decline meaningfully as the comparisons become more difficult.

o Zuckerberg is thinking in terms of 10-year time periods for his goals for Facebook, he says the company is going to "go very deep on the priorities that we have to make sure that we completely nail them all, whether it's a five-year or a 10-year timeframe." In the process, they hope to invest accordingly to help define what the next generation of computing and online platforms will look like.

In summary, we expect more volatility from the financials as Facebook's expenses grow, but we expect ad revenue to continue to grow sharply over time. We'll be watching that Facebook continues to maintain its traffic, and then grow it. Advertising will follow eyeballs, especially as Facebook continues to invest to improve the ad experience for both visitors and advertisers. We have to view our position with a multi-year timeframe.

Starbucks: 'I'll Have My Usual'

Published Jul 28, 2014 at 10:53AM

Pro's Take: SBUX Q3-2014 Earnings

Starbucks (NASDAQ: SBUX)

Quarter Quick Take

New stores (+344 in the quarter, +1,096 this year), new food and beverage offerings, impressive comps (+6% globally), and solid execution translated to impressive sales and profit growth. The formula remains the same for Starbucks, and while that may sound boring, its results are powerful. For the third time this year, management raised guidance, but preliminary FY-2015 targets of +15-17% EPS growth may have disappointed investors. Still, Starbucks growth profile is dynamic, robust, and durable – the results achieved in Q3 only support that assertion.

....

Q2-2014

Sales growth: +11%

Operating profit margin: +200 bps to 16.7%

EPS growth: +22%

....

Guidance Update

Starbucks is a star – the company set quarterly revenue and operating profit records in each of its segments. It has raised EPS guidance after its first and second and now third quarters, suggesting it remains capable of compounding intrinsic value at attractive rates. Nothing in this quarter caused me to rethink any longer-term assumptions, but accounting for the time value of money, the company's fair value ticked up a bit and is on track to hit $78 by the end of its fiscal year. Pro has a 3% allocation, and shares remain a Buy. Shares are flat on the year, and Starbucks needs to execute well to justify its valuation (25x forward earnings). We expect that to happen and believe upside surprises are more likely than downside ones as Starbucks has set the stage to compound its intrinsic value faster than we anticipate.

Updated guidance: Buy (no change)

Recommended Allocation: 3%

Fair Value estimate: $76 (up from $75)

End of Fiscal Year expected FV estimate: $78 (no change)

CAM price: $61 (up from $59)

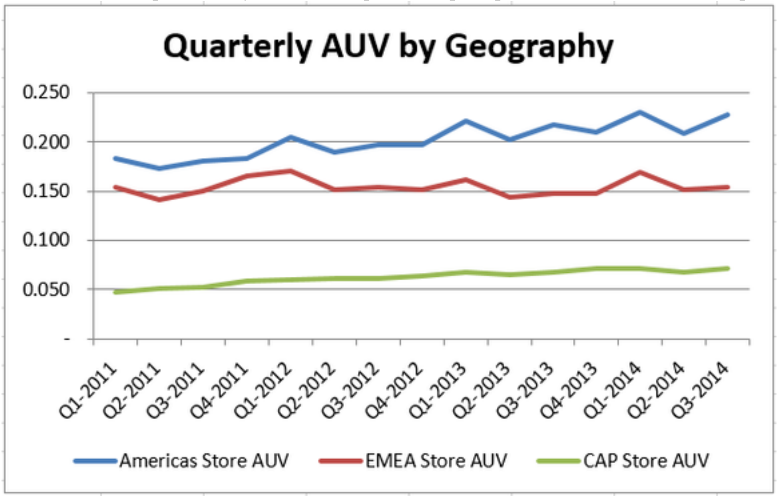
Our Thesis

We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new dayparts and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

The Most Important Things

1. ***Americas store performance.*** At the end of 2013, the Americas segment still accounted for 75% of Starbucks' total revenue – so as *it* goes, Starbucks financial performance goes (for now). Americas comparable store sales growth was up +6% driven by a +2% growth in traffic and a +4% growth in ticket. The company's ability to drive sales on such a large and mature base is impressive. Improved food (primarily La Boulange) offerings continue to be the largest driver of incremental sales, and with the roll-out expected to be completed by September management is already turning its sights to improving lunch offerings. Combined with continued expansion of the Fizzio carbonated beverage program and growth in digital marketing and app acceptance, the Americas segments still has meaningful tailwinds to drive comps and average unit volumes higher (see chart below). As we've noted before, alternative format stores are another growth vector, and management's

confidence in the profitability of these unique stores prompted the announcement this quarter that 50 additional units will be opened this year.



2. ***Channel Development.*** As the company's second largest segment, CD leverages the brand strength of Starbucks' cafe stores into alternate channels (primarily grocery stores). Segment sales grew 13% (up from 7% and 11% the last two quarters) and profits were up 45%. VIA and K-Cup sales are strong and new flavors are on the way. Starbucks K-Cup sales appear to continue taking share. Lower coffee costs helped drive operating margin expansion, but that cost tailwind is turning – with only 60% of coffee prices locked in for next year we should expect a bit of margin pressure as Starbucks dabbles in the spot market or locks in higher-priced beans. Finally, international consumer packaged goods (CPG) opportunities should begin to drive growth in the coming quarters.

3. ***Future growth drivers.*** There is quite a bit to cover. (A and B) With the pastry portion of the La Boulange roll-out about three-quarters complete in the US Starbucks is turning its sights to additional lunch SKUs. Remember, the LB roll-out was measured, with lots of test and learn, and lunch will be too. This should drive transactions, ticket, and attach rates (which are currently only 1 in 3 transactions in the US). It will also introduce further complexity to orders and throughput but can be very meaningful to sales and profits – food sales represent ~20% of US store sales. (C) Starbucks' "evenings" program tests were a success and it will begin expanding the program to more than 1,000 stores. Interestingly, evenings has seemed to revitalize Starbucks as the "third place" – with shared platters among friends being the centerpiece of the evening hang out. (D) Carbonated beverages will soon be in 3,000 US stores as well as some Asian stores. So far, these sales have helped sales during softer dayparts and been largely incremental. (E) Teavana products should be getting a boost from a pair of marquee NYC tea bars. It is often cited that the tea market is larger than the coffee market, but what could be more relevant is that tea currently only makes up ~9% of Starbucks sales. (F) There was no update on the potential licensing or white labeling of the Starbucks app and mobile payments package. If anything comes of this opportunity, it could represent a very high margin, recurring revenue stream for the company.

WWTN

The world's specialty coffee leader will continue its global retail expansion and leverage its brand to offer consumers more choices — including tea, carbonated beverages, and juice – at more times in more convenient locations. The company has dynamic growth opportunities, operational discipline, and deft management. Starbucks stores and its trusted brand are a powerful platform off of which to introduce locally relevant new products, build relationships with customers, and compound intrinsic value..

Conference Call Notes

- Starbucks now has 300,000 partners serving >70 million customers in 65 countries each week at its 21,000 stores. Q3-2014 marked the 18th straight quarter of 5% or more SSS growth.
- U.S. stores delivered an above-estimate 7% comp – a pretty remarkable feat on a store base of 6,800+.
- On success abroad: Schultz commented: "*New stores in different countries on different continents with different coffee cultures and no aided awareness to speak of, but the same results – lines out the door and customers clamoring to get in day after day, rom morning until night. These openings remind me that despite the size of our current global store footprint, pent-up demand for the Starbucks experience continues to increase and that we have untold markets yet to open and expand in the years ahead.*"
- On food: In the US, improved food quality and variety drove two points of the comp growth, and it is driving margin improvement. The rollout of La Boulange breakfast sandwiches, the first real formula change in 10 years, resulted in a 40% increase in breakfast sandwich sales. Now that the LB rollout is largely complete, Starbucks is turning its attention to expanding its lunch lineup with additional SKUs. COO Troy Alstead noted "*By the end of fiscal 2015, we expect the lunch program to look very different than it does today.*" CEO Howard Schultz said: "*I think we could all admit that for many, many years, [food] was a weakness and a challenge for us. And I would say unequivocally, with the acquisition of La Boulange and the execution of Cliff and his team, has now become a significant strength and a driver of multiple occasions, need states, and the opportunity for Starbucks to leverage dayparts that we did not have access to before. And we're just getting started.*"
- On drive thru: More than 40% of company-operated domestic stores have drive-thru ability and they're growing double digits. Starbucks is going to experiment with ordering and payment to speed throughput on drive-thru locations. Management thinks drive-thru has been so successful because the Starbucks relationship already existed and it simply added a layer of convenience.
- On China: Schultz commented that China has "*never been stronger.*" Starbucks opened two flagship stores in the country, including its first ever 24-hour location. CAP has logged 15 consecutive quarters of revenue growth >20%, driven by new store openings and strong comp sales.
- On Channel Development: Revenue grew +13% on the back of share gains in packaged and single serve coffee and tea. Growth should continue to be strong with limited-time offerings, single-origin coffee promotions, new K-Cup SKUs and additional teas. Favorable coffee costs (relative to last year) helped operating profit grow 45% to $139 mm and expand operating margins 800 bps.
- On tea: Starbucks is slowly opening a few marquee tea bars (in NYC right now) to draw attention to the tea category and elevate the Teavana brand. Expect to see more of these stores, which will serve as a tea marketing expense (at least until the unit economics are figured out), a product R&D lab, and a testing ground for tea bar operations.
- On Fizzio: Fizzio is now in 3,000 stores across the US Sunbelt, in Japan and in Singapore. Customers are inventing their own concoctions like mad, which Starbucks believes is encouraging.
- On MSR, digital, and payments: The Starbucks card is available in 29 countries. MSR has over 8 million active members. Astoundingly, MSR (My Starbucks Rewards) transactions account for 40% of total tender in China. Almost 12 million people are active users of the mobile app in the US and Canada, and the app facilitates ~15% of tender. Starbucks believes the app is the fastest way to pay, and it will be experimenting with app-enabled "order ahead" programs in select stores.
- On Guidance: Non-GAAP EPS for Q4 should be +22%-25% and about 22% for the full-year. The longer-term targets of sales growth of 10% and operating margin expansion remain in place. The company raised its new store opening target by 50 stores to 1550, with the additional stores expected to be opened in the Americas

segment. **The company released its first cut of 2015 guidance. EPS should grow +15%-20%, but likely toward the lower end of that range as coffee costs rise. Next year, coffee costs will be neutral to a minor headwind – only 60% of next year's coffee costs are locked in. Revenue growth of 10%, global comps in the mid-single digits, and 1600 new stores seem doable. The Americas segment should see 650 openings, 150 in EMEA, and 800 on CAP.**

Tupperware Cracks a Little

Published Jul 25, 2014 at 4:15PM

Greetings, *Pro* members.

Summary: Quarterly revenue at **Tupperware** (NYSE: TUP) fell short of expectations, though earnings per share were in-line with guidance. Three regions lowered results significantly, all for different reasons (shared below): Germany, Russia, and Indonesia. Management believes these are short-term issues, to be resolved in quarters, not years. Meanwhile, China, Singapore, France, both beauty businesses, and many others did well. The company lowered full-year EPS guidance to a range of $5.40 to $5.50 per share. The $74 stock trades at 13.5 times the mid-point of updated earnings guidance. Our $85 fair value estimate (unchanged, having been conservative to begin with) assumes 15.5 times these lower earnings and a 3.2% yield, and assumes low double-digit EPS growth in dollars (TUP is now modeling 11% itself).

Pro Guidance: **Buy 2.5%.** Members lacking a 2.5% allocation are advised to buy it. The stock remains a buy. We are considering adding to our 2.5% allocation or writing puts; any such decision will be sent to you in a trade alert.

What We're Thinking

The past few years, Tupperware has disappointed as much as it has pleased investors. This is the third quarter the past year that has led to lower expectations, but each time the problem is in a different area (France, or Mexico, or the U.S., Germany or Russia). On those rare quarters where most areas go well, results top expectations. This quarter, Germany alone knocked revenue considerably as sales in Germany fell 29%. Why? Some 70% of sales occur on weekends, and five of the 12 weekends this quarter were holidays in Germany (not to mention the World Cup). Then there's Russia/Ukraine/CIS, disrupted by war. And in Indonesia, Tupperware had to increase prices 25%, which knocked sales growth to 16% from 25% in prior quarters. Each problem should improve. We're content to own 2.5% in this business, and are now considering adding to it at these prices.

How it Fits Into Pro

In the *Pro* portfolio, we like that TUP provides non-tech exposure and consumer retail exposure in large emerging markets (66% of sales), while trading at a reasonable price with a strong yield. It doesn't face the same retail risks (or costs, or limitations) as a bricks and mortar retailer. The meta-thesis is Tupperware can grow free cash flow and EPS -- in a choppy fashion -- strongly enough to top the North Star, especially including the dividend, over the next 10 years as the salesforce grows from 2.9 million to potentially 5 million.

Notes from the Call

Projections:

*2014 FCF of $235-$245 million (down from $263 million in 2013)
*2014 sales in local currency up 4% to 5%
*2014 EPS of $5.40 to $5.50 -- up 11% in local currency at the high end

*Q3 2014 EPS up 7% in local currency at the high end of a range of $0.89 to $0.94
*Long term, still aiming for 6% to 8% annualized revenue growth in local currency, comprised of about 10% emerging market growth and small moves in established markets.

Misc.:

*Sales in local currency were up 3%, with emerging markets up 10% and established markets down 7%. It will take a long time to strengthen the U.S. market.

*Tupperware's sales force is 2.9 million, up 5% from last year, but the active sales force slipped 1%; TUP has a new focus on on-boarding, retention, and party activity.

*Fuller Mexico and BeautiControl both improved (BC sales were up 8%).

*Sales in Germany declined 29% as discussed above. Russia, U.S. and Canada were also weak (with North America down 6%, but better than the previous quarter). TUP has taken numerous actions to change the momentum of the business and expects progress in a matter of quarters (its actions include management changes, fresh marketing promotions, new products in the third and fourth quarters, better merchandising and fewer discounts -- frequent discounts make consumers wait for the next one before buying).

*Big opportunities remain in China and India (and the region in general). TUP did no more than $100 million in sales in each of these countries last year.

*Expect better year-over-year results in Germany and CIS next quarter.

*The last six years, a 2% increase in sales force retention would have resulted in $800 million in more sales; retention is a new focus.

*Keep in mind, the bulk of TUP's 2.9 million in sales staff are volunteers. They only get paid when they sell. Some need to be more motivated to sell.

In closing, after two disappointing quarters, we hope to see improvements the rest of this year, and to follow (even if in choppy fashion). Sales per country are randomly hot or cold, and we give the company leeway for cultural holidays and seasonality, but we hope to see operations implemented that start to bring a bit more consistency over the years. We're also watching TUP's leverage ratio and use of capital. Let's point out that TUP's share repurchases at $89 and $85, etc, are losing money. We were a bit concerned about that use of capital at the time. Long-term, we certainly hope it will prove a good investment.

Here is TUP's IR site: http://ir.tupperwarebrands.com/events.cfm

Best,

Jeff (TMFFischer)

Gentex Shines Bright (No Glare, Of Course)

Published Jul 25, 2014 at 7:02AM

Pro's Take: GNTX Q2-2014 Earnings

Gentex(NASDAQ: GNTX)

Quarter Quick Take

Gentex sold 12% interior and exterior mirrors than it did in Q1-2013. That growth was spread evenly across geographies and product lines, and it outpaced global auto production, which suggests that the core element of our thesis (higher auto-dimming mirror penetration rates) is playing out. The sales growth translated into strong all-around financial performance. Management also presented a compelling new product lineup which lends credence to our longer-term growth and profitability forecasts.

....

Q2-2014

Sales growth: +18%

Operating profit margin: +460 bps to 29.5%

EPS growth: +45%

....

Guidance Update

Gentex is right on track with our model and I'm not making any changes to our guidance this quarter. The first half of the year has been strong and management reiterated its guidance (I think they could be sandbagging a bit). At sub-$29, shares look a bit undervalued and are trading for 15.5x EPS, a discount to the market's 19.7x.

Updated guidance: Buy (no change)

Recommended Allocation: 3.0%

Fair Value estimate: $33 (no change)

End of Fiscal Year expected FV estimate: $35

CAM price: $25 (no change)

Pro has a 3% allocation to Gentex. Members lacking a (full) position should feel comfortable purchasing shares today – they're priced to notch NS-like returns over the long-run. Writing puts to buy shares lower is also a sensible strategy. If given the opportunity, I would look to add to this position.

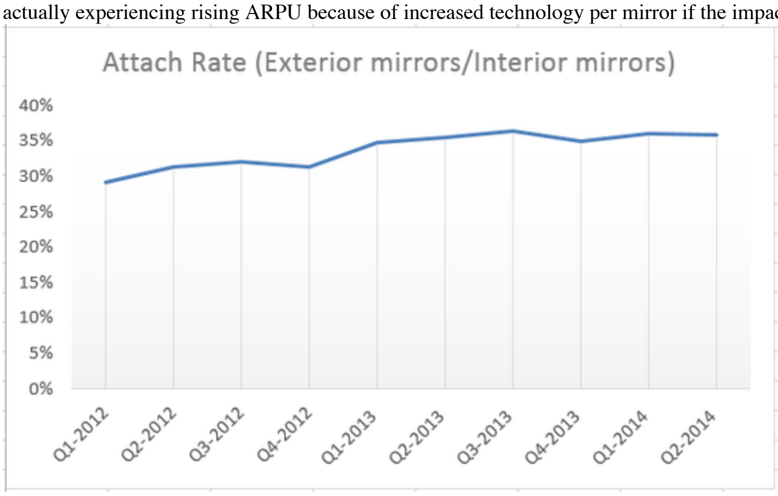
Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1. ***Penetration: Unit growth vs. auto production.*** Over time, we want Gentex's auto-dimming mirrors to become standard in every car produced. If, over time, the company is growing units faster than auto production, it is moving in the right direction. Interior mirror unit volumes were up +11% and global auto production was up only +1% (suggesting further penetration). For the first time in a few quarters, the volume strength was evenly spread between North America, Europe, and Japan/Korea. Interior unit growth should continue to be pressured by the slowdown in RCD unit shipments, but Gentex has dealt with this issue well. Interior units sold in North America increased +6% and international increased +15%, for 11% interior unit growth overall. Exterior mirror unit volumes grew even faster, up +13% in both North America and International. The exterior mirror attach rate was 0.36, modestly higher than previous quarters.

2. ***Pricing and value: Unit growth vs. automotive segment sales.*** Auto makers force annual price concessions on their suppliers and Gentex isn't immune. Management contends that recent concessions have been in the range of 2%-3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices and gross margins. During the quarter, total units (interior + exterior mirrors) increased +12% and automotive segment sales were up +18% (including HomeLink). Making my best estimate adjustment for sales without HomeLink, sales were up around +5-7%, suggesting lower ARPU and consistent with the continued pressure from lost RCD sales. During the call management addressed this directly, noting that the company is actually experiencing rising ARPU because of increased technology per mirror if the impact of RCD is removed.



3. ***Margin performance.*** During the quarter gross margin was 39.7%, up from 35.8 % in Q2-2013. For the trailing twelve months, gross margin was 38.8% compared to 34.6% in the year-ago TTM. If Gentex can continue its strong unit sales growth it may be able to eke out further gross margin improvements, but they will be tough to come by. Management is clear that it can hold the line on 39% gross margins (give or take), but at the moment it doesn't see dramatic upside. SG&A and R&D expenses are in-line with historical norms and are contributing to operating margin expansion (29.5% in the quarter versus 24.9% in Q1 last year).

WWTN

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house development should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

Conference Call Notes

- Units were up 12% overall while automotive revenue was up 18% to $338 mm. My best guess is that HomeLink generated $33-$37 mm in revenue this quarter, which suggests organic sales automotive sales of $303, or 5-6% organic growth.
- Non-automotive revenue was $8.9 mm, up 24% over Q1-2014.
- SG&A expenses were a touch higher than expected, but they should grow in-line with sales over time.
- The balance sheet is strong, with $3.42 in cash per share, and cash greater than debt. We should an update next quarter on the capital allocation plan going forward. Perhaps one piece of the puzzle is a rising quarterly dividend, which now stands at $0.16 per share and a 2.2% yield.
- The company announced it will begin construction of a new manufacturing and distribution facility. The project will cost $30-$35 mm, of which $5-$10 mm will be spent in 2014. This is consistent with the company's build capacity 'as needed' philosophy.
- Management spent a bit of time talking about exciting new products. Four are worth calling out:
  - CMOS imager camera chip. This chip is the physical brain behind the SmartBeam product. A smarter brain means more features available on SmartBeam products. Mirrors with the new chips should begin to ship near the end of the year.
  - New SmartBeam functionality. With the power of the new chip, Gentex is improving the vision detection and features available on SmartBeam enabled mirrors.
  - Video camera technology. Gentex has been working on this technology for a long time and testing it in concept and race cars. It is now rolling out its technology on passenger vehicles. Importantly, having in-house camera technology should allow Gentex to capture more of the profit pie for SmartBeam (and other driver assist features) by using more of its own technology and relying less on licenses from MoblilEye. It is also possible that in-house production with the company's manufacturing prowess could lower the cost sufficiently to make RCD mirror unit prices more attractive to car makers.
  - HomeLink line extensions. Gentex is releasing a battery powered version of HL, which could help drive adoption more quickly. Right now, HL has to be designed into new models, which only change every six years or so. A battery powered version removes the design and wiring requirement. Gentex is also touting HL applications in non-autos, like motorcycles, ATVs, farm equipment, etc. It announced a pair of contract wins outside of auto.
- On guidance: management expects Q3 sales growth of 15-20% and gross profit margin of 39.5% to 40%.
- HL performance so far: Management noted that HL sales are running toward the higher end of the $125-$150 mm in sales they expected, and slightly higher than gross profit margin expectations as well. A "low double digit" sales growth rate is not out of the question, and is consistent with my estimate of this quarter's performance.

- On longer-term gross margin: Management commented on gross margin performance and I suspect analysts will hang on this news and use it as a reason to bash the stock. Gentex has increased its gross margin from 33%-39%, and thinks the 39%-40% is the "sweet spot" and is sustainable. Getting higher is unlikely. "We're not looking out beyond this year saying, we see 41% or 42%, we just don't see a path to get there right now with the current volume and product mix that we're shipping. But like I did mention, anything about 39% we feel comfortable with, like we can manage the business in and around that range."
- Gentex benefited from an R&D tax credit that may not repeat. The benefit was ~$5.5 mm, or $0.04 per share. This does not diminish the solid performance during the quarter.
- Gross margin improvement was due to HomeLink, improvements in product mix (higher technology per unit), purchasing cost reductions, and leveraging fixed overhead costs. Per usual, these gains were offset by normal price concessions.

Coca-Cola Still on Ice, but Thawing?

Published Jul 24, 2014 at 10:05AM

In another sequentially improving quarter, **Coca-Cola** (NYSE: KO) reported 3% growth in unit case volume, including 2% growth in global sparkling beverages (sodas). Coca-Cola's total net revenue grew 3%, and operating income grew 5% excluding currency headwinds. Free cash flow remains strong with $4.5 billion in cash from operations this year, and the company is valued at 21 times free cash flow. With our fair value estimate of $44, *Pro* is content to keep its 2016 synthetic long position in place right now.

Brand Coca-Cola grew 1% in North America, but most growth continues to reside in emerging markets, including China and India. Diet Coke and Coca-Cola Light volume declined by mid-single digits; the company continues to fight negative press associated with diet soda, and healthier alternatives. The company's "still" beverage portfolio saw 5% volume growth, led by sports drinks (up 6%), water (up 7%), tea (up 4%) and energy drinks. Juice had a challenging quarter, but held up despite price adjustments to offset higher costs.

Management wrapped up by saying that they're "pleased with these results in a difficult operating environment, and to get growth back into sparkling [beverages] is a significant achievement." CEO Muhtar Kent said, "...I believe our approach is working," as they make gradual progress to restore growth, and the company "is where they hoped to be by mid-year." Kent (and I!) believe the company's long-term growth objectives remain obtainable, although they know challenges remain ahead. Our position in *Pro* is sized accordingly, even though we're optimistic for better quarters. Keep in mind, northern hemisphere summer weather can play a substantial role in the year, so we'll keep an eye on temperatures.

What We're Thinking -- or What Makes Us Different?

I realize that reciting financial metrics -- quarterly numbers -- is of little value. You can read the press release. The only interesting thing is, "What's our take? How do we differ from the market?" And in this case, we believe in the strength of Coca-Cola's distribution and branding to overcome challenges that surround the soda market. For better or worse, we think there's more growth to be had in sparkling beverages around the world, while much of Wall Street seems to think the growth there is all but done.

Conference Call Extras

- Coca-Cola and its bottling partners will invest another $8.2 billion by 2020, on top of global systems investments of $60 billion+ since 2010. This speaks to Coca-Cola's competitive moat: Few can invest that type of cash in bottling and distribution. (Keep in mind: *what* it bottles and distributes can always evolve.)
- YTD revenue growth is 3%; operating income was dinged by 4 percentage points this quarter due to currencies, but is up 6% year-to-date excluding currencies.
- Coca-Cola's use for cash remains: 1) reinvest in the business (about $2.5 billion this year); 2) pay a healthy dividend (it has increased it for more than 50 years straight); 3) acquisitions, partnerships, etc, to grow; 4) repurchase shares ($2.5 to $3 billion this year).
- EPS will be dinged by $0.02 per share the rest of this year due to structural items and changes in Venezuela.
- The balance of the year, Coca-Cola "should be able to fall within the corridor of the long-term growth targets" it sets for itself.
- Smaller packaging resulted in about 60% of the uptick in North America Coca-Coal sales; customers want smaller servings, which offer Coke better price value.
- Latin America should start to improve toward the end of this year
- Marketing costs continued to go up, to drive sales, with spend increasing as Q2 ended. Coke is in a place where it wants to reinvest proceeds into building growth momentum again, and it has a "whole lot more work to do." They're focused on driving long-term growth.
- Much of Europe improved.

Coca-Cola remains a long-term growth resumption story, supported by strong fundamentals and a distribution network second to none. The stock, with its 3% yield, still looks reasonably priced for long-term, patient owners.

Best,

Jeff

Stop Making So Many Decisions

Published Jul 21, 2014 at 2:57PM

Pro Guidance Changes

- **Wells Fargo** (NYSE: WFC): Another solid quarter from Wells has Billy and the *Pro* team impressed. We're raising our Fair Value Estimate to $56 and our Consider Adding More price to $44.

Dear Fools,

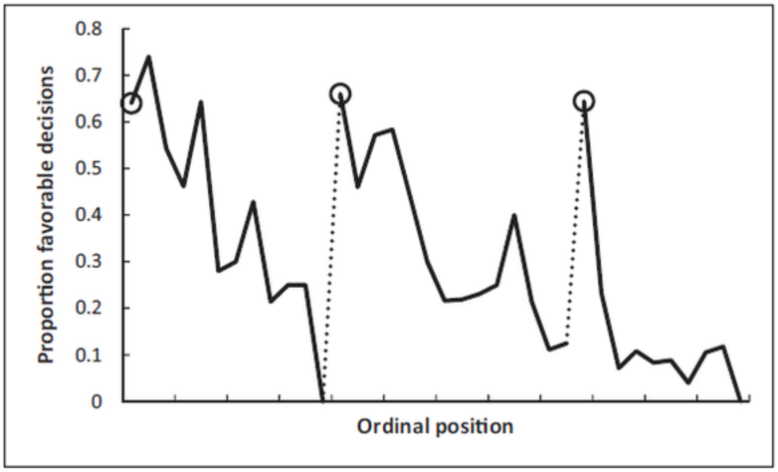
The longer I live, the more I wish I had an instruction manual to keep from doing dumb things. Two years ago, I wrote about how the weather (the weather!) influences serious financial decisions we make — like buying a house or a car. Of course, the weather wouldn't impact *our* decision making; we're all too smart, right? But now I read that being hungry impairs my decision making, too. I'm doomed!

Just Like the Rest of You, Your Brain Gets Hungry and Tired

Researchers from Ben Gurion University of the Negev and Columbia University studied more than 1,100 judicial rulings regarding prisoners asking for an adjustment to their parole arrangement (a parole request, the removal of a tracking device, or a change in prison). The 1,100 rulings were made by eight judges in large chunks — about

23 cases per day. If you're thinking this sounds like a lot of serious decisions to be making in quick succession, you're right. To cope with this, the judges were given two food breaks per day (an average of 38 minutes each), breaking each day into three distinct decision-making periods.

Now, these are judges, remember. They're trained in the consistent application of the relevant laws to the facts presented. This stuff is black and white (or should be). So what did the study reveal? Well, if you were a criminal whose case was heard at the beginning of one of the sessions, you had about a 65% chance of receiving a positive ruling. But if your case was heard at the end of one of those sessions? Sorry Charlie, you had almost no chance of a positive ruling. Check out how dramatically the likelihood of receiving a positive ruling fell as the judges grew tired:



Source: [Proceedings of the National Academy of Sciences (link opens PDF)](#).

Unfortunately, you're not seeing that wrong. As each session went on, the likelihood of receiving a positive outcome declined dramatically. The study controlled for variables such as the severity of crimes, prisoner demographics, and months served, so we can be pretty confident that the phenomenon demonstrated, known as decision fatigue, is real. While not exactly life or death, these *were* serious decisions made by professionals, and it doesn't appear that each prisoner was given a fair shake.

Give Your Brain a Break

Now consider the impact of being tired or hungry on your investing decisions. *Yikes*. Here are some tips on how to set up your investing life to avoid making bad decisions because of fatigue:

1. **Make fewer decisions.** Clearly, the more decisions you have to make, the more tired your brain gets. One way to make fewer decisions is to buy and own the shares of great businesses. Like our core holdings in *Pro*, you don't need to worry about selling at the slightest hint of overvaluation provided that the business is likely to compound its intrinsic value over time. Another trick is to use the options expiration date every month to act as a "trigger point" to think about each of your holdings. By having a set date to think things through once per month, you save yourself from the tendency to think about your holdings more frequently.
2. **Don't tax your brain.** One of the benefits of running *Pro* in front of you, our members, is that we have to document the rationale for every action we take. While this slows us down sometimes, it gets us on record, and when we have to make a decision down the line we don't rely on taxing our brains to remember what we expected or why we took the action. We can simply pull up the alert and refresh our memories, which frees up some mental space and makes it easier on our brains. Another way to lighten the brain's load is to share the decision making. *Pro*'s team approach and your access to the Fool community do just that.
3. **Take a load off.** It's frightening to realize the number of decisions we ask our brain to make every day. It is so many, in fact, that we make many of them on autopilot to reserve some decision-making capacity. I propose that the more menial decisions you can make automatically, thanks to well and deliberately constructed habits, the more computing power your brain will have for the really important things. For example, I eat the same thing for breakfast every day — no hemming and hawing; I get my nutrition without thinking. I shop at a grocery store that has basically one brand of everything — not six to choose from. I'm also considering the Steve Jobs approach to dressing: jeans and a black t-shirt, every day (my wife is not amused by this one). Autopilot can be dangerous, of course, which is why spending a little time to develop and implement *good* habits is the key to this strategy.

The *Pro* Bottom Line

Investing is hard enough as it is, and our brains don't do us any favors. For long-term success, we have to master ourselves as much as our portfolios. My advice: [Keep some good dark chocolate and butter handy at all times](#), don't be afraid to take a break, and use the strategies above. Tell us how you prevent decision fatigue and use good habits by dropping by the [Memo Musings](#) or [Optimize Your Life](#) discussion boards.

Onward.

Intel Raises the Bar, but Moves to Hold

Published Jul 21, 2014 at 12:57PM

Intel (NASDAQ: INTC) adjusted expectations higher in June, and surpassed them in July. After two years of flat results, the company grew Q2 revenue 8% to $13.8 billion, while earnings per share jumped 41% from depressed levels as gross margins gained 6.2 percentage points to 64.5%. Margins are expected to stay above historical levels the rest of this year.

Looking a bit deeper, the Data Center business enjoyed 19% revenue growth year-over-year, while PC Client Group unit volume jumped 9% as more enterprises refreshed aging computers (although average selling prices declined 4%). Intel estimates the number of PCs four years or older to be 600 million, and with **Microsoft** (NASDAQ: MSFT) support for XP ending, there are more reasons to upgrade. Plus, Intel is taking market share with the likes of two-in-one PC/tablet designs.

The company expects enterprise PC strength to continue the rest of 2014, but we need to take Intel's prognostications with a grain of salt. In January, the company predicted a flat year, which is proving quite wrong; in the past, Intel has predicted sustained up-cycles that then faded away as quickly as summer itself. Still, there's no denying that enterprise PC sales are currently on the rise, Intel is making headway into mobile computing (though profits here won't materialize until at least 2016), and Intel maintains a multi-year nanometer technology lead over competitors.

Plus, the consumer PC business remains weak. Representing roughly 60% of Intel's business, consumers represent a large catalyst if and when they revive. Already Intel sees "more optimism" from PC manufacturers for the second half of the year in regards to consumers, but stocking won't equate to sell-through unless consumers come to the table. Intel needs time to see the results, and our crystal ball lacks an ability to foresee short-term customer behavior, although we've always argued that consumer PC sales would revive in one form or another.

Aside from higher margins, one of the largest financial revelations this quarter was Intel's decision to run the business at net-zero cash-to-debt going forward. In other words, rather than maintain net cash on the balance sheet in the billions, Intel is going to use excess cash to buy back shares and pay dividends, while relying on cash from operations to fund internal investments. This suggests that Intel isn't eyeing any large acquisitions anytime soon (unless it were to use stock or take on more debt), but would rather manufacture more shareholder value.

The company increased its share buyback authorization by $20 billion (nearly 12% of its current market value), and intends to purchase about $4 billion in stock in the third quarter alone (that represents three days worth of normal share volume). This aggressive use of capital was not modeled for by us, and it -- along with stronger results at higher margins -- increases our fair value estimate by about 10% to $30. **The stock moves to Hold as we assess our in-the-money covered call options.** To discuss Intel, please visit its board on *Pro*.

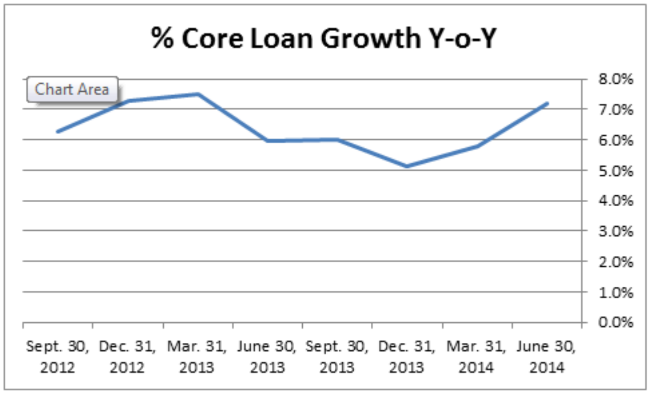
Guidance Change: Wells Fargo Continues to Impress

Published Jul 18, 2014 at 9:56AM

Wells Fargo (NYSE: WFC) reported Q2 earnings on July 11. Despite solid results, as of pre-market today, the stock price is down about 2% since the day before earnings, and about 4.5% from its year-to-date high of $53 on July 3.

Core loan growth (i.e., excluding non-strategic/liquidating loans mostly related to the Wachovia merger) was encouraging, up 7.2% year over year and 2% quarter over quarter. I view trends in core loan growth as the best representation of trends in the lending business, as non-strategic/liquidating loans now represent less than 8% of total loans, down from about 9.5% last quarter. That number should continue to tick lower over time as those old loans roll off the books.

Core loan growth is accelerating in recent quarters, which is an encouraging sign as economic activity picks up after an awful (-2.9% GDP) first quarter:

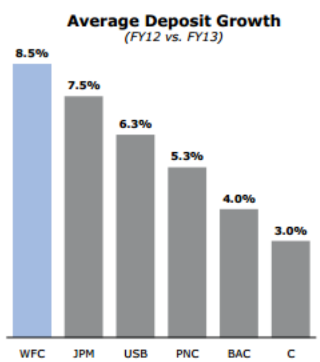


Source: Company filings and analyst calculations.

There was particular strength in commercial and industrial loans (up 10% year over year), auto loans (up 11% year over year), and credit card loans (up 10% year over year. Accelerating loan growth is a big driver for Wells Fargo, since loan income represents 75% of interest income, and interest income represents half of the company's earnings power. As loan growth picks up, we should expect to see interest income increase as well.

And this acceleration in loan growth is occurring even in the face of stagnant interest rates, which is very encouraging. When long term rates finally rise, I'm thinking it could be a big boon for the banks — especially Wells Fargo with its conservative lending nature. This is because as the spread between short-term and long-term rates increases, loaning becomes more profitable for the banks, which allows them to take on additional risk and lend to businesses and households that haven't qualified for years.

As for deposits, Wells again demonstrated its strong deposit franchise with growth coming in at 5.9% year over year, up from 5.2% last quarter and 4% the quarter before that. Its scale, proficiency in cross-sell, and network effect (largest nationwide branch network) allow it to collect assets at a higher rate than competitors, and at a lower cost. It's 0.10% cost of deposits (down from 0.11% last quarter) is best in class. Here we can see how Wells has been outperforming its peers in gathering deposits:



Source: Wells Fargo 2014 Investor Day Presentation.

As short-term rates rise, Wells should be able to put more of those deposits to work in investments (Wells' management has been conservative with its investments due to the low rate environment), increasing the business's earnings power.

So, in my estimation, Wells Fargo is well-positioned for any interest rate environment. Short-term rate increases should be beneficial via increases in investment income and ability to put deposits to work, and long-term rate increases should be beneficial via an increase in the profitability and growth of loans as the rate spread grows.

After analyzing the quarter, the Pro team remains bullish on Wells Fargo as a long-term holding and we think it will continue to achieve North Star-beating returns. **I've increased my Fair Value estimate from $53.50 to $56 and Consider Adding More price from $41 to $44, reflecting a book-value increase from last quarter and more optimistic return-on-equity assumptions.**

After our strangle strategy on Wells Fargo concluded with a well-timed close of our short call and a fully profitable expiration of the $48 short put in June, the *Pro* team is presently deciding how we want to proceed with this position.

Fool on!

Short Five Below

Published Jul 16, 2014 at 10:25AM

Is this for you? This trade is for Fools with a margin account and who can locate shares with their broker. Prior to releasing this alert, Interactive Brokers and TD Ameritrade had shares available to short. OptionsXpress did not have shares. Check with your broker to locate shares and inquire about any fees involved. This trade is also only for Fools who don't mind volatility — we expect this to be a bumpy ride.

How You Participate

- **Trade:** Sell Short **Five Below** (NASDAQ: FIVE)

- **Allocation:** 1.5%
- **Price Guidance:** Short above $33
- **Recent Prices:** $36
- **A Special Note of Caution:** Five Below is currently a recommendation in our *Hidden Gems* and *Rule Breakers* newsletters. We're motley, and are disagreeing with some smart investors who believe in Five Below.

What We're Thinking

Five Below is a specialty retailer that sells "trend right" merchandise to teens and pre-teens for five bucks or less. Its stores are a place for young folks to spend their allowance money. The company believes it is transforming the experience for young shoppers with a unique merchandising strategy (a combination of branded toys, accessories, and tchotchkes teens actually want to buy) and high-energy, fun shopping experience.

The typical store is 7,500 square feet, located in a strip mall, and stocks 4,000 distinct products. Store economics are compelling: New stores cost $300,000 and log sales of $1.5 million to $1.6 million in the first year, with most stores having a payback period of just 10 months. Average sales per store were $1.9 million at the end of 2013, increasing from $1.3 million five years ago. Today, Five Below operates 338 stores in 20 states and is set for rapid growth. The company expects to open 62 new stores in 2014 (for about 20% unit growth) and sees a potential for 2,000 or more stores in the U.S (about 11 more years of 20% unit growth). On top of opening new stores, existing stores have notched 32 consecutive quarters of positive same-store sales.

A new retail concept, great store economics, and a high-growth profile made for a successful initial public offering in July 2012. Shares priced at $17, and as they rose, the private equity firm that controlled the company sold off its entire investment. Shares have risen more than 100% since the IPO and we believe they're priced too dearly at about 3.5 times sales, 28 times EBITDA, 40 times 2015 expected earnings, and 31 times 2016 expected earnings. We wouldn't short solely on valuation, of course; Five Below shows signs of trouble in each of the three key areas we focus on for short candidates:

- **Competitive flags.** Five Below is performing well, but we think it is unlikely to ride into the sunset unchallenged.
  - We don't believe the company has a sustainable competitive advantage. It doesn't have proprietary merchandise, it doesn't have exclusivity agreements with suppliers, it doesn't have the advantaged locations a first-mover might, and it doesn't have a brand that translates to the ability to charge higher prices (in fact, it has painted itself into a corner by capping prices at $5). Success attracts competition and competes away profits, and we think this will play out with Five Below.
  - We've seen the promise of skill in selecting "on-trend" and fashion merchandise fall short more often than not, and Five Below has built its business on getting the fashion right in the eyes of teens and pre-teens. Having just lost its executive vice president of merchandising (more on this below), we think the fashion risk just went even higher.
  - The competition is coming, and coming hard. While dollar stores don't solely target teens and pre-teens, they fight for the car trip the parents provide, they fight for similar store locations, and they're increasingly fighting for more of the dollars spent in the same merchandise categories. For example, **Dollar Tree** (NASDAQ: DLTR) has ramped up openings of its "Deals" store concept, which allow it to sell merchandise up to $5. The expanded price point allows for more merchandise categories, increasing its product assortment overlap with Five Below. With 214 Deals stores already, Dollar Tree plans to grow unit count of this concept about 15% per year, and based on their success, the company could choose to transition some of its traditional Dollar Tree stores into Deals store formats and attack even more aggressively. **Family Dollar** (NYSE: FDO) has also expanded its higher price point offerings and new merchandise categories, including a big push into branded toys this past holiday season. Finally, after years of testing and learning, **Wal-Mart Stores** (NYSE: WMT) is putting the pedal to the metal in small-format store openings (its Neighborhood Market and Express store formats). Wal-Mart expects to open 300 small-format stores this year — nearly as many stores as Five Below has after being in business for 12 years. Even if this competition isn't a direct assault on Five Below, it is illustrative on how easy it is to pop up competing stores and how tenuous profits can be without a competitive advantage.
- **People flags.** None of the below flags are damning in their own right, but taken together, they raise doubt about long-term great performance at Five Below.
  - David Schlessinger (the executive chairman) and Thomas Vellios (CEO) are longtime business partners. In the late '90s, they ran a public company together called Zany Brainy. It sold "on trend" children's toys (think of here-today, gone-tomorrow toys similar to Pokemon cards and Beanie Babies) and more classic games. That business went bankrupt in 2001. It appears to have failed because the pair (a) tried to grow it too fast, (b) made a big acquisition, (c) spent too much building out their online presence, and (d) had no competitive advantage. Causes (a) and (d) are extremely relevant to the path of Five Below, and we're watching (c) in light of a recent Internet specialist executive hire.
  - In August 2013, the company abruptly announced Chief Operating Officer David Johnston was leaving. Johnston was poached from Wawa to become the COO in June 2012, meaning he spent barely one year on the job before jumping ship. The terms of his severance agreement included a non-disparagement clause, so there is little published on why the split actually occurred.
  - Just a few days ago Five Below announced Executive Vice President of Merchandising Jeff Moore was leaving. Moore had been with Five Below since 2007 and worked his way up to the EVP ranks. Five Below claims that it has a deep bench of general merchandising managers, but things don't add up. At the time of its S-1 (IPO filing), the company listed two GMMs, Moore and Lisa Surella. Surella stayed at Five Below for only eight months. The two GMMs cited in the Moore departure press release appear to be brand-new employees with little Five Below (as recent as February 2014 hire) or teen merchandising experience. For a company that relies on getting its merchandise assortment right, this is problematic.
  - Executives are unloading shares. In late June 2014, CFO Ken Bull sold $1 million worth of Five Below shares, eliminating one-third of his ownership stake. Recently, Executive Chairman David Schlessinger established a 10b5-1 trading plan to sell 400,000 shares, half his ownership in the business. Just days ago, the plan unloaded the first 100,000 share block. CEO Thomas Vellios also established a 10b5-1 trading plan, so in the near future we can expect him to divest some of his ownership in Five Below, too.
- **Financial flags.** Five Below shouldn't have a problem opening up new stores — they're cheap to erect and have a quick payback. However, rapid growth with stellar operational performance isn't easy to balance, and great performance attracts attention from competitors. We have our eyes on inventory and operating profits.
  - Even prior to the EVP of merchandising's departure, we were watching inventory. Days inventory outstanding, a measure of how long inventory sits on the shelves, has risen for five consecutive quarters (all the publicly available data we have). If inventory builds, it could be a sign that customers aren't buying as the company expected, or that some merchandise isn't resonating with customers.
  - We think margins could come under pressure not only from the looming competitive threats, but because Five Below appears to be heavily reliant on sales of holiday merchandise in the fourth quarter. Sales from its "party and snack" category, which includes seasonal goods, have grown to nearly 20% of full-year sales, and operating profits generated in the fourth quarter alone account for more than 75% of full-year operating profits. Together, these two facts suggest that Five Below probably does compete head to head with Dollar Tree, and that if it has a poor holiday season, its profitability will fall dramatically.

How It Fits Into *Pro*

This small direct short position will modestly lower *Pro*'s net long exposure to the market. Furthermore, as a teen retailer, Five Below shares some of the same end-customer spending risk that **The Buckle** (NYSE: BKE) does. If the general retail or spending environment weakens unexpectedly, this short should help offset some of the pain inflicted on The Buckle.

Remember, this direct short can only gain 100%, while its potential loss is unlimited. We intend to build out a basket of direct short positions over time and believe the most prudent way to follow-along is to match the entire basket, rather than pick and choose among them.

Catch-Up Trades: July 14, 2014

Published Jul 14, 2014 at 12:54PM

Catch-Up Trades are the Pro *team's timely ideas to catch up on a portfolio position you may be lacking*.

- **iShares Russell 2000** (NYSEMKT: IWM): If you lack a hedge, and you want to hedge some of your assets, then set up a bear put spread on this ETF, similar to ours. Simultaneously buy to open Sept. 20, 2014 $114 puts (one dollar lower than our official trade, to account for different pricing), and sell to open an equal number of Sept. 20, 2014 $105 puts (to finance part of your cost). Lately, you can set this up for $2 or less per spread, or about $200 each. That is your maximum risk, while your maximum reward is around $7 ($700) per spread. Set up one spread for every $112,000 you have invested long and want to hedge. Realize this hedge will expire without value unless IWM declines by expiration, so don't risk money you don't want to lose.

Monday Memo: At 11 for 11, Pro's Building Success

Published Jul 14, 2014 at 11:40AM

Dear *Pro* members,

We start another earnings season this week, making now a good time to remind ourselves that quarterly reports are not what make for investing success. They're merely one step along a long path. Much more important is how you put your portfolio together and maintain your convictions for the long haul.

At least once a year, I like to review the entire history of the *Pro* portfolio to relive past decisions, assert what has worked and what hasn't, and confirm that our approach to building the portfolio is sensible. Sometimes I tighten the scope, as I'll do today by looking at what we've bought (and some sells) since January 2013.

In the last 18 months (about 380 market days, for those counting), we had 11 buys in the portfolio. That's one on average every 1.6 months — or one every 35 market days. That's a rapid pace for long-term investors like us, with a fixed amount of money and low portfolio turnover.

What makes me happy about the buys is they're all making money: We are 11 for 11.

What makes me even happier is they're outstanding businesses that we're excited to own with just a few exceptions: One we already sold; one we bought because it's average but priced below average; and one is an ETF where we see long-term promise. Here's the list of positions we bought anew or added to since January 2013, in order:

- **Apple** (NASDAQ: AAPL): Bought more when it was down
- **GrafTech International** (NYSE: GTI): Bought more, and sold those shares at a strong profit
- **O'Reilly Automotive** (NASDAQ: ORLY: A new buy
- **American Tower** (NYSE: AMT): New; bought twice
- **TD Ameritrade** (NYSE: AMTD): A new buy
- **AIG** (NYSE: AIG): Bought more
- **Valmont Industries** (NYSE: VMI): A new buy
- **Parexel** (NASDAQ: PRXL): A new buy
- **Coca-Cola** (NYSE: KO): New; set up through a synthetic long
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Added more
- **Gilead Sciences** (NASDAQ: GILD): A new buy

AIG is the "average business" that could become much better if the company improves its underwriting, and GrafTech has already been sold. What's left are eight outstanding companies that share common traits:

- Return on equity greater than 10%
- Consistent management
- Growing market opportunities

I realize those last two traits are squishy, but they're valid. We're comfortable with what we own largely because management has consistently run these businesses for greater shareholder value, and we believe there's more opportunity ahead.

Each company made it into the *Pro* portfolio because it displays the right mix of business opportunity, valuation, and good management — all of which put the odds of investment success in our favor. Each remains Buy rated today. (And note, we could add **Facebook** (NASDAQ: FB) to this list if we wanted, since we turned our calls to stock in January.)

The best performers over this short period? The auto parts retailer, up 55%, and Apple, also up about 55% since our March 2013 buy (not including dividends).

And the "Other"

Compared to our buys, our other actions lately have created little value. Hedging since January 2013 hasn't proven necessary (although it has allowed us to comfortably hold more long exposure, which pays off); option income has been modest as volatility remains low and we focus on stock buys; and in most cases our sells have left money on the table as the market keeps rising, but we are happy to be free of the likes of GrafTech and **StoneMor Partners** (NYSE: STON).

My main takeaway from looking at our past 18 months is that our buying process looks healthy. Countless stocks have fallen over this period, but each of our dozen buys (including Facebook) is green since purchase. In fact, all two dozen of *Pro*'s long holdings (and two of three shorts) are profitable. That gives the portfolio near 100% accuracy. We are stringent about what we allow into the portfolio, and for your money (and ours), we will continue to be.

Can we do better? You bet. I see many weaknesses, and questionable decisions, when I look back at our past 18 months, let alone the last six years. Before I cast judgment in print, ballooning this Memo into thousands of words, I'll think some more about our mistakes and save that Memo for another day. Rest assured: We always want to improve how we invest and our results. It may be a curse, but we're never satisfied when it comes to this pursuit.

Tonight, look at your portfolio history the last few years. What can you learn by looking? To start a discussion on the topic, as always, visit the Memo Musings board.

A Mid-Year Review: How Are We Doing?

Published Jul 7, 2014 at 3:52PM

Pro Guidance Change

- **Medtronic** (NYSE: MDT): We raised Medtronic's Fair Value estimate to $65 and its Consider Adding More price to $52 after digging into its proposed acquisition of **Covidien** (NYSE: COV). Shares remain a Buy and *Pro* owns a 3% position.

Dear *Pro* members,

It's hard to believe that the first half of 2014 has come to a close (it seems like just yesterday Jeff was reviewing 2013). Now that we're officially into the third quarter the year, I thought it would be a good time to assess our performance year to date and tell members what to expect for the second half of the year.

It's been an interesting six months for the market, though you wouldn't think so just looking at the total return for the S&P 500 year to date, which sits at about 7% on an absolute basis (on pace for about a 14.4% annualized return this year). After a spike in volatility around late January and early February (the VIX hit an intraday year-to-date high of 21.48 on Feb. 3) that coincided with some sharply negative stock price movements in high-flying growth companies, the market has calmed down. Volatility has steadily drifted lower since the early spike, and as of this writing it sits at 10.32, which is about as low as the index has been in its history. The major indexes now sit at or near all-time highs, and the relentless bull market of the last five-plus years continues to march on.

As for the first six months of 2014 for the *Pro* portfolio, it's performed quite well. Our total return year to date is about 7.4%, outpacing both the S&P (up 7%) and our North Star (up about 4.8%) over the same time frame. We've achieved these returns despite currently sitting at about 73% net long, about in line with *Pro*'s historical averages.

As far as our activity, we're trading at about the same pace as we did through the first six months of 2013. Here's a comparison of our important trading activity for the first half of 2013 vs. the first half of 2014:

	2013	**2014**
New Purchases	2	2
Allocation Increases	2	1
Options for Income	8	8
Hedging	4	4
Sales	2	3

As you can see, *Pro* has maintained its steady, consistent approach. As is typical for us, we haven't tried to do too much trading with our core stock positions, although we've invested in two new companies so far this year (**Coca-Cola** (NYSE: KO) and **Gilead Sciences** (NASDAQ: GILD)) and increased our allocation in another (**American Tower** (NYSE: AMT)). We like to invest in compounding machines and let them be, avoiding the drag of frictional trading costs when it comes to our equity positions.

Where we are more active is with hedging and using options for income, and we continue to employ a combination of strategies, including seeking lower buying prices and hedging against declines. We expect to keep using options opportunistically throughout the next half of the year, specifically looking to continue our strangle strategies on **Wells Fargo** (NYSE: WFC) and **Tupperware** (NYSE: TUP) after the two companies report earnings on July 11 and July 23, respectively. Of course, not all income strategies pan out. Our covered calls on a formerly sleepy **Intel** (NASDAQ: INTC) have cost us significant missed upside in the lively stock this year. We'll manage that position however is best, but if writing options on Intel continues to look reasonable, we may eventually earn income on it.

While we aren't market prognosticators and we can't tell you what to expect from the market over the second half of 2014, we can tell you what our approach to portfolio management will be. We will continue to invest in core stock positions (i.e., compounding machines) when the balance of risk and reward looks favorable. We will continue to use options strategies either for income, to add to our positions at lower prices, or for leverage, depending on what opportunities present themselves. We will seek to short weak, disadvantaged companies that appear poised for a stock price decline, and we will manage our net long exposure via index hedges as market conditions dictate. Here's to a successful first half of 2014, and hopefully to a successful second half as well.

Are Covidien and an Irish Domicile Medtronic's Lucky Charms?

Published Jul 1, 2014 at 1:32PM

Fellow Fools:

Back in October 2012 we introduced to Pro members a framework for analyzing acquisitions. The gist of that essay was that corporate marriage is tough to get right and it has historically destroyed value, so we should skeptically view most acquisition activity our companies engage in.

I've dusted off that framework and used it to analyze **Medtronic's** (NYSE: MDT) proposed $43 billion acquisition of **Covidien** (NYSE: COV). The details and complete analysis are in the table below, but here are the highlights:

- This acquisition is about strategy.
  - The larger and more diversified Medtronic plc will be better positioned to win business in the new global health care regime where hospital administrators and governments are the primary customers. Being large (#1 or #2 in six of the top 10 hospital purchasing categories) allows Medtronic to sell in bulk and offer the convenience of a one-stop surgical shop to these customers.
  - Medtronic plc is in a stronger lineup of businesses -- more diversified and less subject to pricing pressure. This makes its profit stream safer, more resilient, and arguably more valuable.
  - With nearly $4 billion in sales to emerging markets, this move should accelerate Medtronic's leadership position in key emerging markets and set the stage for prolonged sales and profit growth abroad.
- Medtronic will have increased financial flexibility. It frees up trapped cash and regains control of the ability to allocate capital in the geography and method of its choosing.

Accordingly, **we're raising our Fair Value estimate to $65 and our Consider Adding More price to $52**.

Onward,

Bryan (TMF42)

Overview of the Deal

On June 15, 2014 Medtronic announced it would acquire Covidien for $93.22 per share, consisting of $35.19 in cash and the remainder in stock. That price represented a 29% premium to Covidien's closing price the day prior, about 15x 2015 EBITDA and 21x 2015 earnings. When the deal closes. a new Irish-domiciled entity will be formed, called Medtronic plc. This course of events will create a taxable transaction for both Medtronic and Covidien shareholders because both legacy companies will cease to exist and shareholders receive shiny new shares of Medtronic plc. (Please note, we aren't tax experts, but this is our understanding. We'll be researching the mechanics of this more as the closing date nears.) Medtronic CEO Omar Ishrak will be the CEO of the new entity, but all key Covidien executives are expected to stay on board and continue running their divisions. The deal is expected to close in late calendar 2014 or early calendar 2015 and is subject to Medtronic and Covidien shareholder approval.

Prior to the transaction, Medtronic had an enterprise value just shy of $60 billion and Covidien had an enterprise value of almost $37 billion. Medtronic plc will have more than 87,000 employees. For a reference point, Johnson & Johnson (NYSE: JNJ) has 128,000 employees and an enterprise value north of $285 billion.

Filter #1: Guilty Until Proven Innocent

This proposed acquisition is large -- a $43 billion consideration by a company valued at $60 billion. History tells us that large acquisitions perform worse than bolt-ons, and that the acquiring firm's stock tends to underperform over the subsequent five years. Although these are facts, they're averages, so they belie all possible outcomes and instead focus on the middle of outcomes. Still, we should put our skeptical shades on for the rest of this analysis -- Medtronic is making a big bet and it has a history of charges (ironically called "one-time charges" and equal to a nontrivial 4% of sales over the past decade) that suggest this or any merger not guaranteed to sail smoothly.

Filter #2: Key Considerations

Key Consideration	Details	Our Take
Size	Medtronic is paying $43 billion for Covidien's $10 billion in annual revenue and $1-$1.5 billion in annual free cash flow. Covidien was probably the third largest company Medtronic could have reasonably made a play for (behind **Abbot** (NYSE: ABT) and **Baxter** (NYSE: BAX).	This qualifies as a megamerger in terms of size and geography, but has little complexity in terms of overlapping product portfolios.
Strategic Rationale / Vision	**Cost**: Covidien is perhaps the only medical products company ahead of Medtronic in responding to the changing buying patterns of hospitals, where purchase decisions come from administrators instead of surgeons. In an increasingly cost conscious world, Covidien quickly organized its business assets and processes around saving hospital clients money -- a natural shift given its strength in medical instruments. With #1 or #2 market share positions in almost all of its product categories, Covidien has sufficient scale to maximize cost efficiencies. **Marketing/distribution**: Covidien has a sales force of more than 4,000 strong, and when combined, Medtronic will do business in 150 countries. The business will generate nearly $4 billion in revenue from emerging markets and have meaningful ability to be close to customers with marketing, manufacturing, and research and development. **Technological advantage**: Both firms rely on patents and technology. Covidien has recommitted to innovation with considerable investment over the past five years. Both companies have strong pipelines. **Industry balance**: With hospital administrators doing an increasing amount of purchasing, Medtronic and Covidien now meaningfully share customers. Hospitals, and abroad governments, are large customers with significant bargaining power. **Visionary investment**: This business combination may not be visionary, but it is clearly making a bet that the future of health care (surgery, at least) will be increasingly controlled by large customers (hospitals, governments, and other payers).	**Cost**: Medtronic could not have achieved the cost advantages Covidien has in its product lines. It should be able to eliminate some overlapping back office functions, find sourcing savings, and outfit existing sales people with additional products. In all, management expects to achieve cost synergies of at least $850 million over the next few years, which represents about 10% of Covidien's operating costs and 4% of the combined company cost structure. **Marketing/distribution**: This acquisition should accelerate Medtronic's penetration into emerging markets. This is critical because growth in emerging markets is responsible for much of total sales growth. The two companies are highly complementary with their emerging market strategies, with Medtronic adept at innovating into the value segment and Covidien's strong hospital distribution. **Technological advantage**: Covidien should benefit from Medtronic's relationships and experience in navigating the regulatory morass of device approval and study completion. **Industry balance**: Medtronic CEO Omar Ishrak's strategy to focus on economic value was an admission that hospital's are price conscious. Traditionally, Medtronic has had a difficult time convincing hospitals its products save money because all of the savings come once the patient has left the operating room. With Covidien's surgical supply products, Medtronic is now armed with the ability to sell in-hospital savings. In addition, it can bundle surgical products with devices, or sell with volume discounts and trade margin for sales. Medtronic is now the leader in six off the ten largest hospital purchasing categories. The company's ability to master the price and volume trade-off to its advantage is helped immensely. Not only does the larger product portfolio help balance the power between Medtronic and its large customers, but it tips the scales in Medtronic's favor in terms of pricing more attractively than smaller or less diversified competitors in device or surgical supply sales. **Visionary investment**: This move was an offensive one, with Medtronic aggressively realigning the balance of industry power before it had much of a chance to shift. In addition, this move accelerates the ability to expand in emerging markets and brings local presence in key markets. While not visionary, this transaction shows foresight.
Performance and Price	Covidien was spun off of Tyco several years back. Under Tyco's umbrella, Covidien underinvested and growth stagnated. Once independent, it used its cash cow surgical supplies division to fund investment and rekindle innovation. Recently, it spun-off a decent, but not great, specialty pharmaceutical business, and put the pedal to the metal in terms of reinvestment and the results are beginning to show. Covidien was modestly undervalued prior to Medtronic's offer, but probably not 29% undervalued.	There aren't many medical device or medical technology deals to compare this one to. In 2011 JNJ acquired Synthes for $18 billion. It paid 11x EBITDA and 4.9x sales for the quickly growing device maker. In 2007 a few private equity firms purchased Bioment for $11.4 billion, and paid 16x EBITDA and 5.5x sales. Medtronic clearly paid a full price for Covidien, but at 15x EBITDA and 4.1x sales it didn't pay a crazy price. Additionally, Covidien's growth profile looks strong going forward and the use of trapped cash (see opportunity costs below) gave Medtronic more wiggle room in paying up.
Culture and People	It appears the majority of key Covidien managers will stay on board. Medtronic's mission and values are very similar to Covidien's.	Ishrak noted: 'It is important for us that the vast majority of the Covidien leadership team obviously stays with us. I mean, the company is built around its people. "
Opportunity Cost and Experience	Medtronic could not have reasonably replicated Covidien's assets and market position. It could have acquired different companies, but no company would have been as purely complementary. Finally, Medtronic could have instead returned cash to shareholders (via a dividend or share repurchases), but its ability to do this was severely limited by the fact that most of its $14 billion in cash is trapped overseas. Repatriating its overseas cash to return to shareholders or make a domestic acquisition would trigger massive repatriation taxes and destroy value.	The opportunity cost argument is key to Medtronic's rationale. Acquiring Covidien, an Irish company, it puts to constructive use much of its trapped cash. Not destroying value (by repatriating cash and triggering taxes) counts the same as creating it. Re-domiciling in Ireland and taking on a bit more debt should structurally lower Medtronic's tax rate. Furthermore, the new structure provides improved flexibility in deploying future cash flows appropriately -- whether at home or abroad and to dividends, repurchases, acquisitions or reinvestment. Prior to this proposed transaction, Medtronic's capital allocation policies were arguably unsustainable because of the geographic mismatch between where cash was generated and cash was allocated. Finally, Covidien's business provides Medtronic with more diversified business lines subject to lower pricing pressure than its legacy businesses. In this way, Medtronic's profit stream is safer and more resilient.

Impact on Value and Risk

Linking strategy to value is critical. Over the next five years, we see this business combination accelerating Medtronic's revenue growth as (a) Covidien's pipeline goes live and more of its revenue come from higher priced devices, (b) cross selling opportunities arise, and (c) as Medtronic flexes the breadth of its product line and becomes a preferred customer (relative to competitors) of hospitals and governments. Overall, these changes should boost Medtronic's modest five year revenue growth rate to 4.5% per year.

We expect the margin impact from the deal will be largely neutral. Covidien's operating margins are below Medtronic's, but new product margins should look more like the high device margins Medtronic is used to. In addition, Medtronic will likely give up some margin to large hospital clients in exchange for higher sales volumes. Meaningful cost synergies should offset these pressures. Both management teams believe that "at least" $850 million in cost synergies are recoupable within a few years. To be clear, Medtronic must realize these savings to justify the price paid (If I assume $0 in synergy savings Medtronic's fair value estimate falls by $6-$7.) Given CEO Omar Ishrak's focus on execution, $850 million could be a low-ball number, but merger integrations are difficult and nothing is guaranteed. Thanks to a bit of cost savings from taxes, we expect pre-tax profit margins to reach 23% in five years, which should drive returns on invested capital into the low 20% range.

Finally, the acceleration of growth into emerging markets should help Medtronic establish a leadership position in faster-growing markets which will provide a benefit long into the future. This will enable the company to sustain its excess returns and grow profits at 4% for the life of its competitive advantage period.

Our bear case scenario looks much more like a continuation of the blended entity (plodding growth and declining margins) with only modest synergies. We weight that case with a one in four chance of happening given the large degree of integration risk and accounting for a challenging health care landscape. Our bull case assumes 5.5% revenue growth and a bit operating leverage, but we assign a lower likelihood of it becoming reality. Blending these scenarios together, **we are raising Medtronic's Fair Value Estimate to $65 with the belief that the proposed merger will be approved by shareholders**.

Given the lowered business and cash flow variability risk of the new company, we're willing to change our allocation to Medtronic at a 20% margin of safety, which **suggests a Consider Adding More price of $52**.

The Foolish Bottom Line

Pro has 3.1% of its portfolio allocated to Medtronic and we rate shares a buy. Priced at $64, shares look fairly valued.

We do believe there is a chance that investors will choose to reward the new Medtronic with a higher multiple, based on its diversified profit stream (a la JNJ) and the fact that price-resilient surgical supplies sellers are typically rewarded a higher multiple than price-pressured device makers. Should this rerating happen, we may look to sell our shares unless the expected cash flows tell us something different.

The Problem With Single-Variable Analysis

Published Jun 30, 2014 at 4:00PM

Dear *Pro* members,

On Friday, as I was perusing one of my favorite financial blogs (The Big Picture, by Barry Ritholtz), I came across an article written by Barry that really struck a chord with me.

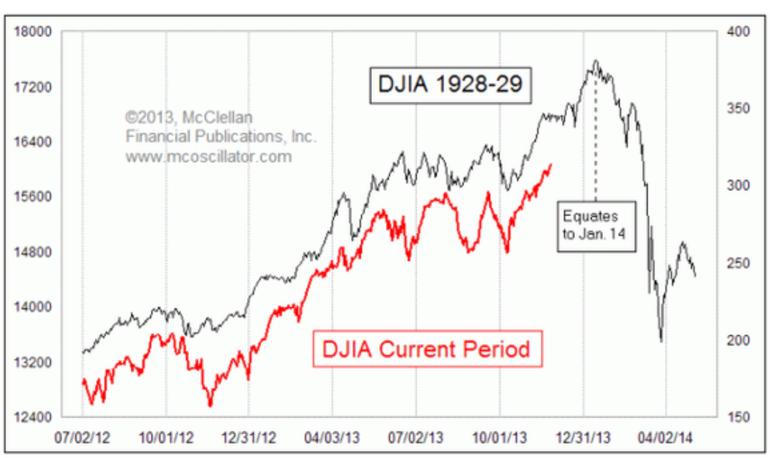
The article was titled, aptly, "Single Variable Market Analysis is for Losers." The article can be summarized by one quote (emphasis Barry's):

*"The behavior of markets or economies simply can't be explained by looking at **just one thing**."*

This is a topic I think about quite often in relation to financial markets, and I've mused about it in the past on the *Pro* boards. I often see financial commentary that relies upon historical data to make predictions about where the market is headed. I have no problem with using this type of methodology for static systems with fixed rules (e.g., coin flips, or throwing a ball in the air). These types of systems have defined mathematical relationships, where output is only dependent upon the value of the input.

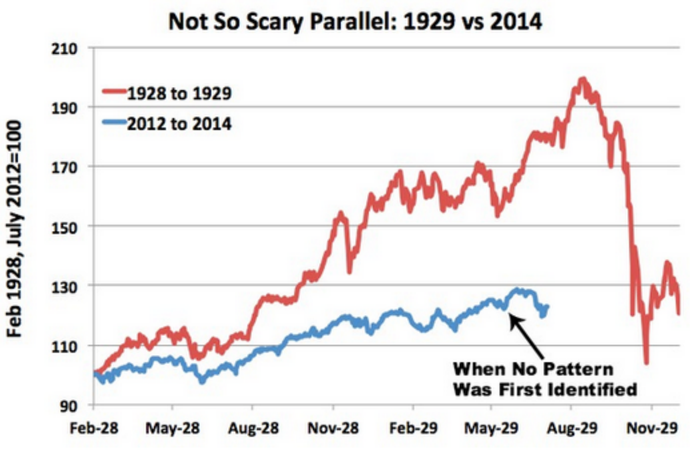
But for dynamic, chaotic systems like the stock market (or a double pendulum), the rules of the system are highly dependent upon initial conditions. One given input could generate a very large number of outputs, depending on the time that the input is introduced to the system. For systems like these, there is no guarantee that historical data is even relevant to the current state of the system. In my mind, using historical data to predict future stock market behavior is almost akin to using the output from a random number generator to try to predict the future sequence of numbers from that same generator.

Here's a widely circulated example of single-variable analysis that, if interpreted incorrectly, could lead to faulty decision making. In October 2013, Tom DeMark of DeMark Analytics identified a pattern in stock market price data that appeared to parallel the price movements of the stock market in the months leading up to the 1929 crash. Then, in late November, Tom McClellan posted about the 1929 price movement analog, where the price movement synchronicity appeared to continue. Here's the chart (and supposed pattern):



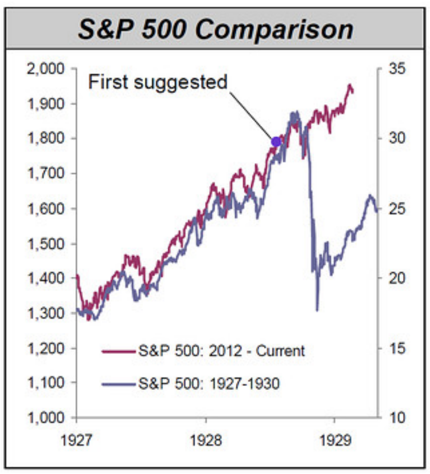
Source: McClellan Financial Publications, "Chart In Focus," 11/27/13.

Not only was this a case of single-variable market analysis, but it's also a case of misleading data visualization (check out "How To Lie With Data Visualization" by Heap's data blog for more examples of misleading charts and graphs). If you account for the fact that the dual vertical axes are on different scales, the chart ends up looking like this:



Source: Matthew O'Brien, *The Atlantic*, 2/11/14.

And finally, here's a graph of the same data series, updated for recent stock market price movements:



Source: Birinyi Associates.

A single-variable analysis (in this case, market index price movements) made it very easy to apply incorrect conclusions to make future market predictions. In addition, a misleading visualization confounded decision making even further.

I'm not saying that data analysis is useless and should be completely disregarded. I'm simply arguing that we need to decouple our minds from "coin flip" or "ball-in-the-air" thinking as it relates to the stock market. We need to understand there are so many variables at play that making forecasts is incredibly difficult and unlikely to yield actionable insight in and of itself. We should use data analysis to inform, but not dominate, our decision making. And we should think in terms of probabilities instead of certainties.

AIG Moves to Buy

Published Jun 30, 2014 at 4:00PM

We're moving **AIG** (NYSE: AIG) to **Buy** from **Buy First**. The margin of safety on this so-so business is narrowing and a CEO transition is on the horizon, but we're very comfortable with shares as a Buy.

- Head on over to the boards to discuss AIG's latest move.
- See all our coverage on AIG.

Checking In With Broadridge

Published Jun 23, 2014 at 3:31PM

Fools,

Earlier today I had a brief telephone conference with a few members of the team from **Broadridge Financial Solutions** (NYSE: BR). I didn't have much of an agenda, but am always happy to chat with management when they offer up time. Below are the notes from my call, in two sections. The first section contains the key takeaways -- they don't contain anything earth shattering but do help construct a more complete mosaic. The second section is the raw notes I was able to scribble down.

Broadridge is a 4.1% position for *Pro*, it remains a Buy, and we think shares are modestly undervalued.

Bryan (TMF42)

Takeaways

- 98% customer retention rates don't come easily or automatically. Pleasing customers is deeply rooted in the Broadridge culture, it is reinforced with incentives, and it is constantly espoused by management.
- While I understood the company's scale-based (low cost) and brand-based (trust, experience, and relationships) advantages, I have underestimated the power of these advantages when it comes to acquisitions. The large, global customers demand strong financial footing and a track record of security. Putting promising acquired products under the Broadridge umbrella provides instant credibility and opens up considerable growth opportunities, which should fuel emerging and acquired sales growth for some time.

Call Notes

What defines the culture at Broadridge?

Very customer centric. The "value profit chain" is the message delivered from the top. You see our commitment to customers the in high customer retention rates. It's almost unbelievable how much we study each client loss. We feel all customer losses the same – material (big customer) or not (small). You see our commitment to our employees in the "best places to work" awards. The culture is also seen in our values: trustworthy, respectful, accountable, engaged, client centric. Every employee can recite them. Finally, Broadridge tries to maintain a small company feel. We're constantly having events to bring employees together, and in almost all cases (no matter how small) a C-level executive is present and accessible.

How do you keep employees of all ranks engaged and motivated?

Associates are already an "extremely passionate bunch." Work gets hard (during proxy season, it gets to be an "all-hands on deck situation"), and hours get long. Broadridge is careful to reward appropriately – customer retention is built into the rewards system.

Engagement is also driven by mobility and empowerment. Al (one of the people on the call) is currently on a rotation across departments (he is a finance guy, and is on a rotation with the IR team). Being empowered matters – if you see something you don't like, change it. Broadridge encourages employees to be strong in business. HR is responsible for training the habits of highly effective people and general business thinking. Again, it loops back to being able to retain clients, and having happy, engaged, educated employees helps.

Are you seeing the competitive landscape change at all? What are the key developments (by segment) that you are keeping an eye on?

Most of our competition is someone doing what we do themselves (internally). Not much is changing there – few new entrants on the horizon. There are definitely a few key developments across ICS and SPS. Security is a big deal – we tell customers how much we spend on security. Compliance is huge – we highlight the cost of compliance failures. Regulation is always a source of change and uncertainty for our clients.

One of the criticisms often cited about Broadridge is slow growth. Why is that criticism wrong? What is underappreciated about the company's growth prospects?

Recurring revenue growth rate over the past five years is 7% -- which is pretty good. That is more indicative of the true business growth than tracking revenue – Broadridge is disrupting its distribution business by helping customers digitize – so while revenue growth might be low, profits are moving just fine: EPS growth should remain in the double digits. Overall, Broadridge is concerned with delivering top quartile total shareholder return, and modest double digit EPS growth with a growing dividend will go a long way to getting there.

Emerging and Acquired product sales have been a strong contributor to growth. Can you explain how they contribute to the company's competitive advantage?

Broadridge has dissected each element of what its customers do. Every node, every piece of the value chain, can be optimized. Broadridge is really trying to become an ecosystem to optimize each step of the process. Many of the emerging/acquired products are solutions to improve one small step along a customer's workflow where Broadridge can do it better, faster, cheaper, more securely, or free up capital. Also, financial services companies are very hesitant to adopt and institutionalize a product from a $10-$20 mm company. They need to know it will be a long-term solution and not be out of business in a few years. Under the Broadridge umbrella, small products is given immediate credibility and durability.

The word "data" is popping up more and more in your calls and presentations. What data does Broadridge have that is proprietary and difficult to replicate? How is Broadridge using this information? How are you communicating the value of that data to customers? What is the sales pitch?

In ICS, we have information on who corporate issuer investor base is, how they're voting, and what their preferences are. Through SPS, Broadridge has access to client data (which is owned by the customers), and with permission it can scrub that data and offer insights. The combination can help inform how customers use their marketing dollars, align resources, etc. Broadridge is really just scratching the surface with data.

SPS client wins generally require customer "switching" – what are the key factors that have to align to push a potential customer over the edge and decide to outsource? What can/is Broadridge do/doing to push those factors forward? How do you translate those factors into numbers/forecasts/expectations?

The underlying regulatory landscape seems to only be getting more intense. Broadridge has helped inform regulatory changes, so both customers and regulators look to the company as a thought leader. Regulation can help speed things up, but Broadridge prides itself on driving that change.

Eventually, companies remember that it is important for them to focus on where they truly add value, and Broadridge will be there to enable them to offload support functions that don't fit that bill. Proxy took about 20 years to move completely away from in-house (now almost nobody does it in-house). Fixed income processing is ~50% processed through Broadridge, equity is about 30%. Eventually, there comes a tipping point in non-value adding (but necessary) services. Broadridge keeps chipping away at market share and driving cost out of the system.

What problems is the Accenture partnership solving? How is the international sales cycle/decision process different than in the US?

First off, it is really hard to cover the rest of the world (outside US) – it is a big place. Having Accenture validating the Broadridge brand internationally lends instant credibility. Accenture also brings in immediate C-suite access, which is where the large-deal outsourcing decisions are made. International agreements will take a while to materialize and implement, but they will be meaningful.

What are the major factors of your cost structure that are under your direct control and how do you manage them? Should SG&A eventually leverage (grow slower than sales)? Do you have any longer-term margin goals?

Labor is the largest component of the cost structure – Broadridge does use some part-time labor during the high proxy season. For much of the business, we're selling scale, so technology investment is huge. Spending on technology will continue to be critical. SG&A has ticked higher, at least in part, because we pay up to keep our acquired talent on board. The return on that investment is an increase in recurring revenue over time. We don't focus on leveraging SG&A immediately – retaining the leadership teams of the companies we acquire is more important than a few basis points of margin. We expect a 30-60 bps increase in EBIT on top of each 100 bps in recurring revenue growth.

How should I think about a normal year of capital spending? What specific areas take the lion's share of reinvestment? What are the major components of reinvestment to support the growth of the business and protect the existing franchise?

Mostly technology. We want to support capabilities to support mutualization of costs, digitization, and analysis of data. The extra investment we are making right now is in the capabilities to support those three things, which is what will drive our growth over the longer term.

What does the future of shareholder communications look like?

60% of people are getting proxies in digital form – Broadridge hopes to get all client communications to that level (higher, really). In general, investor communications are a utilitarian relic – they aren't user friendly at all. Broadridge would like to change that. Everything has to be digital. There has to be intelligence. The information has to be portable (available where investors want it). It has to be consumable.

Remember Where You Started

Published Jun 23, 2014 at 10:58AM

Dear Fellow Fools,

A long bull market can make some investors greedy. Some start to expect gains as a given, and they always want more. A stock account may be worth much more than it was a few years ago, but the account owner may not feel very different. That's because extra money by itself isn't a catalyst for much of anything; it just sits there. Only decisions on what to do with money — action — can really bring it to life. So when you have more money, but life feels the same, it's easy to believe you just need *more* to make a difference, and greed starts to creep.

At times like these, it's helpful to remember what we've been through. Five years ago, nobody had any idea how we would pull out of the steep dive the economy was suffering. The system appeared about to collapse, and only outrageous sums of bailout money from the government might possibly stop the worst (and with untold consequences). When you remember how uncertain, and unstable, everything recently was, it's remarkable that today we stand at new market highs.

Short-sellers, those buying gold, those relying on commodities, those who hedged too much — they've all missed one of the strongest bull markets in our lifetime. Who would have guessed? It's very fortunate that you, along with *Pro*, showed the reasoning and bravado to invest the way we have. We didn't overly hedge our investments. We didn't run to gold. We haven't been 50% short. Instead, we enjoyed this incredible market recovery while investing rationally, maintaining portfolio flexibility, and — perhaps most important — being comfortable along the way.

We shouldn't feel compelled to change our overall approach now. Of all things, we should not become greedy and take bigger chances now that valuations are universally higher. We also shouldn't shy away from hedging, because eventually we'll need it. So far, most market hedges have gone unused in recent years, and option income has paled compared to stock gains. But eventually hedges will help smooth losses, and option income will matter more again. In the end, all markets suffer a setback.

When that happens, let's remember where we came from. No one knew how we would survive the crisis. We're *still* in that state of flux, with the Fed's balance sheet bloated, interest rates artificially low, hiring slow, and share buybacks and operating margins at record highs. Rubber bands are stretched in either direction, and eventually they need to give back ground.

So don't anchor on all-time highs and think that's what you deserve — and more. Portfolios flux. We will enter periods where values go down. Remember where you stood five years ago, and be grateful for where we are today. We'll do our best in *Pro* to continue creating value in a steady way, but we can't always expect it, nor assume that's what we deserve. The reality is, forces much larger than us exist, which means we'll see setbacks at times. We're spirited, so we'll come back stronger, and work harder to keep climbing to new heights.

Rather than greed, we seek new highs out of principle. Building is what we're here to do. Market storms may slow us down, but our foundation is solid, and we have many ways to build when dynamic times call for it. Meanwhile, check out our *Pro* mid-year review.

A Foolish Note

Today I'm headed down to Jupiter, Fla., as family gathers to celebrate my mother's 70th birthday. I'll return after July 4. Have a wonderful holiday! Thank you for being here with us, and to chime in, please visit the Memo Musings board.

— Jeff (TMFFischer)

Pro Completed Trades (see all trade alerts)

- **iShares Russell 2000** (NYSEMKT: IWM): We covered (bought to close) all of our short shares near $118, and set up eighteen September 2014 $105/$115 bear put spreads on the ETF instead, at a cost of $2.10 per spread, capping our risk on this hedge per our two trade alerts from June 18.

Your Most Active Conversations

Today Past 7 Days Past 30 Days

Oracle: Seeing Through a Cloud

Published Jun 23, 2014 at 12:09AM

- **Oracle** (NYSE: ORCL)
- *Pro* Status: Buy First
- Fair Value Est.: $42
- Allocation: 4.7%

Enterprise software leader **Oracle** reported fourth quarter 2014 results to boos and whistles. The stock declined after the database management giant fell short of expectations for the second time in the last four quarters. The stock has gained more than 20% over that time.

In the fourth quarter, revenue grew 3.4% and earnings per share were flat, while free cash flow climbed to a record $14.3 billion. Oracle now claims to be the second-largest Software-as-a-Service (SaaS) company in the world, behind **Salesforce** (NYSE: CRM). Founder and CEO Larry Ellison has a goal of becoming the largest SaaS and PaaS (Platform-as-a-Service) cloud company. Revenue in these cloud divisions grew 25% last quarter, with an annual sales run-rate near $2 billion -- but that remains small compared to Oracle's $38 billion in yearly sales.

It's important to realize that Oracle's revenue base is evolving. For years, it has sold software via a license, receiving a bulk payment as customers bought rights to its software, followed by support and maintenance revenue later. Now more revenue is being booked on a subscription basis – a cloud subscription – so the revenue is earned and recognized on a gradual basis. In fact, it takes Oracle approximately three years of a cloud subscription to match the revenue dollars of one traditional license sale. But, cloud revenue could then continue for another 5, 10, 15 or more years, leading to greater revenue overall than the license model. Oracle looks forward to those days, as do we, but they're far off.

For now, it's encouraging that traditional software license revenue was flat on the year, at $9.4 billion, even as cloud revenue grew at its expense. And, license updates and related support revenue grew 6% to $18.2 billion. This strong recurring revenue (Oracle's traditional bread and butter) makes the business more stable and predictable.

Near $41, Oracle trades at 13.3 times free cash flow and 12.9 times expected earnings for the year ahead. The valuation is attractive as long as Oracle can continue to grow cloud revenue while minimizing the impact on license revenue. As CFO Safra Catz said in the conference call, "I'm actually thrilled that we are where we are in new license [business] considering how much cloud growth we've got."

Us, too. We're still banking on license revenue to be stable in coming years. We have little doubt cloud will keep growing at Oracle, but we need to make sure it's not too much at the expense of license revenue. Many companies want to get their software in a combination of ways, including onsite (usually a license) and offsite (cloud). Oracle is well positioned for this scenario, and we believe it can juggle both well.

A Mid-Year Pro Review

Published Jun 22, 2014 at 10:58PM

As we near mid-year, the *Pro* Portfolio has had six months with little to complain about. As of June 20th, the portfolio is up nearly 6%, outpacing the North Star, the Nasdaq, the Russell 2000, the MSCI World, and on par with the very mighty (the last few years) S&P 500.

We've avoided costly decisions thus far, evidenced by a lack of big losers. But we do continue to seek new investments to grow our returns. We have so far this year missed a handful of opportunities (long and short) that we had been analyzing. We missed simply by not acting, thinking we had more time and might get better prices – which may still be the case in some instances. However, the dip in the market early in the year lasted much shorter than we'd hoped.

Going forward, we're eager to start new positions (long, short, and income) whenever opportunity presents itself.

We've kept the *Pro* portfolio hedged to the tune of 12% to 17% this year, including our deep in-the-money covered calls on **Intel** (NASDAQ: INTC). But hedging hasn't stopped our returns from being respectable, and it has lowered our risk. We're also carrying 18% in cash for new opportunities and continued flexibility. We've only been net long to the tune of about 70% this year, so our returns are all the more pleasing.

Notable winners so far this year have included our two ETF shorts, **AmTrust Financial** (NASDAQ: AFSI), new *Pro* entrant (via a synthetic long) **Coca-Cola** (NYSE: KO), as well as **Medtronic** (NYSE: MDT), **Facebook** (NASDAQ: FB), and **O'Reilly Automotive** (NASDAQ: ORLY) and **Valmont** (NYSE: VMI) -- those last two still fairly new to us.

Laggards have included **MasterCard** (NYSE: MA), **Papa John's** (NASDAQ: PZZA)(which we had on Hold until recently returning it to Buy), **Gentex** (NASDAQ: GNTX), **The Buckle** (NYSE: BKE), and **Tupperware** (NYSE: TUP) -- which we strangled to put into the green by a tad so far.

Back on the positive, we've seen gains from **AIG** (NYSE: AIG), **Wells Fargo** (NYSE: WFC) and new *Pro* entrant **Parexel International** (NASDAQ: PRXL). Parexel's gain followed a sudden drop that allowed us to write puts to target additional income.

Here's the rundown of individual results – biggest winner to biggest loser -- from January 1 to June 20 on positions we've held since December 31 (so, new positions in 2014 aren't included). Keep in mind, we run a portfolio because we don't know how any individual position will ultimately do; we want our portfolio to work as a whole.

AmTrust Financial	30.7%
ProShares UltraShort Real Estate (NYSEMKT: SRS)(SHORT)	(27.2%)
Parexel	22.8%
Facebook	18%
Direxion Daily Financial Bear 3x (NYSEMKT: FAZ)(SHORT)	(17.8%)
O'Reilly Automotive	17.3%
Wells Fargo	16.5%
Intel (unfortunately covered for much of this gain)	16.4%
Apple (NASDAQ: AAPL)	13.4%
American Tower (NYSE: AMT)	12.5%
Medtronic	11.3%
AIG	8.9%
Valmont	7.9%
Oracle (NYSE: ORCL)	6.7%
WisdomTree Emerging Markets SmallCap (NYSEMKT: DGS)	4.9%
Broadridge Financial (NYSE: BR)	3.4%
OpenText (NASDAQ: OTEX)	3.1%
TD Ameritrade (NYSE: AMTD)	2.5%
Starbucks (NASDAQ: SBUX)	(2.3%)
Papa John's	(7.3%)
MasterCard	(11.7%)
Tupperware	(11.8%)
Gentex	(12%)
The Buckle	(13%)

Returns do not include dividends; source: Google Finance YTD returns.

Including **Coca-Cola** (NYSE: KO) and **Gilead Sciences** (NASDAQ: GILD), we have 20 winners on the year, and 6 losers so far. Our allocation decisions largely favor our winners, fortunately, MasterCard and Papa John's aside, both of which started the year among our top 7 positions.

One small frustration this year has been our hedge with **iShares Russell 2000** (NYSEMKT: IWM). We issued the alert to short it as a hedge in January, and by the time we could place the trade ourselves the index was down a meaningful amount. It since rebounded. Our hedge has not been necessary so far, but it has made it easier to stay more fully invested, and the portfolio is up as a whole, which is the point.

Looking ahead to the second half of 2014, we look forward to covering second-quarter earnings for you in July, hopeful that we'll see more sales growth traction than in the tepid first quarter. All of our stocks are rated "Buy." Looking ahead further, with the Fed's Janet Yellen signaling low interest rates for at least another year, stocks may continue to have support from those seeking investment returns.

We'll continue to invest stock by stock, based on a stock's valuation compared to the strength of the underlying business. Overall, we'll continue to invest targeting healthy North Star-type returns over any rolling three-year period. As we enter the second half of 2014, expect more income trades, new buys, and perhaps -- finally -- some direct shorts of weaker companies as the Fed's monetary easing *finally* comes to a close likely before year end.

Meantime, we hope to see you on the *Pro* boards talking about a topic we all love -- investing! Stay long term, stay invested in great businesses, and manage your portfolio for gains as a whole -- remaining comfortable along the way.

Fool on,

-Jeff (TMFFischer)

Close Your Short Position on IWM

Published Jun 18, 2014 at 6:26PM

Is this for you? The relatively few *Pro* members who are short the **iShares Russell 2000** (NYSEMKT: IWM) ETF should consider closing, or covering, their short to match *Pro's* new guidance — the bear put spread shown in today's concurrent alert. Make sure to also look at the alternative trades below, to make sure to do what's best for you.

How You Participate

- **Trade:** Close, cover, or buy to close your short shares of IWM.
- **Allocation:** Close all your short shares.
- **Price Guidance:** The ETF is liquid. Simply cover when you're ready.
- **Recent Price:** $117.16

What We're Thinking

Pro has a 9.5% short position in the IWM ETF as a hedge, but it seems only Interactive Brokers and sometimes TD Ameritrade have shares of IWM available for shorting, so most *Pro* members likely do not hold this position along with us. Members who did the alternative bull put spread were able to close last month at a profit at expiration, and we've been watching for a new recommendation to make since. Our new trade alert — another bear put spread — hit your inbox today alongside this one. So we're recommending members who are still short IWM close that short to start the new bear put spread with us instead. Why?

- We know we can stay in the bear put spread, while we always risk potentially having our short of IWM called away on us, as has happened to other members (in the biz, this is called "recall risk").
- The new bear put spread caps our risk to a nominal amount, while the naked short that we're now closing has unlimited capital at risk.
- By closing our short, we avoid having to pay IWM's dividend in July.
- We prefer having all members in the same positions, with trades all can do in any brokerage account — and the bear put spread fits that bill. And, of course, the spread is attractive on its own merits.

How the IWM Short Fit Into *Pro*

We short market-index ETFs such as IWM as a simple way to hedge our long portfolio exposure. We do not expect our market hedges to make money, but they will if the market declines. On bigger declines, the "insurance" that is a hedge kicks in and offers us a profit that buffers our downside and can be put to work in cheaper stocks. In a rising market, a hedge ends up going unused. Individually, such a position looks like a loss — except for the important fact that a hedge may let you stay comfortably invested in *more* stocks, stocks that ideally rise with the market. That's the case with *Pro*. With our goal of absolute returns, we hedge for downside risk, but we enjoy greater gains during a strong market as a result, too, because we have more dollars invested than we would if we didn't have our hedge.

So, even as we close our direct short of IWM, we'll open a new bear put spread instead — staying hedged, but in this case capping our risk on day one. Please read that alert after you close your direct IWM short.

Alternative Trades

- **Don't want to set up a bear put spread? Want to stay short IWM instead?** Feel free! That's in the same spirit as our new bear put spread, and has greater profit potential in a bad market. But we recommend you set a stop-loss order at around $119 per share, or buy calls at that level to cap your risk. Then sit tight on your short as a direct hedge for your portfolio.

Set Up a Bear Put Spread on IWM

Published Jun 18, 2014 at 6:26PM

Is this for you? *Pro* members who want to hedge some of their portfolio should consider this bear put spread to profit on about a 3.8% to 10% decline in the **iShares Russell 2000** (NYSEMKT: IWM) ETF by our September expiration. Our portfolio currently targets net long market exposure of 70% to 75%, so if you're already at that exposure or lower, you don't need to hedge.

How You Participate

- **Trade:** Use a spread order to simultaneously buy to open Sept. 20, 2014, $115 puts and sell to open an equal number of Sept. 20, 2014, $105 puts.
- **Allocation:** For about a 10% look-through allocation, set up one spread for every $113,000 you manage ($112.55 is our approximate break-even on the trade). *Pro* will set up 18 spreads. Or, you can set up one spread for every $233 you're willing to lose, and no more.
- **Price Guidance:** Aim for a net debit of $2.33 or lower.
- **Recent Prices:** IWM, $117.16; September 2014 $115 puts (bid/ask): $3.49/$3.53; September 2014 $105 puts (bid/ask): $1.20/$1.23; net debit (mid): $2.30
- **Stock-Equivalent Rating:** Short (as a hedge)

What We're Thinking

Setting up bearish positions on market-index ETFs allows us to comfortably keep more money invested in long stocks, because the bearish position lowers our net exposure (or risk) in the market. If stocks continue to rise, we won't need the hedge, and individually it'll lose money — but our portfolio as a whole (which is what matters!) will be appreciating regardless of the hedge. If the market declines, a hedge — even a small one — adds some green to the portfolio, reducing losses and providing new capital to invest.

How It Fits Into *Pro*

Pro has an absolute-returns goal, so it's important that we manage our market exposure. If we're 100% long, we enjoy no advantages when the market declines. By keeping our market exposure lower, lately around 68% net long, we maintain flexibility even during market drops (and flexibility is very important during downturns). Our hedges help us achieve lower market risk and increased flexibility while still keeping the vast majority of our cash invested in great businesses for upside. Given our goals, this is why we've run hedges during most of *Pro's* existence so far.

A bear put spread is an especially friendly way to hedge: It can be done in any account; it caps your risk to only the limited capital that you pay on day one; and you will have no problem staying in the position (you don't risk being called out early, as you do with many shorts). Plus, you can set it up to be quite profitable during a decline (we could make $7.67 on our $2.33 at risk), although a spread is most responsive right near expiration.

More That Matters

- **Maximum loss:** The net debit you pay to set up each spread, so lately about $2.33 ($233 per spread). You can't lose more than that.
- **Maximum gain:** The difference between your spread strike prices ($10 in this case), minus the cost to set up the trade (about $2.33). So, in this case, you clear $7.67 if IWM declines below our $105 strike by expiration, earning more than 300% on your $2.33 at risk.
- **Breakeven:** $112.67 on IWM at expiration.
- **Follow-up:** Spreads are usually "one and done," but we may break the spread (close part of it) if that looks beneficial before expiration, or set up a new one as it nears expiration.

Alternative Trades

- **Like other strikes better?** Move your strikes up or down to find a spread you like best, if you wish.
- **Want to short IWM directly?** Most brokers do *not* have shares of IWM available for shorting, but If you're short IWM already, you could choose to stay short rather than set up this bear put spread. If you do, we recommend that you cap your risk with a stop-limit order around $119 or $120, or buy calls around that strike to cap your risk.

Pro Can Help

Birds, Hands, and Bushes: Pro's Dividends

Published Jun 16, 2014 at 1:04PM

Dear Fools,

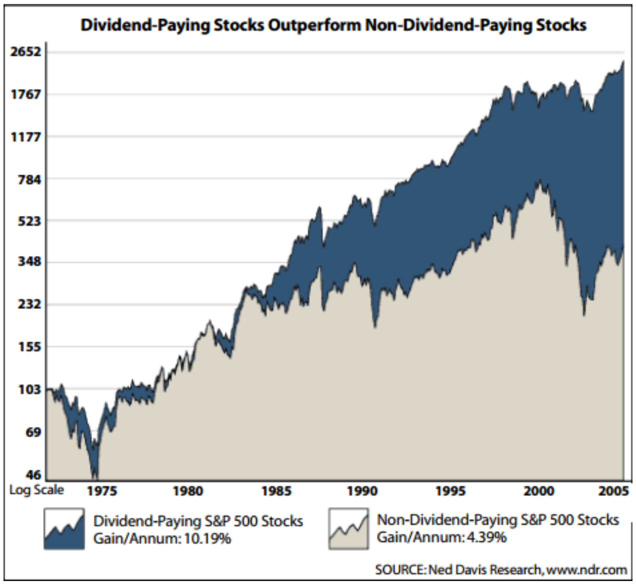
A bird in the hand is worth two in the bush. Like many proverbs, the literal interpretation of this one leaves me scratching my head -- why would you chase birds in the first place? Get a life. The figurative interpretation is a bit more useful: A certain payoff is better than the prospect of a larger, uncertain one.

Now, the math guy in me has all sorts of issues with this logic, but instead of going down the path of probability and expected utility, I'm going to turn to dividends -- the investing topic to which the bird-and-bush proverb is most commonly applied. Adapted to dividends, the saying translates about like this: Dividends provide shareholders cash, and certain cash on a schedule is preferable to unknown, possible cash in the future. We rarely talk about dividends here at *Pro*, so today I'd like to discuss why we like chasing birds and how the *Pro* portfolio stacks up.

Dividend-Paying Stocks Win

Two truths point to dividend stocks winning over their non-dividend-paying brethren:

1. Financial theory holds that any asset can be valued based on the discounted value of its future cash flows. Dividends are real cash flows -- money transferred from the company to the shareholders -- so dividends help determine value. The theory behind the dividend discount model dates back to 1938 and it is still universally accepted today. We frequently use free cash flow as a proxy for what dividend payments *could* be, but that is often a perilous assumption because there is no guarantee that shareholders will ever see those cash flows.
2. Study after study shows that dividends matter with respect to returns -- dividend-paying stocks outperform non-dividend payers. For example: Professor Jeremy Siegel found that from 1926 to 2008, 97% of the S&P 500's total return came from dividends. Research from Credit Suisse shows that the real return on U.S. stocks over the last 103 years has been 6.3% annualized, 2% from capital gains and 4.3% from reinvested dividends. Research from Ned Davis Research suggests that over long periods of time, the stocks of companies that pay dividends considerably outperform those that don't: 10.2% per year vs. 4.4% (see the image below). I could go on, but I think you get the point -- there is significant evidence that points to the goodness of dividends.



Dividends Are Stupid Insurance

The evidence in favor of dividend stocks is compelling, but *why* are dividend payers superior? I believe the answer lies firmly rooted in psychology. In the United States, dividend payments are a commitment -- a social pact companies make with their shareholders promising that, barring extreme circumstances, the dividend can be relied upon. This creates a constant pressure applied to management and boards of directors to keep the company in healthy enough financial shape to sustain the dividend. No CEO wants to be the one responsible for cutting or canceling a dividend ("Not on my watch!").

Complementing that pressure, dividend payments make less money available for value-destroying projects (these often take the form of empire-building, pet projects, or acquisitions). They force discipline in capital allocation, making less money available to be invested poorly. As Charlie Munger says, "It is remarkable how much long-term advantage people like us have gotten by trying to be consistently not stupid, instead of trying to be very intelligent." With less money available to invest, management teams have less money to make big dumb mistakes, and they are pressured to do more -- or at least the same (in terms of growth) -- with less. Empirically, this has resulted in fewer terrible capital allocation decisions ... and, relatedly, outperformance.

Pro's Dividend Payers

Of the 22 stocks in the *Pro* portfolio, 18 pay a dividend -- that's 82%. That high proportion is reflective of the quality businesses we own, a result of their cash-generating ability. While the weighted average dividend yield on our portfolio is less than 2%, the forced discipline counts for much more, precisely because we own businesses that are so profitable. When a business becomes awash in cash, the pressure to spend it builds, and that psychological impact can lead to poor capital allocation decisions. Even though we generally trust our management to make sound choices, we like the idea behind the forced discipline that a dividend conveys.

Our four companies that don't pay a dividend are **Facebook** (NASDAQ: FB), **Gilead Sciences** (NASDAQ: GILD), **O'Reilly Automotive** (NASDAQ: ORLY), and **Parexel International** (NASDAQ: PRXL). I'd classify the first three as growth businesses that have historically had immense reinvestment opportunities worthy of retaining all earnings. Given its slowing growth rates and ample cash flow, however, I would be surprised if O'Reilly didn't begin paying a dividend within the next few years. As for Parexel, the lumpiness of its revenue and cash flow (before partnerships began to change this dynamic) made management leery of paying a dividend.

The *Pro* Bottom Line

Provided we remain disciplined and own stocks trading at reasonable valuations, even a small nominal dividend yield will help the *Pro* portfolio track its North Star -- especially when that yield increases over time and at least keeps up with inflation. Do you have a favorite dividend-paying stock that is ready to fly into *Pro*'s hand? Let us know on the Memo Musings discussion board.

Onward,

— Bryan (TMF42)

Pro Completed Trades (see all trade alerts)

Parexel Increases Our Ownership Stake

Published Jun 16, 2014 at 10:10AM

Fools,

On June 2 **Parexel International's** (NASDAQ: PRXL) board announced a $150 mm share repurchase authorization.

http://investor.parexel.com/phoenix.zhtml?c=94569&p=irol-newsarticle&ID=1936515

This morning, he company announced it is moving ahead with that repurchase. It will buy back about 2.3 million shares directly from Goldman Sachs, with the actual number of shares to be determined by a backwards looking volume-weighted average pricing formula.

http://investor.parexel.com/phoenix.zhtml?c=94569&p=irol-newsarticle&ID=1940017

Here are the takeaways:

1. PRXL is retiring ~4% of shares outstanding, increasing our ownership stake in future earnings.
2. The board is sending two signals: it thinks shares are undervalued and that the company's cash flows are consistent enough to warrant a smaller cash cushion over interest and debt payments.
3. PRXL has plenty of cash (almost $300 million) and access to credit (close to another $300 million) to handle this repurchase without any trouble.
4. This action doesn't have a meaningful impact on our estimate of fair value ($54), but the signal from management on the reliability of future cash flows suggests that our Consider Adding More Price ($40) might be a touch low. For now, I'm leaving it unchanged.

Parexel is a Buy and 3.3% position for Pro.

The Importance of Limit Orders

Published Jun 9, 2014 at 2:17PM

Dear *Pro* member:

Have you ever sat down at a restaurant, looked at the menu, ordered what you wanted and said to the waiter, "And I'd like to pay $5 *more* than the price you list on the menu." Almost certainly you have not. Yet, if you rush to trade on the stock market using a "market order," you risk doing something very similar, and you'll likely sacrifice much more than $5 from your brokerage account.

To get a fair price when you go to enter an investment order — even if it's just getting the current price — it's important to use a limit order. Case in point: Last week, we issued updated guidance on **Parexel International** (NASDAQ: PRXL), suggesting that members write (sell to open) September 2014 $45 puts. At the time, the options bid $0.80 and asked $1.10.

That means a put seller could get paid $0.80 immediately at that moment (as long as the price didn't change after hitting send on the order), while a put buyer would need to pay $1.10 immediately to buy.

But with such a wide spread between the bid/ask (37.5% if you measure from $0.80), there's no reason to accept *either* price. A buyer ora seller should attempt a limit order, splitting the bid/ask, to see if their price is met. Especially because there is a market maker behind most option trades — a professional who provides liquidity in options, takes the other side of a trade, and hedges their own exposure. If you don't use a limit order when trading options, you're at the whim of a market maker who could take advantage of you.

That appears to have happened last week with the Parexel trade. Within minutes of the recommendation being emailed to members, the puts were being sold at $0.70 or even $0.60, despite the bid being $0.80 just moments before, and despite our limit guidance being $1 to start (and $0.80 as a minimum). Members were letting orders go through at much lower prices.

To be fair, the market maker could have lowered the bid upon seeing our orders flowing in, but the trades would not have gone through at lower prices if we had all used limit orders. Instead, apparently more than a few members used market orders — accepting the going price, even as it plunged lower. Had we all used limit orders, the pricing should have been much more stable, and trades would not have been filled at those less favorable prices.

The same has happened on many (if not most) of our stock orders over our history. When we suggested a year ago that members not sell **StoneMor Partners** (NYSE: STON) for less than $27, the stock fell well below that price in mere minutes. It happened again this year with our $25 limit order guidance. Now, perhaps the market sees all of our sell orders (even with limits at higher prices), gets worried, and sellers emerge, pushing prices lower. That may be true -— and the opposite may be happening when we're buying.

But a more likely influence is that too many of us simply aren't paying heed to the guidance to use limit orders, and unfortunately that hurts all of us. So, we kindly ask that you start. Please read our pricing guidance in every recommendation we send, whether it's in *Pro* or *Options* or elsewhere across the Fool, and then kindly follow the guidance with a limit order. Let's see if we can conquer this issue. Let's see if we can all get better prices together by all following the limit order guidance!

As Fools, we're not usually in a rush to trade, so we can be patient and wait for our price. We have a much, *much* better chance of everyone getting that price if we all use limit orders. Let us know if you have questions on the Memo Musings board, and let's see how we do with our next recommendation.

Thank you, and Fool on!

— Jeff (TMFFischer)

Catch-Up Trades: June 9, 2014

Published Jun 9, 2014 at 2:17PM

Catch-Up Trades are the Pro *team's timeliest ideas for catching up to our positions right now.*

- **Gilead Sciences** (NASDAQ: GILD): If you haven't matched our 3.4% allocation yet, shares are down today on acquisition news in the industry. Newcomers should consider starting a position in this Buy First stock.
- **iShares Russell 2000** (NYSEMKT: IWM): Just an update here. As the small-cap index rebounds, new potential hedge strategies start to look better for those who closed May spreads. We're still short shares, but we realize that most members can't short IWM directly, so we continue to watch for option spreads you could set up. Higher prices may make this more attractive soon. We'll put it here if so.
- **Papa John's International** (NASDAQ: PZZA): After spending some time on Hold, PZZA recently moved back to Buy, so build a 3.7% allocation to match us if you haven't yet.

Roll Your Covered Calls on Intel

Published Jun 3, 2014 at 2:30PM

Is this for you? This is for *Pro* members who own shares of **Intel** (NASDAQ: INTC) and have written August 2014 $25 covered calls.

How You Participate

- **Trade:** Use a rolling order to buy to close your August 2014 $25 calls, and simultaneously sell to open an equal number of September 2014 **$26** calls.
- **Allocation:** Roll every call you have previously written. For *Pro*, that's 36 contracts.
- **Price Guidance:** Aim for a net debit of $0.75 or less. If you later have to pay a bit more to get it done, that's OK -- ideally you won't pay more than your past combined credits.
- **Recent Prices:** Intel, $27.45; August 2014 $25 calls (bid/ask), $2.57/$2.64; September 2014 $26 calls, $1.83/$1.88. See current prices. Rolling cost (splitting the bid/ask): $0.75 debit.

What We're Thinking

Shares of Intel are enjoying a strong year (for Intel), up nearly 8% including dividends and pushing well past the $25 strike price on the covered calls we wrote for income. We've already rolled these calls twice this year for a small credit each time. In sum, our three written covered calls since February have brought in $0.85 per share in net credits (your mileage may vary by pennies or nickels, depending on when you traded). We're now about to give most of that credit back, paying about a $0.75 debit to roll to a $1 higher strike price. Why do this? Many reasons:

1. Intel is trading at our fair-value estimate, and we don't want to lose our shares and their 3.3% yield.
2. Our $25 calls already have less time value (lately $0.13) than the $0.225-per-share dividend that will be paid Sept. 1, so we would lose our shares if we don't roll by the August ex-dividend date at the latest.
3. We can roll now and still have a small credit overall on our (four, after this) Intel covered-call trades this year, along with getting a higher potential sell price.
4. If we were to wait and shares climbed higher, rolling would become more costly.
5. Finally, we'll still have a defensive position in our portfolio after this roll, with about $1.85 in short call value that cushions about a 6.7% decline if the stock falls to about $26 or lower.

Paying $0.75 for an extra $1 in stock upside is "only" a 33% return on the capital we're putting back into the position, but we view this position more holistically than that. Again, the $0.75 we'll pay to roll is money that was paid to us to begin with, so we're simply giving it back. This is one way to start to "catch up" to the higher share price at no out-of-pocket cost to us, save commissions. But we won't be entirely caught up; assuming we still have a net credit of $0.10 or so after this roll, our net sell price will be $26.10 on a $27.45 stock. And again, we don't want to sell yet. So, Intel either has to give back some ground, or we'll be rolling our calls again by late summer. In that case, today's recommendation is just another proactive step to better position ourselves (we believe) for our future with Intel.

The business, meanwhile, remains uninspiring but stable, and that seems to be all investors want from it right now. The stock is inexpensive and yields about 30% more than a 10-year Treasury bond. Like us, investors are hopeful about Intel's slowly unfolding mobile business, especially because Intel expects to maintain its historical profit margins as mobile sales hit critical mass and the company pares away sales incentives (even if that's a few years away). We hope to be around to keep watching it unfold, and ideally earn a North Star-matching return while we wait.

More That Matters

- **Maximum loss:** Our exposure remains the same as stock ownership, minus the credits we have in the covered calls.
- **Maximum gain:** Our profit potential will be limited to around a net $26.10 per share, so we're already there.
- **Breakeven:** Around $24.15 per share on these covered calls in isolation.
- **Follow-up:** As long as it's attractive, we aim to keep managing the covered calls to keep our shares and ideally earn premium, too.

Alternative Trades

- If you wrote different covered calls on Intel, visit the Intel discussion board to ask any questions you have.

Pro Can Help

- **Want to learn more?** See our guide to writing covered calls in our sister service, *Motley Fool Options*.
- **Questions?** We'll try to cover (heh!) any questions you have on the *Pro* Intel board.

Position Adjustment: Parexel International

Published Jun 3, 2014 at 1:10PM

Is this for you? This alert is for *Pro* members who ***did not*** write September 2014 $40 puts on Parexel International (NASDAQ: PRXL) per our May 6 alert. Members who ***did*** write the $40 puts should read the Alternative Trades section below and decide how to proceed.

How You Participate

- **Trade:** Sell to open September 2014 $45 puts
- **Allocation:** 2.7% — write one put for every $150,000 you manage; *Pro* will write 12 contracts
- **Price Guidance Now:** Use a limit order of $1 or higher to start (for a 2.2% yield in 108 days)
  - **Later:** We think an 6% annualized yield is acceptable given our willingness to own more shares; that equates to a minimum acceptable credit of $0.80 at the moment
- **Prices (May 5):** Stock, $51.50; options, $0.80 bid / $1.10 ask

What We're Thinking

Mr. Market's "shoot first, aim later" mentality can lead to some wild price movements. We knew **Pfizer** (NYSE: PFE) had made a bid to purchase **AstraZeneca** (NYSE: AZN) when we issued our May 6 alert on Parexel; in the alert, we noted our skepticism about the deal going through and opined that even if it did, the potential impact on Parexel wouldn't be all bad. Still, Mr. Market shot first, assuming the worst, and whacked Parexel's stock price down to the low $40s, prompting us to recommend writing September 2014 $40 puts.

Now that Pfizer has given up on its acquisition attempt and Mr. Market is taking the time to aim, Parexel shares have been bid back up to $52. Unfortunately, this all unfolded very quickly and *Pro* wasn't able to transact near the pricing guidance we originally issued. But the thought process behind our May alert remains intact -- we think the company's business performance and stock-price volatility make it a good candidate for option income, and our willingness to buy more shares makes writing puts a bull's-eye.

At this point, the September 2014 $40 puts don't pay nearly enough to recommend to members who haven't yet followed the original alert (especially for members with more modest portfolios). It does mean that those who did transact are well on their way to a successful expiration. For the rest of us, the September 2014 $45 puts have a risk-reward profile that's sensible given our view of Parexel's business and stock. Writing these puts should provide a $44 breakeven price and a modest 7.5% annualized yield.

How It Fits Into *Pro*

With *Pro*'s recent purchase of **Gilead Sciences** (NASDAQ: GILD), our health-care exposure is now around 9% of the portfolio. We're comfortable with the possibility of more, but are mindful of our current net exposure. We are opting to generate income with written puts rather than purchase more shares directly because Parexel is still relatively new to the *Pro* portfolio, and we'd like to get to know it further before decidedly upping our stake. Should these puts become in-the-money at September's expiration, we'd get shares at a reasonable discount to what we believe they're worth ($54), or we'd have the option to roll them to a later date if we choose.

More That Matters

- **Maximum gain:** Unless the stock declines and we get to buy shares by expiration, the most we can gain is the put premium. At $1, that's a 2.2% yield in 108 days, or about 7.5% annualized.
- **Maximum loss:** Our risk is the same as share ownership starting around $44, 15% less than the current price.
- **Follow-up:** As September expiration nears, we'll be extra certain to clearly communicate our recommended action for writers of both the $40 and $45 strike-price options.

Alternative Trades

- **If you already wrote September 2014 $40 puts per our original alert:** First, congratulations! Things are going as planned. You have two options:
  - You can do nothing. Your written puts look like they'll expire as full income in September. This is precisely our intention for the $45 puts we're recommending in this alert. If you have little desire to purchase more Parexel shares at this time, this is the choice you should consider foremost: Do nothing, or even buy to close your $40 puts early for a majority of the profit.
  - You can roll your $40 puts to the $45 puts to match *Pro*. You should consider doing this if you're willing to trade a bit more risk (a higher breakeven price) for the chance to earn additional income. If you nabbed our guided price of $1.20, your net roll today could nab you another $0.80 or so on top of that. If you are looking to add to your Parexel position, this is the choice you should consider.
- **If you don't own stock already:** We think you should match *Pro*'s 3.2% allocation first — Parexel's shares are a Buy. Then, you should consider writing puts for income or the potential for additional shares.

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Outsource your problem-solving to the Parexel International discussion board.

Keeping Pro at Cruising Speed

Published Jun 2, 2014 at 4:00PM

Guidance Updates

- **Parexel** (NASDAQ: PRXL) moves to **Buy** from **Buy First**, based on price.

Pro Completed Trades

- **Wells Fargo** (NYSE: WFC): We bought to close all of our $50 covered calls expiring June 21. Please note: Because of a trading error at the Fool's trading desk, the portfolio initially bought to open $50 calls on Wells Fargo expiring June 6. Those calls then had to be sold, and our $50 calls expiring June 21 were correctly bought to close. The result was an approximate $72 net detriment to the portfolio, plus extra commissions.

Dear *Pro* member:

Good investing aims to strike a healthy balance between activity and inactivity. Our trade alerts may get all the headlines, but most of the work we do is much less visible, and does not lead to portfolio action. That's how it should be. We've yet to meet a millionaire who got there by actively trading in and out of stocks, but we know of plenty (many of them Fool members!) who have achieved that goal by largely sitting on their hands. When you own great businesses at good prices, you're positioned to compound your money over the years, because everyone at the business is aiming for that outcome, too.

We Have a Winner!

Fools, please congratulate the winner of the 2014 Polaris Award: **aleax**! Thanks to all who voted, and our congratulations to all who were nominated. We're thrilled to have all of you as part of our community.

At *Motley Fool Pro*, we have a bit more shuffle in our investing step because we include options in our strategy. However, much of our time is still spent learning more about our companies and their competitors, eyeing our portfolio construction and allocation, and subtly managing our market exposure. Every quarter, we particularly enjoy getting a new look at the financials of our 24 core holdings, and going through quarterly conference calls to glean more details from each business.

In fact, if I were on a deserted tropical island and could make investment decisions based on only two factors, I'd want the company's financial SEC filings and its conference call transcripts. If given a third factor, I would want to know the current valuation of the business, because that ties directly to the return we might achieve on our estimate of future value.

All of this is a way of saying that investing is complex and simple at the same time — two conflicting attributes that make it extra fascinating. In the past, I've compared managing a portfolio to flying a jetliner, and perhaps that's more accurate than I (a non-pilot) realize. Once you're at cruising altitude, generally the less you do with the plane the better, yet you must be aware of everything going on with the instruments. If we're pilots of a sort here in *Pro*, then as we watch our progress, we're also frequently on our microphones sharing our lessons and our thinking with you the best we're able. Today I want to share some of things we've been working on in the cockpit. Think of this as your *Pro* in-flight checklist.

Position Considerations

Some altitude adjustments we've made, some turbulence we've hit, and some possible changes in our flight path:

- **AmTrust Financial Services** (NASDAQ: AFSI) hit a rough patch today after *Barron's* published another negative article. The gist of the critique: AmTrust writes more insurance premiums than its tangible asset base safely allows, setting it up for a capital shortfall should it get flooded with claims. Additionally, the accounting doesn't always line up when analyzing its relationship with **Maiden Holdings** (NASDAQ: MHLD), and its reinsurance operations overseas are a black box. Ever since Maiden was created years ago, not to mention the Luxembourg reinsurance entities, critical lack of understanding has abounded in the media. But we take these accusations seriously (we take any critique of *any* of our companies seriously), and we'll keep addressing them as part of the *Pro* service. We just need some time. Today, AmTrust offered [a response] to *Barron's*, and we'll have a deeper take on that soon.
- **Intel** (NASDAQ: INTC): It appears we'll want to roll our $25 covered calls again, this time likely to a $26 strike. Shares are lately higher than $27. We don't want to lose our Intel shares — we enjoy the 3.3% yield and still see long-term upside — so we'll actively manage our covered calls to keep our stock and ideally earn option income, too, eventually. We'll roll soon if Intel remains strong, because the higher the stock goes, the harder the roll becomes.
- **iShares Russell 2000** (NYSEMKT: IWM): We remain short this small-cap index ETF as a hedge, but we know those who closed their May spreads at expiration lack this hedge today. Our next decision is whether to keep the hedge, and if we do, whether to offer those lacking it another alternative trade. The last iteration paid off well because IWM declined, but as a result our desire to continue to hedge is lessened a bit, especially as the S&P 500 is again making new highs.
- **Parexel** (NASDAQ: PRXL) quickly recovered in share price now that **Pfizer** (NYSE: PFE) withdrew its offer to buy **AstraZeneca** (NYSE: AZN). We weren't able to write $40 puts at the price we recommended to you, so we're considering alternate positions (which would require a new trade alert). However, bravo! to members who wrote those puts in time and earned a quick return. We'll offer guidance there as needed.
- **Wells Fargo** (NYSE: WFC): We're buying to close our June $50 covered calls as Wells stock lifts to new highs (but remains inexpensive). Assuming our June $48 puts expire, our latest strangle on Wells will result in a small profit, and we'll look to write a new one after earnings in July. We'll actively manage our **Tupperware** (NYSE: TUP) strangle this way, too, if needed. Right now, both options on Tupperware are on track to expire as income this month.
- Elsewhere, we're watching for chances to write puts or add to our positions in **Starbucks** (NASDAQ: SBUX) and **The Buckle** (NYSE: BKE), both of which currently have less than a 3% allocation, among others. We're also continuing to go through shorting candidates (though we want to believe the market favors shorting before we go out on that limb; otherwise there's more to gain by going long), and we always have new potential buys under consideration, as well as — right now — new option income strategies.

Service Enhancements

Along with the focus on our investments, you should know that we're working on new guides to hedging, shorting, and portfolio management in general, as well as possible new options strategies. We're also going to streamline our welcome experience for new members, and keep aiming to be more interactive, including our monthly live *Pro* chats and regular involvement on the discussion boards. Finally, have you seen our new [allocation calculator]?

Thank you for flying with us! We'll aim to keep the bumps manageable.

— Jeff (TMFFischer)

Quick Note: Chopping Up Apple

Apple (NASDAQ: AAPL) is executing a 7-for-1 stock split after the market closes Friday; you should see the results in your portfolio on Monday. If you're following Apple in Scorecard, you'll need to divide your cost basis by 7 and multiply your shares by 7 to reflect the change. Otherwise, no action should be required — the value of your holdings will remain the same, and the value of this excellent company won't be affected at all.

Videos: Key Points on American Tower

Published Jun 2, 2014 at 3:47PM

Hey Fools – this extra by our own Billy Kipersztok originally ran as part of Supernova's Explorer 1 "The Tough Get Foolish" series. Supernova's Exploration No. 5 examined four of the largest and least risky stocks in the Supernova Universe. The challenge was to find the one company with the best chance of beating the market — to become Explorer 1's recommendation for **The Tough Get Foolish**. The winner of the challenge was our very own American Tower! Check out the research here to see why.

American Tower (NYSE: AMT) has already been a [steady winner] for *Rule Breakers*. But after a closer look at this linchpin of the wireless world, I see plenty of reasons why investors should continue to expect market-beating performance.

American Tower and its two publicly traded competitors, **Crown Castle** (NYSE: CCI) and **SBA Communications** (NASDAQ: SBAC), use the same business model: They own wireless towers and lease them to telecommunication carriers like **Verizon** (NYSE: VZ) and **Vodafone** (NASDAQ: VOD) on long-term contracts. The tower industry is an oligopoly in the U.S., with these big three accounting for 82% of the market, although the global market is much more fragmented.

Demand for wireless tower space is driven by consumers' wireless data usage. If any of you have kids with iPads or iPhones, you can probably guess that wireless data use is skyrocketing with exponential growth rates. This momentum should boost demand for tower space worldwide, and global providers like American Tower are well positioned to benefit.

To explore American Tower, I've created three videos to walk you through the key points for investors.

---

1. Demand for Towers

As smartphone and tablet penetration increase, and development of mobile Internet applications continue, it becomes even more important to carriers that their wireless networks can handle the increased strain of data use. The carriers have been and will need to continue to invest in their networks by increasing capacity and deploying new technology. This is precisely what drives demand for the tower space offered by American Tower.

5 minutes, or read the transcript

---

2. Long-Term Security

American Tower is a stable, lower-risk investment because of its long-term, guaranteed contracts. Most of its customers' tower leases expire in 2019 and beyond, and the structure 3% to 5% annual price increases and careful lease roll-off management leads to steady, consistent growth of revenue and cash flow.

---

3. Tops in Towers

Within this booming industry, American Tower stands out. It has the largest international exposure, the most favorable debt profile, and the highest margins of the big three tower companies.

The Foolish Bottom Line

American Tower is a best-of-breed operator in an industry with strong demand and a great business model. With explosive growth in data use, stable revenue, and a strong competitive position, American Tower is a perfect example of a "safety in the storm" type of stock.

Discuss American Tower

Transcript 1

Hey, *Supernova* Fools. Billy Kipersztok here — excited to talk to you guys about why American Tower is a great example of a "safety in a storm" type of stock. I will be annotating over these slides like this, so keep an eye out for the telestrations.

This slide demonstrates how key demand drivers for American Tower are seeing absolutely explosive growth. The data comes from a 2013 Cisco VNI (that stands for Visual Networking Index) study and it shows expected growth rates in users, in monthly usage per device and total monthly traffic between 2012 and 2017 for both smartphones and tablets in North America.

As you can see, there are some pretty astounding growth rates across the board. Numbers getting up into the thousands. This reflects the exponential growth trends in data use here in the United States and in North America — and if any of you guys have kids with iPads, you probably won't be surprised to see that total monthly traffic for tablets is expected to increase nearly 4,000% to 561 petabytes by 2017. One petabyte is just over 1 million gigabytes, so that is a *lot* of data use.

Now with all of that growth in data usage, wireless carriers like Verizon, AT&T, T-Mobile, etc. need to invest in their networks to be able to handle the increased strain resulting from that growing data use. This graph shows the actual and expected capital expenditures from U.S. wireless carriers including — you can see them at the bottom — AT&T, Clearwire, Leap, MetroPCS, Sprint, T-Mobile, U.S. Cellular and Verizon.

The point of this graph here is to show that the carrier spending environment is robust and it's not decelerating. And so you say, "Hey, Billy. You say it's not decelerating, so what's going on here in 2015? It looks like we're getting a decline in 2015." My response to that would be that first off, the 2015 figure is expected, obviously, because 2015 hasn't happened yet and it's subject to change. It could likely be revised upward — just like 2014 estimates were revised upward earlier this year.

Last year if you looked at this figure, Cisco might have given you maybe $32 billion. Now we're seeing $34 billion as 2014 spending figures are more publicized and carriers are talking about their plans for the upcoming year. So, it's possible that this $32 billion figure could increase.

Secondly, carrier network investment happens in waves corresponding to the wireless generations such as 3G and 4G, so you shouldn't be surprised to see carrier capital expenditures be a little bit lumpy and they're not going to go up in a straight line. You're going to see peaks and valleys corresponding to investment and rollout of new generations of technology. That's really what we're seeing here.

This graph is a bit of a narrow view. It only has four data points — four years — but if you were to zoom out, you would see that the graph has a tendency to kind of look like this. It's going to be little bit lumpy and then each of the peaks are going to correspond to different generations. For example, this right here might have been the rollout of 3G and now, in 2013 into 2014 into 2015 and beyond, we're seeing investment in 4G. And you might expect to see, later on in the future once we get to the next generation, whatever they're going to call it ... 5G, maybe ... we might see even higher spending.

That's why I like what I'm seeing from the current demand environment. We're seeing explosive data use growth, we're seeing carriers invest in their networks and all of that bodes well for American Tower and for their demand story.

Transcript 2

Hey, again, *Supernova* Fools. This video is going to describe how and why American Tower qualifies as a great "safety in a storm" type of stock. I think this video makes the most compelling case for business stability, so if there's one video out of the three that you pay attention to, this one is it.

This slide shows American Tower's global tenant lease renewal schedule. The numbers represent percent of leases up for renewal in a given year. For example, in 2014, only 6% of leases are up for renewal. In 2015, only 4%. So on and so forth.

First off, what we know is that American Tower's leases are noncancelable and anything that's on the books is locked in until it's time for renewal. So, this slide is pretty important. And since their tenants are investment-grade — multibillion dollar companies — there's very little risk of default or failure to pay. Their customers are going to pay and American Tower is going to collect their rent, so to say.

Secondly, American Tower's management does a great job managing the roll offs of the contracts. As you can see, over 70% of American Tower's leases are set to renew in 2019 or beyond, meaning that very little revenue is at risk of falling off the table anytime soon. Even if none of their customers renew in 2014-none of the leases that are up for renewal are due — American Tower will only lose 6% of their revenue, which is not that alarming.

Now, that doesn't mean that 6% of revenue is going to fall off the table. Historically, American Tower's renewal rates are around 98-99% ... pretty impressive ... meaning that only about 1-2% of revenue is lost on an annual basis due to churn. That's evidence, right there, of strong switching costs preventing carriers from not renewing.

Customers typically renew and they might renew even early for a number of reasons, so management does a great job of pushing off expirations into further years. Some of that 6% might even get pushed into 2016. Some of the 5% in 2016 might get pushed into 2019 and beyond. American Tower's constantly looking to get its customers to renew and the roll offs of the contracts into a more favorable position for the company.

These long-term, contracted leases with high renewal rates and low churn lead to very stable financial performance. As you can see on this slide, anytime you're looking at a financial company or at a stock or an investment or a business ... whenever you see trends that go up and to the right, generally that's a pretty good thing ... and as you can see in this slide, American Tower has been very stable and very consistent. I think that's a testament to its leases and its contractual obligations and to the annual escalations that they have into their contracts.

I didn't really touch on that, but their lease agreements include annual price escalations that range from about 3-5% every single year. That's basically guaranteed growth of 3-5% every year, and any additional activity adds onto that growth rate. As you can see, both revenue and EBITDA (earnings before interest, taxes, depreciation and amortization — basically a proxy for cash flow for this business) have both increased at very healthy rates over the last seven years, well over 100%, up around 150%, on an absolute basis. So, American Tower has very stable, very steady performance.

Also of note. I'm sure you guys remember in 2008-2009, the stock market had a pretty terrible year and a lot of stocks collapsed. Cyclical companies may have seen huge drop-offs in revenue and in cash flow, but due to the contractual nature of the relationships between American Tower and its customers, American Tower didn't really see any hit to its business in 2008 and 2009, and things continued to progress very nicely in a linear ... well, almost even exponential ... up and to the right pattern.

So, this right here is why I think American Tower is a very stable, steady, "safety in a storm" type of company.

Transcript 3

Okay, Fools. So, in this last video, I'm going to talk about why we prefer American Tower over its two biggest competitors — Crown Castle and SBA Communications.

The trends and the business model advantages that I talked about in the previous two videos benefit all tower operators. With that said, why would you want to pick American Tower over its other two U.S. listed adversaries?

This slide, right here, which shows the tower portfolios for the three tower operators does a good job of explaining one facet of why I prefer American Tower to its two biggest competitors. Obviously the biggest differentiator in this slide is American Tower's international exposure. You can see compared to Crown Castle and SBA Communications — their international exposure represents a far bigger portion of their tower portfolio and that's a big deal for a few reasons.

For one, American Tower was the first mover in the international consolidation of the tower industry. Obviously, the international market is much bigger than the U.S. market. The U.S. market is also more mature. And so being the first mover gives them a big advantage operationally from getting in on the ground early in some of those frontier markets.

Their top three international markets are Brazil, Mexico and India. I'm not sure if they're exactly in that order, but those are the top three and they also have operations in Europe and in Africa, as well. So, the international tower market is growing even faster than the U.S. tower market and the growth cycle in those markets is anywhere from three to fifteen years behind, depending on geography. What that leads to is stronger growth in those international markets.

For example, in American Tower's last quarter, international organic growth was about 16% compared to U.S. organic growth of just about 9% or a little more than 9%. So, even though U.S. growth isn't exactly lagging at 9%, international growth is even faster.

Another reason why I like American Tower's international exposure is because margins are higher internationally than they are in the United States. American Tower is able to pass on some of its expenses, such as land costs, to its tenants overseas, boosting margins. This is going to come up later, so remember that point.

This slide here is a debt overview of the three competitors and it shows why I think American Tower is in the best position with respect to its debt. In the tower industry with very steady, stable cash flow, these companies can support a good deal of debt due to their cash flow, so they're never really at risk of defaulting on their debt because they can plan for and predict what their cash flow is going to look like and how much they need to pay off their debt whenever they need to.

This is a very common ratio here used in the industry, which is the leverage ratio and the calculation for that is debt-to-EBITDA. Remember that EBITDA is basically like cash flow — so it's just basically a cash flow coverage ratio — so how much debt do you have and how much cash flow would you need. Basically how many years of cash flow would it take you to pay off all of your debt if you wanted to do that.

You can see American Tower's debt-to-EBITDA ratio is 5.5x meaning that it would take 5.5 years of cash flow to pay off all of their debt. Crown Castle at 4.6x. SBA at 7.2x. This is a little bit misleading, because historically, American Tower has stayed in the 3-5x range, usually around 4x, which is lower than Crown Castle and SBA. Also, Crown Castle is a little bit lower than their historical average which is about 4-6x. SBA typically stays within 7-9x.

So, American Tower is historically a little bit more conservative with their debt. Right now it's a little bit misleading because they've made some recent acquisitions which pushed up their leverage ratio, but they're historically more conservative. What that leads to is a higher credit rating. If you're levering up to seven to nine times your annual cash flow, creditors are going to reduce your credit ratings. You can see for SBAC — they've got a B+ rating. Crown Castle's got a BB- rating and American Tower's got a BBB rating.

You can look up these credit ratings. These are S&P (Standard & Poor's) credit ratings. The more letters you have, the better your rating, so BBB is better than BB and BB is better than B. Obviously A is better than BBB, as well. And then the minuses and the pluses mean the trends.

So, American Tower's trend is negative and so is Crown Castle's and SBA's is positive. That's not really too worrying. The reason why it's negative is because, like I said, American Tower has made recent acquisitions, as has Crown Castle, which increased their leverage ratio ... whereas SBA Communications has been paying down their debt and they're at the lower end of their historical debt-to-EBITDA range at about 7x.

In this industry — with companies that carry a good deal of debt — having a lower cost of debt is very important, so American Tower has the lowest weighted average cost of debt at 4% compared to 4.2% and 4.1% for SBA Communications. Interest expense is one of the biggest expenses for this company and companies in this industry, so having a lower cost of debt is an advantage and it can help give you better margins than your competitors if you're paying less on your interest.

Speaking of better margins, here is a margin comparison for American Tower, Crown Castle and SBA Communications. And as you can see, across the board American Tower has higher margins ... gross margins, operating margins and EBITDA margins.

Now the reason for that is severalfold. Like I said earlier — I told you to remember the point from the first slide of this video — they have higher international exposure and that international margins are higher than domestic margins. So, obviously, if you have a higher mix of international towers compared to United States towers, your margins will be a little bit higher. Also, this is just a testament to skillful management and operational efficiency ... driving down costs and having higher margins than their competitors.

So, American Tower, for a variety of reasons. Higher international exposure, better debt management (lower cost of debt) and higher margins. I think they are the best operator in the industry. I think they have the best prospects moving forward to capitalize on these nice, secular trends in growth and data use and carrier network investment spending and they should be one of the biggest beneficiaries of all of these trends.

The Buckle: Not Great But Better Than Most

Published May 28, 2014 at 6:01PM

Pro's Take: BKE Q1-2014 Earnings

The Buckle (NYSE: BKE)

Quarter Quick Take

The Buckle remains resilient in a challenging fashion retail environment. Not much changed: store count (450: one opened, one closed) and overall sales were flat, margins were about the same, and earnings didn't budge. It was a sleepy quarter, but one that was very respectable compared to peers. One positive: inventory improved from last quarter. One negative: online sales increased a sluggish +3%. Cash flow generation is reliable, and The Buckle has almost $5 per share in cash. With 17 stores slated to open this year much of that $5 per share is excess.

....

Q1-2014

Revenue growth: +1%

Operating profit margin: -20 bps to 21.8%

EPS growth: -1%

....

Guidance Update

The Buckle's results were very respectable given the current apparel retail environment. While many teen retailers have seen large same store sales declines, The Buckle saw a modest -1%. The Buckle is a Buy and is Pro's smallest holding at 2.4%. I believe shares are worth $53 and are undervalued.

Updated guidance: Buy (no change)

Recommended Allocation: 2.4%

Fair Value estimate: $53 (no change)

End of Fiscal Year expected FV estimate: $56

CAM price: $37 (no change)

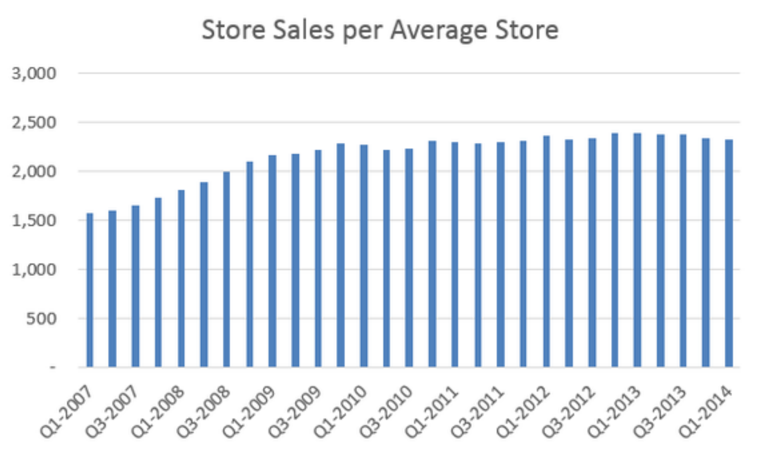
Shares normally trade in a range of 6-9x EBITDA (currently <7x) and I'd look to write puts for an effective buy price around 6x, which is our CAM price.

Our Thesis

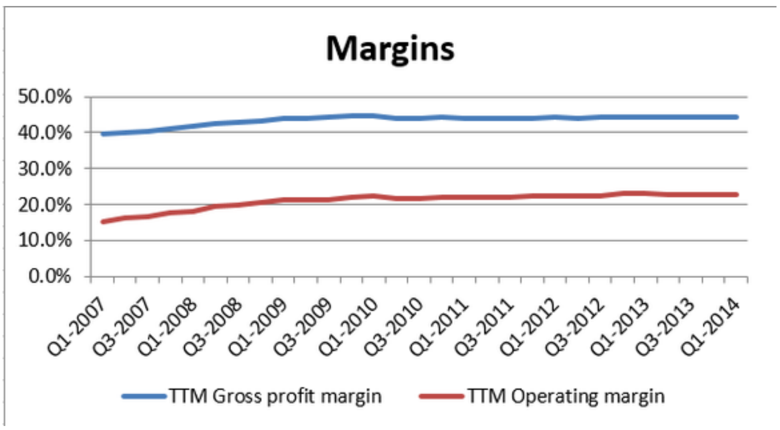
The Buckle offers retail exposure with low fashion risk (jeans and tops). Its management team is properly incentivized, has meaningful ownership, and run the business wonderfully well. We expect measured growth from store openings, online expansion, and expanded merchandise assortment (footwear and children's clothes). We are not expecting dramatic operational improvements, but we believe in-house brand penetration and an improved online experience are opportunities. The Buckle should grow its earnings, pay a regular dividend, and we expect it to pay out excess cash distributions (more years than not).

The Most Important Things

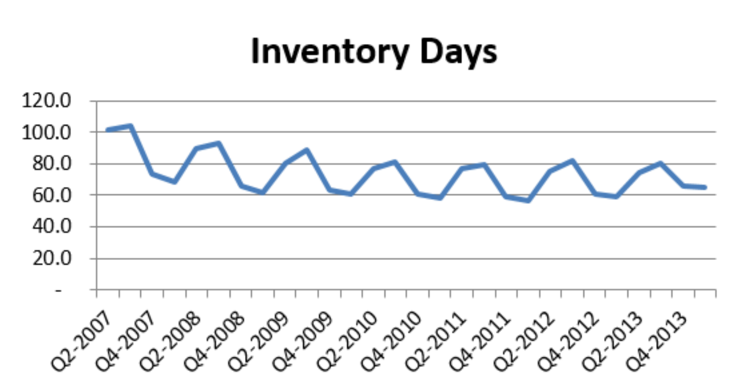
1. ***Store Performance***: Same store sales, sales per square foot, store sales per store, and invested capital per store are all worthwhile metrics to assess store performance. The reason The Buckle has generated so much value over the years is because it has been able to sell more (profitably) through each store without having to invest much more. And while same store sales growth is noisy, it is consistently positive. On a trailing twelve month basis, store sales per average store (excludes online sales) declined marginally. A revival in traffic is the most likely culprit for reversing the ebb in sales per store.



2. ***Operational Acumen (margins and inventory):*** Retailer gross margins and inventory levels expose whether or not merchandise selection is on the mark: if you've got items nobody wants you either have to put it on sale (which will ding gross margins) or let it sit on your shelves (which will ding inventory turnover). Historically, The Buckle has merchandised well, and margins have risen steadily. In Q1-2014, gross and operating margins declined slightly, but on a trailing twelve months basis remain above 44% and 22% (respectively).



Inventory grew 13% over last year, but is improving off last quarter's build. In Q4 management said that the inventory build was the result of running a bit too lean coming out of the holiday season and missing sales, ordering ahead of the Chinese New Year (which is a minor disruption to getting merchandise), and filling the shelves with children's clothes (a new initiative). The improvement makes sense given that explanation.



WWTN

The Buckle is holding steady in a difficult apparel retailing environment. We've incorporated current headwinds, higher investment expected in 2014, and continued strong operational execution into our estimates and think shares remain undervalued and have plenty of long-term upside. With almost $5 per share in cash and investments, another special dividend is likely.

Conference Call Notes

- On SSS: Q1 SSS were down -0.9%.

- On e-commerce sales: Q4 online sales were up +2.5%, a slower pace than trend. Analysts asked about the online strategy and management reiterated its strategy: it's a complement to the in-store experience. CEO Dennis Nelson said: "We see our online business to be just part of our strategy with our stores. We focus on the great specialty service in our stores, as well as with the wide selection. We're always working to drive people to the stores, and we do a lot of special orders with our guests in our stores from our online store. We are working on CRM that we hope to be in place by the first part of next year. We have several projects that we think will not only help our business online, but will help also drive the guest to the store to shop as well."
- On merchandise and store performance: For the quarter, UPTs increased +3%, average transaction value increased by +2%, and the average unit retail decreased -1%. Men's performed a bit better than women, average denim selling price increased (denim selection resonated with customers), and accessories and shoes growth moderated.
- On private label: 32% of sales.
- On stores: The company expects to open 17 new stores next year and 18 remodels.

Steady Performance at Medtronic

Published May 28, 2014 at 3:00PM

Pro's Take: MDT Q4-2014 Earnings

Medtronic (NYSE: MDT)

Quarter Quick Take

This quarter was more of the same for Medtronic: pockets of weakness (spine and coronary) were offset by pockets of strength (diabetes and surgical tech) and the company continues to hold the line on industrywide pricing pressures. Medtronic's broad product portfolio allows gives and takes across product segments that even out to modest, but consistent, sales growth. For the year, Medtronic generated modest operating leverage and prolific free cash flow (~25% of sales). The company also announced it reached a patent litigation settlement with Edwards Lifesciences over transcatheter valve technologies. Medtronic will pay a lump sum of $750 million and an annual royalty of $40 to $60 million. This should allow Medtronic to focus on competing freely in and developing a growth market. Management offered initial guidance for FY-2015, in line with what we had modeled, of sales growth of 3-5% and earnings growth of 5-7%.

....

Q4-2014 | FY-2014

Total revenue growth: +3% | +4%

TTM operating profit margin: +10 bps to 31.5%

EPS growth: -54% GAAP, +2% non-GAAP | -11% GAAP, +2% non-GAAP

....

Guidance Update

Business is tracking well against our thesis of stable legacy markets, success in emerging markets, and stable margins. We expect steps forward and backward from individual products along the way but Medtronic is executing well in the areas it controls and has a very modest valuation (15x expected earnings and 13x FCF). I am lowering my estimate of the company's Fair Value by $2 (incorporating slightly lower realized FY-2014 results, the Edwards settlement, and the ongoing royalty) and CAM price unchanged.

Updated guidance: Buy (no change)

Recommended Allocation: 2.9%

Fair Value estimate: $61 (down from $63)

End of Fiscal Year expected FV estimate: $66

CAM price: $47 (no change)

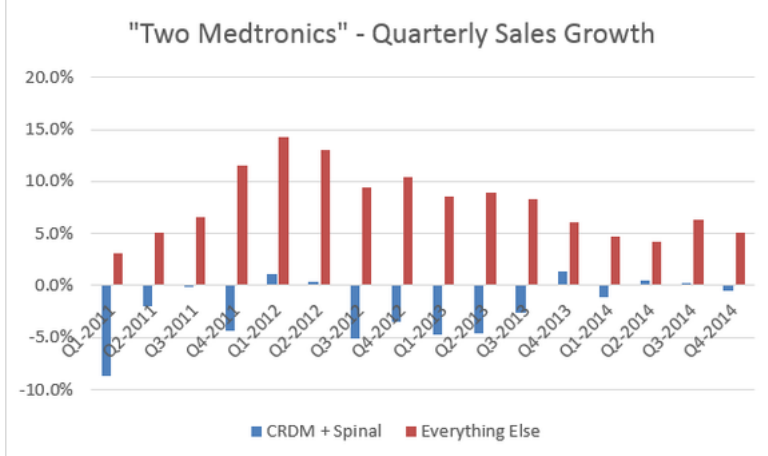
I'm happy with our 2.9% allocation to Medtronic. Shares are fairly priced and poised to achieve North Star-like returns over the coming years. The company's core markets are maturing and achieving growth is difficult; Medtronic's competitive advantages will help it succeed in the new environment, but increased global competition and more cost-sensitive buyers will drive down returns over time. This is a position we'll look to convert into an income play (likely via covered calls) at some point.

Our Thesis

In key product lines, Medtronic operates in an oligopoly that has historically behaved very well, and we expect that rational competition to persist. Competing devices are distinct enough that comparison shopping is tough and switching costs that come from surgeon and physician training support stable market shares. These factors support the notion that mature legacy product lines will continue to be cash cows that fund higher growth product development and international expansion. Medtronic has a strong pipeline and the company distances itself from the crowd with its emerging markets game plan. We admire the company's well designed emerging markets growth strategy and think it will leverage its mature market competitive advantages (scale and intangible assets) to build the distribution and development expertise needed succeed with new products in new geographies. The combination of new product launches, demographic-driven demand, and success abroad suggests that Medtronic can achieve modest revenue growth over the next five years and copious free cash flow.

The Most Important Things

1. ***Two Medtronics:*** One of the company's strengths is its broad product lineup, which allows for segment demand and leadership cycles to be smoothed by other, independently moving, segment demand and leadership cycles. I call this phenomenon "two Medtronics" and I look at the CRDM + Spinal segments (~52% of sales) and the remaining segments (~48% of sales). For the last 16 quarters, CRDM+Spinal has declined an average of -2% per quarter while all other segments have grown +8%. For Q4-2014, year-over-year growth for the two Medtronics was -1%/+5%. The CRDM+Spinal bucket has shown signs (for the last six quarters) of stabilizing and could begin to contribute to growth in FY-2015. If this persistent headwind turns into a tailwind sales growth should come a bit easier and we could see investors regain interest in this sleepy stock.



2. ***Margins:*** The Affordable Care Act (and resultant medical device tax), a challenging insurance reimbursement market, increased hospital buying power, and ever-present competition create a dangerous elixir to pressure margins. With continued innovation I expect Medtronic to hold the line on gross margins (~75%) but see modest deterioration in operating margins over time as the cost to bring products to market (namely more labor- and data-intensive research studies). During Q4, SG&A expenses were higher than expected – management admitted to poor forecasting and has implemented changes to tighten controls over what should have been a controllable line item. More importantly, the long-term profitability and margin profile for the company remain intact.

3. ***Emerging Market growth and strategy:*** Medtronic has truly distances itself from the crowd with its emerging-markets game plan. The company has made emerging-markets growth a strategic priority and has attacked it aggressively (with investments in R&D and physical infrastructure), on several fronts (high-end and low-end products, academic partnerships) and via several models (acquisitions, joint ventures, organic growth). Emerging Market sales represent only 13% of total sales, but mid-teens annual growth rates (it grew 14% in Q4) could make EM sales reach $4 billion in a few years and drive near half of Medtronic's total revenue growth. I expect emerging market sales growth to contribute40-50% of the company's sales growth next year. Changing funding mechanisms in Russia are slowing sales there and distribution challenges in India persist. However, growth in China and elsewhere should keep things on track.

WWTN

Medtronic has a sound strategy to deal with the more regulated and costlier health care environment. We're confident the business remains competitively advantaged, operates in an attractive industry, and is well-positioned to grow in emerging markets. The company's modest earnings growth outlook and valuation make it a prime candidate for covered calls.

Conference Call Notes

- On the vision: CEO Omar Ishrak: "Healthcare payment and delivery systems are changing and evolving around the world. Through these efforts, we feel we are well-positioned not only to respond to these system changes, but to demonstrate the role medical technology and related services can play in making these health care transformations successful." Also: "Medtronic is uniquely positioned to lead the shift to value-based health care, directing our products and solutions to help providers, payers, and governments achieve their goals in driving more value into health care systems around the world. I am pleased with the early work we have done to establish our leadership position, and I look forward to sharing with you at our analyst meeting the opportunities we have ahead as we transform Medtronic from being primarily a device provider today into the premier global medical technologies solutions partner of tomorrow."

- On emerging markets growth: Emerging market growth should accelerate next year – likely to achieve mid-teens sales growth.

- On gross margins: Removing a few one-time expenses, gross margins came in just shy of 75%. Because of increased spending to deal with quality issues (in response to FDA letters) gross margins will likely remain in this range.

- On the medical device tax: Medtronic expects to pay $125 million in FY-2015, a slight increase from what it paid in FY-2014.

- On goals: Medtronic strives to provide consistent results – sales growth in the 3-5% range and earnings growth 200-400 basis points greater than that. It also intends to return 50% of free cash flow to shareholders. The company's three growth avenues are: new therapies, emerging markets, and independent services and solutions.

- On SG&A: Management was very honest about what happened: "although the targets are clear, there was a breakdown in our forecasting process, and, therefore, our control process. We are acting swiftly to plug that hole, and we'll do everything we can to avoid this in the future. But it really is a mismatch between our forecasting process and what we actually got."

- On the Edwards settlement: CFO Gary Ellis: "The good news about settling this long-going patent litigation between ourselves and Edwards is now both of us can focus on growing the market and investing in growing the market versus investing in fighting each other. And so, yes, there is a royalty stream that we've agreed to. There's an upfront payment we've agreed to, but basically now -- we've set things at the table; we know what the costs are related to that. And we can now continue to invest and drive the market going forward, which will benefit not only both of us, but benefit obviously the patients and the customers."

- On negative trial results: CEO Omar Ishrak understands the nature of the business – bad trial results happen and it is part of developing new products. "Like I said at the ACC, look, this comes with the territory. You do clinical trials for a reason, and every so often, you are going to get negative results. And we don't give up on strategic opportunities based on that. We continue to strive on them, because we believe in the long-term need for that kind of therapy."

- On cash: CFO Gary Ellis addressed the idea of repatriating cash from overseas. In short, he said it doesn't make sense for MDT right now because of their ability to borrow at attractive rates in the US. For now, I account for O-US cash at 100% (assuming the company will be able to invest it abroad). If I were to account for a tax penalty, fair value would be reduced by ~$3 or so. "The idea of actually bringing back cash and paying the penalty right now, we are not looking at doing that. And I think most companies who have done that have done that for basically, if they needed to for various reasons. And unless you need to, if you can continue to borrow and have effective use of that, it financially does not pay. So there is no incentive at all for us right now to bring back that cash and pay the type of penalty we would have to pay in additional taxes. So we have enough flexibility with our cash generation and our debt, such that we continue to do our capital allocation as we've discussed up to this point in time. So we have no expectation of making any change to that."

Buy to Close Your Written Calls on Wells Fargo

Published May 28, 2014 at 1:00PM

Is this for you? This alert applies to *Pro* members who are aligned with our recent **Wells Fargo** (NYSE: WFC) covered strangle recommendation.

How You Participate

- **Trade:** As soon as is reasonable, buy ("buy to close") all previously written June 2014 $50 calls on Wells Fargo (*Pro* will be closing all 12 of our written calls). In doing this, we're regaining our upside. We're leaving our written $48 puts alone.
- **Allocation:** We own a 2.9% position, plus we've written June 2014 $48 puts to potentially increase our allocation to about 5.5%.
- **Price Guidance:** Use a limit order and, today, aim to pay no more than $0.45 of time value. Since time value will diminish as we approach expiration, if you don't get to this trade today, pay no more than the time value implied by the ask price.
- **Prices (May 28):** Stock, $50.44; June 2014 written calls, $0.87 bid / $0.89 ask ($0.45 time value at the ask)

What We're Thinking

Just more than a month ago, *Pro* set up a June 2014 $48/$50 covered strangle on our 2.9% Wells Fargo position. Our thinking was as follows:

- With our North Star in mind, we were seeking alternative ways to generate portfolio income.
- We were comfortable accepting more shares of Wells Fargo at an attractive price should the written-put leg of our strangle be assigned.
- We did not anticipate any upcoming catalysts that would push the stock price much higher before the second-quarter 2014 earnings report set for July 11.
- We planned to take action and either roll our strangle or close our written calls if it looked like we were at risk of getting our shares called away.

Nothing has changed since our original recommendation, and with the recent run-up in the stock market and in Wells Fargo's share price (which hit a 52-week intraday high of $50.70 on May 27), it looks like point No. 4 above is coming into play. Thinking long-term, your *Pro* team feels it's prudent to uncover our shares and remove the risk that our written calls could be assigned should the market and Wells Fargo continue to gain investor favor. In closing the written-call portion of our strangle, we're on pace to capture a small profit on the overall strategy, and we'll reassess our valuation and look to continue the strategy (if business and market conditions dictate) after Wells reports Q2 2014 earnings on July 11.

At current prices, if we buy to close our written calls (and assuming our written puts expire fully as income), we will have earned a modest $0.35 per share in 56 days, good for a 0.7% absolute yield and about a 5% annualized yield on the share price at the time of the original covered-strangle recommendation. Although the absolute and annualized returns on this strategy so far are modest, we expect to have more opportunities to generate additional income on this position in the future. It's a nice consolation to know that in 56 days, we've earned more income from this strategy than we did from our dividend payment in Q1 2014 ($0.30 per share). Our return on this strategy also matches the expected dividend payment in Q2 ($0.35 per share), so we've effectively doubled our quarterly yield on the position by initiating this strategy.

For follow-up, we expect to wait until after Q2 earnings on July 11. We'll then consider reopening our strangle at the same or different strike prices, depending on the quarter's performance, market conditions, and our updated assessment of fair value for the business. Until then, we're happy to take our $0.35 per share in profit and wait for the next pitch.

Alternative Trades

- None.

PZZA Still Delicious: Papa John's Moves to Buy

Published May 23, 2014 at 11:42AM

From April 2013 to April 2014 **Papa John's International's** (NASDAQ: PZZA) valuation (the price investors were willing to per dollar of cash flow) expanded by 55%, to a level well above historical norms. Increases in valuation don't have to be scary, but if the expansion isn't sustainable and justified by operations it magnifies every risk inherent in the business – the cost of a mis-assessment rises even if the likelihood of a worse-than expected outcome doesn't change. We changed our guidance on Papa John's to Hold in April to reassess the company's valuation and dig into a few key risks. Since then, two things have happened: the valuation has come down to a more reasonable level and our research on the business revealed that everything on the business front looks delicious.

We're moving shares of Papa John's back to Buy, with a $45 Fair Value Estimate and a $34 Consider Adding More Price. Pro investors who haven't matched our 3.7% position have a great opportunity to do so.

Discuss PZZA with us here!

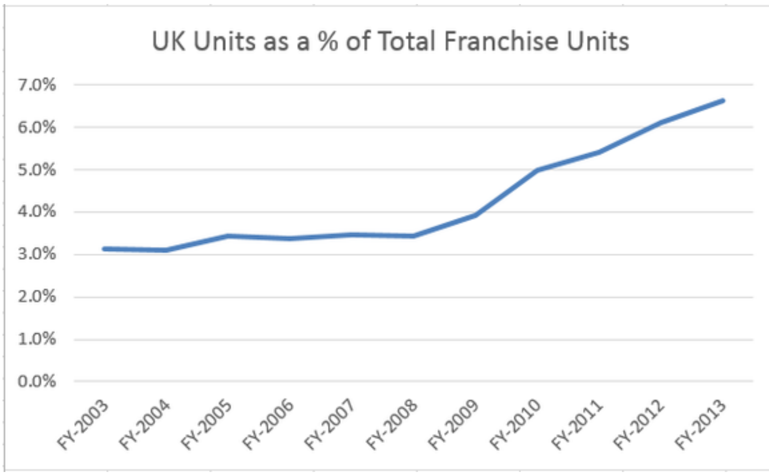
Dear Fools,

As you know, moving a position to Hold in the Pro guidance system triggers a review. I started with questioning the validity of the assumptions that drive our forecast of growth and returns, I reviewed the key risks that could derail those assumptions, and I spoke with company management. Here is a quick rundown of that review:

Slower than expected free cash flow growth

I identified two primary causes of lagging growth in free cash flow that warranted further investigation.

1. *Growing accounts receivable was consuming cash*. For Papa John's accounts receivable balances are money it hasn't collected from its franchisees from selling them sauce, dough, and boxes. It generally collects these payments in seven to ten days, so a growing balance per restaurant suggests something has changed in the business or franchisees are having trouble paying. On my call with CFO Lance Tucker I learned that the bulk of the rise in accounts receivable is due to the nature of franchising in the United Kingdom. As the franchisor, Papa John's must act as the land lord as well, which dramatically alters both the receivables balance per unit and the length of time it takes to collect (rent is paid monthly). Over the past few years Papa John's has expanded quickly in the UK, from 3% of total franchise units to near 7%. As growth in the UK slows but continues in other markets (which don't have the land lord stipulation) the impact on receivables and cash flow should moderate.



2. *Failure to leverage corporate overhead costs*. Papa John's should be able to add 200-250 restaurants per year, with the bulk of those units franchises. Supporting this growth shouldn't take a ton of cash, bodies, or assets at the corporate level (this is one of the reason franchise business models are attractive). Over time, I'd expect this to play out in margin expansion, because the costs incurred to support growth should be moderate. This leverage hasn't played out in Papa John's. Further investigation revealed that this is more fiction than fact; the company's reporting structure classifies most of the costs of operating internationally (other than international commissary related ones) as corporate overhead. These costs are still being incurred, but they're obscuring the eventual margin profile and earnings power of the business. The Papa John's management team is working on presenting its line items in a more helpful way, but more importantly, understanding the obfuscation reinforces the benefit of scale I forecast for the company in the future and its ultimate impact on free cash flow generation.

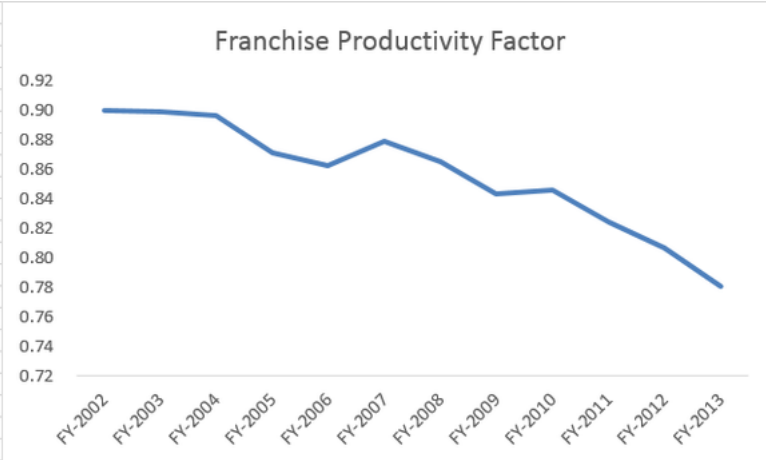
The big two business risks

The two largest threats to the company's business, in our opinion, are the maturation of the domestic pizza business and emerging competitive threats (primarily from the democracy of delivery).

1. *Domestic pizza market*. Although the international growth potential grabs most of the headlines, domestic pizza sales drive 94% of company sales and all profits. A slowdown or decline in the domestic quick-serve pizza market (a $37 billion market) would have an outsized impact on Papa John's. Health trends suggest a modest decline could occur, but even if this happens Papa John's looks poised to grow its share of the market as large chains take share from independent pizza shops. The costs of technology and marketing needed to support mom and pop pizza chains can be oppressive. Add in volatility of commodity prices and it's easy to see why large pizza chains have stolen share from smaller joints, growing their market share from 31% to 36%. If other quick-serve food categories are even close to a guide, we shouldn't be worried about that trend slowing: QSR Hamburger chains control 96% of their market, QSR Mexican chains control 82% of their market, and QSR sandwich shops control 71% of their market.
2. *The rise of delivery services*. One of the primary benefits of pizza is the convenience afforded by delivery. The spread of drive-through formats ate into that advantage a bit, but pizza continued to thrive. The most recent threat is the proliferation of delivery consolidators, or businesses designed to make ordering and delivery accessible to restaurants that don't offer the service in-house. The best known example is recently public **GrubHub** (NYSE: GRUB). While GrubHub is small, it is profitable, and making local restaurant delivery more accessible. We're monitoring this trend, but don't expect too much impact on the pizza business.

The underperformance of Franchisees

I track the performance, as measured in weekly sales per restaurant, of Papa John's franchise stores relative to its company-owned stores (I call it a "productivity factor"). Over time, the performance has diverged dramatically and persistently, with franchise unit performance falling from 90% in 2002 to 78% in 2013.



It turns out there are two primary reasons for this divergence. First, corporate stores perform better because they are in dramatically more penetrated markets. With more Papa John's stores in a given market, the local advertising kitty is larger and there is more mindshare for busy customers driving around town. Second, corporate restaurant operators are, on average, just better. They're longer tenured, are motivated to embrace policy to keep their jobs, and they generally benefit from improvements and best practices early. Franchisees, on average, are slow to embrace best practices and have different motivations. International growth also skews this relationship a bit. The divergence should naturally narrow as existing markets achieve higher penetration, and management is intent on narrowing this gap by offering productivity tools, training, and incentives to franchisees. Accordingly, I assume the productivity factor worsens in my bear case assumptions, improves just a bit in my base case, and improves more meaningfully in my bull case.

The Pro Bottom Line

Papa John's valuation got stretched and has since corrected. We were a touch slow in deciding whether or not to trim our position. The decision we can make is what to do *now* – and we think our thesis remains intact, the company's competitive position is secure, its financial model is attractive, and its management is appropriately focused on the right things to grow intrinsic value over the long term. Papa John's has the hallmarks of a compounding machine and we're happy to move our guidance back to Buy.

O'Reilly Drives Toward Results

Published May 20, 2014 at 4:06PM

One of the country's leading auto parts retailers, **O'Reilly Automotive** (NASDAQ: ORLY) reported 18.1% growth in Q1 earnings per share, on a 9% gain in sales and 6.3% same-store sales jump. The company was helped by the harsh winter, and should see benefits from it linger the coming months as damaged or strained parts break down. A severe summer (extreme heat) would help it, too, as any severe weather (and temperature swings) brings more wear and tear to cars.

Overall, O'Reilly improved margins again and is on track to open 200 new stores this year, for nearly a 5% increase in store count. The stock remains a long-term **buy** at a current 3.6% allocation in *Pro*. You could also write puts if you're ready to potentially buy shares at a lower price.

Our main concern is the stock looks priced for perfection (or close to it), or it may be approximately a year "ahead" of itself on valuation. But for the long term, this management and business has plenty of runway. We're up 46% on our 500 shares bought just 13 months ago, and we may now consider covered calls for income on this large retailer, although we don't want to lose our shares, so we would need to be careful and proactive.

Please see all of our financial metrics in this post.

==============================

Competitive Moat: Locations, parts-availability, expertise, exceptional customer service -- all leading to customer loyalty which drives same-store sales growth.

What We Think Now (our summary/thesis): With exceptional management in the driver's seat, O'Reilly Automotive will grow impressively by adding new auto parts stores, acquiring others, and growing same-store sales.

Conference Call Highlights

- Reminders: O'Reilly is a domestic-only retailer; it benefits from severe weather (hot or cold); it benefits from lower unemployment which leads to more miles driven; it benefits from lower gas prices.
- Total sales grew 9% to $1.7 billion, while operating margins went up 78 basis points to a Q1 record of 16.6%.
- Same-store sales growth of 6.3% was driven equally by the professional and DIY consumer, and equally by higher tickets and more traffic.
- The increasing complexity of vehicles leads to higher-cost repairs, and ORLY expects this trend to continue; old vehicles also have costlier replacement parts.
- We're on track to open 200 stores this year; ORLY opened 50 net stores in Q1, spread over 23 states. They could have as many as 300 stores in FL at some point, as FL is proving stronger than hoped.

- The industry is and remains very rationally priced; you can't jack up prices on parts, nor should you cut your margins to the bone, so you tend to compete on part availability and customer service. ORLY's new distribution centers help on both.
- ORLY offers customers diagnostic tests when the engine light is on, changing the battery, replacing the wipers -- simple services. It doesn't advertise this much, but word-of-mouth gets the word out and leads to repeat customers who want these things done for them. This is slowly building.
- The company's rewards program has 5.5 million customers.
- Professional sales are about 42% of companywide sales.
- The company's adjusted debt-to-EBITDA is 1.86x, while their targeted leverage range (for optimal performance) is 2.0x to 2.25x. They'll move to this range when the opportunity seems right.
- Gross margins should slowly continue to improve, although it appears that the low-hanging fruit has been picked in recent years.
- ORLY bought back $56 million worth of shares at $145.94 on average.

Management 2014 Guidance

- Full-year same-store sales gain of 3% to 5% (with 2% to 4% in Q2)
- Full-year gross margin of 50.9% to 51.4%
- Full-year EPS of $6.82 to $6.92 (excluding any more share repurchases)
- Free cash flow of $580 million to $620 million

Summary

As with many companies today, O'Reilly is growing the bottom-line partly through share buybacks. The share count is down nearly 20% since 2011. Revenue growth of near 10% is healthy, too, and same-store sales are very healthy lately, but in a tepid economy, the company is still pulling out all the stops to generate nearly 20% EPS growth. That can't continue indefinitely.

Our valuation estimate doesn't take into account more share repurchases (nor, of course, possible acquisitions, of which O'Reilly says plenty remain). But, we need ORLY to keep executing very well or else we're going to probably have a year or eighteen months of letting the stock "catch up" to its valuation. We'll consider if and how we might want to address that possibility. The stock is a Buy that we believe will still challenge *Pro's* North Star the next three years.

Questions? Of course ask here!

Best,

Jeff

The Difficulties of Shorting

Published May 19, 2014 at 2:00PM

Pro Guidance Changes

- **AIG** (NYSE: AIG): Our fair-value estimate increases to $62 from $60, and our Consider Adding More price increases to $46 from $44. We have a 3.8% stock position and 0.7% in LEAPS (for members, we recommend warrants). See more here.

Dear Fools,

This year's rising market has seen the S&P pushing new all-time highs, but there's been a disparity between larger companies like those in the S&P 500 (the blue line in the graph below) and smaller companies like those in the Russell 2000 (the brown line in the graph below). The former are up about 1% year-to-date, while the latter are down about 6% in the same time frame.

No Monday Memo Next Week

The stock market, and thus the Fool, will be closed next Monday for Memorial Day, so there will be no Monday Memo in your inbox on May 26. We'll see you again June 2!

Polaris Award Update

Fools, we have a winner for the 2014 Polaris Award, but we have yet to hear back from him about claiming his prizes (and glory). We'll keep you posted! Thanks to all who participated and to all of the deserving nominees.

Combined with investor skittishness, this situation has catalyzed some sharp downward stock-price moves in heavy growth companies. For example, **Yelp** (NYSE: YELP) has declined from a 52-week high of $101.75 in early March to its current price of $55 (a 46% decline in about 2.5 months).

In this type of market environment, we continue to seek ways to earn absolute profits as we aim to meet or exceed our ever-rising North Star. One great way to earn absolute profits in any type of market is to short weak, competitively disadvantaged companies. If successful, this helps us earn profits whether the market goes up, goes down, or stays flat. To that end, since the beginning of the year, your *Pro* team has been very active in seeking short opportunities to add to our portfolio. It has been a constant area of focus for Jeff, Bryan, and me.

In today's Memo, I'll detail the timeline of our decisions regarding a company we researched as a potential short position in the *Pro* portfolio, but ultimately decided to pass on because of a deteriorating risk/reward balance. The company? **Plug Power** (NASDAQ: PLUG).

The Company

Plug Power is a leading provider of fuel-cell technology focused on the design, development, and commercialization of fuel-cell systems for the industrial-material-handling market (think forklifts in high-volume warehouses for companies like grocers or retailers). The company went public in 1999 but has never reported a profitable year. Continual stock offerings have provided it investor cash as fuel to burn in search of profits. Since its public debut, shares outstanding have soared from 2.6 million to more than 97 million as of the most recent 10-Q, and the stock price has declined from a reverse-split-adjusted all-time high of about $1,500 per share in March of 2000 to the current $4.45 today (a 99.7% decline for anyone who has held shares since then — ouch).

Source: Yahoo! Finance.

The Timeline

1. December 2013 Business Update

On Dec. 4, 2013, Plug Power held a special update call it termed the "2013 December Business Update" (link opens PDF). On this call, CEO Andy Marsh enthusiastically and optimistically proclaimed that Plug Power would be profitable by the end of 2014. Just the day before, Plug Power's stock closed at $0.79 per share; the day of the call, it closed at $1.27, a 61% increase in one day.

2. Wal-Mart Order Announcement

On Feb. 26, 2014, Plug Power issued a press release disclosing a "milestone" order from **Wal-Mart** (NYSE: WMT). The stock jumped 13%, continuing its meteoric, momentum-fueled rise.

3. CEO Andy Marsh Appears on CNBC

On March 7, Marsh appeared live on CNBC to talk about Plug's business and investors' resurgent interest. Marsh again proclaimed that Plug would be profitable in 2014, and he sang the praises of the company's recent progress. The share price jumped the following week to a year-to-date high of more than $11 per share (a return of approximately 1,300% in just more than three months!).

4. "Stock of the Day" Segment and Billy's CAPS Call

On March 12, my colleague Simon Erickson (TMFInnovator) filmed a "Stock of the Day" segment on Plug Power, discussing the market's feverish interest in the company and why said interest might be misguided. After chatting with Simon about the company, I quickly looked up its financials; a glance at the numbers was all I needed to lock in a thumbs-down CAPS call. Knowing that *Pro* was seeking shorts, I also began to research the company to better understand the industry and make sure this was a viable opportunity. On March 26, I sent an email to Jeff explaining my interest in a short position and outlining plans for further research. Jeff encouraged me to continue to pursue the idea.

5. Kerrisdale Capital Discloses Short Position in Plug Power

On April 2, Kerrisdale Capital, a New York-based investment partnership, released a blog post with a detailed short thesis on Plug Power. At the time, Plug's stock price was $7.48 per share. The gist of the short thesis is summarized by the conclusion:

> The speculative ramp-up of PLUG's share price is unjustified, and we believe the downside potential is immense. PLUG has never been profitable, operates a business with low barriers to entry, and operates in an unproven industry, all while shareholders have suffered extreme dilution.

6. The Team Reviews Billy's Short Thesis

A day after the Kerrisdale Capital report, I sent my final research on Plug to the *Pro* team. We discussed the idea a bit but were drowning in earnings at the time, so we decided to table Plug until we had time to iron out final details and compile the write-up. We did not feel compelled to act in haste; the nearest catalyst was Q1 2014 earnings, due on May 14, and we had no reason to suspect that the investor enthusiasm surrounding the stock would recede until then. At the time, the stock was hovering around $6 to $7 per share.

7. Plug Power Issues Public Stock Offering to Raise Capital

On April 22, Plug Power announced its intention to sell common stock in a public offering. At the time, Plug shares traded around $7 per share, declining to $6.70 the day of the announcement. Three days later, Plug issued another press release detailing the pricing of the common offering ($5.50 per share), which drove the price down to close that day at $5.37 per share. By offering obviously overvalued stock to the public, the company raised more than $124 million to help offset operating cash burn and to provide ongoing liquidity for operations.

However, all this harmed our short thesis, eliminating much of the "easy gain" to be had from shorting the company and altering the risk/reward balance to the point where we felt uncomfortable initiating our position. On April 28, I updated the team on my research, noting that by that point the price had fallen so much that the opportunity was not nearly as enticing.

8. Plug Power Reports Q1 2014 Earnings

On May 14, Plug released first-quarter 2014 earnings. The company continued its streak of operating losses, demonstrating that attaining profitability in 2014 would be a difficult challenge after all. The market didn't like the results, bidding shares down the day of earnings to $3.82 per share. At this point, the *Pro* team decided that initiating a position was not feasible at this price, and that we would table the idea until we saw a more favorable risk/reward balance.

The Foolish Bottom Line

Members ask us from time to time why we don't have more short positions. I hope today's Memo has helped outline some of the difficulties of shorting intelligently. When you research long positions, you seek fairly priced businesses that will slowly compound over time. But with shorts, you're looking for market expectations that are out of whack with the reality of a business. These opportunities are rare, and when you do find them, the value discrepancy generally remains until there's a concrete reason for the market to change it (in Plug's case, this was the unexpected announcement of a secondary offering). Thus, the pursuit of shorts can turn into a game of timing rather than a simple issue of right or wrong.

Nonetheless, the *Pro* team continues its tireless search for opportunities, short and otherwise. Just last week we had a meeting discussing — among other topics — a new short idea. I hope this Memo was a helpful look at your *Pro* team's research process! To discuss it, click on over to the Memo Musings board.

Fool on!

Broad Strength at Broadridge

Published May 18, 2014 at 10:43AM

Pro's Take: BR Q3-2014 Earnings

Broadridge Financial Solutions (NYSE: BR)

Quarter Quick Take

Broadridge continued its strong fiscal 2014. Q3 showed that (1) recurring revenue closed sales performance (the core, predictable business) is tracking as expected and the pipeline for new business is robust, (2) the modest market tailwind is providing the opportunity to step-up investment for long-term growth, and (3) the company's ability to scale well does not require massive revenue growth. Both segments (Investor Communications and Securities Processing) contributed to the performance, together turning 5% revenue growth into 14% operating profit growth and 17% net income growth. Management guided to the high end of its expected earnings and free cash flow range (remember it raised guidance last quarter). Broadridge has made two small acquisitions so far this year, remains in excellent financial health, and is generating excellent returns on the capital it puts back into its business. Most importantly, I expect the sales and profit momentum to continue based on the company's robust pipeline of business and the sales opportunities that accompany dialogues related to implementing the adoption of new NYSE proxy rules (which took effect January 1).

....

Q3-2014

Total fee revenue growth: +8%

TTM Operating profit margin*: +410 bps to 23.4%

EPS growth: +17% GAAP, +13% non-GAAP

*Operating profit / Fee revenue

This removes the impact of distribution revenue, which is a pass-through, and distorts the true economics of the business

....

Guidance Update

Business is tracking well against our thesis, and the dust is settling on two recent issues (event driven revenue and new NYSE rules for proxy). The current business environment is finally free of headwinds and Broadridge is executing very well – it is starting to exhibit some of the operating leverage we've long said was inherent in its business model. I am pleased to see the company stepping up growth investment (an extra $33 mm of expenses this year) to set the stage for (still modest) growth over the long term. I remain confident that Broadridge will spend this capital wisely – its history with capital allocation discipline suggests a rigorous and thoughtful process.

Updated guidance: Buy (no change)

Recommended Allocation: 4%

Fair Value estimate: $42 (no change)

End of Fiscal Year expected FV estimate: $44 (no change)

CAM price: $34 (no change)

I'm happy with our 4% allocation to Broadridge. The company's business lies at the nexus of Pro's largest sector bets: technology and financials. It is Pro's fifth largest position. Members lacking a (full) position should feel comfortable purchasing shares today – they trade at a discount to our estimate of Fair Value. If the market presents the opportunity, I'd entertain written puts or buying shares to bring the position up to 5% allocation, or an outright resizing if shares fall near CAM territory.

Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

The Most Important Things

1. ***Recurring Revenue Closed Sales:*** RRCS amount to an estimate of the annualized new business won during the period. Given the nature of the company's business, the revenue should recur at extremely high rates (we're talking 98%). Tracking this metric gives us insight into future sales, how new products are resonating with customers, and the degree to which customers are partnering with Broadridge. RRCS were up +7% in the quarter (and +7% through the first three quarters of 2014). Broadridge hasn't signed any large transactions (>$5 mm) so far this year which underlies the strength of its diversified product offering and sales efforts. Emerging and Acquired (E&A) recurring revenue closed sales have been particularly strong, with the recent Bonaire acquisition (Q1) contributing more than expected.

2. ***Fee Revenue Margin Performance:*** Broadridge maintains a technology platform upon which its business operates. As it brings more business (volumes) on board, it should benefit from low variable costs and increasing margins. I track gross and operating profits as a percentage of fee revenue, which ignores distribution revenue and costs, and makes my numbers differ from what you might read in the press release. Broadridge achieved fee revenue gross margins of 42.5% during Q3-2014, up from 37.5% a year ago. On a TTM basis (to smooth the calendar lumpiness) fee revenue gross margin was 43.2% versus 39%. Fee revenue operating margin for Q3-2014 was 19.5% up from 18.2% a year ago. On a TTM basis fee revenue operating margin was 23.4% versus 19.3%. The increases were largely due to the natural leverage off of higher sales volumes. Last quarter management announced an extra $28 mm of growth investment spending because it saw the opportunity and the year's performance allowed for it – this quarter it raised that figure to $33 mm. Only $10 mm of that spending will be recurring.

3. ***Capital Allocation:*** Although BR is a slow-grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 40% payout ratio, then looks for bolt-on acquisitions that can achieve a 20% IRR, or it looks to repurchase shares. Last quarter, management raised full-year FCF guidance to $275-$325 million. This quarter it guided to the high end of its range (earnings too). Broadridge will likely spend ~$100 mm on dividend payments, and has spent $141 mm spent so far on CapEx and acquisitions so far this year, suggesting that Broadridge will add to its cash reserves next quarter. This will likely prompt a raise in the quarterly dividend (BR currently yields 2.2%). Broadridge remains in great financial health.

WWTN

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. Revenue growth will modest, but cash flows are predictable and returns should improve further as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Conference Call Notes

- CEO Rich Daly summed up the quarter: "*In our seven years as a public company, our confidence in our business is higher today than it has ever been*."

- On investing: Broadridge is taking advantage of the strong year and upping its investment in growth by an additional $5 mm (on top of the $28 mm it announced last quarter). $14 mm will go to SPS, $12 mm will go to ICS, and $7 mm will go to corporate. Year-to-date, only $9 mm has been spent, so the remaining $24 mm will be expensed in Q4.

- On the Emerald acquisition: Emerald is a 27-year old company that provides compliance-friendly marketing tools to support financial professionals. Emerald should add to earnings in fiscal 2015.

- On E&A contributions: In Q3, emerging and acquired product solutions made up more than 46% of recurring revenue closed sales booked, and will likely be 50% for the full-year. This speaks to the broadening of the Broadridge product suite, the diversity of its revenue stream, and successful cross selling efforts.

- On the big picture: CEO Rich Daly said: "*Overall, we are well-positioned to deliver steady financial growth over the long-term. Our business has evolved significantly over the past several years. We've leveraged our expertise and unique positioning in both segments to develop and introduce the next generation of product solutions to further strengthen our existing client relationships and expand into new opportunities. The benefits of our efforts will continue to be evident as we take our business to the next level, enhanced by this year's meaningful investments into new growth opportunities. Combined with our capital stewardship program, we believe this will translate into substantial value creation and sustainable top quartile returns for our stockholders for years to come.*"
- On strategy: CEO Rich Daly summed up the company's strategy succinctly: "*Our solutions address two client needs: Reducing non-differentiated spending and providing solutions that enhance our clients' revenue growth. We will continue to create new products that expand our solutions in these areas, and through this effort further strengthen our position in the marketplace and generate additional net new business momentum*"

A Lot of Pizza, Less Profit

Published May 16, 2014 at 3:38PM

Pro's Take: PZZA Q1-2014 Earnings

Papa John's International (NASDAQ: PZZA)

Quarter Quick Take

Papa John's achieved remarkable systemwide comparable store sales growth (+13%), but that didn't translate to even higher profit and cash flow as we would have expected. Instead, cheese prices soared, growth-related expenses remain elevated, and PJ rewarded its employees for a strong 2013 with performance-based compensation, resulting in flat bottom-line performance. The commodity cost headwinds and looming expense of implementing a new point of sale system caused 27 domestic franchisees to close, but the company still added net 12 stores during the quarter and expects to open 220 or so stores in 2014. Long-term business drivers appear to remain, but we continue to study competition from fast casual pizza concepts and the democracy of delivery.

Since the earnings call was announced, Papa John's COO Tony Thompson was hired away to be the new CEO of Krispy Kreme. The COO role was quickly back-filled by promoting from within, with Steve Ritchie stepping up to the plate.

....

Q1-2014

Total revenue growth: +13%

Operating profit margin: -36 bps to 8%

EPS growth: +7%

....

Guidance Update

Papa John's is currently on Hold. I have an outstanding call with the company's CFO, Lance Tucker. I'm going to hold off making any guidance update until I'm able to get a few of my questions answered.

Updated guidance: Hold (no change)

Recommended Allocation: 3.6%

Fair Value estimate: under review

End of Fiscal Year expected FV estimate: under review

CAM price: under review

It's worth reviewing what I wrote last quarter:

My decision to hold our shares at this valuation rests squarely on the upside potential that remains if things go right and management's skill in execution and protecting the brand. Also contributing to the decision is the fact that PJ has a resilient business, a strong growth profile that should hold up well in a rocky economy, and the marks of a compounding machine (precisely the type of company you don't want to sell because of valuation). Of course, I won't ignore the downside – cash flows and valuation matter. I'm getting uneasy with the valuation, but I'm not compelled to sell or reduce at this point.

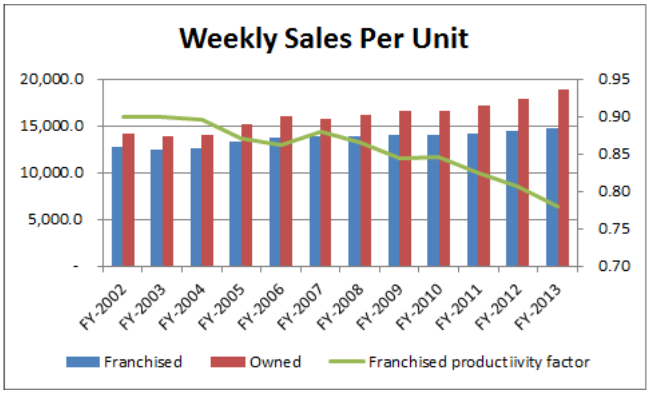
Hindsight says I should've listened to my uneasiness – the air has come out of the valuation. At the time, PZZA shares were trading for 17x EBITDA and they're now down to 13x or so, much closer to the historical norm. Little has changed with the business, but a lot has changed in what investors are willing to pay for PZZA earnings and cash flow. My focus is on where we go from here, and speaking to management should help make that decision.

Our Thesis

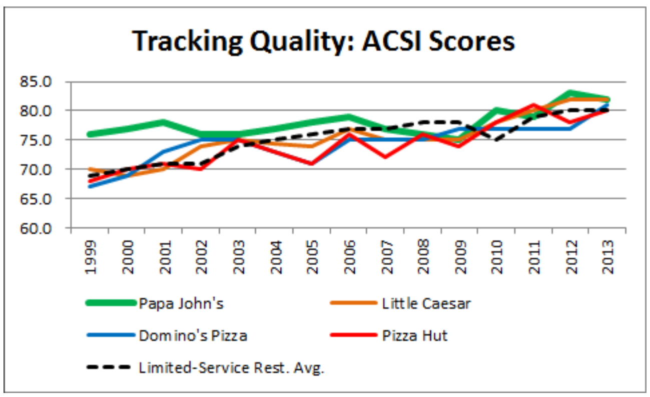
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main QSR-pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only 1,000 international restaurants the company has a long runway for growth. Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

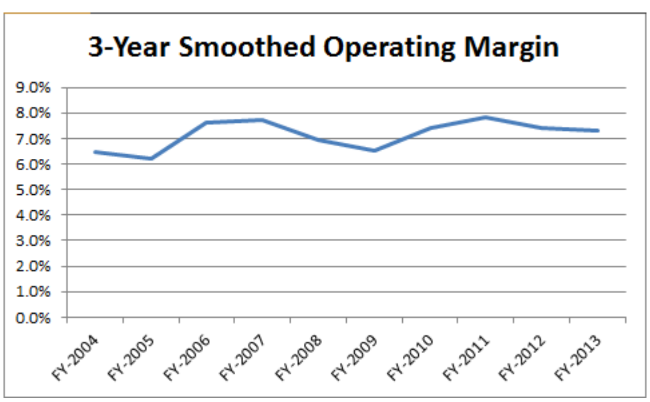
1. ***Store Performance:*** Without healthy franchisees Papa John's has no business. Same store sales offer one look into store performance, but we also track sales per store, store-level profitability, and how all of this translates into the pipeline of committed new franchisors. During Q1-2014, systemwide comps increased an astounding +13%. Domestic stores led the way with +10% comps while international was +8%. This is strong performance, but it can be bumpy. The rolling two and three year comps are still very impressive. We won't know more about store-level profitability until the end of the year, but management did hint that store operating profit margins increased. This solid performance keeps franchisees signing up: PJ opened 265 restaurants (net) in 2013 and expects to open 220-250 (net) in 2014. Its pipeline consists of 200 domestic commitments (to be opened over the next three years) and 1,100 international commitments (to be opened over the next six years).



2. ***Brand***: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantaged and higher price per pie. Papa John's domestic outperformance and share gains suggest its brand positioning remains strong. Management is as committed to quality and the "better ingredients, better pizza" mission as ever, as evidenced by: continued drum-beating on conference calls, consistent media messaging, increasing the franchisee marketing spending rate, and the hiring of a new marketing agency to spread the message beyond television. We are eagerly waiting the next ACSI customer satisfaction survey due out in June to see if PJ can continue its strong performance (it rated #1 in customer satisfaction among national pizza chains 12 of the last 14 years).



3. ***Margins***: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. In the near term, we expect Papa John's to continue to spend heavily to support the build-out of its technology platform, new POS system, and international infrastructure. This trend continued in Q1-2014, exacerbated by spiking cheese prices, and operating margins declined by 36 bps to 8%. Eventually, PJ should leverage its buying power and corporate overhead to improve margins and drive cash flow.



WWTN

We're actively reviewing our investment in Papa John's to make sure we full grasp the competitive landscape, financial possibilities, and ability to grow intrinsic value.

Conference Call Notes

- On unit count: PJ added 12 net new stores during the quarter – 0.3% store growth, giving it 4,440 at the end of the quarter. This was a notable quarter for store closures: 1 domestic owned, 27 domestic franchised, and 6 international. COO Tony Thompson had this to say about the closures: "*Our model continues to be very strong, as demonstrated by our corporate restaurants performance and results. And as you see, we have very minimal closures on our corporate side. So when our model is executed correctly and well, it performs well. We're going to have ebbs and flows based on commodity environments that where you'll see a little bit few more closures. In addition, we're rolling out our new FOCUS system, as I mentioned in my comments. So that timing of commodity environment, plus a need for investment at the restaurant level, is another factor that's contributing.*"

- On cheese: The market price for chees during Q1 was $2.21 per pound, up 33% over Q1-2013. This represents close to record prices and it does cause pressure and angst on the franchise level. PJ tries to alleviate some of that pain by sacrificing some commissary margin. It also hedges some of its cheese buying, which gives it sufficient confidence in visibility for guidance purposes.

- On higher G&A: This is attributable to performance-based compensation. PJ had a very good 2013 and it rewarded its employees.

- On share repurchases: PJ repurchased $32.8 mm worth of stock – much of this was accomplished by taking on more debt. PJ generated $26.7 mm in CFFO and spent $11.1 mm on CapEx, resulting in $15.6 mm in FCF. From that, it paid $5.2 mm in dividends, leaving $10.4 mm in FCF after dividends. It spent all of that, and $22.4 mm more to repurchase shares and boost EPS. PJ's business can support a much, much higher debt level, but I still wish there was more clarity on its policy here.

- On Guidance: Management reaffirmed previously announced full-year guidance, but warned that given the persistently high commodity costs it is more likely to come in on the low-end of the range. For a refresher, that is sales growth of +5%-7%, EPS ogf$1.64-$1.72 (and about $0.08 per share higher if we exclude spending on the new POS), domestic comps of +2-4.5%, international comps of +5-7%, and flat free cash flow.

- On international: CEO John Schnatter said: "*Papa John's is the quality leader in the international markets we serve. While our international markets will have their ups and downs as we gain scale, we are extremely bullish on our long-term prospects across the world. Today, we only have about one restaurant per 3 million people in our international market. So there's a long runway for growth for Papa John's internationally.*" Later, he said: "*Both our larger competitors have over 6,000 stores international. So we feel like there's a lot, a lot of runway internationally for growth.*" Regarding quality abroad: "*Your quality is only as good as your consistency. And we have a demonstrably better product here in the US than our competitors. But that gap is way bigger internationally. And I think that's going to pay huge dividends when that kicks in.*"

- It bears repeating: I admire PJ management. They say the right things (that is, the things I'd want them to say if I owned 100% of the company and they worked for me), are incredibly consistent, think long-term, and execute well. My favorite two examples of this from the call came from CEO John Schnatter. 1) "*Going forward, we will deliver on our well positioned to continue to deliver on the three things we know drive shareholder value: driving new unit development, two, building same-store sales growth, three, driving strong unit-level economics. We are confident we will continue our momentum throughout 2014 with steady growth in sales and EPS along with continued digital and technology gains.*" 2) "*We have a fundamental belief, as painful as it is in the short term, at a time when the competition cuts costs, thus cuts quality, that's when we pour it on. That's when we have to stick to our guns. And we are.*"

- On what's going right: The company's marketing messages, digital efforts, customer satisfaction scores, and limited-time offers (LTOs) are combining to drive very impressive domestic comps.

- On why we aren't seeing more operating leverage: CFO Lance Tucker was quick to point out that every segment did see operating leverage – it was the corporate side of things that weighs down the consolidated operating margin. The tax rate, a JV accounting lap, and bonus-related G&A spending all contributed, but shouldn't be recurring. With regard to the performance-based comp, CEO John Schnatter said: "*With the Company executing at this level, the two things that myself and the Board are keen on is to continue to take care of the management team. So there was some executive compensation on long-term incentives. And then, of course, not losing anything on that [demonstrable] value piece with the customer experience. So I think its money well spent to incent and reward high performance. And that's what's going on right now at Papa John's -- high performance.*" He hit on this again later in the call: "*All the business units were up on profitability. The things that went backwards were executive incentives, long-term. I think that's a good thing. Incentives to get stores open. We think that's a good thing. And incentives to run higher comps with the franchisees. That's a good thing. And why it hurt us a little bit in Q1, I think it's going to pay huge dividends in the future. Now, in a year or two we're going to have another great quarter. And you're going to say why did you all have such a great quarter? And we're going to say it's what we did back in Q1 of 2014. It's what we've been doing the last five years, reinvesting in the business and continuing to grab and excel market share.*"

- On new competition in the fast casual space: CMO Bob Kraut: "*We're certainly cognizant of the emergence of the fast casual segment and we've been monitoring and studying the new entries into the category. With that said, we feel that we're in a very good position to gain market share in the foreseeable future. And that's for two reasons. First, we believe that the fast casual segment attracts a different customer with a need for a different usage occasion. But we are prepared to compete with those concepts to the extent, or even in the event, they impact our group occasion delivery carry-out customer. And then secondly, we believe, in echoing John's comments on quality, we believe we're well positioned to grow in delivery carry-out as a result of our superior quality leadership position and our technology leadership position. We believe we've got the best quality pizza available today and that almost half of our customers have discovered that it can be easily ordered on any of our digital channels, which we noted earlier is the highest percentage of any of our national competitors. And then when you couple that with our restaurants delivering some of the highest customer service scores we've seen, you've got an unmatched quality experience that is delivered to your door and one that we believe fast casual can't compete with right now.*"

A Lot of Pizza, Less Profit

Published May 16, 2014 at 3:38PM

Pro's Take: PZZA Q1-2014 Earnings

Papa John's International (NASDAQ: PZZA)

Quarter Quick Take

Papa John's achieved remarkable systemwide comparable store sales growth (+13%), but that didn't translate to even higher profit and cash flow as we would have expected. Instead, cheese prices soared, growth-related expenses remain elevated, and PJ rewarded its employees for a strong 2013 with performance-based compensation, resulting in flat bottom-line performance. The commodity cost headwinds and looming expense of implementing a new point of sale system caused 27 domestic franchisees to close, but the company still added net 12 stores during the quarter and expects to open 220 or so stores in 2014. Long-term business drivers appear to remain, but we continue to study competition from fast casual pizza concepts and the democracy of delivery.

Since the earnings call was announced, Papa John's COO Tony Thompson was hired away to be the new CEO of Krispy Kreme. The COO role was quickly back-filled by promoting from within, with Steve Ritchie stepping up to the plate.

....

Q1-2014

Total revenue growth: +13%

Operating profit margin: -36 bps to 8%

EPS growth: +7%

....

Guidance Update

Papa John's is currently on Hold. I have an outstanding call with the company's CFO, Lance Tucker. I'm going to hold off making any guidance update until I'm able to get a few of my questions answered.

Updated guidance: Hold (no change)

Recommended Allocation: 3.6%

Fair Value estimate: under review

End of Fiscal Year expected FV estimate: under review

CAM price: under review

It's worth reviewing what I wrote last quarter:

My decision to hold our shares at this valuation rests squarely on the upside potential that remains if things go right and management's skill in execution and protecting the brand. Also contributing to the decision is the fact that PJ has a resilient business, a strong growth profile that should hold up well in a rocky economy, and the marks of a compounding machine (precisely the type of company you don't want to sell because of valuation). Of course, I won't ignore the downside – cash flows and valuation matter. I'm getting uneasy with the valuation, but I'm not compelled to sell or reduce at this point.

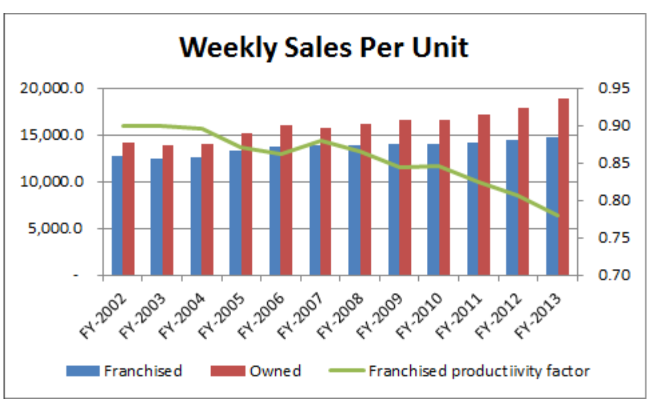
Hindsight says I should've listened to my uneasiness – the air has come out of the valuation. At the time, PZZA shares were trading for 17x EBITDA and they're now down to 13x or so, much closer to the historical norm. Little has changed with the business, but a lot has changed in what investors are willing to pay for PZZA earnings and cash flow. My focus is on where we go from here, and speaking to management should help make that decision.

Our Thesis

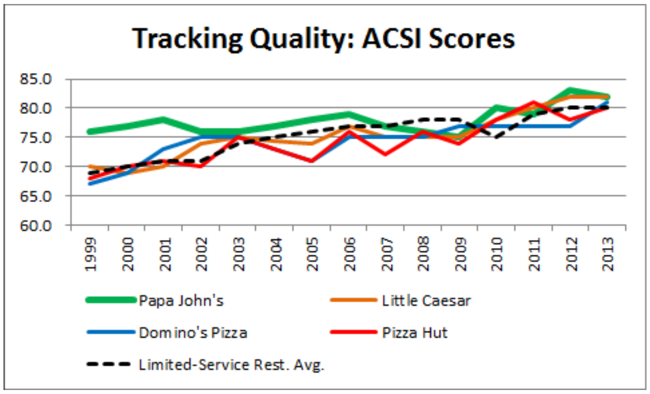
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main QSR-pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only 1,000 international restaurants the company has a long runway for growth. Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

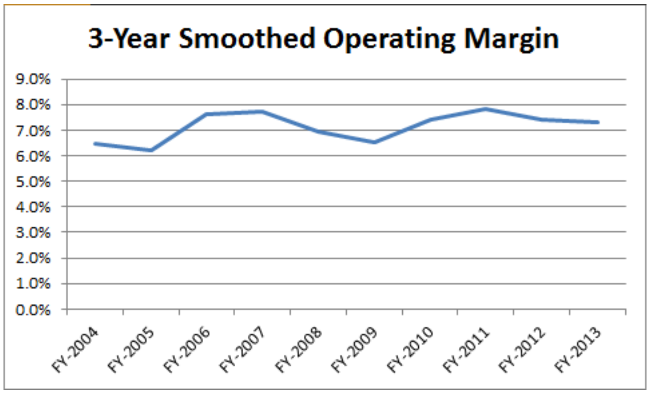
1. ***Store Performance:*** Without healthy franchisees Papa John's has no business. Same store sales offer one look into store performance, but we also track sales per store, store-level profitability, and how all of this translates into the pipeline of committed new franchisors. During Q1-2014, systemwide comps increased an astounding +13%. Domestic stores led the way with +10% comps while international was +8%. This is strong performance, but it can be bumpy. The rolling two and three year comps are still very impressive. We won't know more about store-level profitability until the end of the year, but management did hint that store operating profit margins increased. This solid performance keeps franchisees signing up: PJ opened 265 restaurants (net) in 2013 and expects to open 220-250 (net) in 2014. Its pipeline consists of 200 domestic commitments (to be opened over the next three years) and 1,100 international commitments (to be opened over the next six years).



2. ***Brand***: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantaged and higher price per pie. Papa John's domestic outperformance and share gains suggest its brand positioning remains strong. Management is as committed to quality and the "better ingredients, better pizza" mission as ever, as evidenced by: continued drum-beating on conference calls, consistent media messaging, increasing the franchisee marketing spending rate, and the hiring of a new marketing agency to spread the message beyond television. We are eagerly waiting the next ACSI customer satisfaction survey due out in June to see if PJ can continue its strong performance (it rated #1 in customer satisfaction among national pizza chains 12 of the last 14 years).



3. ***Margins***: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. In the near term, we expect Papa John's to continue to spend heavily to support the build-out of its technology platform, new POS system, and international infrastructure. This trend continued in Q1-2014, exacerbated by spiking cheese prices, and operating margins declined by 36 bps to 8%. Eventually, PJ should leverage its buying power and corporate overhead to improve margins and drive cash flow.



WWTN

We're actively reviewing our investment in Papa John's to make sure we full grasp the competitive landscape, financial possibilities, and ability to grow intrinsic value.

Conference Call Notes

- On unit count: PJ added 12 net new stores during the quarter – 0.3% store growth, giving it 4,440 at the end of the quarter. This was a notable quarter for store closures: 1 domestic owned, 27 domestic franchised, and 6 international. COO Tony Thompson had this to say about the closures: "*Our model continues to be very strong, as demonstrated by our corporate restaurants performance and results. And as you see, we have very minimal closures on our corporate side. So when our model is executed correctly and well, it performs well. We're going to have ebbs and flows based on commodity environments that where you'll see a little bit few more closures. In addition, we're rolling out our new FOCUS system, as I mentioned in my comments. So that timing of commodity environment, plus a need for investment at the restaurant level, is another factor that's contributing*."

- On cheese: The market price for chees during Q1 was $2.21 per pound, up 33% over Q1-2013. This represents close to record prices and it does cause pressure and angst on the franchise level. PJ tries to alleviate some of that pain by sacrificing some commissary margin. It also hedges some of its cheese buying, which gives it sufficient confidence in visibility for guidance purposes.

- On higher G&A: This is attributable to performance-based compensation. PJ had a very good 2013 and it rewarded its employees.

- On share repurchases: PJ repurchased $32.8 mm worth of stock – much of this was accomplished by taking on more debt. PJ generated $26.7 mm in CFFO and spent $11.1 mm on CapEx, resulting in $15.6 mm in FCF. From that, it paid $5.2 mm in dividends, leaving $10.4 mm in FCF after dividends. It spent all of that, and $22.4 mm more to repurchase shares and boost EPS. PJ's business can support a much, much higher debt level, but I still wish there was more clarity on its policy here.

- On Guidance: Management reaffirmed previously announced full-year guidance, but warned that given the persistently high commodity costs it is more likely to come in on the low-end of the range. For a refresher, that is sales growth of +5%-7%, EPS ogf$1.64-$1.72 (and about $0.08 per share higher if we exclude spending on the new POS), domestic comps of +2-4.5%, international comps of +5-7%, and flat free cash flow.

- On international: CEO John Schnatter said: "*Papa John's is the quality leader in the international markets we serve. While our international markets will have their ups and downs as we gain scale, we are extremely bullish on our long-term prospects across the world. Today, we only have about one restaurant per 3 million people in our international market. So there's a long runway for growth for Papa John's internationally.*" Later, he said: "*Both our larger competitors have over 6,000 stores international. So we feel like there's a lot, a lot of runway internationally for growth.*" Regarding quality abroad: "*Your quality is only as good as your consistency. And we have a demonstrably better product here in the US than our competitors. But that gap is way bigger internationally. And I think that's going to pay huge dividends when that kicks in.*"

- It bears repeating: I admire PJ management. They say the right things (that is, the things I'd want them to say if I owned 100% of the company and they worked for me), are incredibly consistent, think long-term, and execute well. My favorite two examples of this from the call came from CEO John Schnatter. 1) "*Going forward, we will deliver on our well positioned to continue to deliver on the three things we know drive shareholder value: driving new unit development, two, building same-*

store sales growth, three, driving strong unit-level economics. We are confident we will continue our momentum throughout 2014 with steady growth in sales and EPS along with continued digital and technology gains." 2) "*We have a fundamental belief, as painful as it is in the short term, at a time when the competition cuts costs, thus cuts quality, that's when we pour it on. That's when we have to stick to our guns. And we are.*"

- On what's going right: The company's marketing messages, digital efforts, customer satisfaction scores, and limited-time offers (LTOs) are combining to drive very impressive domestic comps.
- On why we aren't seeing more operating leverage: CFO Lance Tucker was quick to point out that every segment did see operating leverage – it was the corporate side of things that weighs down the consolidated operating margin. The tax rate, a JV accounting lap, and bonus-related G&A spending all contributed, but shouldn't be recurring. With regard to the performance-based comp, CEO John Schnatter said: "*With the Company executing at this level, the two things that myself and the Board are keen on is to continue to take care of the management team. So there was some executive compensation on long-term incentives. And then, of course, not losing anything on that [demonstrable] value piece with the customer experience. So I think its money well spent to incent and reward high performance. And that's what's going on right now at Papa John's -- high performance.*" He hit on this again later in the call: "*All the business units were up on profitability. The things that went backwards were executive incentives, long-term. I think that's a good thing. Incentives to get stores open. We think that's a good thing. And incentives to run higher comps with the franchisees. That's a good thing. And why it hurt us a little bit in Q1, I think it's going to pay huge dividends in the future. Now, in a year or two we're going to have another great quarter. And you're going to say why did you all have such a great quarter? And we're going to say it's what we did back in Q1 of 2014. It's what we've been doing the last five years, reinvesting in the business and continuing to grab and excel market share.*"
- On new competition in the fast casual space: CMO Bob Kraut: "*We're certainly cognizant of the emergence of the fast casual segment and we've been monitoring and studying the new entries into the category. With that said, we feel that we're in a very good position to gain market share in the foreseeable future. And that's for two reasons. First, we believe that the fast casual segment attracts a different customer with a need for a different usage occasion. But we are prepared to compete with those concepts to the extent, or even in the event, they impact our group occasion delivery carry-out customer. And then secondly, we believe, in echoing John's comments on quality, we believe we're well positioned to grow in delivery carry-out as a result of our superior quality leadership position and our technology leadership position. We believe we've got the best quality pizza available today and that almost half of our customers have discovered that it can be easily ordered on any of our digital channels, which we noted earlier is the highest percentage of any of our national competitors. And then when you couple that with our restaurants delivering some of the highest customer service scores we've seen, you've got an unmatched quality experience that is delivered to your door and one that we believe fast casual can't compete with right now.*"

Valmont Industries Holds Up on Earnings

Published May 16, 2014 at 10:50AM

Greetings,

Summary: **Valmont Industries** (NYSE: VMI) had a blow-out first quarter one year ago (with earnings up 48%), so it was tough to top it this year. But this year, it had its *second-best* first quarter in its history -- and that's despite softness in the U.S. irrigation market and the international utility structure market.

Overall, the company expects business to improve over the balance of the rest of this year, and sees healthy project demand shaping up into 2015 and 2016 for its engineering businesses. The company announced a 12-month, $500 million share buy-back plan (12% of its market value), and doubled its dividend. Priced 8% below our fair value estimate, shares remain a **Buy** at a 3.1% allocation *Pro*.

Conference Call Main Points

- Commodity prices have dropped considerably, leading to lower investment by U.S. farms.
- But looking ahead, Valmont sees irrigation revenue and profitability more in-line with 2013 the rest of this year; Utility Support Structures should see higher volumes but flat revenue due to lower pricing, but still healthy operating margins of at least 15%; Engineered Infrastructure Products should see positive comparisons the remainder of the year. And the Coatings business should be in-line with 2013.
- For the year, Valmont sees EPS of $10 to $10.50 (that's before any shares are bought back).
- If commodity prices just stay where they are (let alone increase), management expects more confidence in the U.S. irrigation market to emerge; international irrigation needs are greater regardless of pricing, and results were strong this quarter; as those markets grow, the irrigation business line should become less cyclical.
- It's the "much smaller projects" in utility structures that are seeing lower competitive pricing pressure, rather than larger projects. So, the pressure may sound daunting, but it affects relatively little revenue (even though it affects the quality, or margin, of earnings in the division considerably if many small projects are signed). Don't expect pricing to fall further. Meanwhile, the extra industry capacity built up in serving this business (due to boon years) will likely be absorbed as little new capacity is coming online now and the market should keep growing.
- The recent acquisition in N. Europe has been seeing double-digit annual earnings growth, with 10% margins.
- Incentive/bonuses will be smaller this year due to lower earnings growth (or no earnings growth).
- The 4G build-out in China helps Valmont's wireless communications structure business there, though they're not big in China yet.
- Priorities for cash are: organic growth; complementary acquisitions; dividends or buybacks.
- After earnings dip about 5% this year, we currently estimate a double-digit (11%) climb next year; none of this includes the new buyback plan, which could change these numbers (favorably) considerably, depending on how much the company spends to buy shares. That's not part of operations, of course, but it can help.

In Sum

Priced inexpensively below 8x EBITDA (see our financials on Valmont here), Valmont remains a value stock that has also been an outstanding growth stock over the years. Believing in management and its business lines, we believe growth will resume and be healthy overall in coming years. And the business may become less cyclical as it becomes more international, which could ultimately afford it higher value multiples, although that's not necessary. Shares remain a buy for the longer haul.

We've owned Valmont since November 2013 in *Pro*, and we're up about 9% so far. It helped to buy it while it was out of favor.

Best,

Jeff (TMFFischer)

Celebrate Our Community: Polaris Award 2014

Published May 15, 2014 at 11:59PM

Fools,

Pro Polaris Award 2014

Let's give a wild round of applause and a standing ovation to aleax!

The team would also like to extend our congratulations to all the (very worthy) nominees, and our thanks to everyone who voted. We appreciate it very much that you are part of our community!

As proposed by ADrumlinDaisy last year, the Polaris Award is "a *Pro* community analogue of the Feste Award, an annual award given to the member who provides the most value to his or her fellow members." Criteria include a regular, frequent, Foolish presence on the *Pro* discussion boards; helpful, expert-level advice; creativity; and efforts to foster a sense of community.

We asked you: Amidst *Pro*'s remarkable community, which members on the discussion boards have truly distinguished themselves to you? Which posts have been most helpful, most thought-provoking, most illuminating? We took nominations through May 1 on this discussion-board thread, and for those who had never explored our discussion boards, we offered the following places to start.

mpfdCPT on his 10-year investing review **JSergeant** on analyzing the analysts **ADrumlinDaisy** on a kookaburra in the coal mine

As this year's winner, aleax will receive a discussion-board charm and $250 to use at Apple or Starbucks — winner's choice! See the full rules here.

Best,

The *Motley Fool Pro* Team

P.S. Want to talk about this award? You're in good company. And if you've never visited (or never posted), introduce yourself!

MasterCard Charges into 2014

Published May 15, 2014 at 7:11PM

Greetings,

MasterCard (NYSE: MA) grew Q1 2014 net revenue 14%, while operating expense grew 12% (showing a bit more leverage), and earnings per share climbed 18% (aided a bit more by buybacks).

The world economy remains mixed, with U.S. slower in the harsh winter weather, Europe continuing a slow recovery, and Asia and Latin America pockets of hot and cold. MasterCard is growing well in most regions, though, as it continues to attack 85% of all transactions that are done in cash. Trading near our fair value estimate, the stock remains a long-term (3 years to start) **Buy** in *Pro*, with estimates for North Star-topping returns over that period.

Some of the incredible things about MA's business:

- Extremely high margins and return on equity
- Minimal investment (compared to operating cash flow) needed in capital expenditures
- The likelihood the dividend could go much higher over time
- And of course, as we know, the leverage in its network. More transactions drive more revenue but not typically more cost. Free cash flow grows much more than revenue, historically.

Conference Call Main Points

- Overall, the U.S. and Western Europe seem to be on paths of continued slow recovery.

- Gross Dollar Volume grew 14% in local currency; and U.S. GDV grew 9%. U.S. debit also grew 9% as MA takes market share. Cross border volume grew 17%. Process transactions grew almost 14% to more than 9.8 billion, and number of MA-branded cards grew 8% to more than 2 billion.

- The Durbin Amendment remains unchanged, which is good for the industry at this point.

- Russia is a bit more than 2% of MA's revenue, and could be a headwind -- right now, the regulatory and political climate is a big unknown. MA expects a small impact from it in 2014.

- MA signed several major deals this quarter, including with SEB Group in the Nordics, which will lead to MA being the leading payment brand in the Nordics; and, it signed with the second-largest retail bank in Sweden, Svenska Handelsbanken, who is converting all cards to MA. This is MA's largest European conversion since Swedbank. Sweden has the lowest use of cash in the world, and now MA will be the leading debit brand there.

- **Wal-Mart** (NYSE: WMT), Sam's Club and **Target** (NYSE: TGT) are converting their cards to MA. Tokenization and security is part of the reason, among many other reasons.

- Europe remains "an enormous opportunity" given that, outside of the Nordics, so many transactions are done in cash. Even if regulation proves tougher in Europe (which is an ongoing possibility), there should be opportunity that overrides it in the longer term.

- New payment flows is an exciting evolution for MA, perhaps the biggest change since the introduction of plastic cards years ago. MA is developing a foundation to provide products, services, and standards for the new digital ecosystem, including MasterPass Digital Wallet, tokenization and C-SAM (which MA acquired as a leading providing of mobile wallet software). MasterPass is now in 7 countries and will soon be an in-app option in mobile shopping software that eliminates the need for a consumer to enter any card information to make a purchase.

- MA stands by its 2013-2015 objective of an 11% to 14% CAGR in revenue, and a 20% EPS CAGR, with an operating margin above 50%. But MA should come in at the low-end of guidance in 2014 given Russia and the continuing loss of Chase customers to **Visa** (NYSE: V), which could stretch into early 2015. It is working hard on new business to make up for it, though, and keep growing.

***Pro* Summary**

Free cash flow has grown much more strongly than revenue the past three years (see our link below), but we conservatively (somewhat, anyway) estimate fair value at $70, or 21x free cash flow. Assuming a bottom-line growth rate that maintains the mid- to upper-teens over time, that's the premium we're willing to attach (even while knowing that FCF growth should expand more quickly than other results).

But keep in mind, we're in a relatively tepid economy worldwide, and in a very strong world economy, this business will scream. Profits should leap. But barring that, we should continue to have a decent long-term investment here anyway. And if the economy does get considerably better around the world, we could have much more upside. For now, we wait for that, happily owning one of (we think) the better businesses out there -- a business that gets a cut of billions of transactions, whatever is being bought or sold, and that levers its profits as transactions grow.

Please see our financial metrics on MasterCard on our discussion board, here.

Fool on!

Dear fellow Fools,

Vote for the 2014 Polaris Award Winner

Pro Polaris Award 2014

We're taking your votes until Thursday, May 15! Honor the members who make our community so wonderful — click here.

Congratulations, Jeff!

As Jeff notes in today's Memo, the Fool's annual company meeting took place last week. What he didn't mention, because he's too modest, is that he was the recipient of a Founders' Award — the TMF award chosen by Tom and David Gardner to be given to the Fools they most consider "part of the family." It goes without saying that such an award is well deserved; who wouldn't love to have Jeff as part of the family? Drop him a note to congratulate him here.

Last week, the Fool hosted its annual company meeting for employees, dubbed Foolapalooza, on the shores of the Choptank River beside the Chesapeake Bay. Great weather helped fuel a productive two days, with speeches, breakout sessions, outdoor activities, dinners and festive parties for some 300 Fools, including employees from Australia, the U.K., and Singapore. The bigger purpose of the event? To talk about how to serve more investors, ever better. The vast majority of the world remains unaware of the benefits (and relative ease) of long-term Foolish investing, and many people will initially lack the emotional fortitude to ride out their first bear market. So, the Fool — and now I mean all of us, including you — has plenty of fun work ahead to strive to reach more people and teach more generations how to invest, better. At the same time, we want to keep doing better work for you.

Today, we have some good ground to cover.

May Option Expiration

Our position on the **iShares Russell 2000 Index** (NYSEMKT: IWM) is the only option *Pro* has expiring this week. We remain short the shares directly, as a hedge, and our risk-capping $122 long calls are set to expire worthless. We'll do nothing and let them. The decision we need to make next is: Do we stay short IWM as a hedge? If so, do we cap our risk again, either by buying more calls or perhaps by setting a stop-loss order? (We're not against such a move with a hedge of this nature; it would ensure our short is automatically covered if IWM rises above a set level.) We'll issue any such decision in a new trade alert, but for the moment, we'll stay short IWM shares as a hedge.

Those with an alternative trade — a put purchase or a bear put spread — should close those positions this week. You have little choice as expiration nears. We assume that you used puts because you can't short shares directly; as the puts near expiration, take your gain this week. Sell to close the puts you bought, or close both sides of your spread. This is an unusually nice situation: You have a gain on the hedge, yet the *Pro* portfolio is up overall, too, because many stocks have gained ground but small caps have declined (we used them to hedge given their relatively expensive price). For more on what to do with your alternative trades, see today's post.

Valmont Holds Up (a Lot of Things)

Maker of poles, utility structures, and irrigation equipment **Valmont Industries** (NYSE: VMI) announced quarterly results that initially sent the stock lower, but shares recovered, suggesting that others see the value we do in this well-run business. Despite some softness in the international utility market and in domestic irrigation sales, Valmont still notched the second-best first-quarter results in its history (behind only last year). International revenue and earnings continue to increase, and gains were spread across most all of Valmont's countries of business.

Although its utility-structure business saw more pricing competition, customers are lining up to spend significant amounts on new projects in 2015 and 2016, and Valmont expects to maintain at least a 15% operating margin in this division. That's healthy; management confirmed that the price competition it's seeing *isn't* irrational, just more pronounced. Over the last 10 years, Valmont has increased this business line from $100 million in annual sales to nearly $1 billion, and there's plenty of opportunity ahead. Meanwhile, as emerging markets continue to expand, Valmont's irrigation system business should become less cyclical.

After spending close to $200 million on high-quality, complementary acquisitions in Northern Europe in the first quarter, Valmont remains open to more purchases. However, management also said that a stock buyback or dividend are on the table, too. Valmont views a stock buyback the same way it views an acquisition, except that it knows its own business best. If a buyback is a strong use of its capital, it will consider it. The stock remains a **Buy** in *Pro*, with a 3% allocation.

OpenText Opens Up

Shares of software provider and business commerce platform leader **OpenText** (NASDAQ: OTEX) reported quarterly results that drove the stock price up again. Legacy software license revenue was up a healthy 6%, and total revenue gained 31% including the recent GXS acquisition. Cloud revenue is soaring, but interestingly, just as **Oracle** (NYSE: ORCL) has said, OpenText tells us that its customers don't just want cloud services; they want the option of cloud *and* on-site services, integrated and hybrid, with ultimately the same software running in any deployment model. If this holds true and the desire is widespread, it speaks well to the strategies on offer at both Oracle and OpenText.

The company's new Enterprise Information Management (EIM) software suite, code-named Red Oxygen, started shipping, and many six- and seven-figure sales deals have already been booked. About 25% of sales are to new customers, the others are upsells. By November, OpenText plans to roll out its next release, code-named Blue Carbon, with three big value drivers focused on applications, cloud services, and analytics. The vast majority (more than 80%) of the company's revenue is of the recurring nature, and renewal rates on its licenses remain in the low-90% range. North American license sales were one weak point in the quarter, but OpenText believes it has rectified the issue and will be back on track in the U.S. in a quarter or two. Finally, OpenText increased its dividend 15%. The stock remains a **Buy** and we have a 3.3% allocation.

Priced to Compound?

Many exciting businesses surround us, but if the price when estimating future results doesn't seem to offer much chance of compounding, we'll continue our search. As both are capable of upping their bottom line by more than 10% annualized, Valmont and OpenText appear priced to continue delivering compounding returns.

Business	EV/EBITDA NTM est.	P/E NTM est.	P/FCF	ROE
Valmont ($149)	7.5	14.2	14.4	16.8%
OpenText ($47)	10.8	12.8	21.2	12%

Terms: Enterprise Value/EBITDA next-12-months est.; P/E next-12-months est.; price/free cash flow, current; return on equity, current.

Thank you for being a member of *Pro*! To discuss the Memo, click on over to the Memo Musings board.

Foolishly,

— Jeff (TMFFischer)

Write a Covered Strangle on Tupperware

Published May 6, 2014 at 3:05PM

Is this for you? This is for *Pro* members who own shares of **Tupperware** (NYSE: TUP) and can write options for income while staying near our allocation guidance.

How You Participate

- **Trade:** Use a combo order to write a covered strangle on your owned Tupperware stock. A written strangle is an income strategy with two option legs — a written put and a covered call — having the same expiration date but different strike prices:
  - Write ("sell to open") June 2014 $80 puts
  - Write ("sell to open") June 2014 $85 covered calls
- **Allocation:** Write one strangle (one written put *and* one covered call) per 100 shares of Tupperware you own. For *Pro*, that's seven puts and seven calls. This could increase our 2.8% stock holding to more than 5%.
- **Price Guidance:** Use a limit order. Aim for a credit higher than the combined real-time bids of the put and call options. As we go to print (so to speak), the combined bid is $2.45, and the combined ask is $2.80. So, aim to be paid around $2.60 or higher initially. As prices change later, we recommend you accept no less than $2 to make rolling easier if need be.
- **Stock Rating:** Buy
- **Recent Prices (1 p.m. ET, 5/6/2014):**
  - Stock: $82.50
  - June 2014 $80 puts (bid/ask): $1.50/$1.65
  - June 2014 $85 calls (bid/ask): $0.95/$1.15
  - Combined bid/ask: $2.45/$2.80 (with this pricing, use a $2.60 limit initially)

What We're Thinking

As I (digitally) pen this, the S&P 500 is up 1.6% year-to-date, while *Pro*'s North Star has increased nearly 4%. We know our North Star (inflation plus 7% a year) won't let up, so we need to work hard to stay near it, especially when stocks are lazing about. One favorite tool at our disposal is writing options for premium, or income. When our targeted stocks cooperate, we can repeatedly pocket new cash.

Expecting revenue growth of only 5% to 7% this year, Tupperware doesn't qualify as a high-growth business. But it pays a 3.2% yield, trades at a reasonable valuation (near our $85 fair-value estimate), and should be able to increase earnings per share by 10%-plus in the years ahead. In the meantime, between quarterly earnings announcements, we should be able to put a lid on some option income.

With shares lately $82.30, this June strangle expiring in just 45 days plays out like so. If the stock price at expiration is:

- **Less than $80**: We'll be assigned to buy new shares around a net price of around $77.40, or about 6% lower. Or we can roll to new options instead of buying more shares.
- **Between $80 and $85**: Our covered strangle expires unused, earning us the equivalent of a 3.2% yield on the current share price in 45 days.
- **Higher than $85**: Our covered calls could be exercised, forcing us to sell our shares at a net $87.60, or 6.4% higher from the current price, and above our $85 fair value, if we don't take action. Or we could roll our strangle to higher strikes.

With second-quarter earnings due in mid-July, news should be scarce from Tupperware over the next month and a half (although you never know!) leading to our June expiration. If that's the case, the stock will bounce around at the whim of the broader market, hopefully staying between our strikes, or close enough to earn us some income.

More That Matters

- **Maximum loss:** The same as stock ownership, minus the credits we received for setting up the strangle.
- **Maximum gain:** Our upside is capped at about $87.60, or 6.4% higher than the recent price.
- **Breakeven:** There are two breakeven points for a strangle — in this case, $77.40 at the low end, and $87.60 at the high end.
- **Follow-up:** We'll likely write a new strangle if this position expires fully as income. If not, we may roll the strangle to avoid stock action, or we may let the strangle result in a stock trade. We'll cross that bridge if and when we need to, but for the record, we're ready for anything: If the market falls sharply, taking Tupperware with it, we'll be ready to buy more shares. If it soars, we may let our shares get sold (again) and look to write new puts.

Alternative Trades

- **You could just write the puts, or just write the covered calls**, if you don't want to strangle the shares. Just realize you'll collect much less premium, and rolling will be more difficult. Be ready to buy shares if you write puts, or sell your shares (though that's not desired today) if you write covered calls.
- **If you don't yet own shares, buy 2.8%**. Shares are rated Buy. Then consider writing this strangle if you want to target income and have bought at least 100 shares, amounting to less than a 3% allocation.

Write Puts on Parexel International

Published May 6, 2014 at 3:05PM

Is this for you? This alert or its alternate trades should be applicable to most *Pro* members, whether you already own shares of **Parexel International** (NASDAQ: PRXL) or not.

How You Participate

- **Trade:** Sell to open September 2014 $40 puts
- **Allocation:** 2.7% — write one put for every $150,000 you manage; *Pro* will write 14 contracts
- **Price Guidance Now:** Use a limit order of $1.35 or higher to start (for a 3.4% yield in 136 days)
    - **Later:** We think an 8% annualized yield is acceptable given our willingness to own more shares; that equates to a minimum acceptable credit of $1.20 at the moment
- **Prices (May 5):** Stock, $44.50; options, $1.35 bid / $1.40 ask

What We're Thinking

Last week, Parexel announced a very good third quarter. The company, which helps pharmaceutical companies get drug candidates to market, turned 8% service revenue growth into 20% earnings-per-share growth and continues to book new business at a healthy rate. With one quarter left in the fiscal year, management raised its forecast for revenue and earnings.

The quarter's business performance, however, was overshadowed by news that Parexel's largest customer, **Pfizer** (NYSE: PFE), intends to purchase **AstraZeneca** (NYSE: AZN). I outlined my initial reaction here. The business combination could be a negative for Parexel because Pfizer and AstraZeneca together could wield more pricing power in contract negotiations and could prune similar drug-development projects as the pipelines are joined.

We are not overly concerned about these outcomes because:

- AstraZeneca has rejected Pfizer bids three times already
- Taxes, rather than operational cost savings, seem to be a key driver of this merger
- We have seen no evidence that Pfizer views its partnership with Parexel as unfairly priced or a cost center to be exploited
- Recent layoffs at AstraZeneca suggest its thinned-out research and development department could actually benefit from more outsourced trials

Furthermore, we believe that over the longer term, the possible Pfizer-AstraZeneca combination could speed outsourcing adoption and lend further credence to the partnership model, which would be a significant benefit to Parexel and other large contract research organizations.

How It Fits Into *Pro*

With *Pro's* recent purchase of **Gilead Sciences** (NASDAQ: GILD), our health-care exposure is now around 9% of the portfolio. We're comfortable with the possibility of more, but are mindful of our current net exposure. We are opting to generate income with written puts rather than purchase more shares directly because Parexel is still relatively new to the *Pro* portfolio, and we'd like to get to know it further before decidedly upping our stake. Should these puts become in-the-money at September's expiration, we'd get shares below our Consider Adding More price ($40) and at a very attractive discount to what we believe they're worth ($54), or we'd have the option to roll them to a later date if we choose.

More That Matters

- **Maximum Loss:** Our risk is the same as share ownership starting around $38.65, 14% less than the current price and 14 times next year's earnings estimates.
- **Maximum Gain:** Unless the stock declines and we get to buy shares by expiration, the most we can gain is the put premium. At $1.35, that's a 3.4% yield in 136 days, or about 9% annualized.
- **Follow-Up:** We'll buy shares if the stock is below our strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire unused, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.8% allocation first — Parexel's shares are a Buy First. Then, you should consider writing these puts for income.
- **If you're more aggressive:** You can write September $45 puts for $3.30 or more. These puts are in-the-money. They provide greater income in exchange for a higher breakeven price and a higher likelihood of resulting in being assigned shares.

Pro Can Help

- Outsource your problem-solving to the Parexel International discussion board.

Earnings: American Tower Q1 2014

Published May 6, 2014 at 2:36PM

American Tower (NYSE: AMT) Q1 2014

What Happened?

Consolidated Results:
-Total Rental & Management Revenue of $960 M (up 23.5% nominally, and up 30.2% on a core* basis from 1Q 2013)
-Adjusted EBITDA of $640 M (core growth of 28.3% from 1Q 2013)
-Adjusted Funds From Operations (AFFO) of $439 M (core growth of 28.2% from 1Q 2013)
-AFFO per share of $1.10 (up 22.2% from 1Q 2013)

*Core growth reflects adjustments for foreign currency exchange rates and prior period one-time items

Segment-specific Results:
-Domestic Rental & Management Segment Revenue of $636 M (core growth of 26% from 1Q 2013)
-International Rental & Management Segment Revenue of $324 M (core growth of 38% from 1Q 2013)

Investing and Financing:
-Total Capital Expenditures of $214 M (down from $277 M Q-o-Q, up Y-o-Y from $124 M in 1Q 2013)
-Cash Paid for Acquisitions of $62.8 M (down from $4.1 B (!) last quarter, when the big GTP and NII acquisitions hit the books)
-Net Leverage Ratio of 5.5x (down from 5.9x last quarter)
-Stock Repurchase Activity: None in Q1 – repurchases have been suspended since GTP acquisition in order to pay down debt and reduce leverage ratio
-Quarterly Distribution of $0.32 per share (up 23% from Q1 2013)

CEO Jim Taiclet:
"The technology transition from 3G to 4G wireless services in the U.S. is in full swing. We expect 4G device penetration to expand from 26% to 33% during the course of 2014. This 3G to 4G transition, coupled with even more applications, games, music and video services is putting significant strain on wireless networks and is driving elevated demand for tower space.

We are experiencing the benefit of this phenomenon, not only on our legacy domestic sites, but also on the GTP assets we acquired last year, which are already exceeding our original expectations. The resulting strong growth in the U.S. business, augmented by our even faster growing international segment has put us firmly on track to achieve double-digit annual growth in AFFO per Share for the foreseeable future."

So What?

Start off by reading TMFDatabaseBob's excellent recap of the quarter if you haven't yet! It's always useful to have multiple perspectives when researching a company, although I must say Bob and I are in the same ballpark when it comes to big picture conclusions.

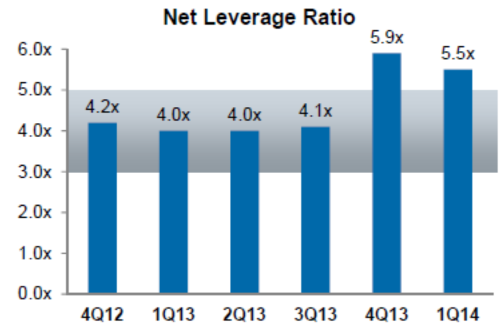
Business momentum at American Tower is quite strong, and management raised its full year 2014 outlook to reflect its robust demand environment. Growth rates continue to outpace my expectations: organic core growth for the quarter accelerated to 9.2% domestically (vs. 8.7% for FY 2013) and 16% internationally (vs. 13.5% for FY 2013). The weighted average organic growth (U.S./ international blended) was 11.5% (vs. 11.2% for FY 2013). Positively, the new GTP and NII assets have been performing above management's expectations, contributing nearly 19% to core growth this quarter.

I wrote last quarter: "*For 2014, I'm expecting continued strong organic growth, and barring unforeseen macro-economic changes, I'd be surprised if organic growth rates were below the mid-point of guidance (7% in the U.S. and 10.5% internationally).*" This metric gets a big fat check. So far so good.

Notably, acquisition and capex activity slowed this quarter, with cash paid for acquisitions coming in at a modest $63 million (compared to $4 BILLION last quarter when the big acquisitions closed). Capex also declined sequentially to $214 million (from $277 million last quarter).

No real surprise here, as management has stated consistently that the recent flurry of acquisition activity would slow and they would focus on extracting efficiency from the new assets (check!) and paying down debt to reduce the leverage ratio.

On that front, meaningful progress was made, with the leverage ratio (Debt/EBITDA) declining to 5.5x (from 5.9x last quarter) as AMT paid down its debt with cash flow:



Source: American Tower Q1 Earnings Presentation

Management expects to get the leverage ratio below 5x by 2015, but if the company sees an acquisition opportunity it likes, I wouldn't be surprised to see them take advantage of their flexibility and change course to pursue it. That would potentially drive the leverage ratio higher again (if another major acquisition does indeed happen – who knows if it will).

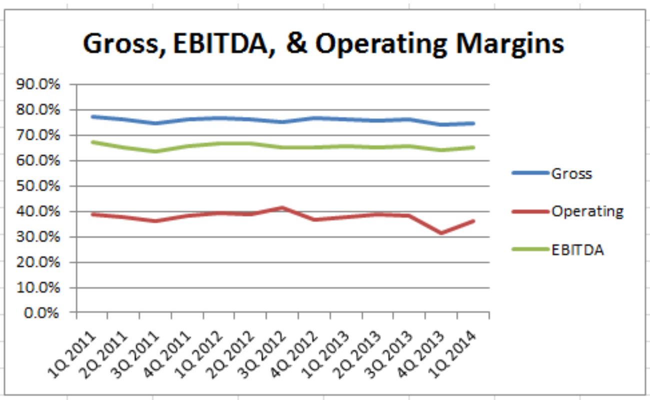
Yearly distribution growth continues to track ahead of management's 20% growth target, coming in at 23% growth ($0.32 per share). 20% annual growth continues to be a more than reasonable target for 2014.

Now What?

The market liked AMT's earnings report, bidding up shares on the day of the report about 3.2% compared to the previous day's closing price. I'm not surprised by the positive reaction, as almost every metric I watch looked great.

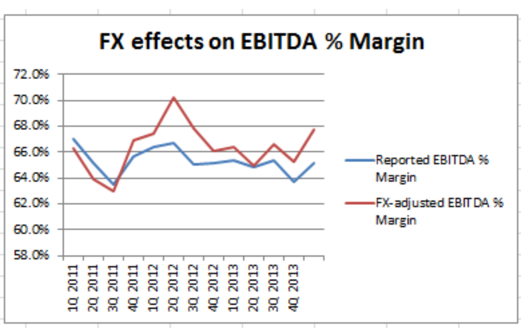
This quarter's report again provides confirming evidence that our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time) continues to play out.

Notably, after a decline in margins last quarter (see this post for why), we saw a nice uptick in gross, operating, and EBITDA margins this quarter as big acquisition-related costs came off the books and the company extracted efficiency out of its new assets:



Source: Company filings, analyst calculations

Even more notably, we saw this uptick in margins despite continued FX pressure, with an estimated -5% impact on core revenue growth from FX fluctuations this quarter compared to about a -3.3% impact last quarter and a -2.8% impact the quarter before. If we adjust for FX effects, margin performance was even more impressive:



Source: American Tower Supplemental Materials, analyst calculations

All in all, things look pretty promising for American Tower for the rest of 2014 and beyond.

Data and Guidance:

- Current Price: $87.54
- Fair Value: $105
- CAM (updated): $76

- Market Cap: 34.9 B
- EV/EBITDA: 19.2

AMT remains a Buy First, with no change to our recently updated $105 fair value estimate and a 3.9% allocation after adding to our stake in mid March. I'm bumping up CAM a bit to $76 to reflect improved cash generation since last quarter and increased confidence in my valuation due to the accelerating demand environment in the industry. Even though the stock price is higher, you could argue that AMT is a better value than it was last quarter, as the EV/EBITDA (my preferred metric for AMT) is lower (19.2 vs. 20.6 last quarter). This is a good example of how you can find value in a company despite a higher price. If you've yet to start a position or didn't add to your stake when we did so in mid March, now is as good a time as any to match our 3.9% allocation.

Fool on!

What Drives Coca-Cola, Facebook, and Tupperware?

Published May 5, 2014 at 4:00PM

Pro Guidance Changes

- **Parexel** (NASDAQ: PRXL): Shares move up to Buy First from Buy, and our Consider Adding More price increases to $40. We have a 2.9% position. See more here.
- **Apple** (NASDAQ: AAPL): Shares are up more than 40% since we moved them to Buy First and added to our position. Now, after that large gain, we're lowering shares back down to Buy.

Dear *Pro* member:

An extraordinary business is not easy to copy, because its success is driven by unique attributes that, combined, are difficult to recreate. Brand, products, distribution, customers, and financial strength: They all come together to give an exceptional business a soul of sorts that resonates and carries it forward.

Polaris Award Nominations Closed

Pro Polaris Award 2014

Fools, we've collected your nominations for our second annual Polaris Award — which, unsurprisingly, include some truly exceptional Foolish community members — and we'll be asking for your votes shortly! In the meantime, you can see the full details of the contest here.

But you *can* boil down most businesses to a single driver — the one thing that determines the company's fate more than any other. This is a key exercise in understanding what you own, so let's run through it with three *Pro* positions. We'll use last quarter's earnings as a jumping-off point.

Coke's Volume Is the Real Thing

In the first quarter of 2014, **Coca-Cola** (NYSE: KO) increased unit case volume 2% worldwide (excluding currency fluctuations). That's on top of 4% volume growth the year before. Two percent may not sound like much, but it represents an incremental 100 million unit cases sold, or the equivalent of 27 million additional servings every day. (A unit case is equivalent to 24 eight-ounce servings.) That's a lot of new customers drinking more Coca-Cola products. Because Coke enjoys pricing stability, unit case volume is the single biggest driver of the business. Its several billion-dollar brands (both sparkling and still), hard-earned relationships with bottlers, a giant distribution network — everything it's built over the last century is geared toward generating higher volume. And with spending power rising in the most populated parts of the world, its potential customer base is increasing just as hoped.

Although volume declined 1% in developed markets last quarter, emerging markets were up 3%, with China 12% higher and Brazil 4%. For the year, Coca-Cola is confident that overall unit case volume will return to its long-term goal of 3% to 4% growth. Coca-Cola also has pricing power., and when you couple volume gains with two to three percentage points in annual price increases, increased efficiency, and a 3% dividend, you can see 10% annualized returns. But the business hinges *most* on volume growth. Last year's growth disappointed, providing us an opportunity to start a position as others sold. Sellers were looking back, while we work to look forward.

To drive growth this year, Coca-Cola is improving its marketing and spending more on the brand. Management can model returns on effective marketing, and strong campaigns more than pay for themselves. The company plans to increase its investments in branding by $400 million this year, and by $1 billion total by 2016. So far, only about 5% of its 2014 brand spending has been broadcast to customers — meaning it's all yet to come. The main goal: Drive unit case volume.

Clicks Drive Facebook's Ad Revenue

One could argue that **Facebook**'s (NASDAQ: FB) fate relies most on maintaining its giant user base, and there's truth to that. But the factor driving its financial destiny *most* is the effectiveness of its advertising. The more relevant the ads, the more people will click on them (even if the audience is smaller during some quarters). This will cause advertisers to spend more, and drive Facebook to make more money.

Last quarter, Facebook's ad revenue jumped an impressive 82%, and the effective price per ad rose 118%. Ad impressions declined 17% on a continued shift toward mobile, where fewer ads are shown, but the new ads are more effective and cost more — supporting our argument that quality matters. Nearly 1.28 billion people use Facebook each month, and 63% of them visit daily. Each visitor has a unique experience depending on what they like and how often they click ads. If Facebook can deliver more relevant ads to more people, it will have stronger results. This is why the company continually promotes its goal of having advertising that is as relevant to each visitor as the "organic" social content.

So far, the company is only showing ads on Facebook. Its other apps — Messenger, Instagram, and WhatsApp (once that deal closes) — will not be monetized with advertising until later. The company wants to increase the audience of each and improve the services before starting to populate them with ads. In other words, Facebook has *much more* room to grow its revenue base, and it will take its sweet time doing so. Video ads are another "really big opportunity"; for the first time, consumers are spending more time online each day than they are watching TV.

To sum up, although it's 10 years old already, Facebook is still in "phase one" of its business. With a goal of not just connecting the world but understanding those connections, it will continue to create or acquire new apps that help hundreds of millions of users share content in unique ways. When the audience has settled in and the content is strong, the company will monetize those apps, and in the end, clicks on ads will drive its financials. Just as Coke depends on bottling partners and distributors to help it increase its volume, Facebook depends on the size of its audience in a supporting role. The *star* is ad effectiveness when coupled with a mass audience.

It's All About the Party

The single biggest driver of results at **Tupperware** (NYSE: TUP) is the number of parties its sales representatives throw. With 2.9 million representatives around the world overseen by regional managers, the company keeps close tabs on the number of parties on the calendar. In many countries, the party schedule is planned five weeks ahead of time. If Tupperware doesn't see enough parties scheduled, or the parties aren't bringing in the desired revenue, the company offers incentives to sales reps to host more parties. This is how they steer the Tupperware ship.

These days, less than one-third of the products Tupperware sells are food storage. Most are kitchen tools. The company's best-selling product in France, for example, is a Microsteamer (which turns a microwave into a steam oven) — it costs up to $150 in France and has become a top seller in the United States as well. Tupperware is more innovative than it gets credit for, and it offers lifetime guarantees on quality-made products that are designed for each culinary region it serves. But it's still the Tupperware parties that move the product. Even in China, where apartments are too small to host parties, the company has set up 4,300 storefronts where customers gather for cooking classes and demonstration parties led by representatives. As with Coca-Cola, emerging markets (not developed ones) are driving growth.

Three Companies, Three Drivers

So, three companies, three key drivers: unit case volume; effectiveness of advertising; and the number of parties thrown.

The Price We're Paying

As investors, we aim to look ahead, because what's going to happen is more important than what just happened. All three of these stocks are rated Buy (in Coca-Cola's case, we've set up a synthetic long), and you can see our allocations on the Recommendations page. Here are some estimated 12-month valuation multiples on these three:

Multiple on next 12-month estimates	EV/EBITDA	Price/Earnings	Price/Free Cash Flow
Coca-Cola ($40.70)	14.7	19.2	23
Facebook ($60)	18.1	39.8	37
Tupperware ($84)	10	14.4	17

Sources: CapitalIQ, analyst estimates.

You pay a premium for the strong growth at Facebook, but I estimate it's a reasonable premium. Coca-Cola and Tupperware both pay investors a 3%-plus dividend, and both are increasing their sales by 5% to 7% annually, and earnings more than that. With Coca-Cola, you're paying for a world-class franchise with staying power. With Tupperware, you're paying closer to (and in some cases less than) average market multiples.

What Drives You?

Now, what single factor *most* drives your other companies? You should be able to explain it to an 8-year-old. And to close on a Foolish note ... what is it that drives *you*? What gives you the most reward each day? How do you double down on that?

To discuss the Memo, visit the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Completed Trades

- **GrafTech International** (NYSE: GTI): We sold all our shares at $11.23.
- **Gilead Sciences** (NASDAQ: GILD): We bought 900 shares, for a 3.5% stake, at $78.86.
- **Intel** (NASDAQ: INTC): We rolled our July 2014 $25 covered calls to August 2014 $25 calls for a $0.07 credit — to keep our shares and get the dividend.
- **Wells Fargo** (NYSE: WFC): We wrote a covered strangle, selling to open June 2014 $48 puts and June 2014 $50 calls on all our shares. Aiming for income, we were paid a $1.23 combined credit.

Your Most Active Conversations

Today Past 7 Days Past 30 Days

Buy Gilead Sciences

Published Apr 30, 2014 at 2:45PM

Is this for you? All *Pro* members can participate in this investment in a regular or IRA account.

How You Participate

- **Action:** Buy a 3.5% stake in **Gilead Sciences** (NASDAQ: GILD)
- **Scorecard Status:** Buy First
- **Recent Price:** $77
- **Price Guidance:** Gilead is large and liquid; you can buy at going prices.
- **Fair-Value Estimate:** $105
- **Consider Adding More:** $65
- **Options:** We may use them someday, but they aren't necessary.

What We're Thinking

Gilead Sciences helps millions of people fight life-threatening diseases. Currently, eight HIV products account for the majority of Gilead's revenue, and those drugs are being joined by newcomer Sovaldi, which treats (and cures) various forms of hepatitis C. Sovaldi's debut last quarter was the most successful drug launch in history, yet so far it only reaches a tiny portion of its potential customers. An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, and a whole 2.8% of the entire world (almost 200 million people) is thought to have this common bloodborne infection. That means tens of millions could conceivably benefit from Sovaldi — and this would still leave plenty of room for upcoming competing drugs to do well, too.

Thankfully for us, the pending approval of those competing drugs has Wall Street concerned. This allows us to buy shares of Gilead at a reasonable price even as the business stands on the cusp of mighty growth. Gilead enjoys the strength of a $119 billion market value, yet its earnings per share are expected to soar more than 200% this year, leading to 38% annualized growth the next five years. Gilead offers a rare investing trifecta: financial strength and size; extreme growth on hand; and a value seeker's price. With Gilead trading at 11.8 times estimated 2014 earnings, we're glad to become investors for the years ahead.

What We're Watching

Gilead depends on a handful of products to generate most of its revenue, but it's no one-hit wonder — management is adept at building on past successes. HIV treatments originally required taking multiple drugs every day, making the regimen harder to follow. Gilead was able to combine many of its previous treatments into single-pill regimens and obtain new patents on them before key expirations hit. The company continues to work to improve its HIV franchise, with several drugs in clinical trials; management's long-term goal is to ensure that all various-stage HIV patients can choose a single-tablet regimen (of which Gilead currently sells three).

HIV and liver-disease treatments drove 83% of Gilead's revenue in 2013, representing $9.3 billion of $11.2 billion total. In the pipeline are new treatments for cancer and cardio diseases; in the meantime, new iterations of existing drugs should help Gilead maintain long-term revenue from many of its past successes. And many top sellers have years until patent expiration anyway.

Gilead's Top Products	2013 Sales (in thousands)	Indication	U.S. Patent Expiration
Atripla	$3,648,496	HIV	2021
Truvada	3,135,771	HIV	2021
Viread	958,969	HIV	2018
Complera/Eviplera	809,452	HIV	2023
Stribild	539,256	HIV	2029
Letairis	519,966	Cardio	2018
Ranexa	448,624	Cardio	2019
AmBisome	351,827	Infection	2016

Source: Gilead 2013 10-K.

Atripla, with $3.6 billion in sales last year, will give up its crown to Sovaldi this year. Sovaldi earned $2.3 billion in sales during the first quarter alone, tripling Gilead's year-over-year profits in the process. Wall Street is concerned that Sovaldi will face pricing pressure from competitors, though that concern was softened last Friday when top competitor **AbbVie** (NYSE: ABBV) — which has filed its hepatitis C drug for FDA approval — said a pricing war is not in its strategy. Wall Street is also concerned that Sovaldi is a "one-and-done" drug (in many cases, eight to 12 weeks of treatment leads to a cure). Analysts worry that this will result in a burst of revenue that then trails off sharply. There's no question revenue will be front-end-loaded this year and early next, but sales are likely to remain robust afterward as the drug's approval spreads around the world, and as more patients come forth for treatment. At any given time, only a minority of the population is even aware they have hepatitis C. We expect steady demand in the years ahead, even if it won't match the initial burst this coming year or so, and management at Gilead has said the same. After all, in the U.S. alone, 20,000 to 30,000 new patients are diagnosed with hepatitis C each year.

Meanwhile, Gilead has more than 200 active clinical studies taking place, and at least 10 compounds filed for regulatory approval or in final phase III development. Yet, as earnings grow, the company could soon be the cheapest it's been since the 2008-2009 financial crisis.

Since 2004, Gilead has averaged an EV/EBITDA multiple of 17.8. Thanks largely to Sovaldi, the stock trades at only 8 times our estimated EBITDA for the next 12 months. Assuming Sovaldi sales start to taper by early 2015, the stock still needs to gain at least 50% from today's price to trade at least *near* its long-term valuation average (at a multiple of 12). As Sovaldi sales slowly deflate (but persist well enough) and the fear of a revenue cliff abates, investors should have no reason to let shares maintain a valuation discount. Meanwhile, the odds favor Sovaldi exceeding expectations the next 18 months, rather than falling short of a skeptical Wall Street. The sheer size of the patient population and the fact that more patients will come forward upon hearing of a cure weighs in the drug's favor; also, it helps that a meaningful price war with a top competitor (who still lacks FDA approval) does not appear likely. Finally, more patients are likely to be diagnosed than before, because now there's something a doctor can do about hepatitis C: cure it.

How Gilead Fits Into *Pro*

With 5.6% of our portfolio in **Medtronic** (NYSE: MDT) and **Parexel** (NASDAQ: PRXL), *Pro* is underweighted in health care. Starting a 3.5% stake in Gilead, we gain exposure to a top-rated, growing biotechnology company with a healthy pipeline and acquisition strategy. We're investing at an estimated valuation multiple that, on many measures, should make Gilead one of the more attractively priced stocks in the portfolio.

Alternative Trades

- We see enough value in shares to buy outright, but if you'd rather target a lower potential buy price, you can write ("sell to open") pretty much any puts you like.

Pro Can Help

- **Questions?** Let's make this a two-way discussion on our new Gilead Sciences discussion board.

Roll Your Covered Calls on Intel

Published Apr 29, 2014 at 3:00PM

Is this for you? This is for *Pro* members who own shares of **Intel** (NASDAQ:INTC) and have July 2014 $25 covered calls written on them.

How You Participate

- **Trade:** Use a rolling order to buy to close your July 2014 $25 calls, and simultaneously sell to open an equal number of August 2014 $25 calls.
- **Allocation:** Roll every call you have previously written.
- **Price Guidance:** Aim for a net credit of at least $0.08, but as Friday nears, execute at the prices offered.

- **Recent Prices:** Intel, $26.50; July 2014 $25 calls (bid/ask), $1.66/$1.74; August 2014 $25 calls, $1.78/$1.79. See current prices.

What We're Thinking

Intel will pay its next $0.225-per-share dividend on June 1, but its ex-dividend date is May 5. This means that folks need to own shares by Friday, May 2, in order to get paid the June dividend. Our July $25 covered calls currently have less time value than the dividend is worth ($0.20, splitting the bid/ask), meaning we strongly risk having our shares called away (and not receiving the dividend) if we don't roll our calls this week.

It's unfortunate that this is the case, because this is not a roll we're anxious to make. But ultimately it's a small one-month difference in expiration in order to keep shares that we've owned for years, avoid turnover or taxes, and earn the dividend. We're rolling out one month to August, but keeping our defensive $25 strike price. In the process, our new calls should have enough time value that we won't risk an early exercise this week (lately, their time value at the ask is $0.28).

Thanks to this roll, we'll keep our stock, enjoy the dividend, and still have our shares covered against about $1.78 (or 6.7%) in potential downside. We also continue to seek to earn option premium as additional income.

More That Matters

- **Maximum Loss:** Our exposure remains the same as stock ownership, minus the credits we have in the covered calls.
- **Maximum Gain:** Currently, our profit potential is limited to the credits in the calls, since they're in-the-money.
- **Breakeven:** Around $24.72 per share on these covered calls; our stock position is lately up 29% for us, not including several years of dividends.
- **Follow-Up:** As long as it's attractive, we aim to keep managing the covered calls to keep our shares and ideally earn premium, too.

Alternative Trades

- If you wrote puts on Intel as an alternative trade, just wait for those to expire as income. If you wrote different covered calls on Intel, make sure that they have more than $0.225 in time value, so you don't risk losing your shares this week. If they lack that much time value, roll to a different option (ideally the one in this trade).

Pro Can Help

- **Want to learn more?** See our guide to writing covered calls in our sister service, *Motley Fool Options*.
- **Questions?** We'll try to cover (ha) any questions you have on the *Pro* Intel board.

Sell GrafTech International

Published Apr 29, 2014 at 1:20PM

Is this for you? This trade is for Fools who own shares of **GrafTech International** (NYSE: GTI).

How You Participate

- **Trade:** Sell GrafTech International.
- **Allocation:** We recommend selling all shares. For *Pro*, that is 4,500 shares and 2.6% of our portfolio.
- **Price Guidance:** Be patient. Use a **limit order to sell at $11.20 per share** or higher.
- **Recent Price:** $11.50
- **Scorecard Status:** Sell

What We're Thinking

For businesses that are struggling, sometimes just the promise of doing less is a big deal. That's what happened when GrafTech announced its "rationalization plan" after its third quarter, promising to close two smaller electrode plants, eliminate 20% of its workforce, and slim down its cost structure. The market applauded these measures and sent shares up 40%, but we can't ignore the reality that brought all this on: GrafTech operates in a competitive industry plagued by cash-strapped customers and, it seems, increasingly irrational competitors. We have long believed that adoption of electric arc furnaces (EAFs) to produce steel abroad and a position as a quality leader in electrode manufacturing would be enough to overcome the competitive landscape and enable GrafTech to earn acceptable returns over a cycle. But we're not so sure anymore, and here's why.

- **Weak EAF adoption in Western economies:** Even though the benefits of EAF steel production are well-known (lower energy consumption, lower CO2 emissions, more flexible cost structure), Western economies have failed to embrace it as quickly as anticipated, and with the North American energy boom dampening a rise in global energy costs, the cost of running more energy-intensive facilities may not be felt as painfully.
- **We aren't so confident GrafTech will win:** Even though we believe in the long-term trends favoring EAF adoption, there is no guarantee GrafTech will succeed in providing electrodes to those facilities. Chinese and Indian electrode producers have continued to expand output even in the face of low demand, and we don't see evidence that more rational behavior or meaningful consequences are on the horizon. Even though the steel cycle may be firming, electrode pricing may not recover in kind.

As if this operating environment weren't challenging enough, management and the board of directors are engaged in a proxy fight brought on by a group led by former director Nathan Milikowsky. Milikowsky's criticisms have already resulted in a new CEO, but his plans to fix the company seem to revolve around competing on market share — not quality. We think this is a dangerous game given the competitive landscape, because it implies accepting lower margins. Another possible consequence of this brouhaha is that new CEO Joel Hawthorne has failed to communicate his long-term vision for the company. After numerous unsuccessful attempts to talk with members of management (who were unresponsive and even questioned why they should talk with us), we're left guessing blindly, which lowers the confidence we have in assessing the risk-and-reward equation. So, with shares trading a bit above fair value (which historically has been a volatile number), we're choosing to let our position in the steel-company supplier melt away.

How It *Doesn't* Fit Into *Pro*

We don't mind the volatility of cyclical businesses as long as we believe there are underlying secular growth trends that create the possibility of strong compounding over cycles. We're now questioning that with GrafTech, and think our capital will be better invested elsewhere. We're happy to have exposure to industrials, manufacturing, and emerging markets via **Tupperware** (NYSE: TUP), **Valmont** (NYSE: VMI), **Gentex** (NASDAQ: GNTX) (three companies that will talk with shareholders, incidentally), and the **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS). If you haven't matched our allocations there, do so. Meanwhile, we look forward to putting this capital to work elsewhere.

News: Mr. Market Questions Parexel's Partnership Value

Published Apr 28, 2014 at 4:38PM

Fools,

Parexel International (NASDAQ: PRXL) was down 7% today. I don't always feel the need to comment on a 7% swing (they're not that uncommon), but because the news that likely caused the price move could have business implications I figured I'd throw my hat in the ring. Parexel announces earnings tomorrow, so we'll hear more in short order. For now, here are my thoughts.

Bryan (TMF42)

What Happened?

This Merger Monday featured two large health care announcements. Shares of British pharmaceutical giant **AstraZeneca** (NYSE: AZN) soared 12% today as news broke that **Pfizer** (NYSE: PFE) is willing to purchase the company for around $100 billion. The strategic fit of the oncology franchises seems like a no-brainer, and the fact that AstraZeneca is a UK domiciled company suggests that Pfizer will save a ton on taxes by using cash that is trapped overseas. The second deal, much smaller in size, has **Forest Labs** (NYSE: FRX) offering $1.5 billion to buy **Furiex Pharmaceuticals** (NASDAQ: FURX). Both of these deals see big companies getting bigger – with promises of the business combinations leading to cost savings and possibly bolstered research departments.

It is that last piece that likely sent shares of Parexel lower. At the end of fiscal 2013 Pfizer accounted for 17% of Parexel's revenue. Pfizer has been one of the early adopters of the partnership outsourcing model. As a refresher, this model centers on biopharma companies (like Pfizer) integrating tightly with a large contract research organization (like Parexel) for a baseline of R&D work. The relationship allows the biopharma company the ability to keep a smaller R&D department (which offers cost savings), outsource trials work to its trusted partner, and allow it to spend more time on what it does really wellt: drug discovery and drug marketing. Outsourcing the more rote portion of the value chain, clinical trials, to a specialist gets better results and costs less.

What Does It Mean?

The worst case here is that the combination of two mammoth biopharma companies may provide Pfizer some reason to take back its clinical trials work in house. AstraZeneca has not embraced the partnership model, but Pfizer has. If a Pfizer/AstraZeneca merger go through the combined entity would need to decide what role its CRO partners will play. That unknown is scary for Parexel because 17% of revenue is potentially at stake.

The less bad case is simply that a combination creates a mammoth biopharma company with even stronger contract pricing levels. I don't think this is all that likely – what good does it do Pfizer to bleed its chosen partner? A poorly balanced partnership would also encourage cutting corners and would likely hurt trial performance. In any case, larger biopharma customers does probably put a cap on how high CRO profit margins can get. But that was never the basis for our thesis. (Margin improvement, yes, but not 'margins to the moon'.) I view the biopharma/CRO relationship as symbiotic, not cut-throat.

To be clear, this could just as easily be a boon to Parexel (run some portion of AstraZeneca trial work through the Parexel network – more revenue and ability to leverage its fixed costs) as it could be a punch to the gut (lost business or lost pricing power) – but the market's reaction has clearly cast its vote in the direction of a punch to the gut. I'm not so sure this awful news.

Here's What We Know

- Pfizer's behavior has recently been to outsource more to Parexel, not less. It accounts for 17% of revenue (as of the 2013 10-K).
- AstraZeneca recently laid off a 5,600 workers – at least 1,600 of those jobs came from R&D. In addition, AstraZeneca folded plans to expand R&D in Bangalore.
- Whatever happens, there will little immediate business impact. Trials take time and Parexel will complete the work it is already engaged in.

Pro's position in Parexel is now modestly in the red and down to 2.9%. I'm inclined to leave the shares rated Buy knowing that we'll learn more tomorrow and that the bulk of our thesis rested on analysis that the partnership model was superior to the transaction model – I have seen no evidence that Pfizer has changed its mind on that stance either. Whether we change our mind or have our thesis confirmed, you'll be the first to know.

From Strategy to Valuation

Pro Guidance Changes

- None this week

Dear Fools,

Starbucks (NASDAQ: SBUX) carries a $54 billion market value and is followed closely by at least 24 highly paid sell-side analysts patrolling Wall Street. So what business does a (much) more modestly paid Foolish analyst roaming the colonial bricks of Duke Street have trying to more accurately estimate the intrinsic value of the coffee king? Well, that analyst is me, and if I weren't open to thinking a bit differently than my brethren in the Big Apple, I would be neither Motley nor Foolish.

Nominate a Fellow Fool!

Pro Polaris Award 2014

Fools, it's time to honor our amazing community by nominating those members you think especially distinguish themselves on our discussion boards. We'll be accepting your nominations through May 1; the winner receives a shiny discussion-board charm and $250 toward their choice of Apple or Starbucks! See the full details here.

As evidence of my willingness to think differently, here are three takeaways from Starbucks' second-quarter earnings. These observations are probably too nebulous to ever find their way into the big-broker valuation models, but they feature prominently in mine. Although the concepts are a bit squishy, the attempt to analyze how they may create value is very serious and rooted in finance and valuation theory. The quest to go from strategy to value is challenging, but it's worthwhile because so many other analysts don't even try.

Ability to Manage Through Difficulty

Starbucks has struggled in Europe for years. Even with around 2,000 stores in the region and a mature coffee culture already in place, customers found the Starbucks experience poor and the division struggled to make money. In fiscal years 2010 through 2012, Starbucks' European division (which also includes the Middle East and Africa) earned only $40 million in pre-tax profits off of more than $3.1 billion in sales -- a pre-tax profit margin of only 1%, which is a few venti Frappuccinos short of the 19% the rest of the company earned. Frustrated, CEO Howard Schultz threw talent at the problem, putting first Michelle Gass and then Cliff Burrows in charge of engineering a turnaround focused on building brand relevance, improving the in-store experience, and licensing more stores. The plans are finally starting to take hold: The last four quarters have seen accelerating same-store sales growth (up an impressive 6% this quarter) and profitability beginning to climb toward longer-term targets.

How does managing through difficulty affect value? Starbucks was able to turn around its European operations by narrowing its focus -- doubling down on the relationships it builds with its customers. It sounds silly, but a concerted effort to write names on cups signaled the reestablishment of the barista-customer relationship and the company's determination to make sure the brand was relevant because of the relationships and experiences, not just the product. Knowing that the executive office is willing to deploy top talent to fix trouble spots and that the first steps to recovery involve better and more personal service gives me confidence to make longer-term forecasts with the belief that the Starbucks brand can endure and remain relevant to customers. This relevance should translate to sustained elevated profitability 20 years into the future (in my model), which drives value.

The Third Place Lives On

For the past 13 years, Starbucks' Americas division (mostly stores in the U.S.) averaged same-store sales growth of 5% a year -- an astounding feat. Given its almost 14,000 locations, we'd be lower-case fools not to wonder whether maturity, and much lower sales growth, will be brewed into the next pot. But much of the commentary on the conference call was about the success of the food program, starting with the La Boulange upgrades to the pastry case and slowly extending to better lunch offerings. The opportunity to improve the food attach rate (the number of transactions in which a food item is purchased, currently about one in three) is immense, and improvements to the existing food lineup and headways into lunch options are already bearing fruit. Management also commented that its evening beer-and-wine tests have been a success; they believes there's room for 1,000 or so locations offering the expanded evening lineup. So far, the success seems to be attributable to Starbucks offering a comfortable, convenient place for friends to meet up rather than a strong attraction to alcoholic options. Schultz has been preaching for years that Starbucks is a "third place" between home and work; the company seems to be breathing new life into that role as works toward becoming a relevant stop-off for more hours each day.

How does the revival of the Third Place affect value? If Starbucks has success in increasing its lunch, happy-hour, and evening sales, its mature Americas store base should be able to sustain elevated same-store sales growth for years -- 4.5% per year over the next decade in my model. And offering additional food and beverage choices requires little additional investment (the stores are already built and the staff hours are already logged), so the added business should translate to high returns on modest incremental capital investment. Big profits and modest investment are the recipe for strong free cash flow (about 8% of sales in my model) and increasing value.

Playing Offense

At the end of January, Starbucks announced a few promotions and the expansion of its senior leadership team. This move shored up the day-to-day management of the core business while freeing up Howard Schultz to focus on innovation, dream big, and expand the vision of the company. To me, this announcement was a clear sign that the core business is set up for years of success and that Schultz can turn his attention to the factors that will drive growth five years from now. Right now, it looks like Schultz is spending his time on mobile payment initiatives; on the call, he noted that Starbucks has been approached by several retailers and tech firms about possibly licensing some of its technology. The company began planting the seeds for its digital marketing and payments system years ago, and it's now on the cusp of monetizing that work in a way that compliments its benefit to the core business. I believe this is just one of the areas Schultz is focusing on -- he's likely making long-term bets on several fronts with large market opportunities (perhaps health foods and tea in the near term, sustainable farming and supply chain changes down the road).

How does playing offense affect value? Playing offense allows Schultz to expand the vision of Starbucks well beyond beverages. It also keeps employees challenged and thinking big. It's difficult to capture this undefined "what if" in a spreadsheet, but my attempt takes the form of sustained earnings growth and a 25% weighting to the "bull case" scenario. (My model has three scenarios, bear, base, and bull; with Starbucks, I give the bull case a 25% probability of occuring.) Under the suite of bull-case assumptions -- an attempt to capture how the company could grow if many things go well -- Starbucks could be worth $107 per share.

The *Pro* Bottom Line

A willingness to factor in softer elements of company strategy, in my opinion, gives individual investors an edge. Quantifying the ability to manage through difficulty, the reinvigoration of Starbucks as the Third Place, and a visionary leader able to play offense is an imprecise challenge, sure -- but these things are just as likely to affect the company's financial future as its coffee hedging program and new store opening costs. They contribute to our belief that Starbucks shares are currently undervalued and worthy of a 2.9% allocation. Starbucks remains a Buy.

Onward,

— Bryan (TMF42)

Starbucks Brews Impressive Results

Published Apr 28, 2014 at 10:39AM

Pro's Take: SBUX Q2-2014 Earnings

Starbucks (NASDAQ: SBUX)

Quarter Quick Take

Global same store sales (+6% consolidated, +6% Americas, +6% EMEA, and +7% CAP) and accelerating channel development growth drove another good quarter for Starbucks. Margins expanded in all four segments and the company raised FY-2014 EPS estimates to $2.62-$2.68. Food – primarily from the rollout of La Boulange pastries – and effective mobile marketing brought customers into Starbucks stores despite horrible weather and show a glimpse of the levers that exist to continue driving future sales. The quarter's big news is that Starbucks is investigating the license of its digital payment, loyalty, and marketing assets to other companies.

....

Q2-2014

Sales growth: +9%

Operating profit margin: +130 bps to 15.1%

EPS growth: +17%

....

Guidance Update

Starbucks is performing as expected so far this year – it has raised EPS guidance after its first and second quarter suggesting it will continue compounding intrinsic value. Nothing in this quarter caused me to rethink any longer-term assumptions, but accounting for the time value of money, the company's fair value ticked up a few bucks and is on track to hit $78 by the end of its fiscal year. Pro has a 2.9% allocation, shares remain a Buy and are undervalued. We are looking for opportunities to add to our position.

Updated guidance: Buy (no change)

Recommended Allocation: 2.9%

Fair Value estimate: $75 (up from $73)

End of Fiscal Year expected FV estimate: $78 (no change)

CAM price: $59 (no change)

Pro has a 2.9% allocation to Starbucks. Members lacking a (full) position should feel comfortable purchasing shares today – they're priced to notch NS-like returns over the long-run. Writing puts to buy shares lower is also a sensible strategy. If given the opportunity, I would look to add to this position.

Our Thesis

We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new dayparts and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

The Most Important Things

1. ***Americas store performance.*** At the end of 2013, the Americas segment still accounted for 75% of Starbucks' total revenue – so as *it* goes, Starbucks financial performance goes (for now). Americas comparable store sales growth was up +6% driven by a +2% growth in traffic and a +3% growth in ticket. The company's ability to drive sales on such a large and mature base is impressive. Comments during the call revealed that food (primarily La Boulange) was the largest driver of incremental sales. This benefit should continue as La Boulange pastries are put into more US stores through September. Store unit volumes and profits ticked up over Q2-2013 and management commented, for the second quarter in a row, that the opportunity in the US and Canada for more stores remains huge. This opportunity seems to be in drive-through locations (in popularity and ability to drive higher food attachment), the economics of "unique configuration" stores, and increasing food options making marginal locations more economically viable.

2. ***Channel Development.*** As the company's second largest segment, CD leverages the brand strength of Starbucks' cafe stores into alternate channels (primarily grocery stores). Segment sales grew 10% (up from 7% last quarter and expected to accelerate through the rest of the year) but profits were up 35%. VIA and K-Cup sales are strong and new flavors are on the way. Starbucks K-Cup sales appear to continue taking share. Lower coffee costs helped drive operating margin expansion to 34%. The company also called out strength in ready to drink sales in some Asian markets.

3. ***Future growth drivers.*** There is quite a bit to cover here – with all this opportunity comes heightened execution risk, but so far, there are no cracks in the foundation. (A and B) With the pastry portion of the La Boulange roll-out about three-quarters complete in the US Starbucks is turning its sights to lunch. Remember, the LB roll-out was measured, with lots of test and learn. The company seems confident it understands the formula and is looking to add incremental food options to the mix. This should drive transactions, ticket, and food attach rates. It will also introduce further complexity to orders and throughput. With the potential for so many hiccups, I expect lunch to be a 2015 store more than a 2014 store. (C) Starbucks also announced that its "evenings" program tests were a success and it would begin expanding the program to more than 1,000 stores. Interestingly, evenings has seemed to revitalize Starbucks as the "third place" – with shared platters among friends being the centerpiece of the evening hang out. (D) Carbonated beverages will be rolled-out in 3,000 US stores as well as some Asian stores, just in time for summer. (E) Teavana products will start showing up more in Starbucks stores, and a new tea with Oprah's name on it could speed up acceptance. (F) Schultz announced that Starbucks has been approached by "tech companies and national retailers" to see if the company would consider licensing or white labeling its mobile platform. This underscores the strength of the Starbucks digital program and validates the technology. Schultz says "we are actively

pursuing a number of conversations because we strongly believe that, one, there is a tidal wave of consumer adoption, smart phones and mobile commerce, and we are in the sweet spot of being in a position to take advantage of that in a very unique fashion." This could represent a very high margin, recurring revenue stream for the company.

WWTN

The world's specialty coffee leader will continue its global retail expansion and leverage its brand to offer consumers more choices — including tea, carbonated beverages, and juice – at more times in more convenient locations. The company has dynamic growth opportunities, operational discipline, and deft management. Starbucks stores and its trusted brand are a powerful platform off of which to introduce new products, build relationships with customers, and compound intrinsic value.

Conference Call Notes

- Q2-2014 was the 17th consecutive quarter of comp growth greater than or equal to 5%. The +6% comp growth in EMEA was its strongest in 14 quarters, suggesting that the turnaround of that segment is firmly under way.
- On new stores: Starbucks claims it has never been better at site selection and new store opening procedures. New store sales to investment ratios are not over 2-to-1. The company continues to believe drive-throughs and unique-format stores are large opportunities. (This marks two consecutive calls where management hinted that the U.S. is nowhere near saturation. My base case calls for 19,500 Americas stores by 2022 – if the success of alternative format stores continues this estimate may prove a bit low.) Cliff Burrows said: "There is a strong indication that we have a significant upside in the US and in Canada. Also, I think we have done a very good job over the last 12 to 18 months in creating store designs that are linked to real estate segmentation which gives us the ability to almost create any configuration now in terms of size and the kind of real estate it is...there is so much upside we believe in the incrementality of creating new day parts, fulfilling the needs base that customers have other than the peak morning period. And as a result of that, we can put Starbucks stores in areas that previously we probably thought were not the kind of stores that we would have gone after because they were morning day part driven."
- On Teavana: Schultz says: "By summer, Starbucks customers will be able to sample and experience a full range of Teavana branded, hand-crafted tea beverages, loose leaf teas and tea merchandise inside their local Starbucks stores." Teavana tea bars (tested in NY and Seattle) will be rolling out – for further testing – to Chicago, Los Angeles, and additional NY locations.
- On Fizzio: Hand-crafted carbonated beverages will be rolled out to 3,000 stores across the US, as well as in Singapore, Korea, and a few stores in China.
- On mobile and digital: Over 10 million customers are actively using the Starbucks mobile app. Mobile payments account for 14% of tender and 25% of transactions in company-owned stores in US/Canada. Starbucks also believes it is only scratching the surface in terms of serving up targeted offers to its members. Schultz confirmed the rumors that Starbucks may monetize its digital assets by licensing the technologies to other companies. "Today, as the retail industry's unquestioned leader in mobile payment and mobile loyalty, we are uniquely positioned to leverage our digital leadership and to both develop and monetize new platforms, revenue streams and opportunities for growth in ways that will be highly complementary to our existing core business and our customer base. By way of example, major tech companies and retailers have recently begun inquiring about whether or not Starbuck would be willing to license and/or white label our technology and mobile platforms. We are taking a very thoughtful and disciplined approach as we consider these overtures and what we believe will ultimately prove to be a very significant additional driver of long-term share value."
- On food: Food purchases are still only about 1 in 3 US transactions. La Boulange is now in 6,000 US company owned stores and 2,500 licensed stores. The bakery roll-out should be complete by the end of September. The "much larger prize" is lunch, which will be given much attention in the coming quarters. COO Troy Alstead said :food was the single largest incremental driver of comp growth in the second quarter, and food attach is clearly and consistently higher after the launch of La Boulange in the market." Later, Alstead said "we're seeing an acceleration of the contribution from food, and remember, that is coming despite the fact that food is only in three-fourths or so of the US system...we'll always do learnings and check and adjust...in fact, throughput will be at its highest level, highest historical level this year."
- On evenings: The evening beer/wine tests have shown great results. Alstead said: "Based on these results, we are no longer testing evenings. We are now moving forward with the rollout of the program in a disciplined way over multiple years. Ultimately, I would expect certainly greater than 1,000 stores across the US to have an evenings offering."
- On EMEA: Growth was driven by +5% transaction increase.
- On CAP: This was the 14th consecutive quarter of revenue growth greater than 20%. Starbucks opened 174 net new stores in Q2 and almost 700 in the past 12 months.
- On Channel Development: K-Cup sales are strong – up +33% in dollar terms. Margins were helped by lower coffee costs.
- On margins: Much of the quarter's margin improvement was due to lower coffee costs (locked in for 2014 and 40% is locked in for 2015 at even better prices). Since the beginning of the year Starbucks has suggested commodity costs would be a $0.09-$0.10 EPS benefit. (I suspect that we'll hear plenty of fears over margins not being sustainable because of artificially low coffee costs, but keep it in perspective – coffee is shockingly only about 15-20% of COGS and declining with new ventures. It has also navigated turbulent coffee price markets in the past. I am not worried.)

Write a Covered Strangle on Wells Fargo

Published Apr 25, 2014 at 3:40PM

Is this for you? This is for *Pro* members who own shares of **Wells Fargo** (NYSE: WFC) and can write options for income.

How You Participate

- **Trade:** Use a combo order to write a covered strangle on your owned Wells Fargo stock. A strangle consists of two legs – a written put and a covered call – with different strike prices but the same expiration date:
  - Write ("sell to open") June 2014 $48 puts
  - Write ("sell to open") June 2014 $50 covered calls
- **Allocation:** Write one strangle (one written put *and* one covered call) per 100 shares of Wells Fargo you own. For *Pro*, that's 12 puts and 12 calls.
- **Price Guidance:** Use a limit order. Aim for a credit slightly higher than the combined bids of the put and call options (around $1.33 as of the day we issue this trade; realize that it will change. We recommend you accept no less than $1.15).

- **Recent Prices**
  - Wells Fargo: $49.15
  - June 2014 $48 puts (bid/ask): $0.76/$0.81
  - June 2014 $50 calls (bid/ask): $0.57/$0.60

Why Write a Strangle?

- With our North Star in mind, *Pro* has been seeking income trades as an alternative way to generate portfolio income.
- Wells Fargo pays a nice dividend (2.8% if you annualize next quarter's expected payout) and tends to trade within a narrow range, making it a worthy target for a covered strangle.
- Covered calls alone don't pay very well, so adding written puts allows us to earn an acceptable yield. Additionally, we'd be happy to own more shares of this well-run compounding machine (if necessary) at a net price of 87% of our fair-value estimate.
- This income-generating strategy could earn us a 2.7% yield on shares in 56 days, or about 19% annualized.

Why a Covered Strangle?

A covered strangle is an income-generating strategy that allows us to profit within a certain range of stock prices. Specifically, at expiration, if the stock price is ...

- Less than $48: We'll be assigned to buy new shares at a net price of $46.67.
- Between $48 and $50: Our covered strangle will earn us the equivalent of a 2.7% yield on the current share price in 56 days.
- Higher than $50: Our covered calls could be exercised, forcing us to sell our shares at a net $51.33 if we don't take action.

Note that the third bullet point above violates Rule No. 1 of writing covered calls: Don't write calls on shares you don't intend to sell. We want to continue to hold Wells Fargo and we intend to roll this strangle as needed, but if we are forced to sell our shares, we'll do so at 96% of our $53.50 fair-value estimate — not a terrible outcome.

If you've read our write-up on Wells Fargo's recent first-quarter 2014 earnings, you know that we view the business and the stock favorably. It's a well-run bank with limited downside and steady but unspectacular upside. With no catalysts in the coming months, we think it's unlikely that the stock price will run away from us in either direction, which makes this covered strangle an opportunistic attempt at earning some income.

Choosing a June expiration means we will sidestep any potential earnings surprises (and associated stock-price volatility) coincident with Q2 earnings, which will be announced in mid-July. Our $48 and $50 strike-price choices provide us with acceptable outcomes on either end of the strangle, as well as flexibility to roll up or down if necessary.

More That Matters

- **Maximum loss:** The same as stock ownership, minus the credits we received for setting up the strangle.
- **Maximum gain:** Our upside is capped at $51.33, or 4.4% higher than today's price.
- **Breakeven:** There are two breakeven points for strangles -- in this case, $46.67 at the low end, and $51.33 at the high end.
- **Follow-up:** We'll likely write a new strangle if this position expires fully as income. If not, we plan to roll the strangle to avoid accepting new shares (for the written-put leg) or selling our owned shares (for the covered-call leg).

Alternative Trades

- None. Neither individual leg (the written put or the covered call) pays well enough on its own, so we only suggest pursuing this strangle.

Pro Can Help

Earnings: GNTX Q1-2014

Published Apr 25, 2014 at 1:08PM

Pro's Take: GNTX Q1-2014 Earnings

Gentex(NASDAQ: GNTX)

Quarter Quick Take

Numbers are a bit inflated (when comparing to prior periods) because of the inclusion of HomeLink, but regardless, underlying business performance was strong. Offshore performance drove unit and sales results, margins improved, and cash flow generation was strong. Gentex remains in excellent financial health and its strategy is sound.

....

Q1-2014

Sales growth: +25%

Operating profit margin: +520 bps to 28.9%

EPS growth: +47%

....

Guidance Update

I'm not making any changes to our guidance for Gentex after this quarter. RCD mirror declines continue to weigh on North American mirror unit volumes (this should continue throughout the year) but Europe has begun to show signs of turning. In aggregate, results are tracking nicely against our expectations.

Updated guidance: Buy (no change)

Recommended Allocation: 3.3%

Fair Value estimate: $33 (no change)

End of Fiscal Year expected FV estimate: $35

CAM price: $25 (no change)

Pro has a 3.7% allocation to Gentex. Members lacking a (full) position should feel comfortable purchasing shares today – they're priced to notch NS-like returns over the long-run. Writing puts to buy shares lower is also a sensible strategy. If given the opportunity, I would look to add to this position.

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1. ***Penetration: Unit growth vs. auto production.*** Over time, we want Gentex's auto-dimming mirrors to become standard in every car produced. If, over time, the company is growing units faster than auto production, it is moving in the right direction. Interior mirror unit volumes were up +12% and global auto production was up +11% (suggesting further penetration). Once again, the strength was not evenly spread. North American interior unit growth continues to suffer because of continued pullback in sales of RCD units. In some cases (not all, of course), where Gentex has lost the RCD sale, it has lost sale of the mirror as well. In North America, interior units slid -3% while auto production expanded +3%. Domestic weakness was offset by offshore strength. IHS data for Europe + Japan/Korea shows production growth of +15%, while Gentex interior unit shipments grew +23%. Exterior mirrors continue to increase penetration too, with both North American and offshore units increasing faster than broad production (+5% for North America and +21% for offshore).

2. ***Pricing and value: Unit growth vs. automotive segment sales.*** Auto makers force annual price concessions on their suppliers and Gentex isn't immune. Management contends that recent concessions have been in the range of 2%-3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices and gross margins. During the quarter, total units (interior and exterior mirrors) increased +13% and automotive segment sales were up +24% (including HomeLink). Making my best estimate adjustment for sales without HomeLink, I believe automotive segment sales were up around +11%, suggesting lower ARPU and consistent with the continued pressure from lost RCD sales.
3. ***Margin performance.*** During the quarter gross margin was 39.1%, up from 34.7% in Q1-2013. For the trailing twelve months, gross margin was 37.8% compared to 33.9% in the year-ago TTM period. If Gentex can continue its strong unit sales growth it may be able to eke out further gross margin improvements, but they will be tough to come by. management is clear that it expects to hold the line on 39% gross margins (give or take), but at the moment it doesn't see dramatic upside. SG&A and R&D expenses are in-line with historical norms and contributing to operating margin expansion (28.9% in the quarter versus 23.7% last year).

WWTN

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in all-time high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house development should continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

Conference Call Notes

- The quarter's solid results were driven by strength in Europe, Japan, and Korea.
- SVP Mark Newton addressed the KTSA legislation: "*On March 31, 2014, the National Highway Traffic Safety Administration issued a final rule requiring rearview video systems in the US light vehicle application space by May 1, 2018, with a phase-in schedule requirement of 10% of vehicles after May 2016, 40% of vehicles after May 2017, and 100% of vehicles after May 2018. In this release, NHTSA estimated that 57% of model year 2014 vehicles already have a rear video system, and that even without a final rule, 73% of the vehicles sold in North America would have already included a rearview video system by 2018. This NHTSA ruling, as is clearly indicated from the percentage of US vehicles already having a solution, does not currently indicate an immediate opportunity for new Gentex RCD mirror applications. Customer opportunities may exist by the time the 100% requirement is in place, but no new material guidance is available from us at this time. The Company's rear camera display mirror application meets all the technical requirements of the NHTSA ruling, when installed in a vehicle and appropriately paired with an OEM specified camera. We have previously reported that in anticipation of the NHTSA ruling requiring rearview video systems, that four of our customers had implemented standard equipment rear video display in the radio in place of the Gentex RCD mirror option, and that the Company would experience those lost US applications on interior mirrors in 2013 and 2014. Actual RCD unit shipments for calendar year 2013 decreased 21% as a result, and we expect similar unit shipment declines in 2014. But in spite of this headwind, the Company is growing with new technology in mirrors, cameras, and HomeLink, and this is the area we are hoping to emphasize with you in this earnings release and in further discussion.*"
- On Guidance: GNTX estimates net sales in Q2 up +15%-20% and expects gross margin in the range of 39%-39.5%.
- On the integration of HomeLink: It continues to run slightly ahea of expectations. The focus so far has been on customer approvals, transitioning manufacturing to Zeeland, Michigan, integrating suppliers and compatibility partners, order processing, logistics, sourcing, and new product development.
- On RCD: Gentex continues to see RCD applications for the mirror outside the US.
- On the balance sheet: Management is going to wait until the back half of the year before determining the financial plan – the priority of debt repayment, share repurchases, cash build, etc. Gentex has $3.34 in cash per share, about 11% of the stock price.
- On the risk of cameras replacing mirrors: Mark Newton handled this question well, noting that the risk "is not new" and that safety-related barriers are real and of the utmost importance. This is the answer we'd expect to hear, but he went on to explain in more detail that, regardless of how this plays out, Gentex will be a player in the solution. The company has always kept its R&D work very close to the vest, but he revealed that Gentex was "*a market leader in designing and supplying the video camera for the Audi E-tron digital rearview mirror development in 2012.*" This was news to me, and provides added confidence that the disruption and displacement risk often referred to (for as long as I have followed the company) isn't lost on Gentex, and it hasn't sat idly by. Newton continued: "*We look forward to further product announcements in this area. So, for us overall, it's our intention – and has long been – to participate in both sides of this as a market leader.*"
- On success in Europe: SVP Mark Newton summed it up: "*It's starting to become visible that we're penetrating. And we're achieving new applications in addition to increasing take rates.*" Notably, it seem Gentex is having success moving "down market" into less expensive cars, which is a strong positive.
- Hinting at acquisitions and life outside the mirror: The new blood running Gentex (even though Bauer is still CEO) is clearly focused on the company's strategic options and sustaining growth. The stance to take on debt, the possibility of issuing shares, and recent comments all suggest Gentex is open to making a big splash – which is a distinctly different view than has pervaded the last decade.

Earnings: PRXL Q3-2014

Published Apr 25, 2014 at 1:08PM

Pro's Take: PRXL Q3-2014 Earnings

Parexel International (NASDAQ: PRXL)

Quarter Quick Take

Parexel had a very good third quarter. Organic revenue growth drove impressive gross margin expansion (+360 bps); each of the company's three of Parexel's three segments expanded margins. The business showed its operating leverage, turning the 8% service revenue growth into +20% EPS growth. With one quarter left in the fiscal year, management raised its forecast for revenue and earnings (by about 1% and 7% respectively).

The quarter's business performance, however, was overshadowed by news that Pfizer (NYSE:PFE) intends to purchase AstraZeneca (NYSE:AZN). I outlined my initial reaction here. Since then, AstraZeneca has declined Pfizer's offer, but the market seems to think PFE will simply raise the price and ultimately prevail. CROs continue to be under pressure due to fears that a combined Pfizer/AstraZeneca will eliminate redundant drugs in development, causing the CROs to lose near-term business. This is a possibility, but overshadows the long-term likelihood that the combined entity will, over time, drive more trials work to CROs under the partnership model (upon which our thesis is based). The driving factors of the merger appear to be tax related (allowing Pfizer to put trapped overseas cash to work and access a lower tax rate over the long term) as much as business related, and in no way suggest that Pfizer is souring on its adoption of the partnership model. We think the price movements create an opportunity for patient investors. [I have copied in some of management's comments on all of this in the Q&A section below.]

....

Q3-2014

Sales growth: +8%

Operating profit margin: +270 bps to 10.6%

EPS growth: +20%

....

Guidance Update

Business is tracking well against our thesis so far. Margins have improved slightly faster than modeled revenue growth outside of the core CRS segment have been a touch light. I'm not making any changes to the Fair Value Estimate, but I am raising the Consider Adding More price to $40 with as I get more comfortable covering the company, gain confidence in the thesis, and watch the company strengthen its balance sheet. Given the stock price discount to Fair Value, we're moving shares to Buy First.

Updated guidance: Buy First (up from Buy)

Recommended Allocation: 2.8%

Fair Value estimate: $54 (no change)

End of Fiscal Year expected FV estimate: $57

CAM price: $40 (up from $38)

Members lacking a (full) position should feel comfortable purchasing shares today – they are one of the rare opportunities we see to buy a good business for less than we think it is worth. Writing puts to buy shares lower is also a sensible strategy. We're considering this action ourselves.

Our Thesis

Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing market pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

The Most Important Things

1. ***Penetration and Backlog***: Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and provides evidence that the biopharma/CRO partnership model is winning. We'll check in on this driver annually, when the best data becomes available. In the interim, we'll monitor backlog trends to ensure Parexel is filling the pantry with future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth. Backlog's ability to explain future sales is influenced by conversion rates and cancellation rates, so we monitor this, too. Backlog grew 2% sequentially and 9% year over year. It has grown sequentially for four consecutive quarters now. The trailing book-to-bill is 1.15, a bit below the 1.20 goal, but strong enough to support 10% revenue growth going forward.

2. ***Margin Performance***: (I remove pass through revenue to more clearly track the business, so my numbers may be different from what is reported in the press.) Company gross margin expanded 100 bps sequentially and 300 bps year over year. The impressive improvement was driven by gross margin expansion in all three

business segments. We expect this trend to continue, although not to this magnitude, with CRS and PI leading the way. The how is also important; much of the improvement appears to have life remaining – the only source of improvement that appears maxed out is the benefit from using fewer contract workers. I expect the next step higher to come from increased productivity of recent hires. SG&A is temporarily elevated due to important investments in the business, but company operating margins increased to 10.6%. This reflects 100 bps improvement over last quarter and 270 bps improvement over last year.

3. ***PI Business Trends:*** Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PCMS segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits. Revenue continues to grow around a 9% rate, organically. New business awards and the pipeline for new business appear strong. Gross margin declined sequentially (to 44.3%), but continues on its ascent toward 50%. The biggest contributors to this margin expansion have been scale and the shift of activities to low-cost countries. I expect PI to achieve 55% gross margins in seven years given its current product mix – performance is tracking nicely.

WWTN

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process. We believe this is likely to continue even if large biopharma companies merge and Parexel loses a bit near-term trials work as pipelines are combined and redundant drugs are eliminated. We also expect margin expansion as recent investments pay off and continued growth of the Parexel Informatics technology segment.

Conference Call Notes

- It probably goes unnoticed by most, but Parexel increased the "supplemental disclosures" it releases on its company website with each earnings call. I truly appreciate this and view it as a shareholder friendly action. This company already presents things very clearly, but I applaud the additional information.
- On Book-to-Bill: B:B came in at 1.16, slightly below the company's stated goal of 1.20. While some analysts may see this as a shortfall, here is what CEO Joe Von Rickenbach had to say: "*You all know that the increment above 1 in the net book-to-bill basically is growth. If we have a 1.2 forever, we would grow at 20%. That is not our growth target. Our growth target really is as Ingo just said, roughly in the double-digits, 11%, 12% let's say. If all else stays the same, conversion stays the same, we could -- our book-to-bill could be as low as 1.12 or 1.123 maybe. The reason why we needed it at 1.2 was because we had erosion in our conversion rates over a long time. But as you, I'm sure, have observed, over the last three years or so, the conversion has basically plateaued and maybe even come up a little bit. As that happens, the net book-to-bill above 1 and the growth rates are now starting align much more. So with that, we're actually not that worried about the net book-to-bill being a tad lower. Although, of course, we're still striving higher. As I also pointed out in my comments, we have a good proposed portfolio. So fourth quarter from an opportunity perspective looks pretty good.*"
- On Contract Research Services (CRS) segment: Revenue grew +9% and gross margins improved for the fifth consecutive quarter. The margin improvement remains the result of numerous efforts and still has room to improve further.
- On Parexel Consultiing (PC, formerly PCMS) segment: Organic sales dipped slightly (loss of some business) but grew when including the HERON acquisition. Gross margins improved and remain at normal levels.
- On Parexel Informatics (PI) segment: Segment sales and gross profit grew 9% and 11%, respectively.
- On client concentration: Parexel's largest client (16% of sales) is Pfizer. Its top five clients account for 49% of sales, and its top 20 clients account for 79% of sales. The remaining 21% of sales is spread across more than a thousand customers.
- On Backlog: Backlog is $4.9 billion, up 9.3% year over year and 2.3% sequentially. Conversion and cancellation rates are in normal ranges. Right now, the backlog is filled with work from large customers, but that concentration is coming down with the recent wins in the company's Biopharm unit.
- On the PFE/AZN merger announcement: CEO Joe Von Rickenbach was asked numerous questions about this. Here are some highlights:
- ...
- "*Several biopharma companies have reported that they are engaged in strategic repositioning activities. While big pharma M&A activity in the past has occasionally caused short term disruption, in the long run it has consistently led to higher outsourcing penetration rates for our industry. Successive waves of biopharma consolidation has had less and less of a disruptive impact on us. Partly because our back log has become an increasingly larger stabilizer. In addition, the quality of our clients' portfolios has improved. We are in close communication with our clients and we feel that the benefits of outsourcing are increasingly evident to them. Combined with continuing strong opportunities from small and emerging biopharma companies and potential market share gains for the top CRO's we believe that prospects for our business continue to be quite positive.*"
- ...
- *"First of all and maybe most importantly, this is not the kind of activity that we experienced 15 years ago when this all started. In the interim, most of these large pharma companies and the industry overall for that matter has really purged their pipelines. The name of the game is not so much anymore a question of taking out projects and culling the portfolios, but much more, if you want, other strategic elements are probably overriding. So, what that means for us, specifically, is that the safety, if you want, of our projects and our work is much higher than it used to be in the past. So our review is that even if this were to happen, that the positives are actually higher because the experience has been that every time an event like this happens actually eventually outsourcing gets bigger. But the projects that are ongoing right now are very high priority for all of these companies. I would be very surprised, in fact, I would be shocked if there were delays in that. In fact, maybe the exact opposite may happen. Because they may rely on us to make sure that things stay on track. So our view is not one of concern actually that much and rather one of a situation where we can make potentially a positive contribution to keep things on track."*
- ...
- *"One of the benefits of our strategic partnerships is that we have basically an intimate discussion with them about these things. As of right now, we have been completely reassured that things are on track."*
- ...
- *"In the big scheme of things, it really doesn't even change really much of anything actually and certainly not negatively. I mean, overall, as I kind of pointed out before, we view this, actually, probably more with an optimistic approach. I think the benefits outweigh the potential downsides here -- for us, that's specific for PAREXEL."*

Intel's Results Promise More to Come

Published Apr 23, 2014 at 1:56PM

Intel (NASDAQ: INTC) reported first quarter 2014 earnings last week, and investors were sated enough to keep the stock near recent highs. Although revenue, net income, and EPS declined year-over-year, investors currently like the direction Intel is going. Even though the company lost $929 million in its young mobile operations division last quarter (and lost $3.1 billion last year in this division), management has a roadmap to turn the division profitable. Meanwhile, PC sales stabilized a bit (revenue down 1%, but units up) as companies resumed purchases. Consumer PC purchases remained relatively weak, but ticked up in emerging markets. Finally, the company's high-margin data center business continued its double-digit sales growth, up 11%. With Intel's mobile division starting to get traction, investors may be banking on more good news down the road.

Foolish Summary: Intel remains an exceptional operator in an average industry. Although the industry is filled with competitors, Intel stands out for its manufacturing and design prowess, its market share in PCs and servers, and its sheer size. Now its size is letting it start to take market share in mobile, mainly tablets. The key insight garnered this quarter is that Intel doesn't fear selling into lower-end markets, including tablets, because it believes it can eventually maintain healthy profits doing so. That's instrumental to an investment case as the company starts to sell much lower-priced mobile processors.

Guidance: The stock trades near *Pro's* $27 fair value (a fair price for a seller or a buyer), and yields 3.36%. Pro's guidance remains Buy, and we're content to manage covered calls on Intel in hopes for additional income. Assuming reasonable prices, we'll roll our covered calls whenever we need to in order to keep our shares and get the dividend. May 5th is the next ex-dividend date ($0.225), so we may need to roll before then.

Outlook

The company expects flat revenue in 2014, capital expenditures of around $11 billion (up slightly), and flat gross margins of around 61%. The data center group should grow revenue by low double digits (helped by Cloud), and the PC Client Group by mid-single digits. Overall, completely flat EPS is expected this year, and 6% growth estimated next year (helping drive our decision to write options now).

Intel Financials

- Share Price: $26.80 (up from $24.70 last Q)

Guidance

Fair-Value Est.	$27 (no change)
Consider Adding More:	$20 (no change)
Allocation	4.8% (up from 4.6% last quarter)
Yield	3.3% (down from 3.6%)
Status	Buy (no change)
Options use	Write covered calls (if you want to follow Pro)

Valuation

Metric	Multiple
EV/EBITDA	6.2
EV/EBITDA est. NTM	5.8
P/FCF Est*	15.9
P/E	14.3
P/E est. NTM	13.8

NTM = Next Twelve Months
*The 10-Q isn't filed yet, so FCF numbers are estimated.

Q1 2014 Conference Call Notes

*PC Client unit volume grew year-over-year for the second consecutive quarter, as enterprise clients bought more; mobile PC unit volume was up year-over-year for the first time since Q2 2012, while desktops were flat. Notebook unit volume was up YOY, but keep in mind that last year was very weak (inventories were low), so it was an easy YOY comparison. Inventories are now in very good shape across the chain.

*Intel's new Internet of Things division saw revenue of $482 million, up 32% YOY.

*The company has a goal to ship 40 million tablets this year. They have 90 design wins on Android and Windows, and shipped 5 million in the first quarter.

*Intel is subsidizing its mobile and communications (tablet and phone) sales, and will continue to this year, leading to large losses in this division. This "contra-revenue" is a straight deduction from revenue, and a hit on gross margins. It should start to abate (smaller losses) in 2015. Profits will take longer. But, see how Intel's size allows it to take market share by cutting prices to win designs? Then it gets into product architectures to ideally stay even as the contra-revenue ends.

*The company admits that it still has a lot to learn about being a foundry. Altera is helping them learn. Foundry partners signed up today will probably not see volume ramp until 30-36 months from now. The foundry work will run side-by-side with Intel's own manufacturing.

*14 nanometer should arrive in late 2015 or early 2016. Intel remains about 2 years ahead of competitors here, it claims.

*If Intels sells into 40 million tablets, it will have 15% to 20% market share in tablets.

*Intel believes it's crucial to be in PCs, tablets and phones, because you want products across the board being designed on Intel architecture. So, it needs to be in all of them, and win long-term contracts based on its architecture.

*CFO Stacy Smith: "We don't fear the low end of the market... Our manufacturing leadership can give us the cost structure to play profitably at the low end as well."

Property & Casualty Insurance Industry Checklist

Published Apr 21, 2014 at 4:00PM

Dear *Pro* members,

A few Monday Memos ago, I shared my investing checklist for the wireless tower industry, outlining five key areas to focus on as you research the wireless tower space. This week, I'll continue my checklist miniseries with a look at the property and casualty (P&C) insurance industry.

The Second Annual Polaris Award!

Pro Polaris Award 2014

Fools, it's time to honor our amazing community by nominating those members you think especially distinguish themselves on our discussion boards. We'll be accepting your nominations through May 1; the winner receives a shiny discussion-board charm and $250 toward their choice of Apple or Starbucks! See the full details here.

In contrast to the wireless tower industry and its three-headed oligopoly, the P&C industry is much more competitive, with the top three companies commanding only about 21% of the market, and the top 25 commanding only about 65%. (I'm focusing on U.S.-only market share for simplicity's sake.) Here are the top 10 U.S. insurers by amount of premiums written (source: April 2013 NAIC P&C Industry report):

1. State Farm — 10.3%
2. **Zurich Insurance** (NASDAQOTH: ZURVY) — 5.5%
3. Liberty Mutual — 5.4%
4. **Allstate** (NYSE: ALL) — 5.1%
5. **American International Group** (NYSE: AIG) — 4.5%
6. **Travelers** (NYSE: TRV) — 4.4%
7. **Berkshire Hathaway** (NYSE: BRK-B) — 3.9%
8. Nationwide — 3.3%
9. **Progressive** (NYSE: PGR) — 3.2%
10. United Services Automobile Association — 2.6%

With such a wide distribution of competitors, it's clear that there aren't strong barriers to entry in this industry, and competitive pressure (often in the form of pricing) is much more fierce than in the wireless tower industry. In competitive industries like the P&C industry, operational excellence is often one of the most important ingredients for success.

My P&C insurance industry checklist covers five key areas to focus on to help you find those insurance companies that are the operational cream of the crop.

Investment Checklist: P&C Insurance Industry

1. Underwriting Discipline

Perhaps the most important contributor to a P&C insurer's success is disciplined underwriting. Take a look at the company's combined ratio. If the ratio is less than 100%, it means that the company is collecting enough premiums to cover both its operating expenses and its payments on claims (i.e., the company is underwriting profitably).

Next, check how this ratio has trended historically. Is there a clear trend upward or downward? Does the company consistently underwrite profitably? Looking at underwriting trends can give you a sense of a company's discipline, the strength of its management, and the direction it may be headed.

2. Reserving History

Because insurers take on risk now and pay out claims later, they need to reserve some of their capital to pay for those future liabilities. Since no one knows what the actual liabilities will be until they happen, management must estimate expected losses and reserve enough capital to cover them.

And since reserves are based on management estimates, it's important to make sure management has a conservative history of reserving. If management is playing the earnings game by under-reserving, management is simply stealing from the future to boost today's profits.

You can find historical data on reserves and payouts in the company's 10-K. For an example of an insurer with a conservative reserving history, check out **Markel** (NYSE: MKL), which has reserve redundancies every year going back to 2003 (see page 115).

3. Investments

By collecting premiums up front and paying out claims later, during the time between premium collection and claim payment, insurers benefit from access to virtually no-cost capital (i.e., float).

In order to generate profit in addition to the income generated from profitable underwriting, insurance managers can invest their float in investment securities. Most often, insurers invest in conservative fixed-income portfolios, but that's not always the case, so it's important to review the investments.

Check out the insurer's investment portfolio and try to estimate its expected future return by comparing the split between bonds and equity. Get a sense of the riskiness of the fixed-income portfolio by looking at credit ratings and the duration of the securities.

In rare cases, great investment managers can be the single biggest driving force behind long-term returns. That's the case with Warren Buffett's investment portfolio with Berkshire Hathaway, which has helped drive an astounding 19.7% annualized growth in book value per share over the last 48 years.

4. Management

As hinted in the previous section, extraordinary management can often be the difference between an average insurer and an exceptional one. Each of the preceding three factors in this checklist is heavily influenced by management.

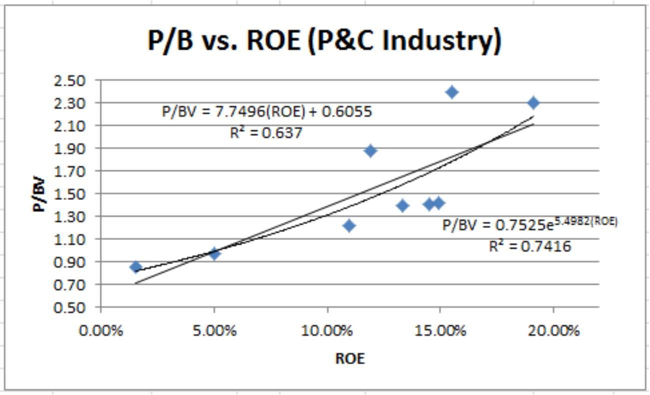
Take a look at management's tenure and track record. A good measure of an insurance manager's track record is growth in book value per share. Over the long term, anything higher than 12% annualized is pretty darn good.

Next, check management's incentives. Do the incentives align management with common shareholders? Does management own a significant amount of stock? You can find this information in the company's proxy filings. The best compensation policies are based on long-term metrics that drive shareholder returns, such as returns on capital, underwriting profitability, and growth in book value per share.

5. Valuation

Finally, armed with all this research about the company's fundamentals, take a look at valuation to see if now could be a good time to buy. My preferred metric to watch for insurance companies is the price-to-book (P/B) ratio. The more profitable the company (as measured by ROE), generally, the higher the P/B.

Here's a graph showing both linear and exponential trend lines for ROE and P/B for a peer group of 10 publicly traded P&C insurers:



Peer group: Allstate, Progressive, Chubb, ACE, Alleghany, RLI, Zurich, and Hartford. Source: S&P Capital IQ.

The Foolish Bottom Line

There you have it, Fools – my top five areas to research when looking at companies in the P&C insurance industry. We Fools love checklists because they help simplify the investing process and make sure you are focusing on the most important variables. I hope this one will help you better understand our investment in AIG and inform your future research on the industry and its participants. Just like the wireless tower industry checklist, this is a continual work in progress, so, again, stop by the Memo Musings board to give your input and/or suggestions for improvement.

Fool on!

Pro Guidance Changes

- **Papa John's International** (NASDAQ: PZZA): The stock moves from Buy to Hold while we reassess the valuation. We continue to own a 4.3% stake.

Pro Catch-Up Trades

- **American Tower** (NYSE: AMT): A reminder that we recently increased our allocation on this Buy First stock to 3.7%. Match us if you haven't, or write near-the-money puts (take your pick) if you'd rather target a lower buy price.
- **Oracle** (NYSE: ORCL): A reminder that we recently increased our fair value estimate to $41. We have a 4.8% allocation and Buy First guidance.
- **Tupperware** (NYSE: TUP): If you don't yet own 3% in stock, you can buy shares up to that amount, or sell to open May 2014 $85 puts for about $2 each, for a 2.4% yield in less than a month (or sell later, lower-strike puts if you want to be more defensive). Sell one put for every 100 shares you could buy at $85 (or $83 net), up to a 3% allocation.

Earnings: Wells Fargo Q1 2014

Published Apr 16, 2014 at 1:14PM

Another quarter in the books, and we got more of what I've now come to expect from Wells Fargo (NYSE: WFC) - excellent execution from the management team in a less-than-robust macro environment. WFC yet again continued its streak of record quarterly profit (now 12 consecutive quarters), again achieving efficiency gains (i.e. reduced expenses) and improved credit quality in a tepid demand environment.

What Happened?

- Record net income of $5.9 billion (up 14% from 1Q 2013)
- Record diluted EPS of $1.05 per share (up 14% from 1Q 2012)
- Revenue of $20.6 billion (vs. $20.7 billion 4Q 2013 vs. $21.3 billion in 1Q 2013)
- Efficiency ratio decreased to 57.9% (vs. 58.5% 4Q 2013 vs. 58.3% 1Q 2013)
- Net interest margin declined to 3.20% (vs. 3.27% 4Q 2013 vs. 3.48% 1Q 2013)
- ROA of 1.57% (vs. 1.47% 4Q 2013 vs. 1.49% 1Q 2013)
- ROE of 14.35% (vs. 13.81% 4Q 2013 vs. 13.59% 1Q 2013)

Continued increases in loan/deposit growth and credit quality:

- Total average loans up to $824 billion (vs. $817 billion 4Q 2013 vs. $798 billion 1Q 2013)
- Total average core deposits up to $974 billion (vs. $966 billion 4Q 2013 vs. $926 billion 1Q 2013)

- Net charge-offs as a % of total loans down to 0.41% (vs. 0.47% 4Q 2013 vs. 0.72% 1Q 2012)
- $500 million reserve release* (vs. ~$600 million 4Q 2013)

Capital allocation:

- Share buyback activity continued (common stock share count declined 7.5 million from 3Q 2013)
- Quarterly common stock dividend of $0.30 per share (up from $0.25 per share 1Q 2013)
- Received a non-objection to 2014 Capital Plan under the Comprehensive Capital Analysis and Review (CCAR), which includes a ~17% increase in the quarterly dividend to $0.35 per share (2.9% yield as of today's stock price) and a 350 million share increase in proposed share buyback activity

Operating segments:

- Community Banking: Net income of $3.8 billion (up 32% from 1Q 2013)
- Wholesale Banking: Net income of $1.7 billion (down 15% from 1Q 2013)
- Wealth, Brokerage, and Retirement: Net income of $480 million (up 41% from 1Q 2013)

*Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

CEO John Stumpf:

"Our solid first quarter results again demonstrated the ability of our diversified business model to perform for shareholders... First quarter 2014 earnings were another record for our Company and capital levels continued to strengthen... As we move forward in 2014, I am optimistic about the opportunities ahead and believe that we are well positioned for growth."

So What?

I started using a new format in my last earnings write-up, focusing on 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits

After three straight quarters of accelerating loan growth, the acceleration finally reversed, with loan growth up 0.9% Q-o-Q (down from 1.5% growth Q-o-Q in Q4 2013). I wrote last quarter that I'd have been pleased to see the acceleration of loan growth continue, but this result isn't at all disappointing. There were likely some seasonal and economic factors at play here, with record low mortgage originations, a continued low interest rate environment, and poor weather all combining to pressure loan growth. That loan growth still grew in this environment is an impressive feat, especially given that Wells was the U.S.'s largest mortgage originator through the recent refinance boom and they have also tightened standards on credit quality, which inherently reduces the pool of potential loanees. I have no qualms with trends in loans. As intermediate-to-long-term rates rise (who knows when that will happen... rates have *decreased* since the beginning of 2014... play around with this visualization if you want to see how rates have changed over time), I'd expect to see a resumption of accelerating loan growth from WFC. Let's see how it plays out.

As for deposits, it was another strong quarter, with 2.7% Q-o-Q growth and 4% Y-o-Y growth. Funding costs stayed stable, as WFC again reported a rock-bottom 0.11% cost of deposits. WFC is nearing $1 trillion in deposits (!). Since deposit growth again exceeded loan growth, compression of the net interest margin (NIM) continued, coming in at 3.2% (down from 3.27% last quarter and 3.48% a year ago). I've written about net interest margin compression here. Bottom line is, it's not a big deal and we should see NIM compress until rates rise and loan growth picks up.

2) Trends in credit quality

Credit quality continued to increase, with net charge-offs as a % of average total loans down to 0.41% (from 0.47% last quarter). It's impressive how management continues to wring out improvements in credit quality, and it is a testament to WFC's conservative underwriting (one of the many reasons I think WFC is the best-run big bank). The story here is not much different from last quarter, so I'll just quote myself from last quarter's write-up (updating it for this Q's numbers):

"Improvements in credit quality are starting to level off (as well they should - the trend in this figure has been unsustainable, as charge-offs can't possibly decline below zero). If you were to graph charge-offs as a percent of total loans since 4Q 2012, it looks like a negatively sloped asymptotic line approaching 0%. Credit quality improvements should continue to level off in the coming quarters and Wells Fargo will need to find other ways to drive profit growth. The [$500] million reserve release represents about [8.5%] of Wells Fargo's earnings this quarter (down from [$600 million and roughly 11%] last quarter). See the thread beginning with Dom's question here for some more color regarding reserve releases if you are interested."

3) Trends in the efficiency ratio

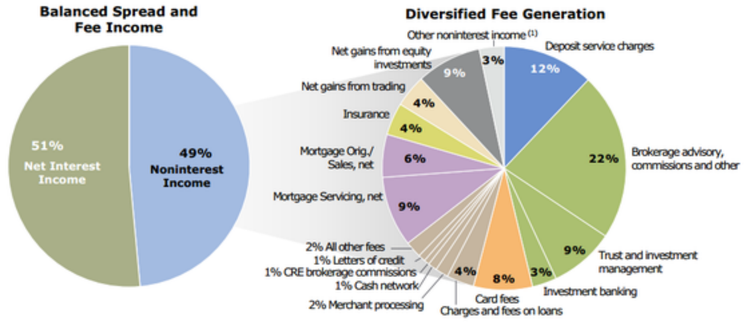
Nothing much here to analyze: we saw continued improvements in efficiency, with the efficiency ratio declining to 57.9% from 58.5% last quarter. Management continues to impress me with their consistency and ability to deliver as they promise with regards to efficiency. Management has stated that their goal is to ultimate get the efficiency ratio down to 55%. There was a veiled comment on the conference call suggesting that this ratio may increase next quarter (let's see!):

"We also plan to continue to invest in our businesses, and revenue-based incentive compensation expense could increase as businesses grow. However, we expect our efficiency ratio to remain within our target range of 55% to 59% in the second quarter." - CFO Tim Sloan

but I'm still confident in management's ability to steadily drive this figure lower over time.

Now What?

Not much different from last quarter (or the quarters before for that matter). Wells Fargo continues to execute its strategy and boast admirable consistency despite a fluctuating and uncertain macroeconomic environment. The company's performance is a testament to its diverse operating model. The company has so many levers to pull that if one segment falls (e.g. mortgage originations) others pick up the slack:



Source: Wells Fargo 1Q14 Supplement, Slide 4

There's no change to the $53.50 Fair Value estimate (representing a 1.75x P/B multiple) or the $41 CAM (1.35x P/B). Depending on next quarter's figures, I might alter my long-term ROE assumptions and update my model (ROE this quarter slightly exceeded my expectations), but for now it'll stay put.

Due to this company's stable performance, I likely won't be providing in-depth quarterly analysis from here on out (changing perhaps to bi-quarterly), unless there is an item in the quarter that stands out. I'll provide my high-level thoughts and do a deep dive anywhere that requires special attention.

Data and Guidance:

- Current price: $49.03
- Fair Value: $53.50
- CAM: $41
- Market Cap: $262.4 billion
- P/B: 1.61x
- Allocation: 2.9%

Wells Fargo remains a buy on our scorecard, and now is as good a time as any to match our 2.9% allocation in this workhorse of a company if you haven't yet.

Fool on!

Taking Stock of Where We Stand

Published Apr 14, 2014 at 4:00PM

Dear *Pro* member:

As you wrap up your tax filings for 2013, it seems a good time to take financial stock of where we stand here in *Pro*, too, before we all head deeper into the second quarter and earnings reports this month. We'll start by noting that the first quarter of 2014 was tranquil in the end, though it may have felt volatile. *Pro* had a stealthily good first quarter, matching our North Star, as shown in the column to the right (from our Recommendations page):

	Annualized Return Since Inception	Annualized Return, Rolling 3 Years	Year-to-Date Return
Pro	13.7%	11.6%	2.6%
North Star	8.4%	8.8%	2.6%
S&P 500	13.4%	14.7%	1.8%
MSCI World	8.4%	7.8%	0.8%

Table returns are as of March 31, 2014. Start date for annualized inception return is the close of Oct. 6, 2008. Pro *opened the morning of Oct. 7, 2008.*

The annualized S&P 500 index return over the past five-and-a-half years is historically high (topping 13%) and is likely to slowly revert toward the long-term mean, which is much closer to 10%. To keep our gains running stronger than that, we need to work to create additional returns, as discussed in last week's Memo. We also need to make some money when prices decline.

Price Volatility

Live Chat Coming Up!

We've got another live chat coming up Wednesday, April 23! Set a reminder and bring your questions.

The Nasdaq Composite fell more than 3% last week, and the S&P 500 nearly as much. That's a blip in the grander scheme, but it brought the market into negative territory for the year, with the S&P down nearly 2% as of Friday and the Nasdaq down more than 4%. The *Pro* portfolio started the year at $1,975,109, so it had declined only 0.8% (to $1,958,123) as of Friday. That's close to nothing, a single day's move, although it has felt like more.

It certainly could be more in the future. As we've been writing since mid-2013, some of our stocks look "ahead of themselves" on valuation by about a year or so. What does that mean? It means investors *appear* to be pricing in the assumed growth of 2014 and some of 2015 already, in some cases. So we may need to wait for results at some companies to "catch up" and for their valuation multiples to come down from, say, 18 times free cash flow to a more average 15 times (for example).

Why don't we sell instead? With some stocks, we may. But in many instances, we need to remind ourselves that valuation is an estimate, and far from precise, and the only way to compound your money with great companies is to own them for a long, long time. If we sold **MasterCard** (NYSE: MA) or **Starbucks** (NASDAQ: SBUX) because its valuation multiple looked a year ahead of itself, there's no guarantee we would get back in at a better price, especially if we take into account any taxes we may need to pay. These stocks will actually remain Buys as long as the valuation stays within reason.

The bottom line is that we're investors, not traders. So even when we see some valuations *reasonably* stretched, we need to be patient and stay true to our beliefs regarding what works best in the market, in order to reap the full long-term rewards of ownership. It's only when a business appears to be priced far ahead of its fundamentals — a few years' worth of results or more — that we will certainly lean toward selling it, or at least using options to generate returns or protection while we wait. We know that investing is three parts patience and one part a winning discipline, but we want all of our positions working for us as often as possible.

Middle Ground Now

Where do we stand now? After last week's decline, only five of our stocks trade higher than our fair-value estimates, and modestly so. For instance, Starbucks and MasterCard have already dropped below our fair-value guess; you can see that on the Recommendations page. Does this mean the decline is over? We don't know. But it makes it "easier" to own the stocks. As I wrote last year, I dislike seeing the market soar, because it's only stealing from future returns. I'd rather see reasonable, steady, annualized returns of around 10% a year. The market doesn't work that way in the short term, but that's how we think as we analyze our buy and sell decisions. Because ultimately annualized returns *have* smoothed out that way going back to 1927.

But right now, we're in a sort of middle ground. Our stocks aren't low enough to hit their Consider Adding More prices — prices where we may be eager to increase our allocations. Nor are most stocks we're watching for new purchases low enough to make us want to leap just yet (although some may be close). It also remains a tricky market for shorting. A word from the Fed about loose monetary policies can send the market soaring again, as it did last Wednesday. We need high conviction to short companies in what is still an accommodating Fed environment, especially as Europe begins to consider quantitative easing now, too. But we expect steady options trades to bring us profits within a price range in the market, and we expect earnings results this month to shake out some new opportunities, too, if the market itself doesn't. A falling market would open new doors.

All told: We may be in for a seesaw market for now. Children tend to love a seesaw; as adults, though, most of us already have enough adversity in life, so we don't tend to enjoy more of it. But adversity is part of the market, so we should view it as an opportunity when it occurs. The *Pro* portfolio is built on a solid foundation that provides flexibility, and we like our current market exposure of around 70%. Where we stand today, we're ready to act on any new opportunities we choose, long *or* short. One way or another, this middle ground that we're sitting on right now won't last. And that's good, because it will lead to opportunities in either direction.

Fool on!

A Note of Appreciation, and a Look Forward

Published Apr 7, 2014 at 4:00PM

Dear *Pro* member:

It's neither Thanksgiving nor the holiday season, but today I want to pause to thank you for being a Fool with us. We're grateful that you put your trust in the Fool and in *Pro*, and that you invest alongside us. We would not be here without your support, so you mean everything to us.

Relive Our Last Live Chat!

Our April live chat took place last week; if you missed it, you can read the transcript here!

In fact, it is your belief in the Fool that makes it possible for us to share our work with you. That has been true since The Motley Fool began in 1993; the community has lifted the Fool up every step of the way. Working together, we believe we're much stronger than we could be alone. And in *Pro* (and across the Fool), we want our service to add *much more* value to your life than it ever extracts. That's the core reason we're here.

Additionally today, we offer a warm welcome to new *Motley Fool One* members who are visiting *Pro* for the first time. If our investing strategies geared toward steady profits appeal to you, we hope you'll become a regular part of our family. You can learn much more about *Pro* in our Guidebook.

So, on an ordinary April day, thank you! We appreciate you, and over the coming months and years, we aim to show you just how much as we continue our dedicated work for results.

What's Up?

The first quarter of 2014 recently drew to a close. After a fairly volatile three months, the S&P 500 index was up nearly 2% for the year through March 31. The *Pro* portfolio was up a bit beyond that at quarter's end, on pace with our North Star (inflation +7% a year), which runs at about 2.6% per quarter right now.

Though one never knows, it seems likely that the higher-than-average stock market returns of the last few years will not recur this year. With that belief, we're compelled in *Pro* to undertake more activity to keep sight of our always-positive North Star. TheNorth Star is a relentless taskmaster. It goes up steadily. When we close our eyes, we have creepy visions of a clown-like star climbing an endless ladder and smiling down at us, mockingly.

So what are we going to do?

Income

We've been on the hunt for new option strategies with which we can confidently begin to generate recurring income. We want the allocations to be large enough that the income makes a difference – ideally, we'll start a small handful of such positions, and each will target 0.5% to 1% in income on the portfolio per year. Added up, that would make a sizable difference in returns. But it's no easy task when share prices are up considerably. If we're setting up diagonal calls, for example, we need to be confident that the underlying stock will hold its ground. An income strategy has little value if you impair your invested capital in the process. But we're confident that we can start several positions that will lead to steady income and long-term returns.

Shorts

We've been going through short candidates all year; we don't short stocks lightly. The most you can make on any short is 100%, so if you find a great short candidate, it shouldn't matter much whether you short it after it has already fallen for a while. In fact, in many instances that's preferable to shorting it on the rise and risking being called out early. We expect to have new individual shorts (for those members who use them) to help us profit on weak companies and when the market is weak.

Hedges

Meanwhile, we hedge by shorting market indexes. This way, we keep our market exposure lower even though much of our capital is invested. Our net market exposure continues to average around 70% (as shown at the bottom of the Recommendations page).

It's important to remember what a hedge is: It's a position that tempers your market exposure, but *will* lose money if the market goes up. This year, our hedge hasn't helped at all yet. The market is still higher than the price where we set the hedge up, and we pay a cost to cap the risk in the hedge. It's like any insurance policy -- you usually lose money on your insurance in the end, unless you have an usually large claim. And do you really want that catastrophe? Still, hedges let us keep more money invested for long-term appreciation, and will ultimately help in large declines.

Long Calls and Stocks

Finally, we would welcome a quick rout in the market for at least one other reason: We know several stocks we would like to buy – or, perhaps more interesting, long-term call options we would like to buy, or synthetic longs we'd like to set up – if more attractive prices come along.

Remember, there are two ways to capitalize on a market downturn: Either you can be mostly short as the market falls (which is a costly approach when you're wrong, and requires knowing when to close); or you can be ready to put more money to work at good prices when you see them. In an ideal scenario, *Pro* does both, but in some cases we're going to need to be happy with less than that. As long as we capitalize one way or the other, we can make a downturn work for us in the end. Right now, we're still hoping to capitalize in both directions the next time the market declines more than, say, 7%. But we need to work to get there.

Summing Up

By owning our core companies, adding more option income strategies, shorting carefully selected companies, and being ready to buy great opportunities when we see them, we're going to continue to work to generate our desired returns. We like what we own, but we realize that the market will not always have our backs by lifting prices higher. Sometimes you need to do more of the heavy lifting yourself, and the coming year or two may be one of those times. Right or wrong, we are going to proceed as if that's true, so that we ideally earn returns either way.

Roll Your Covered Calls on Intel

Published Apr 7, 2014 at 1:20PM

Is this for you? This is for *Pro* members who own shares of **Intel** (NASDAQ: INTC) and have April 2014 $25 covered calls on them.

How You Participate

- **Trade:** Use a rolling order to buy to close your April 2014 $25 calls, and sell to open an equal number of July 2014 $25 calls.
- **Allocation:** Roll every call you have previously written.
- **Price Guidance:** Aim for a net credit of at least $0.25, but as expiration draws nearer, execute at the prices offered.
- **Recent Prices:** Intel, $26.50; April 2014 $25 calls (bid/ask), $1.74/$1.80; July 2014 $25 calls, $2.02/$2.08. See current prices.

What We're Thinking

We wrote covered calls on Intel early this year to target extra income after the company announced lackluster earnings guidance for 2014. Shares have gained ground since then, forestalling our income and now forcing us to roll our covered calls to keep our shares. Rather than pay to chase the stock higher as it zigs, we will keep our strike price the same at $25 and wait to see if the stock zags back down, perhaps after earnings next week.

But if shares keep climbing higher, we'll be inclined to roll our calls again before long (and perhaps add some other options to the mix to boost our premium). The bottom line is that we're targeting extra income on the stock given a belief that it will stay in a general price range, but we aren't eager to sell our shares (with their 3.4% yield) right now, so we'll keep managing our covered calls as necessary and as long as it's attractive to do so. So, let's roll to keep our shares, get a bit more credit, and see what happens after earnings on April 15.

More That Matters

- **Maximum Loss:** Our exposure remains the same as stock ownership, minus the credits we have in the covered calls.
- **Maximum Gain:** Currently, our profit potential is limited to the credits in the calls, since they're in-the-money.
- **Breakeven:** Around $25 per share on these covered calls; our stock position is lately up 30% for us.
- **Follow-Up:** We'll keep managing the calls to likely keep our shares and ultimately earn premium, too.

Alternative Trades

- If you made the alternative trade of writing puts on Intel, for now wait as those expire as income.

Pro Can Help

- **Want to learn more?** See our guide to writing covered calls in our sister service, *Motley Fool Options*.
- **Questions?** Post your thoughts on the *Pro* Intel board.

Wireless Tower Industry Checklist

Published Mar 31, 2014 at 4:00PM

Pro Guidance Changes

- **Oracle** (NYSE: ORCL): Following third-quarter earnings, our fair value increases 9% to $41, and Consider Adding More rises $3 to $33. We have a 4.6% allocation, and the stock remains a Buy First.

Dear *Pro* members,

Recently on the boards, my colleague Sara Hov (TMFTycoon) posted a checklist detailing her process for analyzing companies in the retail industry. We at the Fool are big fans of using investment checklists to help us systematize our thinking and make smarter decisions. While a checklist isn't the end-all and be-all for our decision-making, it does make an excellent starting point and/or self-checking mechanism. As a member of the Fool's Analyst Development Program (ADP), I was assigned the same project as Sara and chose two different industries for which to make checklists.

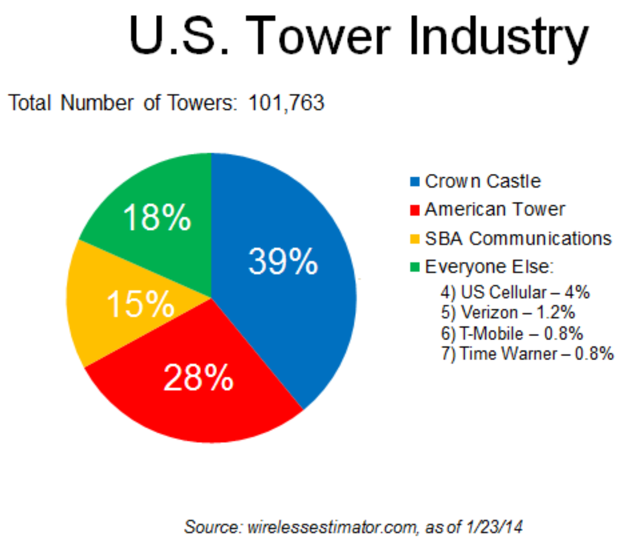
Live Chat Coming Up!

Our April live chat is coming up soon! Mark your calendar for 2 p.m. Wednesday, April 2, and bring your questions for the team. We'll see you there!

I picked the property and casualty (P&C) insurance and wireless tower industries. These choices were deliberate -- for *Pro*, I cover companies in each of those industries (**AIG** (NYSE: AIG) and **American Tower** (NYSE: AMT), respectively), and I figured that developing these checklists would dovetail nicely with my *Pro* coverage.

Being as *Pro* recently added to our stake in American Tower, giving us a 3.7% total position in the company, I thought I'd dedicate this Memo to discussing how I use a checklist to think about American Tower and its competitors in the wireless tower space.

The wireless tower industry is small in terms of the number of investable companies it offers -- there are only three U.S.-listed tower companies, namely American Tower, **Crown Castle** (NYSE: CCI), and **SBA Communications** (NASDAQ: SBAC). In the U.S., the big three collectively command 82% of the industry, with the rest being a fragmented mix of wireless carriers and independent tower owners.



The big three tower companies have historically been rational and profit-focused competitors, and this oligopolistic market structure enables healthy economic profits and consistent cash-flow generation, so long as the current market structure stays the same. They all benefit from scale, switching costs, and zoning and/or regulatory barriers to entry.

My checklist covers five key areas to focus on as you research the wireless tower industry. I'll discuss each area and provide a few examples of applying the checklist.

Investment Checklist: Wireless Tower Industry

1. Leverage

Tower companies all use leverage for several reasons:

- Consistent, contracted revenue and cash flow allow tower companies to easily service their debt
- It takes significant capital to fund acquisition-fueled growth
- Debt lowers the firm's weighted average cost of capital (up to a point)
- Interest payments are deductible and provide tax savings

So start by checking the company's debt covenants to see whether its leverage ratio (some form of debt/EBITDA) and interest coverage ratio (some form of EBITDA/interest) fall comfortably within the allowed ranges. You'll also want to check the company's weighted average cost of debt (the average interest rate it pays to its creditors), as well as its debt maturity schedule (when it needs to repay its loans), to make sure it can effectively service its debt.

For example, here is a table showing the current weighted average cost of debt for each of the tower companies.

Company	S&P Rating	Weighted Average Cost of Debt
American Tower	BBB-	4.9%
Crown Castle	BB-	4.9%
SBA Communications	B+	6.1%

Source: S&P Capital IQ

Get a good handle on the company's overall liquidity: Does it have undrawn credit or loans? How much cash does it have? If these metrics don't add up or seem untenable, this may be as far as you need to go to rule out the company as a good investment.

2. Tower Portfolio

Assuming the debt picture looks sustainable, it's time to look at how many towers the company has. How many are in the U.S. versus abroad, and what do margins look like? Here's the tower count for the big three:

Company	U.S. Towers	International Towers
American Tower	28,019	39,399
Crown Castle	39,600	1,700
SBA Communications	19,683	5,196

Source: Company filings

Since international wireless penetration rates are generally lower than in the U.S., tower companies have seen faster growth and often better margins abroad. We want to see tower companies investing in the most attractive opportunities, so look for tower portfolio expansion plans focused on the highest growth and/or most profitable areas.

Then move on to how effectively the towers are used. How many tenants are there per tower, and in each geographical area? How are those trends moving over time? Since each additional tenant increases profitability, the higher the tenancy rate the better.

And because tenants sign long-term leases, you'll also want to check on the company's recurring lease revenue. What does the renewal schedule look like, and what's the typical or historical lease renewal rate?

The same applies to the real estate on which the towers stand: Does the company own the real estate or hold long-term leases? Are many of those leases up for renewal soon, and is it likely the company will be able to get the same or similar rates when it renews? We want to make sure the company's revenue and cash flow are secure, so the longer the amount of time until a company has to renew its leases, the better.

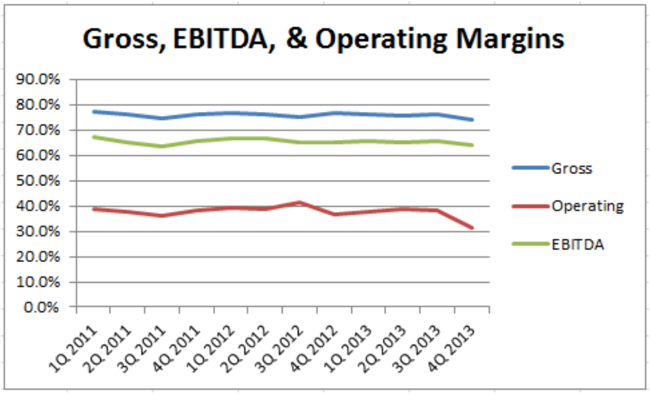
3. Financial Performance

Now it's time to dig in to how well the company is deploying the cash flow its towers generate and allocating its capital. Check out historical revenue growth, breaking out organic versus acquisitions, if possible. Healthy organic growth is a good sign.

You'll also want to study return on invested capital (ROIC) trends over time. As the company increases its portfolio and leases unused tower space to more tenants, expect ROIC to gradually rise. A good formula to use for ROIC is EBITDA (earnings before interest, taxes, depreciation, and amortization) minus maintenance capital expenditures divided by property, plant and equipment plus goodwill and intangibles:

(EBITDA – maintenance capex)
(PP&E + goodwill / intangibles)

Finally, take a look at gross, operating, and EBITDA margin trends over time. Are the margins growing? If so, the company's operations, its bargaining power, and/or trends in the larger market are likely growing stronger. Here's what American Tower's margin trends look like since 2011:



Source: Company filings and analyst adjustments

4. Management

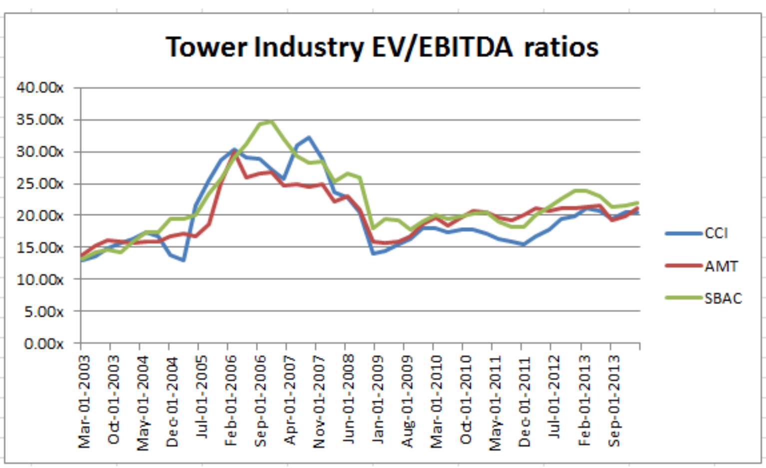
Now you'll want to look into the company's leadership. Does management's tenure, experience, and historical performance align with a strong outlook? Are executives spending their capital sensibly, on projects likely to earn the highest returns? Are management's incentives aligned with shareholder-friendly goals?

It may be worth reading transcripts or listening to webcasts of the company's recent earnings calls to get a sense of the personalities heading up the company and their levels of confidence. I prefer level-headed, rational, efficient managers who can make quick yet prudent decisions. I also like to see managers who are optimistic, but not overconfident.

5. Valuation

Armed with all this research, you can now take a look at the company's valuation to see if now is a good time to buy. Because tower companies are capital-intensive and use lots of debt, their cash flows are tax-shielded by large depreciation and interest expenses. As such, their reported earnings (the denominator of the P/E ratio) are not representative of their true cash flows.

To strip out these distortions, I prefer to use the enterprise-value-to-EBITDA multiple (EV/EBITDA) instead. Check how it's changed over time, and how it compares to those of other wireless tower companies. Based on the other information you've found, does this multiple seem higher or lower than it should be? And how does this picture align with your investment goals? Here's what the EV/EBITDA ratio looks like for the three tower companies since 2003:



Source: S&P Capital IQ

The Foolish Bottom Line

Checklists can help simplify the investing process and make sure you are focusing on the most important variables. I hope this one will help you better understand our investment in American Tower and inform your future research on the industry and its participants. Almost all of this information can be found in the companies' SEC filings, investor presentations, and conference-call transcripts. As Sara mentioned in her original post about her retail checklist, this is a continual work in progress, so stop by the Memo Musings board to give your input and/or suggestions for improvement ... and keep an eye out for my P&C insurance checklist in a future Memo!

Fool on!

Earnings: ORCL Q3-2014

Published Mar 26, 2014 at 11:26AM

Oracle (NYSE: ORCL) reported healthy numbers in a slow environment and is confident about its future. With new products in hardware, software and cloud, Oracle has a total business computing solution and scale (giving it better pricing) that smaller rivals can't match; and, it has a newly larger, trained sales-force to go after new deals. As companies look to move their processes, applications, and data onto the cloud, and not worry about hardware, Oracle can make the process easy and comprehensive by offering a full solution under one roof. Customers commit to long-term contracts with Oracle, especially data customers, as they invest in the relationship.

Our Fair Value increases 9% to $41, and Consider Adding More rises $3 to $33. We have a 4.6% allocation and the stock remains Buy First.

Synopsis for Q3

- Currency neutral software revenue grew 6% YOY
- Software updates and product support (aka, recurring revenue) grew 7% and were nearly half of total sales
- Q3 renewal rates hit a four-year high
- New software license revenue grew 5%
- Database software (Exadata, Exalytics, B.I.) all grew more than 30%
- Hardware revenue grew 10%, with Engineered Systems up more than 30%
- Total revenue grew 6% to $9.3 billion; operating margin was steady at 47%
- Free cash flow increased 11% to $14.4 billion over the past 12 months
- Guidance: Q4 revenue could grow 3% to 7% in dollars, as software and hardware both grow from 0% to 10%, currency neutral

Business Highlights

- It was Oracle's best cloud quarter, with booking growth up more than 60% (more than doubling revenue growth, since revenue is earned over time)
- Engineered Systems is growing rapidly for the same reason that Cloud is: Customers want an integrated hardware and software solution so they don't have to do it themselves; Oracle is uniquely positioned to offer both together
- Oracle believes it is replacing IBM's pSeries as the leader in high-end computing
- Oracle's hardware grew in every single region, while competitors are seeing declines. It views its Engineered Systems as a new category in high-end computing, especially since it allows Cloud implementations of all your Applications
- Engineered Systems started small and are now about 30% of sales, and soon it's going to be more than 1/2. They've gotten out of the commodity storage business and into computing systems running its own IP -- these are rapidly growing businesses with "very high margins."
- Database continues to grow strongly, and Oracle anticipates its 12c roll-out this summer, which should improve data analytics performance by more than a factor of 10, and in some cases a factor of 100, will drive more deals. Oracle wants to become the #1 data analytics company in the world.
- Oracle is ready to compete with Amazon (even though it's a commodity business, it's not a bad one, it says), and feels great about its competitive position against Workday and the others often noted.

- Oracle has more feet on the ground. As you'll recall, it greatly grew the sales staff the last few years, and that staff is now becoming more adept at selling Oracle's new product lines.
- The company believes its ecosystem is complete and highly competitive for the future -- with performance and cost benefits smaller companies can't match
- The company will keep adding salespeople next year, as it moves to take on competitors in new arenas
- Cap Ex spending is down YOY; the company believes it has "enormous scale" that it has not fully tapped yet. They've been investing for scale for years, and they have a lot more scale to gain from it. So, they're very happy with where they are right now.
- As a result of past investments, ORCL's current cap ex should not ever be as high as its infrastructure competitors in the cloud. The company is ready to roll.

Going Forward

- Database, cloud applications, and Engineered Systems should continue to drive FY 2015 growth.
- ORCL is driving to be a leader in all three cloud areas: SaaS, Cloud Applications and platform and infrastructure. They're cost competitive at the infrastructure level, and highly differentiated at the platform and application level. They say they're positioned to offer better performance, complete solutions, and lower overall prices. Following Oracle for nearly 10 years now (remembering how they started cloud programming 8 years ago), I believe them.

Hedging Our Way to Portfolio Success

Published Mar 24, 2014 at 4:00PM

Dear *Pro* member:

Live Chat Coming Up!

Our April live chat is coming up soon! Mark your calendar for 2 p.m. Wednesday, April 2, and bring your questions for the team. We'll see you there!

Last week, I attended the annual Risk Management Conference hosted by **CBOE Holdings** (NASDAQ: CBOE). As in years past, about 300 analysts and investors from every major Wall Street firm you could name (and several I couldn't) gathered to hear presentations on volatility and risk. As you might imagine, this year it seemed everyone was talking about an illusion — some fictional character named "volatility" that long ago used to haunt the market. Volatility has been slight the past 15 months, and memories are short, but surely we'll see more of it eventually.

That makes it all the more ironic that many investors are no longer hedging. Indications are that many institutional clients have told their money managers they no longer wish to hedge, because they're tired of sacrificing returns. One has to wonder if this collective "throwing in the towel" is a contrarian sign that suggests now *is* a good time to hedge. Our plan in *Pro* is to invest as we normally do. We haven't sacrificed greatly by hedging, because most of our hedges have been low-drag or low-cost. Sure, we've given up some good ground by being short market indexes, but on the whole, we can't complain that we're topping the North Star and the S&P 500 while only being about 70% net long.

Our bottom line on hedging remains this: *A hedge is a position that helps you keep more money invested (otherwise, why hedge?). So, in the long run, reasonable hedges can lead to greater total gains because you have more invested than you otherwise would — while exposing you to less risk.*

A similar belief was voiced at the conference, when a panelist noted that if you lose 40% on a hedge that makes up 5% of your assets, but that hedge allowed you the peace of mind to be 95% invested, and you earned 30% on that 95% of your money ... then you've won by far.

I summarized my experience at the Risk Management Conference on the *Pro* philosophy discussion board. To whet your appetite, here are just three points:

- Pricing models suggest that buying long-term calls (namely LEAPs) and writing short-term puts (expiring in 30 to 60 days) remain two of the more attractive option strategies today — when done well. With the VIX (the CBOE volatility index) and interest rates both low, long-term option prices could go up over the coming few years as implied volatility and interest rates tick higher.
- The average mutual fund using options has gained 10% annualized since the market bottom in March 2009, while mutual funds not using options have gained 18% annualized. That's a large difference (one *Pro* is happy to have sidestepped), but when the market is flat for a few years, funds using options should be relatively stronger.
- Historically, hikes in interest rates have *not* led to substantial increases in stock volatility, although implied volatility (the VIX) may trend higher. Right now, many expect interest rates to start to rise in 2015.

I hope you'll enjoy much more from my summary of the event, even though (or possibly because!) my experience there reiterated my belief in the Foolish way of investing. Thousands of smart people spend their time trying to understand and invest for volatility. Meanwhile, Fools like us have focused for years on buying outstanding companies to compound wealth. There's no question in my mind which group is coming out ahead. We'll continue to hedge, short, and of course enjoy the great power of options in *Pro*, while aiming to smooth our returns and capitalize on downturns; but our long-term goal is to compound the bulk of our assets by owning great businesses at good prices.

One Fool to Rule Them All

Speaking of compounding, now there's a way to compound your exposure to Foolish advice, all in one service. Members have been talking about *Motley Fool One* on the *Pro* discussion boards, so I want to share some thoughts about the service. First, *One* is the Fool's all-access offering to every Fool service in existence. *One* also gets you access to services only offered in *One*, including:

- Tom Gardner's real-money service, the Everlasting Portfolio.
- Access to Motley Fool Wealth Management (MFWM), including Ayco financial advisors you may call on the phone, and real-time portfolio analysis tools.
- *One* members can also use Motley Fool Wealth Management's new separately managed accounts (SMA) service to automatically mimic the real-money Fool portfolio of their choice, without needing to make any trades themselves.

If you're subscribing to a few Fool services, a long-term *One* membership may save you money in the end. You keep your *Pro* and *Options* memberships, of course (again, *One* is all-access), and any credit remaining in your existing services goes toward paying your *One* membership. We hope you're delighted with *Pro*, of course — but if these other offerings sound appealing, please do consider *One*. If you've already applied, check your inbox for your invitation; if you haven't, you can click here to join the waitlist.

Fool on,

— Jeff (TMFFischer)

Pro Completed Trades (see all trade alerts)

- **American Tower** (NYSE: AMT): We bought 300 more shares at an average cost of $81.62, bringing our total stock allocation to 3.6%. The stock remains a Buy First.
- **iShares Russell 2000** (NYSEMKT: IWM): We rolled our long March 2014 calls to long May 2014 $122 calls, and let our short calls exercise into a short of IWM shares. This left us with a covered short position in IWM at a 9.9% allocation -- as a market hedge.
- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): We let our short March 2014 $46 puts exercise into more shares, bringing our stock allocation in DGS to 2.6%. Shares remain a Buy.

Guidance Changes

- **WisdomTree Emerging Markets SmallCap Dividend Fund**: Our fair-value estimate moves down to $54. Emerging-market stocks in aggregate trade at a 20% discount to their long-term average valuation, so we're comfortable buying more, but after a few years of little growth, our fair-value estimate needs to come down. Our Consider Adding More price also comes down because we did just buy more. The new CAM is $40. Shares are a Buy at 2.6%.

Coverage

- **The Buckle** (NYSE: BKE): Bryan published an update on the jeans retailer's results. Shares remain a Buy First at a 2.6% allocation.

Roll Your Long Calls on IWM

Published Mar 18, 2014 at 2:15PM

Is this for you? *Pro* members with a March bear call spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF who wish to continue the hedge, or end it, should follow the guidance in this trade alert or its alternative trades.

How You Participate

- **Actions:**
  - **If you *can't* stay short shares of IWM because of your broker:** Close your entire March spread and follow the alternative put-buying or put spread trade at the end of this report, assuming you want to continue to hedge.
  - **If you *can* stay short shares of IWM:** Use a rolling order to simultaneously sell to close your March 2014 $118 calls (substitute your adjusted strike price if you adjusted your original position up or down), and buy to open an equal number of May 2014 $122 calls (adjust up or down a strike if you like that roll better for your situation).
  - Assuming you can short shares of IWM at your broker, leave your March 2014 $100 calls alone; they'll exercise into short shares by the weekend. Their risk will be capped by the long calls you're rolling to.
- **Allocation:** As before, 10%. Keeping the same allocation you had before, roll one long call for every 100 shares of IWM you are or will soon be short. If you're setting up an alternative spread trade, set up the same number of contracts as before (one spread for every $118,000 you manage, now). If you're just buying puts, only invest what you're willing to risk.
- **Price Guidance:** Prices will vary as the ETF moves, and with expiration near, specific price guidance is not practical. Lately, the roll will come at a small debit.
- **Recent prices:** IWM, $119; March 2014 $118 calls, $1.61; May 2014 $122 calls, $1.78; subsequent roll debit, $0.17 (but that will change; use what you get).

What We're Thinking

What *Pro* Is Doing

We can stay short IWM, but we'll cap our risk by rolling (selling to close our long March 2014 calls, and buying to open an equal number of May 2014 $122 calls) our long calls. We're leaving our short March 2014 calls alone to turn into additional short shares of the ETF by this weekend. Those who can't short should follow an alternative trade if they wish to hedge.

The bull charges on! The iShares Russell 2000 ETF enjoyed a record-long rebound from February into March. Thankfully, our bear call spread capped our risk on this hedge from day one, so we didn't sweat the ascent. The core *Pro* portfolio enjoyed the market's rebound, and our capped-risk hedge added some peace of mind.

Now, though, this hedge is coming to an end, our hand forced by the approaching March 21 expiration. We want to maintain a 10% market hedge as we continue to seek individual shorts to buttress the portfolio against downside. The cleanest way to continue the hedge is to let our short March calls ($100 strike price for most of you) simply get exercised this weekend, resulting in a short position on the ETF itself. Assuming you can short shares of IWM at your broker, just wait and the options will be exercised soon. Given our original credit when we wrote these calls earlier this year, most of us start with a short price of around $112.

But we do want to continue to cap our risk on this short, so we're rolling our protective long calls ($118 strike for most of you) to May $122 calls. This will cap our risk at that strike price, while we'll still enjoy (if that's the right word) unlimited gains from our IWM short if the index falls. So, in summary, we're simply letting our short calls turn into a short of the stock, and rolling our protective long calls to a later expiration and higher strike. Our hedge remains in place, then, with just one roll trade on the higher-strike calls we own.

We hedge to smooth volatility and have a profitable position should the market decline. If you don't care about those things, you don't need to hedge.

More That Matters

- **Maximum Loss:** Risk is capped at our $122 strike, so about $3 per share higher.
- **Maximum Gain:** Our maximum gain stems from the short position and occurs if IWM declines to zero (minus the cost of our long calls).
- **Follow-Up:** We'll stay short IWM and manage our risk with long calls for as long as we desire, but not likely more than a handful of months.

Alternative Trades

- **Unable to short IWM directly?** Close both sides of your March spread, and then – if you want to remain hedged – simply buy to open May 2014 $118 puts (they're lately about $3.15 each). Buy one put for every $315 you're willing to risk. The puts will go up in value if IWM's price falls more rapidly than the time value does, but will expire worthless if IWM doesn't decline.
  - Or, set up a May 2014 bear *put* spread. Simultaneously buy to open May 2014 $118 puts and sell to open an equal number of May 2014 $110 puts to finance part of your put purchase. You'll profit on a decline in IWM all the way to your lower strike (about 7% lower), and your risk is your net debit to set this up -- lately about $2, or $200 per spread. To target a 10% allocation, set up one spread for every $118,000 you manage.
- **IRA-friendly:** You can't sell short stock in an IRA. If you have the March bear call spread, close both sides of it with a spread order, and set up the alternative put-buying or bear put spread trades in the bullet points directly above.
- **Or do nothing!** Remember, you hedge only if you want to protect against some downside. You don't need to hedge if you don't have that desire at present.

Pro Can Help

- **Questions?** We imagine there will be some! Visit our IWM discussion board.

Earnings: BKE Q4-2013

Published Mar 17, 2014 at 4:19PM

Pro's Take: BKE Q4-2013 Earnings

The Buckle (NYSE: BKE)

Quarter Quick Take

The fourth quarter completed a steady but uninspiring year for The Buckle. The company opened 10 stores (net) and saw growth in its online sales but only held the line everywhere else. The lack of a dramatic decline in sales and profits during the year actually puts The Buckle's performance near the top of its mall-based apparel retailer peers. The company's exclusive merchandise strategy (roughly 70-80% of items can't be found elsewhere) has greatly helped maintain margins in a period of industrywide discounting. In 2014, management expects to open the most stores (17) it has since 2010, build a new headquarters, and sell more jeans.

....

Q4-2013 / FY-2013

Revenue growth***: +1% / +2%

Operating profit margin: +70 bps to 27.8% / -10 bps to 22.8%

EPS growth: -4% / -2%

Corrects for the 53rd week in 2012

....

Guidance Update

The Buckle's results were a bit worse than I had modeled, but very respectable in the current apparel retail environment. Management does not provide guidance, but they did announce healthy 2014 store expansion plans (17) and a high capital budget ($48-$53 million for new stores, remodels, and a new building at HQ). The new building at HQ will ding near term cash flow and won't have any positive impact on future growth or profitability. Still, the long-term drivers of value remain in place: new store openings, modest profitability improvement from increased BKE branded products, and slight comp store improvements as new stores age and merchandise assortment expands. Accounting for stronger near-term headwinds, I'm lowering the company's Fair Value a bit to $53 and Consider Adding More to $37. The Buckle remains a Buy First and we're content with our 2.5% allocation.

Updated guidance: Buy First (no change)

Recommended Allocation: 2.5%

Fair Value estimate: $53 (decreased)

End of Fiscal Year expected FV estimate: $57

CAM price: $37 (decreased)

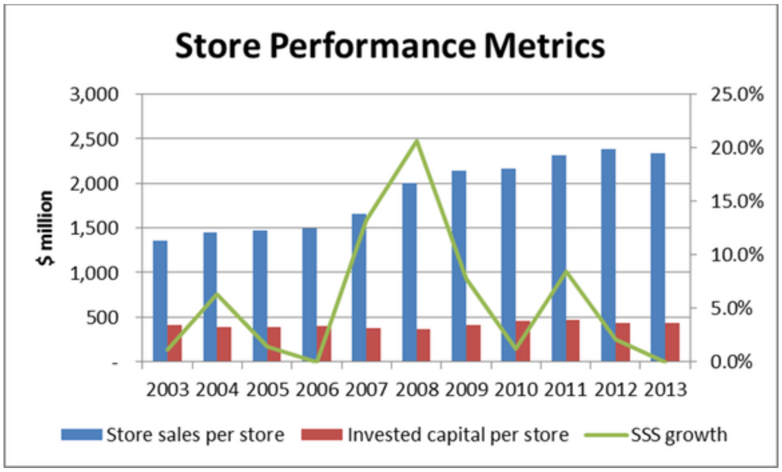
Shares of The Buckle remain undervalued. Shares normally trade in a range of 6-9x EBITDA (currently <7x) and I'd look to write puts for an effective buy price around 6x, which is our CAM price.

Our Thesis

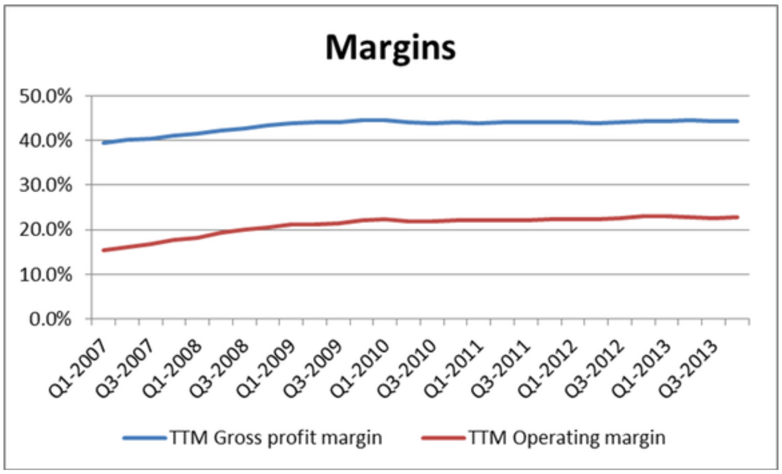
The Buckle offers retail exposure with low fashion risk (jeans and tops). Its management team is properly incentivized, has meaningful ownership, and run the business wonderfully well. We expect measured growth from store openings, online expansion, and expanded merchandise assortment (footwear and children's clothes). We are not expecting dramatic operational improvements, but we believe in-house brand penetration and an improved online experience are opportunities. The Buckle should grow its earnings, pay a regular dividend, and we expect it to pay out excess cash distributions (more years than not).

The Most Important Things

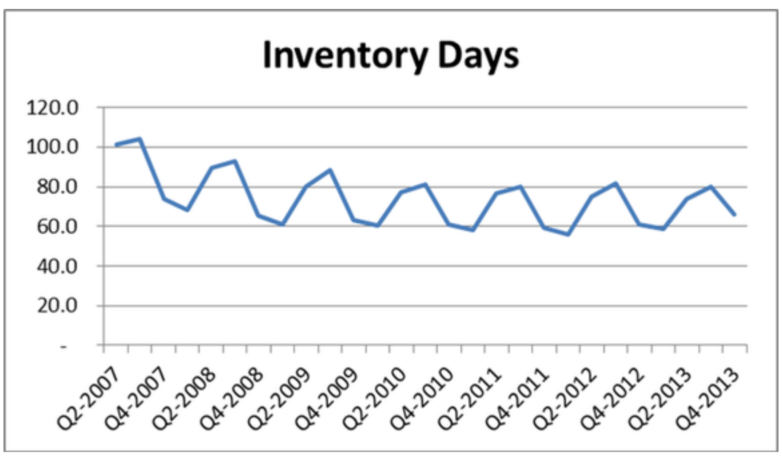
1. Store Performance: Same store sales, sales per square foot, store sales per store, and invested capital per store are all worthwhile metrics to assess store performance. The reason The Buckle has generated so much value over the years is because it has been able to sell more (profitably) through each store without having to invest much more. And while same store sales growth is noisy, it is consistently positive. Store sales per store ($2.3 million) and sales per square foot ($461) both modestly declined in 2013, mostly because the 2012 included a 53rd week and because the units sold per transaction declined a bit.



1. Margins and inventory: Retailer gross margins and inventory levels expose whether or not merchandise selection is on the mark: if you've got items nobody wants you either have to put it on sale (which will ding gross margins) or let it sit on your shelves (which will ding inventory turnover). Historically, The Buckle has merchandised well, and margins have risen steadily...



...while it's days in inventory have also improved:



I don't expect much improvement in gross margin going forward. Inventory management will remain critical. Inventory grew 20% over last year, which is a yellow flag when compared to flat sales growth. However, management contends that the inventory build is the result of running a bit too lean coming out of the 2012 holiday season and missing sales, ordering ahead of the Chinese New Year (which is a minor disruption to getting merchandise), and filling the shelves with children's clothes (a new initiative). I'll be watching this – BKE management has certainly earned the benefit of the doubt, but this could signal slowing sales or declining gross margins to come.

WWTN

The Buckle is operating admirably in a difficult apparel retailing environment. We've incorporated current headwinds, higher investment expected in 2014, and continued strong operational execution into our estimates and think shares remain undervalued and have plenty of long-term upside.

Conference Call Notes

- On SSS: Q4 SSS were down -2.8%, FY-2013 SSS were flat. Q4-2012 included an extra week which makes these figures appear worse than they are.
- On e-commerce sales: Q4 online sales were up +7.3% (excluding the 53rd week last year) and up +7.5% for the full year. When asked about why online sales continue to grow at below market rates, management said "we have not been promotional with our online sales, and have not had any free shipping specials. We continually run it, our business, full price like our stores." I continue to believe BKE is underperforming with its online strategy – this remains an opportunity.
- On merchandise and store performance: For the quarter, UPTs increased +3%, average transaction value increased by 0.1%, and the average unit retail decreased -2.5%. For the year, UPTs increased approximately +3.5%, the average transaction value increased +2.5%, and the average unit retail decreased -1%. Sales per square foot was $461, compared to $475 last year, and BKE has 2.271 million square feet of retail space. Accessories and shoes continue to perform well, and sales of men's clothing was stronger than women's.
- On private label: Now 34% of sales.
- On stores: The company expects to open 17 new stores next year and eight remodels. At the end of 2013, 341 of the company's 450 stores were in its newest format.
- On merchandise margins: CEO Dennis Nelson: "But our margins have continually improved and they are at a level now that we don't promise continued improvement there. But we will do our best to work at improving that."
- On the new stores: The 17 new stores reflect opportunities for great long-term investment .
- On the performance drivers: CEO Dennis Nelson: "The biggest impact on our business and the stores is our manager and the teams they develop. And so, region-wise, I don't see any great exceptions to different areas. It basically comes down to the quality of the store manager, and the experience the guest has there, that has an impact on the store."
- On losing share to e-commerce (show-rooming): CEO Dennis Nelson: "Well, I think the key to our success, along with our people is in our selection. With our brands, we almost are probably 70%, 80% exclusive styles in most seasons. And so, to find that exact product, or sometimes it is a exclusive fit for us as well as design, so that the guest cannot go elsewhere to buy that product. And then, among our own brands, we have several of our own labels in both men's and women's that our teams merchandise and design, and are also exclusive. And not only have a great look, fit, but is unique styling, and has been very successful as well. So it would be very difficult for somebody just to shop us, and then go elsewhere to make the purchase."
- On the core customer: CEO Dennis Nelson: "I think the misunderstanding is that we are only high school and college shop -- for a lot of investors think that's our only customer. And we have actually developed, where some of our stores where we have a little longer history will tell us that they are -- they have more guests over the age of 25 than under the age of 25."

3 Takeaways From Our Talk With O'Reilly

Published Mar 17, 2014 at 4:00PM

Upcoming Expirations

- **iShares Russell 2000 Index** (NYSEMKT: IWM): We will provide official guidance on our bear call spread this week. We plan to keep our hedge going and will offer guidance for those who want to do the same.
- **WisdomTree Emerging Markets Small Cap Dividend Fund** (NYSEMKT: DGS): Our $46 written puts are currently (slightly) in-the-money, and we expect to accept new shares at expiration after Friday. This will bring our stock allocation to around 3%.

Dear Fools,

Your *Pro* team is committed to understanding the companies we are part-owners of. We believe the key to sensible portfolio management is a deep understanding of risks, opportunity costs, and alternatives — weighing potential new investment opportunities (whether stocks, options, or cash) against our current investments with respect to our North Star and our understanding of any potential external derailments.

One way we attempt to refine our understanding of the companies we own is by speaking to their management teams. We understand this can be a controversial practice, but in the end, we'd rather have the added information — and be responsible for sifting through its fluff and bias — than not have it at all. As a result, we visited **AmTrust Financial** (NASDAQ: AFSI) in December, spoke with management at **Valmont Industries** (NYSE: VMI) later that month, and touched base with **The Buckle** (NYSE: BKE) in February. Last week, I sat down and spoke retail again; this time, the topic was auto parts retailing, and my conversation was with management at Buy-rated **O'Reilly Automotive** (NASDAQ: ORLY). Here are my takeaways.

Plenty of Miles Left to Travel

O'Reilly's consistent performance has been remarkable: twenty-one consecutive years of positive comparable-store growth and 20 straight quarters of 15% or greater earnings-per-share growth. But now, with more than 4,100 stores across the U.S., how much additional room for growth is there? Plenty. So far, O'Reilly is only in 42 states — it has yet to crack states as large as Pennsylvania. Management also believes it has lots of room to expand in key geographies: It has about 100 stores in Florida and thinks that market can easily handle 300, and its penetration of the northeast is really just beginning.

Management contends that the availability of attractive locations does not constrain its potential growth, but the ability to find and promote the right people to run those stores the O'Reilly way *does*. Because O'Reilly is a "promote from within" culture, the company's ability to find the right people and train up its teams is the real anchor to its new-store growth rate (which the company caps at about 200 stores per year). It also sees opportunity to win additional market share in established markets, both in its retail segment (sales to do-it-yourselfers) and its commercial segment (sales directly to mechanics).

O'Reilly is also steadily improving its e-commerce platform, which seems to be less of a massive sales engine than it is a gateway to the store — auto-parts sales to the weekend DIYer most often require a bit of hand-holding and advice that's best delivered in person. The final piece of the growth puzzle is the occasional acquisition, ideally of a small chain of stores with a motivated seller (these are admittedly rare occurrences, but the O'Reilly team keeps a close watch on worthy candidates).

The math seems to work out to another 5 to 10 years before O'Reilly begins to saturate the United States market, at which point its sales growth will be a function of store-level improvements, market share, commercial penetration, and organic growth. But we expect profits to grow even faster, and the company is likely to at least explore expansion into the rest of North America, which should pave the way for North Star-like returns.

Relationships Breed Stickiness

I typically avoid investing in retail companies because the barriers to entry are low and customers typically have no switching costs. As I tried to understand what might set O'Reilly apart, the answer kept coming back to "relationships." For commercial customers (mechanics), availability of parts, delivery, and price are critical — but that's just the beginning. It turns out mechanics don't buy their parts from O'Reilly; they buy their parts from "Joe, the local O'Reilly salesman."

This distinction is critical because it makes the transaction personal. O'Reilly trains its Joes (and Josephines) not only to sell parts, but to take ownership in the operation and growth of each customer's shop as a business enterprise. This means understanding the local market, having the systems to tie into the technology that runs each mechanic's shop, having the parts and training to assist in the repair of the equipment the mechanic uses to run the business, and never giving a customer a reason to call another supplier.

All this does appear to have resulted in some customer stickiness — which bodes well for O'Reilly as the leader in the commercial market that competitors are trying to enter. It also speaks to the challenges of entering new markets and winning share. O'Reilly's strategy is simply to establish the relationship, and when the opportunity arises to fill a customer's first order, "to service the heck out of 'em."

Culture Is the Glue

Selling auto parts to DIYers and mechanics doesn't seem like a business that should be as profitable and growth-laden as O'Reilly has proven it to be. The secret may lie in the company's culture, which jumped out at me through the phone. You can read about it here.

Two culture-related anecdotes will best show its impact. First, as noted, O'Reilly is a promote-from-within organization — most of the senior leadership team started behind the counter (including CEO Greg Henslee, who started as a parts specialist about 30 years ago). The company's leaders believe its district and regional managers should move up from store-level management. This ensures that they're in touch with store-level happenings, have established relationships, can empathize, and know how to foster great communication. The other culture-sustaining practice is requiring each meeting to start with a "culture statement," where the meeting leader tells a story of one of the company's values they've witnessed in action. While this may seem hokey, it ensures that the culture persists, remains prominent, and touches every decision.

The *Pro* Bottom Line

Pro owns a 3.7% allocation to O'Reilly, and shares are rated a Buy. Today, I have a better understanding of how the company has been able to achieve its remarkable financial and operational performance. While the retail industry is notoriously competitive and rarely conducive to competitive advantages, I'm learning that companies that can create service-focused niches, supported by unique cultures and leaders who are lifelong employees, have a fighting chance and are capable of great things. O'Reilly, as well as The Buckle, seems to fit that mold.

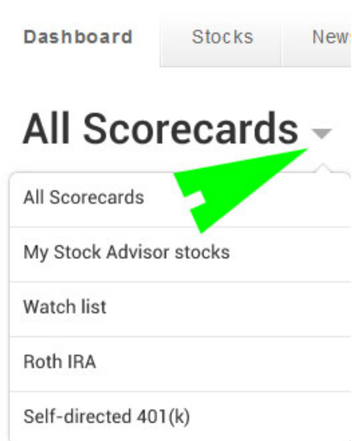
Onward,

— Bryan (TMF42)

Insider Tip: Track Multiple Portfolios in Your Scorecard

By popular demand, the Fool's new scorecard tool lets you track multiple portfolios! Keep your IRA holdings in one, your brokerage account in another, and stocks you're watching in a third — the possibilities are endless.

To get started, head to the tool and click the "Create a New Scorecard" button on the Settings page. You can then filter your Dashboard, Stocks, and News views using the portfolio selector drop-down menu at the top of the page, like so:



Pro Completed Trades (see all trade alerts)

- **iShares Russell 2000 Index** ETF: Eight of our 17 short call contracts were turned into short shares of stock. We're holding these short shares, and the rest of our IWM hedge, for now. We'll have new guidance this week.

Buy American Tower

Published Mar 17, 2014 at 1:45PM

Is this for you? *Pro* is raising our allocation to **American Tower** (NYSE: AMT) to 3.6%, so if you're following our portfolio closely, you should do the same.

How You Participate

- **Action:** Buy American Tower
- **Allocation:** Buy shares to bring your allocation up to 3.6%. *Pro* will be buying another 300 shares.
- **Recent Price:** $80.50
- **Price Guidance:** $82 or better
- **Options:** We may use them later, but they aren't necessary

What We're Thinking

Stock Info

- **Fair-Value Estimate:** $105 (recently raised from $100)
- **Consider Adding More:** $72
- **Scorecard Status:** Buy First

Pro members who have been following our **American Tower** (NYSE: AMT) position since its addition to our portfolio know that we have been writing puts since July 2013 with the goal of eventually adding a second helping of shares. Since our last put write expired as income in January 2014, *Pro* has been considering other ways to increase our allocation to this Buy First position.

We wanted to wait for Q4 earnings to be reported before making a decision, in order to update our valuation methodology to account for business performance over the past year or so. Those earnings have been out since Feb. 25, and we feel comfortable enough with our assessment of the business to increase our allocation by about 50%, bringing our 2.4% stake up to 3.6%. We expect that continued global growth in data consumption will stimulate wireless carrier network investments, leading to tenancy growth (meaning more service providers per AMT tower) and rising returns on capital over time.

American Tower continues to make progress against the checkpoints in our thesis, increasing our confidence that that the current discount to fair value is unwarranted.

- **We expected American Tower to continue to invest in and grow its tower portfolio, both domestically and overseas:** Check. 2013 was the most acquisitive year in the company's history, with more than $4 billion in acquisition spending, including two big transactions. Those acquisitions, along with continued investment in new site builds, contributed to more than 23% growth in 2013 in the company's tower portfolio, which now stands at more than 67,000 towers.
- **We expected strong organic growth in both domestic and international revenue, with international growth outpacing domestic growth:** Check. Organic growth (that is, growth *not* including acquisitions or new site builds) for full-year 2013 was 8.7% domestically (vs. 7.3% in 2012) and 13.5% internationally (vs. 13.6% in 2012). Both domestic and international growth outpaced management's guidance (6% to 8% domestically, and 10% to 11% internationally).
- **We expected tenant co-location to contribute to rising returns on invested capital (ROIC):** Check, sort of. We calculate returns on capital thusly: (adjusted EBITDA-maintenance capital expenditures) / (Gross PP&E + Goodwill/Intangibles). The company's big acquisitions of assets with low tenancy rates inflated both parts of the denominator of this equation (PP&E and Goodwill/Intangibles), causing downward pressure on ROIC. This downward pressure should only be temporary, and as those underutilized assets become more productive and gain more tenants, overall ROIC should continue to rise. Adjusting for the dilutive effect of acquisitions, 2013's ROIC was the highest in American Tower's history (just over 11%, vs. about 10% in 2012), and we expect it to continue its steady march upward.

To summarize: Our investment thesis is progressing nicely, the stock is undervalued relative to our recently updated $105 fair-value estimate, and we think now remains a good time to increase our small 2.4% stock position. Rather than write puts again and risk missing a further share-price increase, we'll increase our position to about 3.6% now, and we may consider more written puts in the future as business performance and market conditions dictate. If you prefer writing puts instead yourself, feel free to!

Alternative Trades

- **Looking for a lower potential entry price?** The April 2014 $80 and the July 2014 $80 and $77.50 puts offer reasonable premiums. Remember to use a limit order!

Your Slow-Mover Advantage Over Wall Street

Published Mar 17, 2014 at 12:42PM

Wall Street's short attention span makes it seem like the odds are stacked against snail-paced Fools like us. But in reality, high-frequency traders, big-pressure hedge fund managers, and supercomputers that calculate moves by the millisecond make our investing strategy even more successful.

In this exclusive glimpse at *Motley Fool One*, Morgan Housel reveals evidence for your single greatest — possibly even your only — advantage over Wall Street, along with three easy steps for maximizing your edge. Plus, listen to the *Fool One* podcast to hear Morgan and analyst Bryan White talk about how you can invest against the market's shortsightedness.

Podcast Transcript

BRYAN WHITE:

Welcome to EP Weekly. I'm Bryan White joined in the studio today by Morgan Housel. Thanks for joining us today, Morgan.

MORGAN HOUSEL:

Thanks for having me.

BRYAN WHITE:

And today, folks, it's just me and Morgan. Jason and Robert Brokamp and Chris Hill couldn't make it today, so you're stuck with just both of us, but we should have a great discussion today as Morgan has put out another special free report. It's called "Your Slow-Mover Advantage over Wall Street." We'll dig into that and also earnings season is just beginning for our EP companies. Coach reported yesterday and Starbucks reports today after hours.

First let's dig into this report, Morgan. A very interesting report -- another one from you. What gave you the motivation? Why did you pick this topic?

MORGAN HOUSEL:

I think there have been a lot of investors over the past couple of years -- maybe not necessarily all of our members from *Motley Fool One* -- but I've seen a lot of investors really start to question why is it worth being an individual investor when the evidence seems overwhelming that Wall Street has an edge over you. That the game is rigged in their favor against the individual investor. Things like high-speed trading, insider trading. We hear all these stories about how Wall Street can succeed over you.

But I think there's one huge advantage that individual investors have over Wall Street and it's this concept of *time arbitrage* -- which very simply put is if Wall Street is focusing on the next five months and you, the individual investor, are focusing on the next five years, that is a tremendous advantage that you have over them.

And you have that advantage over them because the way that Wall Street is set up ... And when I say Wall Street, I'm really talking about hedge funds -- big institutional, professional investors. They're by and large graded on the short term. They have to focus on the next quarter or else their clients start firing them. It's really a very short-term focus game. So, they're kind of stuck in that short-term bubble. If individual investors can get away from that and focus on years, it's a huge advantage.

So, I had some statistics in the chart about if you go and look back the past 150 years of the S&P 500 ... If you're looking at the market based on a one-day basis or a one-month or three-month basis, the odds of you making money is pretty close to a coin toss. The market goes up, goes down. That's what it is. If you can invest for five or ten years, your odds of making money are very good. And that flows down to individual companies, as well. If you're talking about stocks that miss earnings by a penny per share and then fall 20% after hours ...

BRYAN WHITE:

Yes ...

MORGAN HOUSEL:

... well that's Wall Street's game. But if you're in this for the next five years -- not only does that not affect you, but that becomes your opportunity at that point. So, really I think when investors focus on this, it becomes that this is the advantage that you hold over Wall Street and this is why individual investors can, indeed, outperform the market over the long run.

BRYAN WHITE:

Well, I think as One members, you do have an advantage. I think as members of One, you have a huge collection of great companies to choose from ... from all of the different services here at the Fool. And then, taking some cues from this report, we're likely to continue to see dramatic moves based on headlines, based on earnings reports, and especially with the more-and-more high-frequency trading that's going on in the market.

So, there's two different perspectives. One, the game's rigged against me or the perspective that hey, prices are going to jump quite a bit, and if I can only get my hands on a nice list of great companies for the future, I can be patient and wait for the most part. Or at least set my portfolio and then my incremental investments going forward -- part of them can be some of these things that move huge based on headlines and the news.

Obviously, you want to look at the fundamentals because sometimes a stock deserves to get hit, but a lot of times we're seeing an earnings season that stocks are just getting crushed just based off the headlines. The headline barely comes out and the stock's moved double digits.

MORGAN HOUSEL:

And I think it's really tempting for some investors to look at those moves and think, "What does Wall Street know that I don't?"

BRYAN WHITE:

Yes.

MORGAN HOUSEL:

My stock is down 20% after hours. Do they know something that I don't and should I be worried about that? And maybe sometimes that is the case, but I think most of the time the answer is no. It's just that they're just focused on the next 90 days. So, this move after hours or in the short run really doesn't apply to your goals as a long-term investor.

BRYAN WHITE:

Let's flip the coin on the other side. The short-termism, let's say, and let's say the advantage of high-frequency trades. What would be one negative that you would point out for individual investors like us that take the long-term approach -- but one negative that we should be mindful of because it's a true negative. Not everything is a positive story. What is one thing that we should watch out for?

MORGAN HOUSEL:

Well, I think it's really interesting. About two years ago at Fool.com, there was a group of writers that did this long, in-depth report on the flash crash which happened in May, 2010. The Dow fell a thousand points in a matter of minutes. So, they did this report and they set out to do this big investigation. They wanted to find an individual investor who had been harmed by the flash crash ...

BRYAN WHITE:

Okay ...

MORGAN HOUSEL:

... and they looked for weeks and weeks and they could not find one.

BRYAN WHITE:

Yes ...

MORGAN HOUSEL:

The flash crash -- the Dow fell a thousand points and then about five minutes later, it regained most of that. It's called a flash crash because it was over before most people knew it ...

BRYAN WHITE:

Yes.

MORGAN HOUSEL:

So really, I think when we're talking about high-frequency trading, it might harm individual investors if for whatever reason you need to sell stocks right this minute. I don't know why you would need to do that -- because you've got to raise money to pay a bill or whatever. Then, you know, it makes the day-to-day action more volatile.

But in terms of the value as an investor, and that we look at it, is owning real businesses for the long term, just like you would as a private investor. You own a McDonald's franchise and that's your business. If you think of investing that way, I really, firmly believe that high-frequency trading does not pose any risk to you whatsoever.

BRYAN WHITE:

I think you bring up a good point in your perspective. For investors [00:05:59] your portfolio is one of your small businesses. You may own another small business, but one of your small businesses ... it's your portfolio.

MORGAN HOUSEL:

Right.

BRYAN WHITE:

And to make snap decisions ... I mean, why not view it as if it was a small business? Would you run around and make snap decisions every day?

MORGAN HOUSEL:

Right.

BRYAN WHITE:

Every week? Acquire a company. Sell it off. Hire someone. Fire them the next day.

MORGAN HOUSEL:

You know, I've made the analogy before. If you own your home, let's say, and you go to Zillow.com one morning and you look up the value of your home and Zillow's having problems with its servers and it says your home is worth zero dollars ... Your home isn't actually ... Like, nothing happened to your house. Like, it's still warm. You've still got a roof over your head. Just because you get a bad quote or you get a problem in your servers -- nothing happened to the value of that house. And it's really the same thing when we're looking at stocks and talking about volatility and high-frequency trading.

BRYAN WHITE:

Well, it's a great report, Morgan. I hope everyone reads it. It's out there on the One home page if you haven't seen it yet, and we'll be looking forward to the next report, Morgan.

MORGAN HOUSEL:

Thanks.

BRYAN WHITE:

Now moving onto Coach. Coach reported yesterday. Basically the quick summary for Coach is the same struggles are still there. Comparable store sales, comps, in the United States or in North America fell 13.5%, which is a pretty disappointing result. They're still in the middle of a turnaround. The financials are not looking great right now. There's sort of a debate internally and within the market that Coach is a great value right now, great buy ... and then there's also the argument from the bears that Coach is in some big trouble. There's legitimate arguments on both sides.

We're obviously going to hold pat. We bought it for at least the next five years when we did buy it, so we've got about four years to go with Coach. Where I stand ... See, we all think differently. Between Tom, Jason and myself ... Jason tends to be more bullish on the name. I came into Coach incredibly bullish, but there are some warning signs out there. Number one -- fashion. Fashion is fickle. You can invest in a genius, but when it comes to fashion, if it turns on you, it turns on you. Not one person can really turn that around.

MORGAN HOUSEL:

Do you remember B.U.M. Equipment from the 1990s?

BRYAN WHITE:

Yes. Yes, I do. Wow!

MORGAN HOUSEL:

Things go from huge to laughable really quickly.

BRYAN WHITE:

Well, yes, and I wouldn't compare that ...

MORGAN HOUSEL:

No, I'm not making that equation, but when you said fashion is fickle ...

BRYAN WHITE:

Well, I think Coach is a great example, because Coach is one of those iconic brands ... and if it can happen to Coach, it can definitely happen to anybody out there. And then at the same time, it's almost a perfect storm for Coach. Huge management turnover. Both their lead designer and their leader and CEO, Lew Frankfort, stepping down. A lot of turmoil.

And at the same time, you have a category that Coach dominated, which was the affordable luxury category. The price point for handbags -- they dominated it for years. And now, all of a sudden, out of the woodwork, while you have management turnover, you have companies like Michael Kors and others that come into your territory and start taking share and they're very successful ...so far taking shares. So, Coach is under some pressure. Come to the boards. Jason's going to have a recap of the quarter after going through the conference call. We'll have further discussion on Coach. Tom's been out on the boards talking about Coach in the past, so you'll find his board posts out there. And then after hours today, Starbucks reports, so that'll be a big report. We'll be covering that today after the market.

All right, folks. That's all we have today. We will see you next week.

Save Time, Make Money

Pro Guidance Changes

- **Papa John's International** (NASDAQ: PZZA): We have raised our fair-value estimate to $46.50 and our Consider Adding More price to $35. Shares remain a Buy with a 4.7% allocation. Get the details here.
- **Parexel International** (NASDAQ: PRXL): We're moving Parexel from Buy First to Buy after the stock's strong price appreciation. We have a 3.6% allocation.

Dear Fools,

Live Advisor Roundtable With Tom Gardner Tomorrow!

In preparation for the reopening of *Motley Fool One* in just 10 short days, we're bringing you a special investor roundtable on **Tuesday, March 11, from 5 p.m. to 6 p.m. ET.**

Tune in to see a LIVE video stream of Fool co-founder Tom Gardner, *MDP* and *Deep Value* advisor Ron Gross, *Pro* and *Options* advisor Jeff Fischer, and *Supernova* Odyssey 1 mission lead Matthew Argersinger as they discuss the current market and answer your questions. It's not too often we're able to pull the wide-ranging investing insight of these top-notch Motley Fool advisors and analysts into a single chat, so **set your reminder now**!

In case you missed it, on Jan. 30, the Bureau of Economic Analysis announced that for the fourth quarter of 2013, U.S. gross domestic product (GDP) increased at an annualized rate of 3.2 percent. Woohoo! Then, on Feb. 28, the BEA revised its GDP estimate down to 2.4 percent (that's a reduction of 25 percent, but hey, who's counting?). I'm not picking on the BEA statisticians — it's hard to measure the entire output of a country. What *does* seem silly is that many investors hang on the 8:30 a.m. first releases and feel compelled to alter their portfolios and investing strategies based on what they hear — but it never seems like the first and second revisions (often dramatic) receive much consideration at all. Compounding the problem, I'm not even sure GDP measures what we, as investors, should really care about.

What Should We Care About?

Calling the GDP's usefulness into question isn't new or very helpful. An economy, or any measure of a population's welfare, is much more of a complex system than a discrete structure. In the last few years, there has been no shortage of proposed alternatives to the GDP with which to measure general progress:

- The United Nations came up with the Human Development Index, which considers life expectancy, educational attainment, and income.
- Friends of the Earth makes environmental adjustments (like the cost of climate change and ozone depletion) to traditional economic measures to calculate the Index of Sustainable Welfare.
- The Center for Bhutan Studies suggests that happiness is what matters, and has proposed a method of measuring Gross National Happiness.
- The OECD has identified 11 vectors to measure how life is improving or not; the intersection of those 11 vectors provides the Better Life Index.

While these measures clearly vary in their usefulness, they suggest GDP is not the be-all, end-all, and that we should be open to thinking about progress differently.

Productivity and Free Time

In his excellent book *The Rational Optimist*, Matt Ridley proposes that "prosperity is simply time saved," and that innovation and idea exchange are the engines that power that prosperity. Ridley didn't concoct a bespoke statistical measure to track this, but instead used existing measurements to triangulate and support his thesis. Of course, considering prosperity as time saved means we don't get the comfort that comes with a nice clean number like GDP. But then again, is a measurement really nice and clean when it can change by 25% after 30 days?

Happy Birthday, Internet!

On Wednesday, March 12, the World Wide Web turns 25. Happy birthday, Internet! Ridley opines that, if we look at productivity and the ability to spend time on what we want, things have never been better and the pace of improvement has never been more dramatic. The Internet's 25th birthday is a potent reminder of that belief — in 25 short years, the Web has changed almost every aspect of the world we live in by enabling the sharing of ideas, increasing productivity, and providing alternative ways to spend our resulting free time.

Productivity, free time, and wealth creation

When we circle back with more traditional measures of progress, it's hard not to think Ridley is on to something. The Internet has created immense wealth in its 25 short years — and its contributions to productivity and free time have been the backbone of the creation of some wonderful businesses and investing opportunities. Just look at the *Pro* portfolio to see it: **MasterCard** (NYSE: MA) adds efficiency to consumption habits, **Papa John's** enables productivity by outsourcing dinner prep and delivery, and **Facebook** (NASDAQ: FB) automates data collection on consumers for advertisers and provides a platform for efficient social connection. (And that's just to name a few.) In very clear ways, *Pro*'s companies embody Ridley's thesis about prosperity and time saved. These businesses' success in saving time has resulted in fantastic financial performance. We would be wise to consider adding another criterion to our "compounding machine" checklist: magnitude of time savings.

The *Pro* Bottom Line

The willingness to pay for time savings hits home here at *Pro*. Our recently opened Optimize Your Life discussion board has hosted some great discussions on this topic so far, and has the potential to meaningfully affect the lives of many members as our community increasingly shares its own time-saving secrets. Let's also be open to these discussions informing possible investment opportunities.

Onward,

— Bryan (TMF42)

Live Advisor Roundtable With Tom Gardner and Jeff Fischer

Published Mar 10, 2014 at 1:29PM

In preparation for the reopening of *Motley Fool One*, the Fool hosted a roundtable discussion with Fool co-founder Tom Gardner, *MDP* and *Deep Value* advisor Ron Gross, *Pro* and *Options* advisor Jeff Fischer, and *Supernova* Odyssey 1 mission lead Matthew Argersinger.

Transcript

TOM GARDNER:

Welcome to the *Motley Fool One* Live Chat. We're going to get right into it. We've got an hour together. I have the promise of my panelists that this will be the most interesting and entertaining one hour of investment programming …

RON GROSS:

We made no such promise.

TOM GARDNER:

And the reason we make the promise is because we've heard that Ron Gross, our advisor in *Million Dollar Portfolio* and *MDP Deep Value* … his parents are watching today, so …

RON GROSS:

Hi mom and dad. Thanks for joining us.

TOM GARDNER:

So, we've got Ron. We've got Jeff Fischer — *Motley Fool Options*, *Motley Fool Pro*. The original Fool portfolio, as well. And we've got Matt Argersinger — *Supernova*, *Rule Breakers*, in *Stock Advisor* probably pitching in some ideas there …

MATT ARGERSINGER:

I'm on there — sure …

TOM GARDNER:

They're all over the place. Someday — perhaps not that far away — Motley Fool Germany, as well.

MATT ARGERSINGER:

That's right.

TOM GARDNER:

Pre-announcement there. So, we're going to get right into it. We have a couple of conversations that we're going to start with. Then we're going to talk to a member of *Motley Fool One*, Mark Timmerman. Very excited about that. And then we're going to be taking your questions throughout, so please know that you can submit questions about our conversations or any questions you have about *Motley Fool One*. We have a number of analysts out in the chat ready to answer your questions directly there. And, of course, we'll take some of your questions and answer them here as a panel.

I just want to start, team, with a conversation about where the market is today and what it makes you think about investing. Are you thinking the same way about investing in stocks that you did three years ago, or has there been a change because of the remarkable performance? Or even one year ago, before the market had risen 30%-plus?

So, where are you now …

RON GROSS:

Hm. Can I jump in?

TOM GARDNER:

Yes …

RON GROSS:

My preferred answer, when anyone ever says to me, "What do you think of the market," is to say, "I don't know. I honestly don't know." If you had asked me on January 1 of 2013 when unemployment was high and GDP was low … interest rates were also very low …would the market have been up 32%, the S&P 500 … I would have never guessed. I think it's very difficult to opine where the market, as a whole, is. What I prefer to do is each day, every day, look at stocks, look at stocks, look at stocks …

TOM GARDNER:

Blind to what's happening with the macro issue.

RON GROSS:

It's there. I'm educated on it, but I don't make predictions and I don't make investment decisions by it. But what I can see as I analyze stocks every day, all day, is some patterns that are emerging …

TOM GARDNER:

It's getting harder.

RON GROSS:

… is it's harder to find good stocks.

TOM GARDNER:

Is it harder to find good stocks?

RON GROSS:

I am definitely finding it harder to buy stocks, especially if you're looking at stocks in the *Deep Value* service. We're almost 50% cash in that service. Very hard to find deep value stocks. In *Million Dollar Portfolio*, a little bit easier because we can look at growth stocks, high-growth stocks, innovative rule breakers …

TOM GARDNER:

Which is more important to you, Ron, when you're looking for these stocks? Are you looking for stocks that are going to make you money over the next five years, or stocks that are going to beat the market over the next five years or the next three years? If you knew that you were going to buy a stock and the market would be down 8% and you'd be down 2%, is that satisfying to you, or is the baseline that it's profitable?

RON GROSS:

It's a really difficult question to answer — but my standard answer to that is that I'm looking to beat the market under the assumption that over periods of time, the market does very well. Let's call it 9 or 10%. And if I can consistently beat it, even in bad years, then not only will I outperform the market, but I will also make investors money.

TOM GARDNER:

Now just before we came on air, you were calling the person to your left and to the audience's right fanboy Jeff Fischer. There are so many fanboys for Jeff Fischer. So, great answers, but I guess the world wants to know what Jeff thinks.

JEFF FISCHER:

That must be true. It must be true. And I'll start by saying to Ron's parents that Ron is really a nice guy.

RON GROSS:

Thank you, Jeff.

JEFF FISCHER:

He's nice to work with and he's genuine.

RON GROSS:

I appreciate that.

JEFF FISCHER:

He's the real deal.

RON GROSS:

Very thoughtful.

JEFF FISCHER:

Well, it's true. Speaking the truth. On the market. When I look ahead, the next three to five years, I'm excited. I'm excited about what good companies, what good stocks could do over the next three to five years. When I think in the next one to two years, it's more of a random guess. I don't know.

TOM GARDNER:

Is that always true for you, or do you have a particular feeling that the market, having gone up quite a bit over the last couple of years, it's cloudier …

JEFF FISCHER:

Yes. I think it's cloudier. The higher the valuations go in general, the more uncertainty there is in the next couple of years. Because you could say a stock needs some time to catch up to the valuation as much as we may dislike that phrase. So, yes. When the market, as a whole, was 20% or 30% cheaper a year ago, it was much more easy to be excited about the next year or two. But now, where they're at …

TOM GARDNER:

Getting a little harder. But your view of three to five years forward not seriously impacted by valuations today.

JEFF FISCHER:

I agree with Ron. It's harder to find things you're clamoring to buy, but there are still good companies that we're very happy to own and to recommend today, especially given our rolling three-year outlook.

TOM GARDNER:

Matthew?

MATT ARGERSINGER:

I tend to pay attention to the headlines.

RON GROSS:

What about my parents?

MATT ARGERSINGER:

When I'm not paying attention to Ron's parents, I tend to pay attention to the headlines because I think understanding market sentiment is kind of important. And what I see is there is a lot more enthusiasm about the market today. At the same time, there's still definitely a genuine level of skepticism. And I think as long as that's out there, I feel pretty good about investing and like Jeff, I feel very good about the next three to five years. But there are pockets, I would say, of the market that I would say are probably a little beyond their expectations …

TOM GARDNER:

What's a pocket for a company?

MATT ARGERSINGER:

As much as I love the social media companies, I think they're pricing in a lot of future growth today. They might very well be worth what you're paying for them today several years from now. I just don't know if they've earned that yet. We all know Seth Klarman. I don't know if he's been mentioned in previous …

TOM GARDNER:

Baupost Capital …

MATT ARGERSINGER:

Sure. Tremendous track record. He was out the other day saying, "Listen. The market's pretty high in certain places." And I look at that as a little bit of a shot across the bow. I think he's early and I think there's still a lot of skepticism.

RON GROSS:

Value investors are typically …

TOM GARDNER:

He's closer in the deep value camp, so he's going to come out with those shots earlier, but there's an analogy that I can't come up with here, but it's basically … Well, you can say *canary in the coal mine* … But it's basically an early indicator that you should consider thinking a little bit differently about what's happening than what's been the environment that we've been in over the last couple of years …

JEFF FISCHER:

I agree with that Tom, and I think you could easily look at this video a year from now and talk about, "Oh my gosh, so many stocks were overpriced or declined quite a bit in the year since," but then look at the video two or three years from now and most good businesses will be worth more.

TOM GARDNER:

Absolutely.

MATT ARGERSINGER:

Absolutely.

RON GROSS:

One thing I love about Foolish investing is you'll rarely hear someone in the building say, "The S&P 500 is 16x forward earnings — therefore we're moving to cash." You're more likely to hear that on CNBC. We're more company-centric. One company at a time. Is Tesla overvalued? Has it run its course? Is Netflix overvalued? Does Intel represent a good value? Do I want to own that? Rather than making these big, big macro stock market calls.

TOM GARDNER:

Quick question from each of you about your personal portfolio and then we're going to go to Mark Timmerman. We're going to start with MattyA this time and go from the audience's right to left. What percentage of your personal portfolio is in cash? Or you don't have to share your personal details. You could say what percentage of a portfolio that you would buy someone to manage right now would be in cash?

MATT ARGERSINGER:

I'd say less than 10%.

TOM GARDNER:

Less than 10%. But more than 1%?

MATT ARGERSINGER:

More than 1%.

TOM GARDNER:

But some cash on the sidelines.

MATT ARGERSINGER:

There's something on the sidelines for sure.

JEFF FISCHER:

Mine is around 25-30%.

TOM GARDNER:

Twenty-five to thirty percent in cash.

RON GROSS:

Woo!

TOM GARDNER:

Okay.

JEFF FISCHER:

That's pretty standard.

TOM GARDNER:

That's standard.

JEFF FISCHER:

It's close to standard. It fluctuates. But when you're chugging along …

TOM GARDNER:

Why is that happening?

JEFF FISCHER:

I use options, so the cash secures a lot of those options. Pro members see this in Pro where we have about 20% cash and that's partly defensive given Pro has absolutely …

TOM GARDNER:

If you were not using options at all — you had an all-equities portfolio and it was all long — what percentage in cash would you feel comfortable having? Or what would your standard …

JEFF FISCHER:

Well, then at my age, I would think I'd be more 90% invested maybe …

TOM GARDNER:

Because you're what? You're 26?

JEFF FISCHER:

I'm 44.

TOM GARDNER:

You're 44. Very healthy.

JEFF FISCHER:

So, I think I'd have less cash.

TOM GARDNER:

You'd have less cash.

JEFF FISCHER:

I'd have less than 30%.

TOM GARDNER:

But let's modify the question. I apologize. You're a 58 to 64-year-old right now. How much would you have in cash?

JEFF FISCHER:

Whatever money you need in three years should be in cash.

TOM GARDNER:

Got it. Ron?

RON GROSS:

Personally, about 10-11% in cash, *Million Dollar Portfolio* is 5% in cash. I don't see a huge difference between that. There's a 5% swing.

TOM GARDNER:

And is 5% a statement that it's difficult to find stocks or 5% …

RON GROSS:

No, I think having 95% of your capital at work means you can still find stocks to purchase. At any given time, we may have sold something and not put the cash back to work yet because we are managing a finite amount of money. So, portfolio management is all about sometimes selling a good stock to buy a great stock. So, sometimes we'll have some cash on the sidelines as that's taking place.

But as I mentioned earlier, *Deep Value* is almost 50% in cash because it's very difficult to find deep value stocks right now, and that's exactly how that philosophy is supposed to work.

TOM GARDNER:

I mean, Seth Klarman … It will not be unusual for Seth Klarman to be 40%-plus in cash and yet he's delivered something like 18% per year results going back 20-plus years. He's obviously a brilliant investor. One of the things I love about investing …

Obviously some investors or some members of The Motley Fool are trying to have it done for them as much as possible and trying to minimize the amount of time you're spending on investing. Others want to dive deep and learn more about business, about your portfolio, about portfolio strategies.

As somebody in the latter group for all four of us — it's really fascinating and has been for 21 years to study how other people are investing. Because Seth Klarman could sit down with growth investors at our company that are in that camp and I think they would find, actually, a fair amount of common ground, but they've taken a different path to getting extraordinary long-term results.

JEFF FISCHER:

Well, Tom, Warren Buffett, too, has quite a bit of cash. I don't know, offhand, how much right now, but he almost always carries cash for opportunities.

TOM GARDNER:

And Wally Weitz, I know, who's in Buffett's circle of great investors … He's often 30-40% in cash, even though he's all equity, all long. Okay. We're going to put our headphones on and we're going to tune in with Mark Timmerman from Des Moines, Iowa. First of all, Mark. Is it Des Moines or Des Moynes?

MARK TIMMERMAN:

It's Des Moines. Des Moines, Iowa. Thanks for having me here.

TOM GARDNER:

I'm sure you're passionate about making sure that people know how to pronounce your hometown.

MARK TIMMERMAN:

Oh, absolutely. We get really touchy about it, especially after the kind of winter we've had.

TOM GARDNER:

Actually, yes. Before we talk investing with you, just give us a quick snapshot of the winter in Des Moines — this winter.

MARK TIMMERMAN:

Did anyone see the movie *Frozen?*

RON GROSS:

Yes.

MARK TIMMERMAN:

That's pretty much it. We had more school snow dates because of temps below 10, 15 below and wind chills up around 35 to 40 below. But that's the Midwest. Anyone can live in Florida, can't they?

TOM GARDNER:

I love that. Trash talking. So, Mark, before we talk a little bit about your experience as a Motley Fool member and a *Motley Fool One*, I just want to hear a little bit about your investment philosophy. How do you think about investing and how's your portfolio been doing the last couple of years?

MARK TIMMERMAN:

The investing philosophy has evolved a lot. One of the things … I was just getting ready to talk to you folks. It's just amazing to look back — since I joined the Fool back in 1997 — and really not knowing much about how to do any of this. I knew I needed to save. I knew I needed emergency reserves.

It's evolved so much over the years, but I do understand and have refined so much more of the long-term focus on owning not stocks, but great businesses and sticking with them through the long term. That's grown a lot, but I always had that seed and that's grown so much with all my learning that's taken place over the last 17 years or so.

TOM GARDNER:

What is an example of a great business that you have held and enjoyed the fruits of their success? And what is an example of a great business that you sold too soon?

MARK TIMMERMAN:

Whoa!

TOM GARDNER:

Sorry.

JEFF FISCHER:

Shudder …

MARK TIMMERMAN:

My largest position, actually, is one of my smallest investments … Netflix. I've talked a lot about it on the boards. That was something I invested in, in 2004. My cost basis in Netflix was between $10-12 a share …

TOM GARDNER:

They're $440 now …

MATT ARGERSINGER:

Bravo …

MARK TIMMERMAN:

Yes. That's the fun part. But to me, the much more important part of that story is that I rode it down 85% in what was it? 2011? 2012? I've tried to block it from my memory completely. But I rode it down maybe 5%. Didn't sell a single share and continued to believe in what the company was doing. They hit some road bumps, but that taught me so much about sticking with a company that I felt like I truly understood.

Some of the other ones — I've owned Starbucks since 1998. Obviously, that's been very rewarding. Buffalo Wild Wings I've owned since 2004. That's been rewarding. One of the things I wanted to mention is it's really rewarding when you, Tom, select companies like that for another five-year holding period in the Everlasting Portfolio and the conviction is there to add your own money to those positions after all that growth. So, I'm really excited about just holding onto companies for the long term and really watching them blossom.

TOM GARDNER:

I notice that you've avoided the second question.

MARK TIMMERMAN:

I picked up — I invested — my first position in Tesla. My cost basis was around $30 a share. It must have been probably two, two and a half years ago — whenever it was $30 a share. I held it for about a year and just before earnings were coming out at that particular time, the price was hovering around $63 a share.

I just didn't have the conviction of understanding that company. I completely am amazed by Elon Musk — I admire him greatly — but I just didn't understand the size of the market with electric cars and what he was trying to do. One of my faults is that I sold it at $63 just before earnings. Obviously they blew out earnings and it's been on a rocket ride since.

TOM GARDNER:

Out of curiosity Mark, do you view that as a mistake, or do you view that as just the natural course of having conviction and you're thankful that, that conviction caused you to hold Netflix and certain times that conviction will steer you wrong, but it's important to follow through your belief and thesis and then try and learn from it after.

MARK TIMMERMAN:

That's a really good point, and I firmly believe that the discipline of following a process where I feel like I understand what I'm doing, I know why I'm doing it and I can stand by it — I've built into the assumption that I'm going to make some mistakes like that. I certainly can't own all the stocks that are going to do wonderfully out there. I'm certainly not going to sell all the stocks that should have been sold — but I'm going to be right more than I'm wrong and the winners have more than made up for my mistakes. So, on balance, I'm very happy about it. Still, when you put a microscope on it, it's a little tough to look at, but that's just part of how this works.

TOM GARDNER:

Sorry to pull the microscope out. So, we have Ron Gross, Jeff Fischer and Matthew Argersinger here with us from *Million Dollar Portfolio*, Options Pro, *Supernova*, *Rule Breakers*. I just wanted to talk a little bit, Mark, about your experience in Pro and Options and how that has impacted your investment approach. I'm presuming that in 1997, you were not using options when you joined The Motley Fool.

MARK TIMMERMAN:

No. Back then, remember, options were evil back then.

TOM GARDNER:

Absolutely.

MARK TIMMERMAN:

We didn't talk about options then. I was listening in on your conversation as I was waiting to join and I heard you talking about cash. My personal position on cash or percentage is hovering around 22-23%. By contrast, in 2001 when we had the big recession and 2007 and 2008, I was fully invested both times. That stuck with me, because I was stuck in not being able to act or have any opportunity to take advantage of the situation. And that, to me, was really painful.

As far as having cash now, the ability to use options — to productively use that money — while I'm waiting for opportunities and the ability, now that my portfolio has grown to the extent it has … I have the ability to hedge in a way that I never had before. So, the tools I've learned through Pro and Options have been priceless. Jeff's guided a real neophyte through this process. I was very apprehensive and had a lot of anxiety about making a mistake or doing something that was really going to cost me a lot of money by doing something stupid.

TOM GARDNER:

Out of curiosity, because of the deployment of options in your portfolio, does that cause you to feel less anxious about where the market is or what's happening in the macro environment because you have some built-in protections and hedges with options?

MARK TIMMERMAN:

It really does. I have an even more holistic view of how things are playing out. I just have more tools in the toolbox to use. Obviously the meat and potatoes of my portfolio is long-term positions that I anticipate growing nicely over the years, but while I wait for that, while there is volatility in the market, there's a nice opportunity for part of your portfolio to generate returns that not only add to your returns, but also stabilize your portfolio a little bit more.

In 1997, I was starting a family. Now I have kids that are going into college and I'm within 10 years of retirement. My objectives have evolved over time, and now I'm thinking about how can I generate income at sufficient levels? How can I take advantage of a special opportunity? That's allowed me to do it.

JEFF FISCHER:

That's a great point, Mark. So many people nearing retirement or in retirement use these really conservative options strategies, as you know now, to generate income month after month … and meanwhile you can let your stocks be for the long term to appreciate. So, I love how you put that … that the meat and potatoes of your portfolio remains great businesses …

TOM GARDNER:

Are meat and potatoes really recommended, though, at this point?

RON GROSS:

In Iowa, I think.

TOM GARDNER:

In Iowa.

MARK TIMMERMAN:

If you come to Iowa, that's all we have.

TOM GARDNER:

Okay, got it.

RON GROSS:

Mark, it's Ron Gross. Thank you so much for joining us. I really appreciate it.

MARK TIMMERMAN:

Hi, Ron.

RON GROSS:

I was curious. Obviously, you really like your experience with Jeff at Pro and Options. So what made you join One and how do you use the service?

MARK TIMMERMAN:

One of the things that drew me to One is that with things changing in our family's life where my wife is almost six years younger than I am, so my objectives for some of the IRA portfolios I've been managing were starting … I could see retirement or at least I was going to start working for fun and stop having to work at a certain time within 10 years. Pro became a really big lever for that.

But my wife — I've moved more of the new money and she's adding more money on a regular basis, too. So, *Supernova*, Odyssey 1 …

MATT ARGERSINGER:

Right on …

MARK TIMMERMAN:

… and the Everlasting Portfolio have been home for that new money.

TOM GARDNER:

How is your wife connected into the investment decisions and what success have you had in getting your children investing? But really looking at the entire family and trying to get every family member of a *Motley Fool One* member investing has been an aim of ours, but it's going to become a much more intentional aim in the year and years to come. So, how's that going in the Timmerman household?

MARK TIMMERMAN:

I'm really excited about the future, but I can tell you right now. I have a 17-year-old that's getting ready to go into a pre-law program, and I've not been as successful at luring him in or interesting him in the way I want, but I'm giving that time. I'm also trying to make sure that I do the right things to meet him where he's at rather than try to bring him along where I'm at. My daughter is more focused on probably being a teacher some day and has not shown any interest at this point. That's a development area for me.

But my wife is an actuary by profession. She's hardwired for number crunching. She leaves the more organic side to investing to me, but we talk about it constantly and she's very interested and has a tremendous amount of confidence in watching my experience over the last 17 years with the Fool. So, very supportive. She's hands-off, but very interested in hearing about how things are working.

MATT ARGERSINGER:

Mark, Matt here from *Supernova*. Thanks for joining us. How are you doing?

MARK TIMMERMAN:

Hi, Matt.

MATT ARGERSINGER:

I love the story about Netflix, Starbucks and Buffalo Wild Wings. You've held those companies for so many years. That really is the game that we're trying to play in *Supernova* with Odyssey 1 and I know Tom's playing that game with the Everlasting Portfolio. Is there a company that you see in *Supernova* or in the Everlasting Portfolio that you say, "This is the one. I'm going to hold this one for many, many years. I see so much upside for it. This is going to be a driver, a meat and potato of my portfolio for a long time."

MARK TIMMERMAN:

Oh, gosh. I should have my portfolio in front of me.

MATT ARGERSINGER:

I'm putting you on the spot, I realize.

MARK TIMMERMAN:

I'm really excited by what I see in LinkedIn. I've been very fortunate to get in well under $100 on that one and the growth has been nice. One of the most valuable parts of any of the services — and with *Motley Fool One* — you get access to all them … are the discussion boards. And the education I've received is literally priceless. In my estimation, you could almost get a finance degree really, if you wanted to dig in deep enough with all the information that's available to you.

LinkedIn is one of those companies that I've learned a lot more about. I knew very little about it. I apologize …

TOM GARDNER:

Here's what we're going to do for you, though, Mark … or at least I've got a couple of ideas … and then if anyone wants to chime in any. I've got some stocks for your kids. I'm going to make a couple of recommendations for your children …

MARK TIMMERMAN:

Excellent.

TOM GARDNER:

They may not have taken to the subject yet, but maybe if we go into the center of their area of interest … So, for the lawyerly son, there's a company called RPX Corporation. I believe it's Rational Patent Exchange. It has to do with patents — essentially large technology companies helping this organization buy patents that they then rent to the larger businesses. It came public in the last year and a half.

And in general, when trying to get a child interested, it is more important to pick something that's interesting to them than to pick a winner … although both is the ideal. But for your daughter that's interested in becoming a teacher, I would say obviously Amazon. That's the place to go for all the reading materials that you can find. LeapFrog or K12. That's a *Rule Breakers* recommendation, I believe. Do you all have any legal or educational stocks to give to Mark before we let him go?

RON GROSS:

Hm.

MATT ARGERSINGER:

Hm. [00:24:39]

RON GROSS:

Coach. They're going to need briefcases.

TOM GARDNER:

I love that …

RON GROSS:

I vote for Coach.

TOM GARDNER:

And Coach is …

MATT ARGERSINGER:

He's got to play video games, too. Activision and Blizzard's out there.

TOM GARDNER:

Yes. Activision Blizzard. Okay, Jeff. You're on the spot now. Everyone's got one.

JEFF FISCHER:

I would say eBay. Let's do — when you're filling up your dorm room — that's eBay's price point.

MATT ARGERSINGER:

And probably going to be involved in some big legal dispute over the next few months.

TOM GARDNER:

Sounds like it. [crosstalk 00:25:02]

MARK TIMMERMAN:

MercadoLibre is one of the ones that I've been very pleased with lately. It's [00:25:10] nicely and that's the one I've followed which is kind of a Latin American sister to eBay.

MATT ARGERSINGER:

Absolutely.

TOM GARDNER:

Mark, let me say in closing, it's our honor to serve you as an investor and to provide tools and ideas to help you build your portfolio and a financial plan of that portfolio. But I also just want to say how much I've enjoyed talking to you at the last member events. Hanging at the Minor League baseball game in St. Paul, Minnesota. That was a really great summer two-day that we had there. So, thanks so much, and I look forward to seeing you again at a future event.

MARK TIMMERMAN:

You're very welcome, and it was a real pleasure. It was a real thrill to talk with all of you folks.

RON GROSS:

Thanks, Mark.

TOM GARDNER:

Fool on!

JEFF FISCHER:

Thanks, Mark. Fool on!

TOM GARDNER:

Now we turn, without headphones, to your questions. I'm just going to take them in order. So, we've got Hilltop Gray has written in. "Should options be a part of every investor's portfolio?"

JEFF FISCHER:

I'll take that, and I'll say no.

MATT ARGERSINGER:

Thank you.

JEFF FISCHER:

I'll say no. You should give it a try, like anything. If you have a goal to make income stay or to protect your portfolio or you're adverse to downside and you want to hedge — then options are a tool you can certainly use. And see if you're comfortable with it. I honestly believe there's no better place than The Motley Fool to learn to use options in a Foolish way as an investor — when you use them as investors, not as traders.

And so, if you have a goal such as income, protecting yourself, or leveraging for upside with less money at risk … Like you can buy calls on Coca-Cola instead of buying Coca-Cola stock and pay a fraction of the money and have the upside. But then, there's a place for it. So, give it a try and see.

RON GROSS:

Awesome. Jeff, would you agree that it takes a little bit more activity, you need to pay a little bit more attention … or maybe a lot more attention … to your portfolio if options are a part of it?

TOM GARDNER:

This is Ron competing with you.

RON GROSS:

No, no. It's literally a question …

TOM GARDNER:

… over the *Million Dollar Portfolio*.

RON GROSS:

It's literally a question … versus a [00:27:06] like *Million Dollar Portfolio*? Shameless plug. Would you agree that it does require some more attention?

JEFF FISCHER:

It depends on the strategy you use, but in general, it requires a bit more. But you can do — as we did recently in Pro — we set up a 2016 option position on Coca-Cola …

RON GROSS:

Mm-hmm …

JEFF FISCHER:

So, we can let that go for two years.

RON GROSS:

That's great.

JEFF FISCHER:

If you're making income every month, then as those ideally expire, you write a new one. So, that's some monthly activity.

TOM GARDNER:

For regulatory reasons, I'm not going to be able to say very much about this right now, but I know that you have heard about our new solution that's part of *Motley Fool One* and that's separately managed accounts. And separately managed accounts — there will be a separately managed account option for *Motley Fool Pro*, so you will be able to have your money essentially managed by Jeff's ideas, and that will bear no assets-under-management fee. That's a really incredible … Just one statement on that.

You're not going to find many places out there in the financial world that are going to manage or help you manage your money without an assets-under-management fee. But when you actually look at that fee play out over — not just a year or three years or five years … but over ten years, fifteen years, twenty years where you're paying 1-2% of your portfolio in fees — what I think is going to happen here is we're going to see subscription membership at The Motley Fool significantly undercut that and our move to offer separately managed accounts where you can have *Motley Fool Pro*-like performance without having to spend any time should you choose not to.

Now we go to Pinky who says something in here … Pinky, you're going to upset one member of our panel with this. "I'm a Pro member. I'm an ex-*Supernova* member …"

MATT ARGERSINGER:

Oh …

TOM GARDNER:

Oh, wow. There have been some great returns in *Supernova*, but you had your reasons, Pinky, I'm sure.

"Now my question is in *Motley Fool One*, how do you suggest a member divide their capital between all the services? Is it only for those who have enough to create a reasonable portfolio in each of the multiple services?" I'll take a shot at that first, and then if anybody wants to jump in …

No, it is not our belief that you should have a full-blown portfolio that matches up with each one of the services. In fact, one of the key features in *Motley Fool One* is our Top Recs ranking of … Gosh, there are more than 450 active recommendations across all of our services. And what the Top Recs list does — and our analysts and advisors work on that each month — is it ranks from 1 to 50 the recommendations across all of our services. What we're trying to do is to help you build the right portfolio for yourself.

Now, there are certainly *Motley Fool One* members that are managing multiple portfolios. There are people who are running family offices. There may be a reason to set up multiple portfolios. But our goal in *Motley Fool One* is to set up the right portfolio for you that meets your needs, your risk temperament, your interests, the businesses that you want to learn about and focus on and your style of investing. No, our goal isn't … We're not trying to push you to a huge, huge allotment across each service.

From Diane. "I'm very interested in joining. I currently have *Motley Fool Options*, *Stock Advisor*, *Rule Breakers*. I am really enjoying Options and what I'm learning. Is *Motley Fool Pro* — which I'm interested in joining — is *Motley Fool Pro* part of *Motley Fool One*, Jeff?"

JEFF FISCHER:

Yes. A beautiful, easy answer. *Motley Fool One* is all access to all full services and big extras, including Tom's Everlasting Portfolio that is only in *Motley Fool One* … financial planners financial planning tools and the separately managed accounts that Tom mentioned. So, yes, you get everything and that's the beauty of this service. And you get to apply your current membership as a credit towards your One membership, so it all rolls over into One.

TOM GARDNER:

I guess I'll put it this way. I think that what we're trying to set up is the easiest pathway for you to be as involved and to build as much of your portfolio around our concepts as possible — and one of the key principles in that is the one-year money-back guarantee.

So, if I were living in Missoula, Montana, as I once did, and I were tapping into The Motley Fool not working for the organization — I would take advantage of that one-year money-back guarantee because you can come in, look around. Any service — whether it's *Motley Fool One* or any other service you're interested in — enjoy it for a day, a week, a month, 362 days. And if you decide it's not right for you, you let us know and we refund you in full. Our desire is to set you up on the right path for the next 10 to 20 years, and if a particular service is or isn't right for you, we want you to check it out.

I love the screen name of this next Fool member. MFNorway, which is awesome because MF used to be our nomenclature for somebody working on our staff back in the days when were on AOL. We were all MF … MFJoe … and now we're TMF out there. But MFNorway harkens back to another era.

"Hi, Fools. Given that as you discussed initially, it's more difficult to find attractive investments after the five-year bull market … and that some shares that are attractive long term but which missed their market may feel have run ahead of themselves … the question that I have is should *Rule Breakers* and *Supernova* customers rotate away from the growth stocks which tend to struggle in volatile market times?"

MATT ARGERSINGER:

Ow. [crosstalk 00:32:13] My initial answer would be no, and that's because we are looking at all these companies with three to five-year time horizons in mind and I would say … One thing David will often say and that I repeat — because I like to repeat everything he says — is that we are always interested in buying high.

It might look like we're paying an expensive price for a stock, but that's because we love the fact that the market's recognized that we're paying a high multiple and generally that's a little bit contrarian. Most investors out there are looking to buy the bargains. They're looking to buy cheap stocks. Stocks have come down in value.

We're actually the opposite. We get actually more excited about stocks that have run up quite a bit because we actually think there's a lot more to go and we think that says something about the business behind the stock, as well. So, we're not afraid of high-priced stocks.

TOM GARDNER:

What happens in an environment where so many companies have seen their stocks rise? In other words, is there a period at which you or the *Supernova*/*Rule Breakers* philosophy says it's no longer a distinguishing feature to be considered overvalued because …

MATT ARGERSINGER:

Yes, because everything's overvalued …

TOM GARDNER:

… because the market has gone up. It's like at 2000 and everything looks overvalued. Is that a time where you change or modify your approach or literally it's, "Hey, rolling ten years. We're trying to optimize it. If we have a roller coaster ride that takes us down 30% in an 18-month period, that's not going to present us a problem."

MATT ARGERSINGER:

No, not at all. One thing I always harken back to is that you could look at an investor who came in, in October of 2007, which was the month prior to the peak of the last bull market before … Of course, we know what happened in 2008. And that person, even if they invested their entire net worth, at that point in time … as long as they were investing a proportionate amount every month beyond that into the index or into their favorite companies … a few years later, they were not only in positive territory, they were way ahead of the market.

TOM GARDNER:

So, if you have income and you're getting into the market on a monthly, quarterly, annual basis … you really should be much less concerned about what the overall market's telling you …

MATT ARGERSINGER:

Right …

TOM GARDNER:

If you are at a point where you have no new income and you need to draw off that portfolio, does your philosophy change at all if your time horizon or need for the capital changes or not?

MATT ARGERSINGER:

I'd probably say it does. I mean, I would have to say if you don't have new income coming in, and you know you're going to need money within a five-year time frame, then I think your decision making changes a little bit.

TOM GARDNER:

Got you. But so many people in semi-retirement or retirement — they've got 30 years. We've got more time in our lives in semi-retirement or full retirement. I think at The Motley Fool we're probably big advocates of semi-retirement. Staying active …

MATT ARGERSINGER:

Right …

TOM GARDNER:

… working as Mark said because you love it, not because you have to … so, finding something you love, continuing to generate some income and invest that. But regardless, we're going to live much longer and I think many people are not preparing their portfolio for that and are fearful of the equities market short-term blips when they really should be reminding themselves that "Hey, rolling 10 and 15 and 20-year periods are exactly the place to be."

MATT ARGERSINGER:

Right.

JEFF FISCHER:

And I think if you're concerned about a downturn, which will inevitably happen at some point … maybe this year …

TOM GARDNER:

I hope so. Are you aware …

JEFF FISCHER:

I know you are. I know you're rooting for lower prices …

TOM GARDNER:

Yes, yes. I have to explain that in a second.

JEFF FISCHER:

So, remember that. Mark that down. This is going to take ten minutes, but …

TOM GARDNER:

Good. Go for it. I love it. I'm going to see if I can find water.

JEFF FISCHER:

Uh, where is my train of thought? So, it's important to have a positive action that you can take when prices fall. The people who are saving money — of course, they have something to do with it — so their mind is in the right place. Like, "Great. I can invest this money." But if you're not saving any money — if you're 100% invested and the market falls, your reaction is to start to worry …

TOM GARDNER:

The only positive action would be departure from looking at my portfolio …

JEFF FISCHER:

That would be good.

TOM GARDNER:

So, my positive action … If I have no new income, the market's down 30%, I will not go look, because I can't make, really, any meaningful changes.

JEFF FISCHER:

But as every action calls out for a reaction, too many people, as we know, will sell, because that's all they can really do. They feel trapped, so they'll sell. So, that goes back to having some cash, especially if you need money or you're not adding money …

TOM GARDNER:

Mm-hmm …

JEFF FISCHER:

… or, like we do in Pro, hedging frequently and when the market declines, your hedge pays you and you can then reinvest that cash.

TOM GARDNER:

Jeff, I really love the concept of what's your positive action when the market declines. What have you created that's going to allow you to be somewhat excited by a 10-20% recline? Ron?

RON GROSS:

The question focused on Mr. Market and I would really prefer that investors don't think about Mr. Market. Think about companies.

TOM GARDNER:

Anti-Buffett. This is an anti-Buffett play from you.

RON GROSS:

I would prefer that the individual investor focus on companies. We talked once before about it. I wish it was called the "company market," and not the stock market, because you're truly an owner of each of these companies.

And, as Buffett says, you can buy the same steak on Friday that you bought on Monday at a discount, you should be a happy man, because you're getting a steak at a discount. And that's the way I think about stocks, as well. If I can buy a company that I love at a cheaper price than I bought it a month, a year earlier … then I'm a happy man. I am not sad in any way. Because I am a long-term investor and I have a long-term time horizon — I will let Mr. Market do whatever he wants to do and I will be an owner.

TOM GARDNER:

These are the days when saying you're a long-term investor looks really, really smart … and you know there are a lot of people out there … and there were a lot of headlines in the financial media … and I read a lot of people that I see giving investment advice out there that were saying, "Long-term investing is dead," four years ago or six years ago or ten years ago. And now, you see the benefits of sticking with businesses in the company market and thinking about the prospects and adding money in down periods.

What I want to do now is I want to start with Ron. Put you on the spot first with a slightly trick question. Whoever goes first should be allowed to defer — but here's what it is. I want to know what your most controversial belief is. What your most unorthodox, unusual or flat-out controversial belief is about investing.

It could be about a particular company. It could be about the market. It could be about a philosophy. It could be something you disagree with that you've heard others say at The Motley Fool.

RON GROSS:

I come from a relatively traditional Wall Street background. I used to be a hedge fund manager. I lived and worked in New York for years and I come from that realm. And when I get together with friends or former colleagues that are still of that mind-set — which I am no longer. I am a proud Fool — I get those same kind of conversations and those same kind of questions. What do you think of the markets? What do you think of this? What do you think of that? What are you doing? What deal are you doing?

And I just want to say to that person, "You've got to calm down. Turn off CNBC. Focus on companies one at a time for the long term. It's not about what are you going to do this month or this quarter and what kind of returns did you put up and what kind of fees can you generate? Relax. Invest in companies long term."

TOM GARDNER:

Love it. Jeff. Be radical.

JEFF FISCHER:

Be radical. Well, I don't know how radical this is, but I will say I think probably all of us here, and maybe everyone watching, would have more money in the end if they just never made any sell decisions ever. But how do you get there? That means you're trapped. Why are you investing, then, if everything you invest you can never touch?

TOM GARDNER:

Well, you touch it if you need the cash or have something you want to enjoy. You don't sell because of the valuation, the business, anything that's going on. You let all of your existing investments just run until the end of time and you say, "Recognize that you may need to take cash out at different points along the way." But you're saying, "Leave that factor aside. That portfolio will outperform what you're doing right now."

JEFF FISCHER:

I believe so. And now that may signal that we're at the end of a five-year bull market. But really looking back even further from … Say you started in 1987, as I did. Almost everything I've sold along the way has been a mistake — almost everything — and the few things that I sold that then went down … well, they've become minuscule over time …

TOM GARDNER:

Thanks for the feedback there …

JEFF FISCHER:

… next to the things that I held or would have held.

TOM GARDNER:

Your losers get smaller and less relevant every day.

JEFF FISCHER:

Yes. Now, we're not about to go there in Pro …

TOM GARDNER:

Why not? You just told me this is the best way.

JEFF FISCHER:

Because it's over a lifetime and it's in aggregate and Pro is a very focused portfolio. Twenty positions, twenty-five is all we have. And we don't have new money coming in. So, if we see something we like better, we need to sell to buy it. But for most of us who are fortunate to be working and have savings, we should take some [crosstalk 00:40:31] …

TOM GARDNER:

So, if you have someone in your family that's under the age of, let's say 30, your primary advice to them as an investor to get the maximal, optimal results, is to buy the things according to a variety of factors that we teach at The Motley Fool and never sell …[00:40:44]

JEFF FISCHER:

Find what we call in Pro — taking it from Chuck Akre — find compounding machines like a MasterCard or a Google. Buy those and keep adding to them. Don't think about selling, especially at this age.

TOM GARDNER:

Love it. Radical!

MATT ARGERSINGER:

Oh, God!

TOM GARDNER:

Okay. Matthew. Shake the world.

MATT ARGERSINGER:

Jumping off Jeff, here. I think the buy high, buy higher idea … It's just not practiced enough by most investors. I think what David says often — we're so willing to trim the flowers and water the weeds and you should almost be doing the opposite. You should be ignoring the weeds and forgetting the weeds and continuing to buy and invest in your flowers. And I think that's so hard to do.

If I look at some of our biggest winners in *Supernova* … Zillow, for example. We've bought Zillow three times, and each time it's been at a much, much higher price.

TOM GARDNER:

And it's been volatile. There have been times when it's down and you're like …

MATT ARGERSINGER:

It's very volatile …

TOM GARDNER:

… wow. Could be we made the wrong decision. But if that happens, that's going to happen. However, it's ended up being, obviously, an unbelievable business.

MATT ARGERSINGER:

Right. This might sound crazy because we're in a big bull market and we have nothing but rising stock prices — but back to Jeff's point — over time, if you look at long periods of time, if you just added to your winners … the winners are the ones that are usually being recognized, not only just because the stock market's excited and people are excited about the stock, but people are excited about the business. And the business is going places and it's being recognized by the market. And it's achieving a higher value for a reason and you should double down on those all the time as much as you can.

TOM GARDNER:

Love it. I'm going to go, contrary to Jeff, for the fun of it … even though I basically agree with Jeff …

RON GROSS:

Just to confuse everyone …

TOM GARDNER:

I really do. I think that for the most part, our discipline should be to never sell … not just because we don't lose a great winner … which is the greatest mathematical pain to your portfolio is to watch something rise 5-20x and you sold it. Because how many bankrupt investments are you going to have to make to catch up to the losses that you didn't get by holding that incredible winner?

But I'm also going to agree with Jeff before taking him out at the knees for a second for another reason, and that is that if you have the mentality of "I never sell," you look for very different types of businesses. You look at the culture of the company. You look at the leadership differently. You look at the product line. It's not like, "Wow. They have one incredible innovation right now." It's, "Do they have a system for innovation that's going to lead to greatness over 15 years from now when we can't even know what the consumer marketplace will look like?"

There may not even really be malls. There may just be warehouses where products are being dropped off in driverless cars and it's all incredibly convenient for us to just sit at home and order everything, and it's all the home-related things we should be focused on, as investors now.

We don't know what the world is going to look like, but what do I think is a company that can adapt through those multiple different environments? And so, those are two great reasons to never sell. Mathematically you'll do better and number two, you'll look at the companies that you invest in differently before you make the investment.

I do think that there are a couple of situations where I would sell and I want to share those now. I guess it's not radical, but I just wanted to go contrary to Jeff. As Ron was saying, everyone loves Jeff and Ron's parents are watching, so it's indirectly a way of saying, "Solidarity to the Gross family!"

Here are a couple of sell rules that I have and in the Everlasting Portfolio and *Motley Fool One*, we're mandated to hold at least five years every single investment. We're going to learn from them. We're going to get the best long-term results out of all of them. I know it's surprising to some to think that you would continue to hold something you don't believe in, but I can assure you that some things you don't believe in now end up delivering awesome results. They just had a downturn and a bad cycle in their industry or bad performance with this leadership and something changes. And of course, we'll have some losers that just remain losers … but your best results will come from what Jeff said.

But here are my four sell rules, if I can remember them all *after* holding a business for five years.

1. If there is a major shift competitively in the marketplace that makes me think the business is losing pricing power. Warren Buffett's number one factor is he looks back across all the investments he made through his life. The single factor that he sees matches up with the best performance in his portfolio is pricing power. They have the ability to raise prices.

That's why when I interviewed Jim Sinegal in *Motley Fool One*, I just loved what he said about Costco … that they feel they have always had pricing power, but they have never fully utilized it and they never will. That is true pricing power. It's not like, "Wow. We have pricing power and we're extracting every additional dollar we can from our buyers." No. "We have pricing power and will never do that because we want to maintain a great relationship with our buyers."

So, if I see loss of pricing power, that's a real concern.

2. Succession. Leadership change. Will Thorndike, the author of *The Outsiders*, which is a great part of our *Motley Fool One* experience right now in the member lobby … I highly recommend that you join us. *The Outsiders* is a wonderful book that shows eight CEOs that allocate capital in an unorthodox way and have run their businesses differently and have delivered in excess of 20% a year, in most of those 8 cases, for more than 20 years.

And I can tell you that if you run the numbers on your calculator to what happens when you invest in something and it rises 20% a year for 20 years, you have your family taken care of financially with small, regular investments in businesses like those.

And when I talked to Will and interviewed him about the book about three or four weeks ago, he told me that he spends, in evaluating the CEO — just the CEO of his investments — 30-50% of his investment time is just on the CEO.

First of all, I love seeing that. As we talked about, I love the opportunity to study how different people invest … Seth Klarman, different approaches and all the rest. And I believe that you could crush the market by spending 50% of your time on just the CEO, because you'd start to see things about leaders that are different and a distinguishing factor. And so when I see succession away from an awesome leader, I get concerned.

Talking to John Mackey, our board member … co-founder and co-CEO of Whole Foods … we were talking about the difficulty in succession at Coach, which is a wonderful business under Lew Frankfort. It's a tough industry, and we'll see whether the next CEO can manage things as well as Lew Frankfort did, but it's definitely a concern point. None of these are automatic sell. They're just, "Hey, I have to start thinking what I should make of this situation."

3. The third one I'll say is companies that are too big to succeed. I know this is going longer than we expected. There will be a quiz. So, companies that are too big to succeed worry me. The data going back to 1950 shows that the largest company by market capitalization in the world loses to the market by 40% over the next 10 years.

It still makes money. It just doesn't do as well as the market, so I look very closely when a company is just the largest in the world or the largest in its industry. Those, actually, tend to become points where they slightly underperform and the disrupters come along and take a lot of the market opportunity in that industry away from the frontrunner. So, that's a concern.

4. And then the fourth one is whenever a stock, for me, has become more than 20-25% of the overall value of the portfolio. That would be a time to sell and bring it back into line so that I don't have 60% of my portfolio in a single position. We all feel differently about that, but those are my four sell rules.

JEFF FISCHER:

Nice.

RON GROSS:

Your sell rule about the companies that get too large — is that your proxy for valuation in the sense where you think at a certain point the stock goes up so much that it's unlikely to get you market-beating [crosstalk 00:48:03] …

TOM GARDNER:

That's a really beautiful way of thinking about that, and I'm not just saying that because your parents are watching. I think that's really a great way to view it. I mean, you look at Apple, and Apple's trading at 9x earnings. And everybody's like, "This is shocking." And in a way, it *is* shocking because Apple's a much better company than trading at a multiple … almost a 35-40% discount to the market's average multiple.

But I think that if you look back at the last great performing market … Well, let's go back to the late nineties … Microsoft, Intel, Cisco — they were basically like sure things. They had Bill Gates, Andy Grove, John Chambers. They were like lock-ins. They had balance sheets that were bigger than Fort Knox. They had the future on their side. Software. Chips. Networking. I could imagine so many different ways that they could take their businesses, but their size made it difficult.

Google has been an awesome investment for us across The Motley Fool and in the Everlasting Portfolio. I didn't expect it to essentially double since we recommended it, and it's done better for others who recommended it earlier. Google, to me, is one of if not the greatest companies in the last 100 years. And given how more difficult it is to run a company today — more global, 50,000 people — it's more difficult to run a business today than it was 50 years ago, so I think Google's probably the greatest company in the last 50 years.

But it's of such a size and scope now that I definitely don't feel I'm getting a triple from Google over the next seven years or eight years. And so, it just becomes a little bit less interesting to me as an investment, although as a company I love reading and studying and learning about they're doing.

JEFF FISCHER:

Sounds good.

TOM GARDNER:

Wow.

JEFF FISCHER:

I was going to say. It will be interesting, when Google is twice as big, to see what you're thinking at that point. In the next seven to ten years, it may be twice as big …

TOM GARDNER:

I certainly think it could double in the next seven to ten years. You know, one think you learn from *The Outsiders* is that I wonder whether these companies should begin spinning off divisions and paying special dividends. Essentially, you could have had Microsoft … In fact, I said this on CNBC in 2003, I think, on … What's that? I forget the name of the show. I'm sorry. I'll remember it.

But I said basically Microsoft should voluntarily break themselves up right now. Create entrepreneurial units and essentially give all the shareholders stakes because it happened to Standard Oil, and what happened to those oil companies over the next 70 years? Their market performance was unbelievably outperforming. I mean Exxon — you had incredible performers, and when you broke them apart, you gave them a new entrepreneurial lease on life.

RON GROSS:

Especially with companies like Google or Amazon, where there are going to be so many business lines that are not core to search or online retailing, it may make very good sense …

TOM GARDNER:

To capitalize them and spin them off. Yes. I guess I'll say that maybe my most controversial belief is that I have a little anxiety about the large … [00:50:58] about social media companies … about the large technology companies and the almost can't miss feeling about them that develops because of their incredible performance. That would be an area of a little caution that I would be placing as an investor.

JEFF FISCHER:

Tom, that makes me think of Everlasting Portfolio and *Motley Fool One* and it makes me want to ask …

TOM GARDNER:

Bring it!

JEFF FISCHER:

… to share your vision for Everlasting Portfolio and then for One, as a whole for the investors out there.

TOM GARDNER:

Great. So, Everlasting Portfolio adds $100,000 every quarter. We buy five separate investments. We have the option to leave some of that money in cash or to make investments. We've made investments all the way through. We're about 29 percentage points ahead of the market, maybe 27 percentage points ahead of the market today. That's been awesome. It doesn't compare to Odyssey. So, *Supernova*, which is part of One … That's the great thing, is that anyone who beats me, is a part of *Motley Fool One*.

MATT ARGERSINGER:

It makes it tough to be an employee.

TOM GARDNER:

Just so you know. I created *Supernova*. No. So, the Everlasting Portfolio benefits from all of the research that's happening at The Motley Fool. I get kind of a bird's-eye view, as a *Motley Fool One* member does, on everything that's going on in *Income Investor, Inside Value, Million Dollar Portfolio*, *Supernova*, Pro, Options, *Hidden Gems*. So, I've got a great view.

And then we do all of our own original research, as well, alongside that. So, we're building with a team of about ten investors now, our approach. We'll make five rounds of investments. We mandate holding for five years.

And I guess my view is we've got about $1 million in the portfolio now and I'm excited about looking down and seeing that at $5 million, $10 million, $15 million, $25 million and higher. I think when you run the numbers and show what happens if you generate 13-14% a year — which I think is possible with great long-term business focus, tax-deferred investing — and you run that forward 20-40 years, it's unbelievable the snowball that grows.

JEFF FISCHER:

When does your next investment take place?

TOM GARDNER:

Our next scheduled investment takes place on April 1. And then overall, *Motley Fool One* … Guys, I'm speaking quite a bit right now. I apologize … *Motley Fool One*, by integrating all of the services, is designed to give you the dashboard for what we believe in most. It gives you the opportunity to learn from each of our advisors and to see their most highly beloved investments right now and to see those investments compared across services with a ranked list.

I think what you're going to find in The Motley Fool — now we are adding separately managed accounts as we mentioned. There are pretty much two pathways with *Motley Fool One*. One of them is … Let's put it in the "lite beer" commercials from fifteen years ago.

One of them is Tastes Great. I'm avid. I'm passionate about this. When John Mackey joined our board he had, a couple of months before, become a member of *Motley Fool One* and he called and told me, "Pretty much, I'm done almost nothing for the last two days. I am totally obsessed. I've read through all back issues of *Rule Your Retirement*. I've read *Inside Value, Income Investor*. I'm not just improving my investment portfolio. I am actually learning a lot about these companies and I'm learning a lot about business that's useful for me." So that's the Tastes Great group that wants to dive in and loves this subject.

Then there's the Less Filling group and I think we're going to build out a lot of Less Filling services, particularly because our Tastes Great member has family members … a spouse, children, grandchildren … that they want to pass this onto …

MATT ARGERSINGER:

Plus parents …

TOM GARDNER:

… connecting them in through the Less Filling. Like, "I don't have a lot of time or interest, or my temperament isn't right to be an investor." Separately managed accounts. The access to a financial planner. And I frankly believe that more and more of your investing and financial advice that you see out there is going to be initiated by human research and proven, long-term public performance records which you don't see across the financial services industry.

Please tell me when you meet with an advisor or broker if you can look at their record and if that record is published and compare it to everyone else. It's very difficult to do, but that's coming because of the Internet, and I think that you're going to find a lot of this will be automated. Off of the initial research that is done, you'll be able to put your personal factors, your needs, essentially in surveys, building a profile, and then you'll get the guidance that really works most effectively for you. And that will happen for your kids, your spouse, your parents, etc.

JEFF FISCHER:

And *Motley Fool One* is already going down that route with [crosstalk 00:55:33] …

TOM GARDNER:

That's a big focus of ours. I kind of feel like the best comparison for our company right now … It's very nice to say this with our stock at $250 a share having gone up almost 10x in value in the last two years … but I think of us, a lot, like Tesla because I think that what we're doing does run contrary to the industry, so I'm sure we'll get some complaints.

But that's not important. We want them to follow. Tesla wants as many electric cars out there in the market as possible and we want as much long-term business focus investing with transparency, performance records that you can follow and that have beaten the market over long periods of time — we want as much of that out there for the individual as possible and it's not readily available and hasn't been in my lifetime. So, that's one of the biggest motivators for us. Team!

JEFF FISCHER:

Thank you.

RON GROSS:

It's great.

TOM GARDNER:

Okay. One stock from each person. Here we are. It's 6:13. I guess we have two minutes left, although Steve, our producer. Steve, you have appeared to check out on this. I'm looking at you looking down at the monitor as if you're playing World of Warcraft or Ticket to Ride, which is integrated into *Motley Fool One*. But we probably have about two minutes? Would that be right? Yes, excellent. Two minutes. Each one of us will share one investment that we think is a market beater over the next five years.

RON GROSS:

This is a little staid. It's not too sexy, but it's just a wonderful company …

MATT ARGERSINGER:

It's Markel.

RON GROSS:

It's Markel. MKL is the ticker symbol. Specialty insurer run by wonderful people who are Foolish in their own right. Tom Gayner, the chief investment officer, has an incredible track record. Not only does Markel make money on insurance which many insurance companies don't, but they invest their capital and they're great stewards of investors' capital, as well. I would be happy to own that company forever.

RON GROSS:

MKL.

JEFF FISCHER:

MKL. Markel is sexy compared to the company I'm about to …

TOM GARDNER:

Okay, love it. I think I know where you're going. I know where we're going here.

JEFF FISCHER:

At the *Motley Fool One* member event here in Alexandria last month, I brought this up …

TOM GARDNER:

Telephone poles.

JEFF FISCHER:

Telephone poles and light poles and utility poles. Valmont Industries. Ticker is V as in victory, M - I. And it's beaten down right now because irrigation sales were … they also sell irrigation systems for farmers … were a record high in 2012 and softened up last year and they're going to be softer this year, too. But we like that. It's in a down cycle. The stock is inexpensive in a relatively more expensive market. It's a defensive investment and it should grow well over the next five years. And it's been an outrageously great stock for the past 20 or 30 years topping pretty much everything I can look at.

TOM GARDNER:

Out of curiosity, do you expect your stock to double over the next five years? Markel? Valmont? Are you thinking 15% a year? Is that your target when you make an investment?

RON GROSS:

The Rule of 7 would say 7 years at 10%. So, can we do five years? Yes, I think we can. I think Markel can.

JEFF FISCHER:

We're hoping for that, too.

TOM GARDNER:

Double in five years. Right on.

MATT ARGERSINGER:

I'm going with the outsider theme here. One stock that makes up a big part of my personal portfolio is Biglari Holdings. It's ticker BH run by Sardar Biglari who counts, among a lot of his heroes, Henry Singleton which is certainly one of the premier outsiders I think for the last 50 years in terms of investing. So, you've got Sardar Biglari, Biglari Holdings. They own Steak 'n Shake, which is a Midwest burger chain. Pretty well known. They own a big chunk of Cracker Barrel.

And they recently, a week and a half ago, bought *Maxim* magazine. Talk about sexy, right? But he's amalgamated all these businesses together and I think, more than any investment that I've known … and I've studied Biglari. I've met him several times. I've been to every annual meeting over the last five years. And I think this is a company that I'm confident he can deliver 15-20% annual returns per year.

TOM GARDNER:

Love it. Is that a *Supernova* or *Rule Breakers*? Is that a Live Rec?

MATT ARGERSINGER:

I have tried and I have tried … [crosstalk 00:59:19]

TOM GARDNER:

There's a team-based approach.

MATT ARGERSINGER:

[00:59:23]

RON GROSS:

He's an activist, and something …

MATT ARGERSINGER:

He's a bit of an activist …

RON GROSS:

… and he rubs some people the wrong way.

TOM GARDNER:

So, Biglari is not a Live Recommendation anywhere because of you at the Fool. Is it a Live Recommendation?

RON GROSS:

It used to be a *Million Dollar Portfolio* one when it was Steak 'n Shake.

MATT ARGERSINGER:

When it was Steak 'n Shake …

RON GROSS:

Then he took it over and we said bye.

TOM GARDNER:

Got it. Got it. So, there's a disagreement about Biglari as a leader of a public company.

RON GROSS:

Yes.

TOM GARDNER:

Awesome.

MATT ARGERSINGER:

I would say he's the meaner version of Selim Bassoul. Of course, as the CEO we love him and Middleby that you own in Everlasting Portfolio …

TOM GARDNER:

And why do you say that out of curiosity? What do you read in him? Obviously you favor him. What is the edge to him and how do you …

MATT ARGERSINGER:

So, Sardar. If you look at Buffett or Selim, to a certain extent … I mean, these guys are always trying to do friendly deals. Friendly investments. "We want to work with you." Sardar is a guy who comes in and says, "No. I think I can do it better than you."

TOM GARDNER:

Like icon, a little bit. There's a little icon flavor.

MATT ARGERSINGER:

A little bit of icon. Better than icon, but certainly more of an icon flavor.

TOM GARDNER:

But would we say an icon? He's been an unbelievable investor, right?

MATT ARGERSINGER:

Absolutely.

TOM GARDNER:

Interestingly, about these three companies, because I'm actually going to add four to them, but it's the four outsider companies that we're following right now in *Motley Fool One* in our showdown to our March Madness of finding the best one to invest in. But what's interesting to me is that each of you has essentially picked an outsider company. I don't know about Valmont's leadership, but with a 20-30 year return, I'm going to be interested to learn more with them having done so well.

But these are three companies that the average person has never heard of. I mean, please tell me if anyone in your family has ever heard of Markel, Valmont Industries or Biglari Holdings. I'm going to guess that the answer is no for 99% of the adult U.S. population. And we need to remind ourselves at certain points in time that the stock market is an auction market and where everyone is bidding, two things can be happening. One, there's something unbelievable there and the bidders are right. Rembrandt is Rembrandt — but remember there was also a time in Rembrandt's life where Rembrandt could barely sell his paintings to pay off his debts in the end of his life.

So, you guys have identified three unknown companies that there aren't a lot of conversations about — therefore there aren't casual buyers of the stock who don't really follow it, because they've never heard of it. And I'm going to add to those three Leucadia, which is an outsider business that we're following, Valeant Pharmaceutical, Amazon, which is known, and Berkshire, which is known.

So of the seven stocks we've given you, two of them you've heard of. You would never really have heard of Berkshire Hathaway if it weren't for the fact that Buffett became, essentially, a legend as an investor. The businesses that he is buying, for the most part, and the way he's run his company is much more Markel-like or Biglari-like and not necessarily would you ever follow and get to know what that holding company is all about.

So, there are seven stocks. I'm going to put these seven stocks in the CAPS portfolio. I believe these seven stocks are going to deliver excellent returns over the next five years and I am interested to see in this environment — maybe it was or wasn't in this environment — that we've all focused on companies that are unknown great performers. And that's how I tend to think. When the market starts to look a little bit stretched to me, I look for the underfollowed and the unknown star performer to find the better values out there.

The most important point I can close with is that we're super long-term investors. Morgan Housel has done so much great work for us in *Motley Fool One* over the last year — the special reports — one of them showing that the market falls 10% every 11 months going back more than 100 years and that those drops are pretty evenly distributed. It's not like they're all bunched into a six-year period and then you have fourteen years with no 10% drops …

RON GROSS:

And your earlier comment that you were rooting for …

TOM GARDNER:

You're right, Ron. Thank you for reminding me. I made a bet in our *Motley Fool One* membership on January 1 that given a variety of factors, I felt that this year we would have a 10% decline. And again, they come every 11 months, pretty evenly distributed. We haven't had one for about two years. And so, my bet is that if the market does not fall 10% at some point in this year …

So, in a sense I'm cheering for like, "Well, let's rip it up a little higher here before the summer doldrums start to slough off a little." If it doesn't decline 10% peak to trough at some point this year, I will be walking a marathon on my treadmill desk each day for five days in a row. You know, it was so easy to write that sentence … and now I'm had like an Ironman in our member community and a couple of people here at the Fool that are marathoners go, "You know what? Day four you're going to be in pain, because walking a marathon, you'll be fine." Plus, I can space it out. It's not like I have to do it continuously throughout the day. I can do six hours here and there. But it's going to be a long five days for me.

The reason I did that is I want to make sure that we set ourselves up, eloquently said by Jeff, to have positive actions should the market decline. That we're prepared and expect that a natural course of investing is to see a 10% decline. Because I can promise you one thing. The media's going to make it sound disastrous. They already made it sound disastrous in early January when the market fell 5.5%. So, you can only imagine what's going to happen when it's down 10% and that's going to happen multiple times along the way as our portfolio grows throughout the year.

So, Ron Gross, Jeff Fischer, Matthew Argersinger, thank you all.

RON GROSS:

Thank you.

JEFF FISCHER:

Thank you.

MATT ARGERSINGER:

Thank you.

TOM GARDNER:

Some of my happiest times at The Motley Fool is hanging with the three of you and with our advisors and talking investments and working with you and for you in The Motley Fool. So, I've got some comments that I need to make here in closing our conversation.

First of all, thank you for spending your time with us. I hope you found this valuable and useful in its own right for you as an investor. If you're interested in *Motley Fool One*, the *Motley Fool One* member lobby is a really great place for you to go. If you click the link below, you begin the application process and you join us in our member lobby and our member lobby is fully free.

You're going to find everything from the four outsider companies that I mentioned — but more importantly, the explanation behind those businesses and why we believe they're going to deliver excellent results. You also gain access to my CEO interviews with Jim Sinegal and John Mackey and Selim Bassoul and Monty Moran, the co-CEO at Chipotle, which has been such an incredible investment for us.

We love to sit down and talk on camera with our CEOs, with the companies that we're invested in, not just to learn about the company and its prospects, but we learn things about the industry and about other businesses they love. We've learned so much from those interviews.

Finally, you gain access to interviews at our most recent member event, which I know many of you attended — but for those of you who didn't — our Malcolm Gladwell interview and Pete Miller's great talk, the CEO of National Oilwell Varco who will be a part of a spinoff out of that business and run the spinoff which is a really interesting dynamic that we've talked about in *Motley Fool One*.

So, *Motley Fool One* gives you access to all of our services, to these advisors, to my brother David, to *Income Investor, Inside Value, Hidden Gems*. We're very excited that in the next year it's going to provide you access to all of our international services, as well. It also gives you access to a financial planner. It's going to help you build a financial game plan around your investment portfolio so you really are thinking through not just the equities that you have, but what about allocation with bonds? What about insurance? What about building out your estate and taxes and thinking through the tax efficiency in your portfolio. That's a really important part of *Motley Fool One*.

We have the separately managed accounts coming. For regulatory reasons, I'm not going to go into great detail about it here other than to say that we want you to be able to invest with us whether you want to spend a lot of time on it or not. We want to make sure that you and members of your family can invest the Motley Fool way and aim for great, long-term returns that are tax efficient.

Beginning April 1, our *Motley Fool One* members will see the winner of our Final Four showdown and March Madness of our four outsider companies. If you'd like to see that and be a part of *Motley Fool One*, click the link below to join and apply to join *Motley Fool One*.

Last point is that it bears a 100% money-back guarantee. I have talked to members who have been members of particular services of ours and have stuck with it for 190 days and then felt bad bailing and taking the refund — but that's the nature of what we're trying to do. That's our purpose at The Motley Fool — to help you invest better.

I'll begin inviting members into *Motley Fool One* on March 20. I look forward to working with you, with our entire team … that's what you get as a *Motley Fool One* member …and to helping you invest better for the rest of your life and to set your family up for generations to come. Thanks so much for spending time with us. Ron, Jeff, Matthews …

JEFF FISCHER:

Ron's parents …

RON GROSS:

Bye, mom. Bye, Dad.

TOM GARDNER:

Thank you all and Fool on!

Earnings: PZZA Q4-2013

Published Mar 7, 2014 at 2:42PM

Pro's Take: PZZA Q4-2013 Earnings

Papa John's International (NASDAQ: PZZA)

Quarter Quick Take

This was a strong quarter and excellent finish to the year for Papa John's. Domestic restaurant performance was remarkable, and while the competitive landscape is always treacherous, Papa John's is using technology and key marketing partnerships to take share. The company continues to focus on the long term and increase the value of its business. Looking ahead, Papa John's will be doubling down its quality-focused marketing efforts on web and mobile (it announced a new ad agency to help) and it should see international profitability improve as key markets become more highly saturated.

....

Q4-2013 / FY-2013

Total revenue growth: +12% / +9% (both correcting for the 53rd week in 2012)

Operating profit margin: -10 bps to 7.3% / Flat, 7.4%

EPS growth: +32% / +20%

....

Guidance Update

Papa John's 2013 sales were stronger than I expected while profitability lagged a bit due to increased spending to support international growth. The company's business fundamentals are tracking well against our thesis and management's consistency and long-term focus remains impressive. After reviewing the history/progression of other franchise business growth and profitability trajectories I feel confident in assuming a bit more profitability from international market density and maturation and operating expense leverage for Papa John's. Basically, I think the company's future profitability has the potential improve meaningfully, and I'm confident Papa John's has the growth runway and execution prowess to get there. Accordingly, I'm raising my Fair Value estimate to $46.50 and Consider Adding More price to $35.

Updated guidance: Buy (no change)

Recommended Allocation: 4.7%

Fair Value estimate: $46.50 (increased)

End of Fiscal Year expected FV estimate: $50

CAM price: $35 (increased)

Strong business performance has driven part of the stock's impressive multi-year run (up +184% since 12/31/2011). Multiple expansion has contributed greatly, too. Historically, Papa John's has traded for 12x EV/EBITDA and it now trades for 17x. I believe some of this expansion is warranted based on a lengthening growth runway (international and domestic strength thanks to struggling mom and pops, delivery taking share, and increased order rates/checks/satisfaction from technology), a lowering risk profile (the brand is proving it translates abroad), and outperformance of peers. Still, shares are richly priced, and Papa John's is now Pro's third largest position at 4.7%.

My decision to hold our shares at this valuation rests squarely on the upside potential that remains if things go right and management's skill in execution and protecting the brand. Also contributing to the decision is the fact that PJ has a resilient business, a strong growth profile that should hold up well in a rocky economy, and the marks of a compounding machine (precisely the type of company you don't want to sell because of valuation). Of course, I won't ignore the downside – cash flows and valuation matter. I'm getting uneasy with the valuation, but I'm not compelled to sell or reduce at this point.

I'm also watching three yellow flags that have recently appeared. None of these are damning...but they're worth watching.

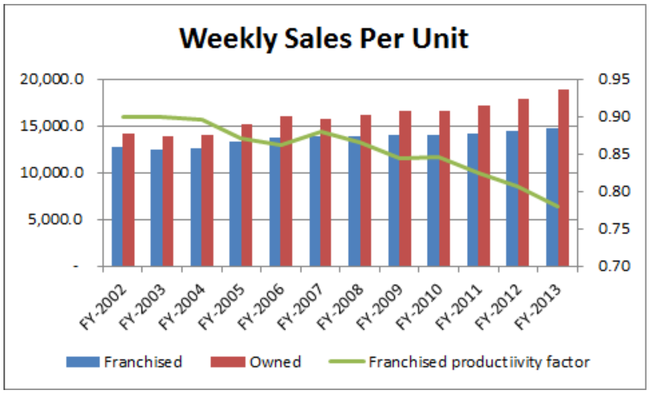
1. Buried deep in the 10-K (note 16) was notice that the company repurchased one million shares ($38.6 million worth) of stock from Founder and CEO John Schnatter. Schnatter still owns 10.3 million shares (25% of the shares outstanding), but he cashed out almost $40 million.
2. Over the past two years PJ has repurchased $225 million worth of shares, but it has funded more than $100 million of that with debt. To be fair, there is nothing wrong with this – debt is cheap right now and the business can support it. However, the company has not communicated a change in its capitalization policy and it hasn't grown FCF to support its repurchase activity. These repurchases juice EPS growth rates, but have no impact on the core earnings power of the business.
3. The initiation of the company's dividend (in light of the Papa himself selling shares and shares and multiple expansion) halfway through the year may be a signal that management sees a more prudent way to return capital going forward is through dividends rather than repurchasing expensive shares. I'm interpreting this myself ... management has not stopped repurchases or said it would slow the rate.

Our Thesis

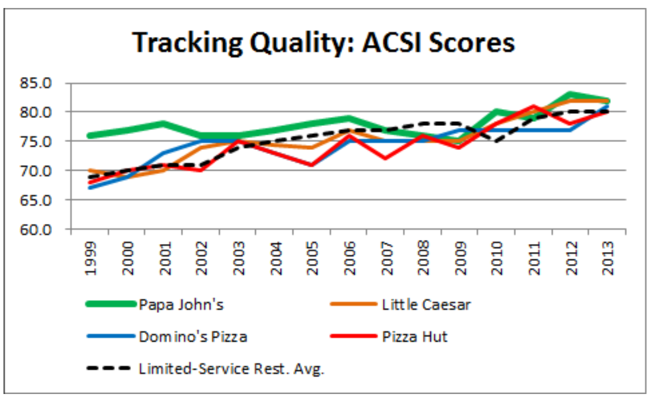
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main QSR-pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only 1,000 international restaurants the company has a long runway for growth. Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

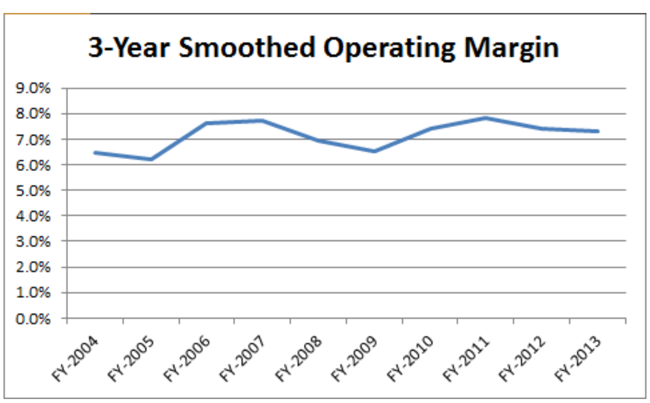
1. ***Store Performance***: Without healthy franchisees Papa John's has no business. Same store sales offer one look into store performance, but we also track sales per store, store-level profitability, and how all of this translates into the pipeline of committed new franchisors. During Q4-2013, systemwide comps increased +9% in North America and +7% for international. For FY-2013, systemwide comps increased +4% in North America and +8% for international. This is strong performance, but it can be bumpy. The rolling two and three year comps are still very impressive. The average domestic company-owned store (633 comparable units) had $988k in sales – the third consecutive year of increase and up from $737k ten years ago. This solid performance keeps franchisees signing up: PJ opened 265 restaurants (net) in 2013 and expects to open 220-250 (net) in 2014. Its pipeline consists of 200 domestic commitments (to be opened over the next three years) and 1,000 international commitments (to be opened over the next six years).



2. ***Brand***: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantaged and higher price per pie. Papa John's domestic outperformance and share gains suggest its brand positioning remains strong. Management is as committed to quality and the "better ingredients, better pizza" mission as ever, as evidenced by: continued drum-beating on conference calls, consistent media messaging, increasing the franchisee marketing spending rate, and the hiring of a new marketing agency to spread the message beyond television. In June PJ rated #1 in customer satisfaction among national pizza chains (and in 12 of the last 14 years) as rated by ACSI.



3. ***Margins***: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. In the near term, we expect Papa John's to continue to spend heavily to support the build-out of its technology platform, new POS system, and international infrastructure. Eventually, it should leverage its buying power and corporate overhead to improve margins. During the quarter and year, operating margins were flat, but management guided for margin improvement in 2014 (ignoring one-time costs associated with the new POS system).



WWTN

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities.

Conference Call Notes

- On Guidance: EPS is projected to be in the range of $1.64-$1.72. North American comparable sales should be in the range of +2%-4.5%. International comparable sales are projected to range from +5%-7%. Pre-tax margin should increase 20-40 bps (excluding the impact of the new POS system). Worldwide net new unit growth will be in the range of 220 and 250 units, of which 70% will be in international markets.
- CEO John Schnatter on comps: "In the face of increasing competitive pressure throughout the year and a global economy that is still struggling to gain its footing, our global system continues to excel at the fundamentals in deliver on our Better Ingredients, Better Pizza brand promise throughout the world. That focus resulted in North America comp sales of 9% for the quarter and 4% for the full year, representing the 10th consecutive year of flat or positive comp sales."
- CEO John Schnatter on how the business works: "Satisfied customers lead to more loyal customers, and loyal customers lead to more profitable franchisees who want to grow their business. It also leads to new franchisees entering the system who want to partner with a winner and want to be part of something special."
- COO Tony Thompson on technology leadership: "We continued to extend our technology leadership position in 2013 by becoming the first national pizza company to have more than 45% of domestic system sales coming to our digital channels. In doing so, we topped the $5 billion mark in all-time digital sales during the year. We are well on our way to becoming the first national pizza chain to achieve a domestic systemwide digital sales mix of 50%. Among others, Papa John's was the first national pizza company to offer systemwide online ordering in 2001. We were the first to offer systemwide text ordering in 2007. And we were the first and still the only pizza company with a systemwide digital loyalty program, Papa Rewards, which launched in 2010. Our digital leadership continues to play a vital role in moving the needle for our brand, both in terms of sales and customer satisfaction. In addition, our technology leadership continues beyond consumer facing innovation to back-of-house initiatives, such as our new point-of-sale system, that we will soon begin to roll to our domestic restaurants."
- On China: Papa John's is moving toward profitability in China...but probably won't get there in 2014. Management is very confident that its investments abroad will pay off – things are progressing as planned.
- On the pace of store openings: PJ could probably grow faster, but it doesn't want investment and build-outs to outpace the infrastructure or compromise the ability to ensure quality.
- CEO John Schnatter on the future: "I don't see anything that doesn't say that our execution is going to get better, our marketing is going to get better, and our scale is getting better. I don't see anything but good." And later..."We are actually out two or three years in our vision. I can tell you next year, 2015, when we have the call that we are having today, Papa John's will be a better company then than it is today."
- On competition: When I started covering PJ I didn't think I was going to keep it in the portfolio. Then I realized they played a different game than their competitors. This quote sums it up: "We certainly pay attention to what they are doing, but we manage out of our own playbook."

Sell StoneMor Partners

Published Mar 6, 2014 at 1:00PM

Is this for you? Only members who still own these shares need heed this alert.

How You Participate

- **Action:** Sell **StoneMor Partners** (NYSE: STON)
- **Allocation:** We're selling all of our 1,400 shares, which represent a 1.8% position.
- **Scorecard Status:** Sell (no change)
- **Recent Unit Price:** $25.40
- **Price Guidance:** Use a limit order and please **do not sell for less than $25.25**.

What We're Thinking

Will StoneMor Partners beat *Pro*'s North Star over the long term?

For reasons explained below, we find it difficult to formulate a reliable answer to that question, and that's part of the reason we're selling. We originally recommended a sell in May 2013, using a covered-call equivalent limit order of $27.50. But that trade alert moved StoneMor's price, so our desired sell has remained uncompleted. Since then, we've collected $2.40 in distributions; when we add that figure to today's unit (or share) price of $25.40, the result is in effect higher than our original desired sell price. Now we can recommend selling by using a limit order of no less than $25.25, and ideally no less than today's price (lately $25.40).

This master limited partnership distributes 9.4% in annual income annually, not much lower than the current performance of our North Star. So why not keep owning it? The dilemma isn't the distribution, but the dilution of StoneMor's units outstanding. Since we originally bought units in the second half of 2011, StoneMor's unit price has declined 10.2%, largely due to the pressure of new units being issued. Adding back the distributions we've received, we have a 14.3% total return in two-and-a-half years. That's not abysmal, but it's below our North Star goal.

The pertinent question looking ahead is, "Would this relative underperformance continue?" We think it may, and here's why. In four of the past five years, StoneMor has created more units each year, diluting the value per existing unit. The partnership's annual distribution remains reliable, but if unit dilution creates a steady headwind, we may be left with only a 6% to 9% annualized return (and lower than that after taxes, since distributions are taxed as income). That's less than our desired 10% or higher, and the difference would add up over time. Many unit owners may be accepting of this yield, but it falls short of our goals.

Starting from 12 million units outstanding, StoneMor created 2.1 million more units in 2010, with the majority sold to the market at $24 each. In 2011, management created another 4.8 million units at $29.25 each. In 2013, 1.4 million new units were created at $25.35 (a big step down in unit price); and last month 2 million more units were sold at $24.45, another step down. Clearly, management is not opposed to creating more units at lower prices, suggesting that this sort of dilution is a regular part of the plan. That might be fine if the distribution were rising in kind, but lately it hasn't. We've seen 45% unit dilution since the end of 2010, while the distribution per unit has increased just 8%, from $2.22 per unit to $2.40. This is a relatively short time to measure, but the problem is we can't reasonably estimate what's next.

How It *Doesn't* Fit Into *Pro*

We can't know the magnitude of future unit dilution; even management doesn't know. It's largely based on capital needs for desired acquisitions of new properties. Not knowing how much dilution to expect leaves us invested in a black box of sorts. Although we continue to believe the company's distribution is safe, we don't know how much of it will be eroded by new units, or if the business will grow enough to offset ongoing dilution. Management has shown skill at acquiring new properties, and StoneMor's long-term track record is enviable, but greater than 10% annualized returns will likely be difficult to realize.

So, we don't have a reliable answer when we ask ourselves our pivotal question: *Is StoneMor a compounding machine that will meet, or beat, our highly competitive North Star and compound our dollars over the years?* We can't say "yes" with enough confidence to merit continuing to own our position. Our 1.8% stake is (still) a sell, and now we're willing to accept $25.25 or higher to exit. We look forward to putting the capital to work elsewhere.

Pro Can Help

- We're not deadbeats! We'll answer any questions you have on the StoneMor discussion board.

Set Up a Synthetic Long on Coca-Cola

Published Mar 4, 2014 at 3:44PM

Is this for you? This is for *Pro* members who lack at least 3% exposure to this company.

How You Participate

- **Trade:** Simultaneously sell to open January 2016 $37 puts and buy to open an equal number of January 2016 $37 calls on **Coca-Cola** (NYSE: KO).
- **Allocation:** 3% if converted to stock. For *Pro*, that's 16 puts and 16 calls, for 1,600 potential shares. Each synthetic long represents $3,700 in stock exposure.
- **Price Guidance:** Since this trade mirrors stock ownership, aim to set this up when Coca-Cola's stock price is less than $39.
- **Recent Prices:** Stock, $38.33; January 2016 $37 puts (splitting bid/ask), $3.80; January 2016 $37 calls, $3.45. Net credit: approximately $0.35.
- **Stock-Equivalent Rating:** Buy First
- **Fair-Value Estimate:** $45

What We're Thinking

The world's largest beverage company is out of favor on Wall Street. Coca-Cola is trading at its lowest multiple to free cash flow (19.9) since 1991, which is as far back as we can check. Despite its low price historically, growth in unit case volume last year, and a 3.2% dividend yield (with another dividend hike expected this quarter), it seems the only ones buying Coca-Cola shares lately are company insiders.

Why are investors flat on Coke's prospects? In a word, soda. Coca-Cola is the world's largest non-sparkling water, juice, *and* soda company, but Coke and Diet Coke brands drive a large portion of profits, and sales of the sugary beverage and its aspartame counterpart are slipping in North America, leading to volume declines as consumers choose healthier options. Against this headwind, management believes North America remains a growth market and is investing in extra advertising to regain lost ground.

The company is also investing in healthier diet soda options and a "truth campaign" surrounding current offerings. Coca-Cola expects to see improvements in North American soda volume as soon as a quarter or two from now, and suggests the improvements will grow over time. The table below shows how the company's *total* worldwide unit case volume growth has stacked up the last several years (a unit case is 24 eight-ounce servings):

KO	2006	2007	2008	2009	2010	2011	2012	2013
Unit Case Volume Growth	4%	6%	5%	3%	5%	5%	4%	2%

Last year's results were dragged down by performance in North America, so the first sign of improvement there should bring investors back, lifting share prices. Meanwhile, it's not as if Coca-Cola is a dying business — far from it. As the table above shows, management knows how to increase volume year after year even from a massive base. And relatively small volume gains can result in healthy earnings growth.

Excluding currency differences, operating income was up 6% in 2013, and earnings per share climbed 8% on a 3% revenue gain. Coca-Cola's worldwide beverage volume grew 2% last year, with a 5% gain in still beverages and a 1% gain in sparkling brands. That mere 1% volume increase meant nearly 100 million more cases of Coca-Cola products were sold last year, and that lapped a big 3% soda volume increase in 2012.

Still, including currencies, 2013 results were down from 2012 and flat with 2011 — hence the market's consternation. But in the bigger picture, Coca-Cola sells approximately 1.9 billion beverages a day, enjoyed nearly $8 billion in free cash flow in 2013, and has a goal to sell 3 billion daily servings by 2020.

How It Fits Into *Pro*

Many investors are excited about stocks right now. Margin debt is at all-time highs, suggesting that if history is a guide, we should be more careful than not. On a risk-to-reward basis, Coca-Cola should not disappoint. Our downside should be modest, and our upside — especially on the synthetic long — more than compensates for the risk. At $45, our fair-value estimate is 17.6% higher than today's price, valuing Coca-Cola at 18.75 times our estimated 2016 earnings — a cheaper valuation than today's, and lower than the stock has averaged for years (excluding a brief dip during the financial crisis).

If the stock gains nearly 18% to $45, our 22.8% return on cash (assuming a net start price of $36.65 on our synthetic long) converts into a 113% return, assuming 20% equity is set aside to secure our puts. Meanwhile, the synthetic long in a margin account ties up little cash, and our potential follow-up is to turn our options into a 3% stock stake at a net $36.65 by expiration. That would be an inexpensive 15.3 times expected 2016 earnings.

All told, if Coca-Cola executes half-decently, this low-risk position should handily surpass our North Star over the next 22 months while offering a chance to buy shares should we want them. Consumer staples are a defensive industry, one in which we're comfortable adding exposure. The world won't stop drinking, and no company matches Coca-Cola's distribution system, product breadth, and brand names — including 16 billion-dollar brands under the Coca-Cola wing.

More That Matters

- **Maximum Loss:** The same as share ownership.
- **Maximum Gain:** Unlimited as the stock rises.
- **Breakeven:** Lately $36.65, or your strike price minus or plus the credit or debit to set up the trade.
- **Follow-Up:** We can allow our syn long to turn into stock by expiration by doing nothing, or we can close it early or roll it to a future year.

Alternative Trades

- **IRA-Friendly:** You can write cash-secured puts in an IRA, but you'll need to set aside $3,700 per put you write. You could instead simply buy 3% in the stock.
- **Less Money:** You can just buy to open January 2016 $35 or $37 calls if you prefer. If you don't plan to turn these calls into stock, then only allocate an amount of capital you are willing to risk.
- **Already own calls from *Motley Fool Options*?** Either sell to close those January 2015 $35 calls to start this synthetic long instead, or (our preferred move) keep them and add enough synthetic long exposure to bring your total KO exposure up to 3%.

Listen Now!

The S&P 500 climbed about 4% in February, bringing the lurching giant back to positive territory for 2014, and to new all-time highs on Friday.

Record highs mean little without the context of valuation, so as of Friday (on S&P Capital IQ numbers), the S&P 500 trades at 18.3 times profits over the last 12 months. That prices it toward the higher end of its historical value range. Earnings per share must rise by at least 7% this year to meet current average expectations, and if they do, that could help keep the index at today's level or higher.

But day by day, not nearly as much is changing at the typical business as the market's recent volatility would suggest.

Free cash flow generation ("earnings") at any business rarely falls or soars monthly, let alone weekly or daily. And if a company is growing by 10% a year, its free cash flow is growing by, on average, less than 1% a month. It certainly isn't experiencing 10% fluctuations up and down, the way the market often swings.

So, why are stock prices sometimes as bumpy as your favorite roller coaster ride?

We can't forget that the stock market is an auction market. Nothing more than active bidding makes prices go up, while selling (or merely wanting to sell) can make prices tick lower. The last few years, steady bidding has led more and more people from the sidelines into the market, increasing the bidding pool. Johnny-come-lately doesn't want to be left behind.

Meanwhile, overconfidence about rising prices is causing others to make the mistake of borrowing money to invest: Margin debt is at record levels. Of course, the more you borrow to invest, the more bidding you can do, adding still more to the bidding pool.

Historically, when prices are rising, people slowly get excited, and start to invest more and more aggressively. Bidding feeds on itself. Barring bad news, this can drive prices up for years. So why are many people buying lately? Because they believe prices will keep going up.

But when stock prices are *falling*, why do you buy? Once the bidding has dried up, and there are more sellers than buyers in the room, what *compels* you to step up and buy?

The answer: Valuation. There's no other reason to buy when prices are falling, except when you see a valuation you like.

So, let's review.

When prices are going up, why do many (non-Foolish) investors buy? Because they believe prices will keep going up.

When prices are going down, what makes you want to buy? Valuation.

This is why the market can climb for so long, but often falls quickly when it declines. Once prices are truly falling, you only want to buy when valuation is attractive. Sometimes that doesn't happen until something falls far.

The 20% Test

One quick way to assess your positions is to ask: All else equal, how would the valuation look if my stock fell 20%? Would the decline *compel* me to buy more shares?

If **Facebook** (NASDAQ: FB) declined 20% from Friday's price to about $54, it would trade at about 32 times expected earnings for 2015. Would we be compelled to buy a bit more? Given the strong growth we expect from Facebook, possibly, yes. If **Valmont** (NYSE: VMI) declined 20%, would we be driven to buy more? Almost certainly, yes! Valmont would then trade at about 5.4 times EBITDA, making it about as cheap as it has been looking back to 1991.

One more example, this time on a stock not in our universe: As of Friday, **Yelp** (NYSE: YELP) trades at 259 times expected 2015 earnings. If the stock declined 20%, would we want to step in and buy? It would then trade at 207 times expected 2015 earnings. It's hard to imagine why I would raise my hand to bid on it at that price, especially in a falling market. Plus, it's easy to imagine more owners wanting to sell even after a 20% decline.

This, I would suggest, is how prices can fall far, and quickly, on some stocks. Yelp may be a great business to own for the long haul, but it may be getting bid up lately mostly because ... it's been going up. However, when prices are falling, you can't expect robust bidding to return until the valuation offers a compelling reasonfor new investors to step in and buy. What valuation multiple will that be?

In the *Pro* portfolio, we want to own companies that we (and as importantly, others) will be compelled to buy (or buy more of) on a 20% decline. In a rising market, *everything* looks good, and oftentimes the riskier stocks rise the most. In a falling market, you need to use valuation to measure what looks good. Sometimes that means a long roller coaster ride down before you start to see the ground. We aim to avoid that with *Pro* stocks.

Share your thoughts on the [Memo Musings board]; see our update on a Buy First stock below; and stay Foolish for the long haul!

-- Jeff (TMFFischer)

Pro Guidance Changes

- **American Tower** (NYSE: AMT): *Pro*'s fair value increases to $105. The stock remains a Buy First with a 2.4% allocation. We're considering strategies to add to our shares. Check out Billy's [full business update here], in our new format.

CHRIS HILL:

Welcome to EP Weekly. I'm Chris Hill joined in-studio this week by Bryan White, Alyce Lomax and chief investment officer here at The Motley Fool, Andy Cross. Thanks everyone for being here.

ANDY CROSS:

Chris.

ALYCE LOMAX:

Hi.

CHRIS HILL:

We've got Middleby's earnings to talk about, but I should kick things off by officially welcoming Alyce Lomax to the Fool One team. Alyce has been working for years at Fool.com. I'm sure a lot of our listeners know her writing from there. And Alyce, before we get to Middleby's earnings, I wanted to touch on one company that I know you follow very closely because a big part of the work you've been doing at Fool.com … a big part of your focus as an investor … is on conscious capitalism. I think it's fair to say there's no one at The Motley Fool we identify more closely with conscious capitalism than John Mackey from Whole Foods.

Where are we now with Whole Foods? When you look at this as a company, you and I are both shareholders … longtime shareholders of this company. But I am curious. What do you see when you look at Whole Foods right now? What stands out to you in terms of their business today?

ALYCE LOMAX:

Well, I'm not sure that everybody is aware of just that holistic sense of conscious capitalism that Whole Foods and John Mackey have tried to further. I think that, that is such a wonderful thing for business. It's such a wonderful example to make that you can have that sense of all stakeholders and do well. I think that it's actually an exciting time right now because of the value. They're trying to get away from "Whole Paycheck." I think that's great for actually spreading the word about their business … Showing people that you can take care of your employees, you can take care of the environment, customers … And I think that a lot more people are going to start to understand that as opposed to a lot of the other grocers.

CHRIS HILL:

On the one hand, if they're lowering prices … if they're offering more value opportunities within their stores … that's potentially great for getting more people in the door. On the other hand, selfishly, as a shareholder, I'm wondering what this is going to do to margins. At least in the short term, it's got to hit them.

ALYCE LOMAX:

Absolutely. Unfortunately, that is going to hit them, but I believe that it's worth the risk right now, especially in the current environment, too. I mean, consumers aren't exactly feeling too flush right now. But I believe that they still have the sense of … I mean, they do still have a lot of … let's face it … high-margin products …

ANDY CROSS:

I had heard, I think, both John Mackey and Walter Robb, who is the …

CHRIS HILL:

Co-CEO …

ANDY CROSS:

Co-CEO and co-founder, talk about much more … When I heard him at the Conscious Capitalism Conference a couple of years ago, he talked about it's really about education. You really want to find consumers … We want to go into highly educated markets because that's as important as the demographics when it comes to how much money they make and how wealthy they are …

ALYCE LOMAX:

Absolutely …

ANDY CROSS:

… because they're a more educated consumer. So, this is the one thing Whole Foods had done very well and they continue to do, and that is try to educate the consumer around the benefits of living a healthy lifestyle. Eating healthier. Organics. Not everyone can afford organics, but when they go into Detroit … And they just went into another, I think, inner city market. They're not offering a ton of organic food because they can't get the supply and also they know a lot of the customers can't necessarily afford it. But these are from customers who have no access at all to any kind of fresh …

ALYCE LOMAX:

They're food deserts. Yes, absolutely.

ANDY CROSS:

Absolutely. So, Whole Foods is going in and they're trying to educate the market. They're doing this in just little test markets, but it really does align with what John wants to do from a conscious capitalism perspective.

ALYCE LOMAX:

Yes, and from a strategy perspective, absolutely. I mean, you're going in where there's a major need for better food, basically. Like you were saying, there's really no fresh food in a lot of these places. And also, the community aspect … Some of them are hooked up with nonprofit things that are actually educating …

ANDY CROSS:

Yes …

ALYCE LOMAX:

… helping people get job skills. Actually supplying the Whole Foods. So, this is exciting, holistic stuff for the long term.

ANDY CROSS:

And as we think about how they are actually expanding their store footprint and trying to increase sales per square foot with including things like the bar that they have in there …

CHRIS HILL:

Right …

ANDY CROSS:

Coffee, much more. It's actually a little bit … I'm kind of mixed on this. Sometimes it gets a little crowded because they're using the floor space to kind of peddle and introduce you to new goods. It gets a little bit crowded in there, but expanding into other lines and trying to make the experience of Whole Foods as not just going to a grocer, but you're actually going to almost a restaurant.

CHRIS HILL:

That's what you want to hear if you're a shareholder, right? The place is too crowded.

ANDY CROSS:

Yes.

ALYCE LOMAX:

Yes. And they're being entertained and having a nice drink …

ANDY CROSS:

Yes. And if only they can continue to push the throughput through the line, which is really important. That's a premium I'm willing to pay for.

CHRIS HILL:

I was just going to say. I'm still bitter about the fact … Right before we started taping, I felt really good about the Whole Foods closest to us here at The Motley Fool because they do have the bar where they have espresso drinks and all that sort of thing. Then I heard about the one near where Bryan lives where it's so big they have multiple restaurants. And a sports bar?

BRYAN WHITE:

A sports bar right at the front door. Yes.

CHRIS HILL:

Hoh! Now, I'm just bitter that there's not a sports bar in the one near me.

ANDY CROSS:

How long will it be until Whole Foods is actually in a sports arena? They may be. I don't even know.

ALYCE LOMAX:

Well, see, expanding the demographic like that … We do not know what is going to happen in 20 years, 10 years. Who knows? Maybe next year.

ANDY CROSS:

And that's a very important point. The stock really has pulled back pretty dramatically here over the last say …

BRYAN WHITE:

Yes …

ANDY CROSS:

… six months …

CHRIS HILL:

Yes …

ANDY CROSS:

… and some members who are listening, who own the stock, may be wondering what's going on. It's a $20 billion market cap and they do probably $1 billion in free cash flow. That's double where it was five years ago during the financial crisis. You have to understand that as they continue to expand that — whether it's internationally, domestically, new markets, test different store concepts, large, small — they are really trying to live up to their mission and do it in a way that is good for all stakeholders, which is a big principle of conscious capitalism. Over time, that's proven to win out and I think it still will. Twenty billion dollars — it's not a real large company.

CHRIS HILL:

Let's move over to Middleby and their latest earnings. Bryan, profit's up 36% …

BRYAN WHITE:

Yes …

CHRIS HILL:

… revenue up nearly 40%. Stock hitting an all-time high today. I mean …

ANDY CROSS:

It's making me hungry. Talking about Middleby now is making me hungry …

CHRIS HILL:

It's really …

ANDY CROSS:

For the stock and for …

BRYAN WHITE:

Well, they're executing against their strategy — which is essentially acquisitions fuel growth — so the top line near 30% growth is not a surprise. Organic growth was around 8.5%. It's that bottom line that long-term investors need to keep an eye on, because the strategy is to acquire smaller players that are inefficient, roll them into Middleby's system and improve the profitability. And then also the reach, too. When you flow them through Middleby's system, you expect some revenue growth, also. But the core reason to go out and acquire these businesses is to really improve their operations and their profitability. And quarter after quarter, they continue to show that they're having success.

ANDY CROSS:

Not just quarter after quarter. Selim's been …

BRYAN WHITE:

Yes, exactly.

ANDY CROSS:

… doing this for years. I mean, they shell out anywhere between … I don't know. Call it $50 million and $300 million in cash …

BRYAN WHITE:

Yes …

ANDY CROSS:

… acquisitions per year. They've gobbled up probably maybe more than 40 …

BRYAN WHITE:

More, yes …

ANDY CROSS:

… companies that are entering different markets with the Viking Range into the consumer market. So, Selim really has this and Bryan's exactly right. They have it down to a model and Selim's going to continue to operate it. He's a sales guy. I feel like he could … What's it? Sell me sand if I'm stuck in the desert. I just feel like he has that. And that's really what you want from a person who is an acquisitive CEO who's going to go in there and turn things for the better, absorb those companies and really drive sales higher. That's been good for shareholders. The stock's more than doubled here in 10 months, maybe. Something like that, right?

BRYAN WHITE:

Yes.

CHRIS HILL:

Well, and one of his strengths must be hiring. I'm assuming he has a smart team around him because …

BRYAN WHITE:

Oh, yes …

CHRIS HILL:

… it's one thing to make acquisitions. It's another thing to make them work well. A lot of companies, regardless of the industry, really struggle with acquisitions and it seems like Middleby is the exception to that.

BRYAN WHITE:

Well, that's an excellent point, Chris. A lot of times we'll focus on the capital allocator and give them all the credit. But absolutely, the managers underneath Selim are doing a lot of work … a ton of work. And look at what they've done with Viking. I mean, this was a business where their sales got cut in half during the downturn …

ANDY CROSS:

Yes …

BRYAN WHITE:

… and they're turning that around. EBITDA margins were up over 15% and that's way ahead of schedule, so they're doing really well.

ANDY CROSS:

And astute, outsider-esque CEOs, to borrow a phrase from Will Thorndike's book, they are very effective users of capital strategies … so, whether it's debt or equity … In Middleby's case, it's mostly debt equity benefitting from low interest rates. Going out there and finding companies they can acquire, bringing them into the family and improving operations. I mean, that's a recipe for success that you can do again and again.

CHRIS HILL:

Brian, last question on Middleby. The market cap's only about $5.5 billion …

BRYAN WHITE:

Yes …

CHRIS HILL:

Over the next five years, how much bigger can this company get?

BRYAN WHITE:

Oh, it can get quite a bit bigger, and I think over the next year or two … maybe three years … it's going to start to become more of an emerging-market story, and I think the investors will appreciate that a little bit more. We're a little ahead of the game because we look at the business and we focus on the business so much — but their food processing segment has a lot of opportunity out there in emerging markets. There's demand that's expected to pick up quite a bit in emerging markets for processed food — the food that we're used to shopping and filling our fridges with here in the U.S. Demand in emerging markets is expected to pick up.

And then we also have the big story in terms of food safety. Middleby will be rolling out its solutions in emerging markets, and we know that's a big story in China with Yum! brands. So, food safety's also going to drive sales from emerging markets for Middleby. It's got a ways to go. The story is far from over for Middleby.

CHRIS HILL:

All right. For Bryan White, Alyce Lomax and Andy Cross, I'm Chris Hill. Thanks for listening. We'll see you next week.

Earnings: American Tower Q4 2013

Published Mar 2, 2014 at 8:41PM

Hey Fools, check out the inaugural article in our new approach to news, analysis, earnings, and guidance changes -- we're going to start sharing that news in articles like these (in our "Extras" section on the site) instead of on the boards. I'll cross-post a link on the boards as well, if you prefer to access your content that way. We think this new format will lead to better readability, search functionality, and we can more easily include graphs, pictures, or rich text. Let us know what you think!

What Happened?

Consolidated Results:

- Total Rental & Management Revenue of $942 M (up 22.6% nominally, and up 30.8% on a core* basis from 4Q 2012)
- Adjusted EBITDA of $600 M (core growth of 27.3% from 4Q 2012)
- Adjusted Funds From Operations (AFFO) of $378 M (core growth of 27.4% from 4Q 2012)
- AFFO per share of $0.95 (up 28.4% from 4Q 2012)

*Core growth reflects adjustments for foreign currency exchange rates and prior period one-time items

Segment-specific Results:

- Domestic Rental & Management Segment Revenue of $623 M (up 24.6% from 4Q 2012)
- International Rental & Management Segment Revenue of $301 M (up 25.6% from 4Q 2012)

Investing and Financing:

- Total Capital Expenditures of $276 M (up from $191 M in 4Q 2012)
- Cash Paid for Acquisitions of $4.1 B (includes Brazil/Mexico and GTP acquisitions)
- Net Debt / EBITDA (Leverage Ratio) of 5.9x
- Stock Repurchase Activity: None – repurchases have been suspended since GTP acquisition in order to pay down debt and reduce leverage ratio
- Quarterly Distribution of $0.29 per share (up 21% from Q4 2012)

CEO Jim Taiclet:

"In 2013, our global sales and operations teams delivered record levels of new leasing business. Collocations, amendments and annual escalators, net of churn, drove Organic Core Growth of 8.7% domestically and 13.5% in our international markets. In addition, we added over 10,000 towers to our portfolio via acquisitions, predominantly in our three largest markets, the U.S., Mexico and Brazil. We are especially pleased with the quality and performance to date of the Global Tower Partners assets, which expanded our domestic tower count by over 20%.

Moreover, we completed the construction of over 2,000 towers in 2013, ending the year with a total of over 67,000 sites. Taken together, our strong organic growth and successful portfolio expansion initiatives made for a great start to achieving our aspirational goal of doubling our 2012 AFFO per Share by 2017."

So What?

To start, if you haven't yet read TMFDatabaseBob's recap of the quarter (here), go read it! It's a great primer on American Tower's (NYSE: AMT) terminology and this quarter's performance. If you read it, I suspect it will make deciphering this report a lot easier.

With that said, American Tower carried its strong momentum from the first 9 months of 2013 into the 4th quarter. The business continues to perform above my expectations and above management's stated guidance. Organic growth (that is, growth *not* including acquisitions or new site builds) for full year 2013 was 8.7% domestically (vs. 7.3% in 2012) and 13.5% internationally (vs. 13.6% in 2012). The weighted average organic growth (U.S./ international blended) was 11.2% (vs. 9% in 2012).

Organic growth comes from 3 main sources:

1. Annual rent escalators (~3.5% in the U.S. and ~4-8% internationally, depending on geography)
2. Altering a lease to add new equipment to towers (i.e. "amendments"), and
3. Adding new tenants to existing towers (i.e. "co-locations")

Last quarter, I wrote: "*Current levels of carrier investment (especially in the U.S.), pricing trends in the market, and current growth rates are leading me to believe that even the high end of [organic growth] guidance (6-8% domestically and 10-11% abroad) might be too conservative*."

This quarter's and full year 2013's results are helping to confirm that hypothesis. For 2014, I'm expecting continued strong organic growth, and barring unforeseen macro-economic changes, I'd be surprised if organic growth rates were below the mid-point of guidance (7% in the U.S. and 10.5% internationally).

As we know, in addition to organic growth, American Tower also generates growth via acquisitions and new site builds. The company spent over $4 billion for acquisitions in the quarter, for the purchase of 4,869 towers in the U.S. (associated with the GTP acquisition) and 4,241 towers internationally (predominantly Brazil and Mexico). With 30.8% core revenue growth and 11.2% organic growth, the remainder (19.6%) can be attributed to new properties. This compares to 10.3% growth from new properties in Q4 2012, and we can see how AMT's big acquisitions have positively affected revenue growth. I'd expect growth from new properties to be lower in 2014 due to a slowing pace of acquisitions, as a result of AMT's higher-than-usual leverage ratio (now at 5.9x Net Debt/EBITDA) resulting from the GTP acquisition (see this post for more information on AMT's leverage ratio).

Yearly distribution growth was about 21%, exceeding management's annual target of 20% distribution growth. I see no reason to believe the 20% growth target is not feasible for 2014.

Now What?

The market reacted negatively to AMT's earnings report the day it was released (2/25/14), with the stock ending the day down about 4.2%. I usually prefer not to speculate on the reason for short-term market moves, but if I had to guess, I'd point the finger at acquisition-related increases in expenses and foreign currency headwinds causing a year-over-year decline in net income, and a decline in operating income margin.

The stock price decline in reaction to earnings looks like classic Wall Street short-term thinking to me. Stripping away these short-term effects, the business continues to perform admirably, with core growth of 30.8% in revenue, 27.3% in EBITDA, and 27.4% in AFFO. The company continues to expand its tower count via acquisitions and new site builds – the overall tower count (U.S. plus international) now stands at over 67,000 towers vs. about 54,000 last year. Strong carrier network demand continues to bolster organic growth at rates above our expectations. Our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to tenancy growth and rising returns on capital over time) continues to play out.

Additionally, I'm becoming more and more comfortable with the management team. Their level of disclosure is outstanding – they release very detailed and granular data, and most likely they wouldn't be so open with disclosure if they had something to hide. They're not the most affable bunch, but they're darn effective. These guys know the tower business inside and out, they've developed strong relationships with carriers, and they're disciplined capital allocators. They are investing where it makes sense, buying back their (in our estimation) undervalued stock when they can, and they are willing to turn down deals if they don't meet internal hurdle rates. Check out this quote from management in response to an analyst question at a presentation earlier this year:

Michael Rollins – Analyst, Citigroup:

"Now as time has gone on and you were early in the international expansion phase relative to some of your competitors, relative to some private equity and start-up companies that are now surveying the landscape to basically do what you've been doing for the last few years, is it getting tougher? And is the incremental return kind of getting squeezed a little bit because the competition for these assets has gone up?"

James D. Taiclet – CEO, American Tower:

"There is this increase in some markets in the competitive entry of other players in certain deal opportunities. We haven't changed our investment criteria at all, though. And when we sort of mark up the scorecard over the year, we've locked away or not been the recipient of more deals than we have won. And so those criteria don't change. If asset prices exceed what we think they're worth, we just don't do the deal."

For a company that's as acquisitive as American Tower, I love that quote. They aren't willing to sacrifice profits for the sake of willy nilly revenue growth. And if smaller competitors with lower margins are less disciplined and are paying more than American Tower, I'm willing to bet that some of them might get into trouble down the road and that could eventually lead to some opportunities for American Tower to acquire assets on the cheap. Bottom line, I really like what this management team has done over the past 5 years or so and they have an effective strategy in place to extend their success.

Data and Guidance:

- Current price: $81.12
- Fair Value (**updated**): $105
- CAM (**updated**): $72
- Market Cap: $32.1 billion
- EV/EBITDA: 20.6x
- Allocation: 2.4%

AMT remains a Buy First, with an updated $105 fair value estimate and an updated CAM (Consider Adding More) of $72. With our most recent put write having expired in January (at a $74.65 strike), the team is actively exploring new put writing opportunities. If you've yet to start a position, now is as good a time as any to match our 2.4% allocation.

Dear Fellow Fools,

Take a Peek at Fool One!

Is the market finally due for a pullback? In this exclusive sneak peek inside the world of Tom Gardner's "crown jewel," all-access service – Motley Fool One – analyst Morgan Housel joins Robert Brokamp, CFP, to discuss the past, present, and future of stock market drops ... including why many investors think a real pullback could be on the horizon. Make sure your portfolio is properly fortified against any impending market moves by digging into this exclusive from Motley Fool One.

Get the Report!

Valmont Industries' (NYSE: VMI) stock price declined 6% on Friday after the company announced earnings. The decline brought shares back to the same price they last traded at on ... Feb. 10. Despite a lack of drama in that fact, the earnings news still merits revisiting our investment thesis. The stock is a Buy today, moving from Buy First only because we want to ask management some questions about our assumptions for the utility business. Here's where we stand today.

The Scoop

Valmont is out of favor, just as it was when we bought it. As of Friday, the business traded at 6.9 times EBTIDA, a 35% discount to its 9.3 average since 2004. The stock fetches 14.1 times earnings – well below its 19.7 average P/E since 2004.

Following a strong three years during which revenue rose almost 19% annualized, investors – including us – are expecting a near-term slowdown in the business, and have priced the stock accordingly. We're happy to have started a 3% position at this valuation while looking ahead. Ultimately, Wall Street looks ahead, too, and although 2014 may be a year where Valmont just holds the line (as we hoped), this would make growth in 2015 and beyond more likely, and that's what we're invested for. Plus, history suggests the stock is likely to resume its long upward trend in anticipation of a return to growth. After a weak start to this year, Valmont's business is expected to improve in the second half of 2014.

While we wait, the business remains inexpensive and healthy ... but barring large acquisitions, it is not likely to grow in 2014. For the full year, management expects a slight decline in earnings as irrigation sales remain below records set during the commodity boom and recent drought, and as international utility structure sales weaken. In this latter product line, supply has caught up with demand for the first time since 2010, and the company is waiting to see how rational (or stable) the pricing remains.

As with many cyclical companies, Valmont enjoys strong leverage when demand jumps, but its fixed costs limit its profit level when demand slumps. Having been through multiple business cycles over the decades, the company prides itself on riding through them profitably. Wall Street is fearing it, but Valmont does not see a deep trough ahead for its diversified business, just a flat 2014 as two of its four business segments take a breather. And its long history of navigating through valleys gives us comfort just the same.

Live Chat Coming Up!

Join us at 2 p.m. Eastern this Wednesday, Feb. 26, for a live text chat with the whole Pro team! Set a reminder here.

In summary, we assumed a slowdown in irrigation would take place in 2014, and we'll be talking to management to get more details about competitive utility sales in international markets and what that means for pricing. Although the condition is expected to be temporary, we want more details than were shared in the conference call.

The Foolish Bottom Line

The bottom line remains that we're paying an attractive price for Valmont, so as long as the business can even stay flat, we should not see much downside volatility. Following that, we're positioned for upside as the market begins to anticipate growth again. We hope to invest in this business long enough to compound our money. With exceptional management, Valmont has been an outstanding stock for decades, yet it remains a relatively small $4 billion company with four promising lines of business. This was our thesis. It stands tall as a light pole today. Meanwhile, if we see more ways to profit on the situation (perhaps using options), we will certainly aim do so.

If you have questions, please visit the Valmont discussion board. For now, Fool on!

-- Jeff (TMFFischer)

Pro Guidance

- **O'Reilly Automotive** (NASDAQ: ORLY): After 50% appreciation, the stock moves to Buy from Buy First. Our fair value increases to $138.
- **Valmont Industries** (NYSE: VMI): Shares move to Buy from Buy First while we wait to speak to management.

Pro Catch-Up Trades

- **Oracle** (NYSE: ORCL) remains a Buy First at a 4.6% allocation. Buy shares if you haven't, Fools.
- **Tupperware** (NYSE: TUP): If you don't have 2.7% exposure through existing puts (we're short April $90 puts), then sell to open April 2014 $75 puts for at least a 2% yield ($1.50 each). If you're not using options, you can buy shares of stock instead.

Pro Coverage

- **Medtronic** (NYSE: MDT) stays healthy and remains a Buy at a 2.9% allocation. See Bryan's earnings coverage.
- **AmTrust** (NASDAQ: AFSI) increased its dividend 40%, giving shares about a 2.2% yield.

Podcast Transcript

Robert Brokamp: Hello everyone and welcome to the EP Weekly. This is Robert Brokamp sitting in for Chris Hill, and of course we're joined by Bryan White as always. But today we have a special guest, Morgan Housel, down from all the way in Baltimore. How are you doing, Morgan?

Morgan Housel: Doing well, thanks for having me.

Robert Brokamp: Great to have you here and we have you here because you are writing a special report that One members will get this week. It's called *[The] Next Market Meltdown*. So Morgan, are you a market timer?

Morgan Housel: I am absolutely not a market timer, but when I talk to fellow investors, when I communicate with readers at The Motley Fool and talk to my friends about investing, one question that keeps coming up quite a bit recently is look, stocks have come so far. Stocks recently hit all-time highs. We've pretty much gone straight up for the past four years. Are we due for some sort of market pullback, maybe something more like a market crash? And many people I have talked to are looking at this and getting nervous about it in a sense of is this a bad time to invest with stocks at an all-time high?

So I just want to think of different ways that I can think about stock crashes and pullbacks with the market at an all-time high, and I think there are two things that I thought about with this report. One is that the stock market being at all-time highs right now is really a matter of perception when you think about the rally we've had over the past four years. So yes, stocks are up about 170% since March 2009, which is an incredible four-year period. It's actually one of the best four-year periods in the history of the stock market.

But that's just anchoring, really focusing to the March 2009 lows. If you think about the last five or six years, since 2007, stocks have barely kept up with inflation, so it really depends on what starting point you're looking at when you talk about how far stocks have come. Two rational investors could look at the stock market and be amazed at how far it's come, or shocked at how flat we've been for the past six years, right?

Robert Brokamp: And I think even since 2000 on an inflation-adjusted basis, it's still not reached its peak.

Morgan Housel: Right, exactly. And then so the other thing I think about with market crashes is in this report I went back and looked at the long history of the Dow and the S&P 500, and I just counted the individual times that stocks have pulled back 10%, 15%, 20%, 30%, 50%, from its recent highs. If you look at 10% market pullbacks, that's happened 89 times since the 1920s, which is about once every 11 months.

So when people ask the question, Should we expect a market pullback, the answer is always yes, no matter what the economy is doing, no matter what that stock market has done recently, the answer should always be yes. These are just intrinsic things that the stock market does. It's a natural phenomenon on the stock market. And when you look at even big drops like 20%, that usually happens about once every four years, so I think most investors at The Motley Fool are investing for more than four years. We're talking about hopefully 10, 20, 15, 20 years we'll be investing for. So when you think that 20% drops happen on average every four years, you are going to experience hopefully several of those during your lifetime as an investor, so when I put those two together, that it's really not that clear how far, how overbought the stock market is and that these drops are much more inevitable than we think.

Really the conclusions that I come up with is that these things are unpredictable and that rather than trying to think about and time around them, we should just accept that they are parts of the stock market and that's just life as an investor.

Robert Brokamp: Right, so you have the drop; those drops are going to happen. The question then is how long does it take to get back to where you were, and you include some of that in your research as well.

Morgan Housel: Right, so historically the bigger the drop, the sharper the rebound that occurs after it. One of my favorite examples is in 1929, which is the massive crash of the Great Depression. From peak to trough, the stocks fell almost 90% during that period, but when you factor in inflation and dividends, stocks were back at an all-time high within six or seven years after that. And that was true for the financial crisis in 2009 too. That was the worst financial crisis in 80 years. It took four or five years for stocks to get back to an all-time high, so there's little precedent in American history at least, for stocks when you include dividends to crash and then not return to their all-time highs in less than a decade, and usually much faster than that.

Robert Brokamp: Right, and then there's the question of all right, so you were saying it happens pretty regularly, so you could think, well, if it happens that regularly, maybe I can predict it, maybe I do know what happens. And also in your report you talk about, all right, so what causes these crashes?

Morgan Housel: Right.

Robert Brokamp: And the answer is really, they're pretty unpredictable.

Morgan Housel: Right, it's really we don't know. You know the biggest factor is it moves stocks around when we have crashes like this is just human psychology. It's people getting optimistic and then people getting fearful. People move in hordes and in droves, they all move together. There's a great quote that I like that says, "Nobody knows what the American people are going to do next, but we know that they're all going to do it at the same time. And that's really true for the stock market. We really don't know when people are going to get fearful or greedy next and there's really no way that you can forecast human emotions like that. We know that people are going to change their moods significantly from time to time, but it's really difficult to nail down the precise timing of that.

Robert Brokamp: Right, and you cite some research by Jeremy Siegel about the causes of the top ten biggest drops. There are things you couldn't predict, like the September 11 attacks, things like that.

Morgan Housel: Right, yeah, so Siegel went back and looked at I think the 20 biggest market drops in the last hundred years, and at least ten of them were tied to things that nobody could have seen coming before hand. President Eisenhower having a heart attack, the start of wars, September 11, things like that. No one could have predicted those things, even 24 hours before they occurred.

Robert Brokamp: Right.

Morgan Housel: So it's certainly not something that we can sit here and try to guess what the stock market's going to do over the next ten years.

Robert Brokamp: Right, so there are events, but then there are various metrics you might want to look at and say like, Oh, this tells me that what the stock market's going to do and some other research you cite is from Vanguard. So you tell us, what has the biggest correlation to future returns: P/E ratio, 10-year Treasury yield or the amount of rain?

Morgan Housel: Right, so there's this really interesting report. Vanguard, the fund giant, looked back at all these interesting metrics that analysts use to forecast where stocks might go next. They just looked at these metrics and said, Okay, in hindsight, how good are they at explaining what the stock market is going to do over the following ten years? So they looked at things like the P/E ratio, the trend growth that the economy is growing at, how fast earnings are growing, things like interest rates and profit margins. Virtually all of them explain next to nothing about where stocks are going to go next during the following ten years.

The biggest, the most important variable that tells us where stocks are going next is the P/E ratio. That's just the basic idea that you buy stocks when they're cheap and they'll do well over the following period; buy stocks when they're expensive, they'll do poorly after that. But even the P/E ratio explains only a minority of stock returns over the following ten years. And things like earnings growth and interest rates and profit margins tell us literally nothing at all about where stock might go in the next ten years, and that really all comes back to the point that what's really driving the stock market over time, in short periods of time especially, are human emotions, just how optimistic and fearful people are about the future.

Robert Brokamp: So I can get rid of that barrel in my backyard that measures the amount of rain? Because that's not going to help me.

Morgan Housel: That's not helping you at all.

Robert Brokamp: Darn, right. All right, so I'm going to play Devil's Advocate because this is all good news. This is all very encouraging. Sounds like you just have to buy and hold, that type of stuff. Some people might say this is actually a bit of survivorship bias and that we're looking at the U.S. market, twentieth century, the American century. We all know that the Japanese stock market is still down about 70% from where it was in 1990 and through most of that period it was the second biggest economy in the world. Great economy, bad stock market, only recently surpassed by China.

So are we focusing too narrow here or is there something so awesome about being American that we can believe in our stock market?

Morgan Housel: Well I think there are two things to think about. If you look at the long history of stock markets, there's one even that consistently throws all of this analysis out the window. There's one event that can really destroy long-term stock returns, and that's of course war. We really saw that a lot in the twentieth century with large developed countries that saw their stock markets go to zero and never recover. During World War II when your currency is destroyed, when you have a dictator in power that's going to really run roughshod over the economy, that's really the variable that can destroy stock returns. But that's not a way of living that I think is very intelligent and to sit here and to think that we're going to have another war and worry about that...

Robert Brokamp: Or zombies.

Morgan Housel: Or zombies. That might be something to worry about. I think when you talk about Japan, the key variable there is that the Japanese stock market has done nothing for the past 25, almost 30 years. The big factor there is that the bubble that they had when stocks peaked around 1990 was like nothing we have ever seen in the United States. It put our dot.com bubble to shame really.

And really when you look at the Japanese stock market over a longer period, when you're not starting at the top of the bubble, but you look at the Japanese stock market over the past 40 or 50 years, it's done quite well. so really that just goes back to valuations, like we were talking about earlier, and that yes, if you buy stocks when they are grossly expensive, just off the charts expensive, then you're not going to do very well.

That's true of the Nasdaq too. The Nasdaq peaked in 2000 at around 5,000; I think today it's somewhere in the three thousands. It could be another decade or more before we return to an all-time high, so that would be 20 years or more before the Nasdaq recovers.

Robert Brokamp: Right, and the other aspect with Japan was they had a huge real estate bubble as well, and that never happens in America. But I was going to bring up the Nasdaq as well as my other devil's advocate because you looked at the S&P 500, and that says a lot about someone who owns an S&P 500 index fund, but individual investors, especially stock pickers, those are how fans of The Motley Fool, have different portfolios. I would say some of them probably have a portfolio that's closer to the Nasdaq. Still 30% down from where it was in 2000. From here you've got to get a return of about 40 or 45% just to get back to break-even.

So even if you are a U.S. investor investing in a major U.S. index, it doesn't necessarily mean that you will recover as well as the S&P 500 has.

Morgan Housel: That's absolutely right, and I think what that really shows is the power of diversification. If you have a portfolio that is heavily weighted toward one industry or even one broad sector like technology, that certainly increases your chances that you're going to go through very long periods of disappointment. It's really imperative for all investors I think to have a well-diversified portfolio.

That's not only true for individual stocks and sectors, but across assets too between stock, bonds, cash and real estate.

Robert Brokamp: Right, right, which I personally am a big fan of. The readers of *Rule Your Retirement* will know that that's one of our major points.

So that's all good stuff. The report will be available soon, if not by the time you listen to this podcast. Morgan, thanks for stopping by, and everyone else thanks for listening in and we'll talk to you next week.

Jeff on "Portfolio Construction With a *Pro* Blueprint"

Jeff Fischer: So first, thank you for being here. I'm Jeff Fischer. In the room with us is Bryan Hinmon, *Pro* senior analyst; Billy Kipersztok, *Pro* analyst; and Jim Gillies I believe as well, the *Motley Fool Options* co-advisor. And later we'll have Ellen Bowman here. She is *Pro*'s and *Options*' editor and site manager. And we have special guests in here, Tom Jacobs, *Special Ops* advisor, and all of you, thank you for being here with us.

So, just so you know, this is all being recorded and the slide deck will be on the Web site and that's true of every session so you won't miss anything today, you can see it all later when you get home and you'll have all of the slides as well.

If you have any questions I believe you have paper and pen, write down your question during the presentation so you can ask it right afterwards.

Now, a little bit of *Pro* history, very briefly, we started in October 2008. It's been an interesting 5.5 years. We're no longer the new kid on the block, the shiny new toy. We've seen some amazing things, we've seen Greece, of course, collapse and bring down all of Europe with it, we've seen the dollar plummet in value and interest rates soar. We've seen the U.S. default and -- no, wait, wait, wait, that's what we were thought we were going to see or that's what everyone said we might see. We've been though a lot of risk events since 2008 to be sure and thankfully so far we've come out well ahead by investing in strong businesses at good prices.

Let's talk about that for a minute. When you're at a cocktail party or maybe last night or anytime with friends, family, even if you're on the Fool site or the Web in general, what you most frequently see are a stock idea, this stock, that stock, get this hot stock. The Fool's guilty of it, I am as well, we all are and it's understandable, it's exciting to talk about a single stock but it's also a little bit wrong-minded because any single stock is hit or miss. What really sets you up for success, long-term and short-term, is a portfolio that works. A portfolio that is built to compound and be flexible when the market throws you a curve and keep growing as you grow; not just a single stock that can flare up like a firework and then fizz out, and yet we spend all of our time, or much of our time, in this world talking about single stocks. When's the last time at a party someone said, hey, let's sit down, I want to talk to you about how my portfolio is constructed? It's never happened to me. Usually it's either a single stock that we talk about or it's are you in the market or out of the market and that's not a strategy at all.

So, I want to ask you, what is a portfolio and feel free to shout out your answer. What is a portfolio? Diversification, collection of holdings.

Audience Member: Allocation.

Jeff Fischer: Allocation.

Audience Member: Everything that's not (invested in) (unclear).

Jeff Fischer: Excellent, those are all great true answers. Now, what makes for a portfolio, what are the factors that make something a portfolio? Strategy. Pardon me?

Audience Member: Balance.

Jeff Fischer: Balance. Protection. Risk management, money! All right so a portfolio, all of those answers are correct and that's what's so great about a portfolio. It's one of the most complicated things in some ways that we build in our lives, in our financial lives and then there are these four things that a portfolio, I believe, should always have. One is a goal, it's goal-driven. So this is a collection of assets that you're putting together with a certain goal in mind and that goal will, of course, evolve over time.

When I was 17 I bought my first shares of stock and I bought a small Florida real estate company called (unclear) for about two or three dollars a share because I loved tropical climates and I still do and I thought how fun to own a little piece of Florida, this was in 1987, I should have done well, you would think over time. That company went bankrupt in a year or two.

I also bought those shares of Citibank and my reason behind that was I wanted to -- whether I knew it or not at 17, I wanted to associate myself with the power of a big American bank. So we have goals that are financially driven but whether we realize it or not they're also driven just as much or more so by something within us, some emotion, some need that's much more powerful. Our goal is to provide for our family, provide retirement, school, education and when all of that is bound up into your portfolio, into your goals, it's hard not to be emotional about your portfolio when things get rocky.

So you have a portfolio, you have goals that drive it and those goals change over time. By the time I was 23 my goal wasn't just to own some Florida real estate it was to get some financial freedom. Man, I had been working in the real world for a year! I need some freedom. So my investing goals changed rapidly, how do I grow whatever I'm making and saving?

So a portfolio, a second attribute, is it demands choices, it's anything but passive. This seems obvious but it's important to realize in yourself at all times. You're taxing yourself a little bit, you're devoting part of your life, part of your energy, to your portfolio because it's going to demand a lot from you over time.

Next as you all hit on so very well, a portfolio has multiple positions, this is a given but it varies greatly. Some of us may only own seven stocks and say some bonds or cash. Some may own 100, would anyone like to say how many positions they hold approximately?

Audience Member: Fifty-three.

Jeff Fischer: Fifty-three. Thirty, 70, 80 …

Audience Member: Twenty.

Jeff Fischer: Twenty and …

Audience Member: Three.

Jeff Fischer: Three, all right! And the beauty of being so young, when I was in my 20s I stared with -- how do you start with more, you start with a couple! And then I've heard some people in their 60s who own 200 are happy and comfortable with that. David Gardner himself, he doesn't own that many but recommends that many.

So the final attribute of a portfolio is that it faces unique risk and reward that you yourself are constructing.

So as we look at these four things we realize that you have a goal and that goal evolves over time and that goal demands and drives your choices. What you put into your portfolio should, of course, feed your goal. And you have multiple positions because you don't know which one or which ones are going to do best. Peter Lynch has always said, if you can bat 60% or .600 -- if six out of 10 of your positions win you're a great investor and you'll do very well because those six out of 10 will hopefully compound over time. Finally you're facing risk and reward. Let's talk about what risk is. That's what we want to narrow down to right now.

Who can define risk? What is risk?

Audience Member: Maybe depends on the (unclear) risk might be completely different (unclear).

Jeff Fischer: That's so true, risk is different for everybody. I'll repeat, risk depends on the individual. For one person risk is very different than for the other and like Anne in her 20s, she may not see much risk at all because she has the bulk of her savings ahead of her and she's going to put that into stock. If you're in your 50s or 60s and you've saved most of what you think you will and now it's in your portfolio and you need that for the future, your risk is very different. You may not want to see a large loss over any three- to five-year time frame so risk differs by individual, that's very true.

My definition of risk, as well, is it's when you're unable to respond in a constructive way to market adversity or adversity in your financial life and that leads you to be compelled to sell at the worst times or when you don't want to.

So, to reiterate that point, it's when you're unable to respond to something terrible. 2009 is fresh in our memories, of course, easy to flash back to that. How many of us were hand-tied and frozen by that and even if you didn't need the money right then because -- you probably didn't, hopefully you didn't if you had it in stock -- you may have been borderline terrified because you're watching your life savings, your emotional ... all of these emotions that you've put into it inadvertently are not your life savings, your self-worth, your family's security, you're watching it evaporate and it's impossible to not become emotional about that and that may force you to do things that you wouldn't otherwise want to do. Your emotions are getting the best of you because you have an inflexible portfolio and all you can see to do -- the only way you see that you can wiggle out of it is to do something a few months ago that you weren't thinking of doing at all: selling something, getting out.

So, what does this come down to? Does anyone want to take a guess what this comes down to, if you're unable to respond or if you're forced to sell, does that come down to allocation, exposure, fear, I'll argue portfolio risk, construction, that's another way of saying this. Allocation, construction and fear works into it.

When your market exposure and your portfolio incapacitates you, the manager, at the worst time. I mean, you don't have any risk really when the market's going up, there's no risk, you sit back, your risk is selling foolishly but when the market's going up your risk is basically nil. When it's going down that's when you need to have risk control already in place and if you don't you're incapacitated at the worst time, at the one time when you need it, it's as if when you're driving a car and when you lose control and you have no hedge. What have car makers done? They've put in seat belts and air bags to help you during that time. Does your portfolio have such a protection to it?

So you have to ask what price do you pay when your hands are tied when as a portfolio manager you're incapacitated at the worst time but what are some of the prices that you pay as a result. Think back to 2009, if that was you in that situation -- it was many of us -- but what are some of the costs of being frozen just when things get rocky.

Audience Member: (Unclear).

Jeff Fischer: Exactly! You're unable to act in a positive way. There are two sides to everything, every well said and you're all one directional at this point. You don't have a backup plan, you see all of these great opportunities and instead of thinking about them and being able to act on them you're thinking the opposite of what you should be thinking. You're thinking, how do I get out of this? I'm stuck, I'm trapped, it's like any creature who's cornered, you don't want your portfolio cornered because that forces you to think differently than you really want to be thinking.

Any other opportunities that you missed out on? I guess they're all related to the same thing but if anyone has a different way to say it -- you don't think well. You may panic, you don't act in your own best interest when you're trapped. So knowing what risk is as we define it here today that it's exposure that takes you out of the game just when you don't want to be. There are ways to manage, there are ways to manage for that and they're not as tricky as it may seem.

Let's think about *Pro*, so let's go to *Pro* and run through quickly the four attributes of the portfolio because that comes first and that will drive how you manage your risk. *Pro* has a goal. I was going to ask somebody if they could name it but here it is. Our goal is inflation plus 7% a year and double our real purchasing power every 10 years. So on the spectrum of say a 30-year-old to a 50-year-old we lean more towards the 50-year-old, I would say, because we want real positive returns on every rolling three-year basis. We don't want to lose money over any rolling three years and then we have this bigger goal of doubling our real purchasing power after inflation every 10 years.

So other than these goals we have other goals that are more human. We want to teach you well how to earn returns with less risk. We want to do well by our coworkers and by the company. We want to be proud of what we create and what we do, so we have a lot of our self-worth behind all of these goals, tied up behind these goals. These are the goals that we put out there but just to remind you just as you have a financial goal and it's driven by emotions, it's the same with us and so we need to make sure that we have ways to keep our emotions in check when things start to get rough.

Now, the second quality of a portfolio, of course, is you have to make choices and *Pro*, as you've seen, we tend to make a choice every week or two with a new trade but at its core, at *Pro*'s core we seek to buy compounding machines, and both Bryan and Billy are going to talk about these with you today and explain exactly what they are. We're trying to buy companies that will compound our money over time. That's the surest way to reach our goals, that's the core of our portfolio.

But other choices that we've made are we want 3% to 5% allocations, that's us, 3% is large enough to make a difference but small enough if we lose it all we can recover and we start a full position or consider a full position to be 5% but if it grows beyond that we're happy to let it grow, we're happy to let our winners go as long as we see potential there and reasonable risk but it's good to know your parameter of what your allocations are when you start.

Some of you have 80 stocks you said so each position is maybe closer to 1%, if that works for your goals that's perfect. *Pro*, another decision we've made is we want index hedges to quickly hedge when we see risk or to hedge over the long term with low drag. As you've seen with bear spreads or ratio spreads, you can set up options to hedge the market index and yet drag very little on your upside returns. We've decided that's how we want to do it in most cases, that's how we've wanted to do it since 2009 and it's going to evolve though and we'll talk about that in a minute and we also want, when we find them, high-conviction shorts.

It's very easy to be wrong when you're short and it's mentally very taxing and it isn't for everybody but when we see things we really believe in we'll want to and I think that's around the corner for us.

Now, next we seek to sell when the potential of any position is impaired or when it's well beyond our estimate of where it should be on value. And then we use options for income and for other strategies, and with all of these choices it's important to remember that choices consume your energy. Every choice that you make consumes some energy. You burn some energy deciding to come to the *Pro* session as opposed to the other two, and we appreciate that, and luckily they're all taped so you can see them all -- but remember, you have a finite number of choices every day that you can make before your ability to make them starts to go down and that's every day, every year, every month so the more choices that you pack into your life the quality of your choices are going to degrade the more you force yourself to make.

So, we try anyway to minimize our choices by having a portfolio of 20, 24 core positions and knowing those extremely well and investing around those and, of course, we're always looking for new ideas because as we've talked about earlier this morning the world's always changing, there are always more things to consider. So, third quality, as we just talked about, multiple positions. These are *Pro*'s top five as of Monday -- it hasn't really changed since, but our top five positions account for 23.6% of the portfolio at the time -- as of right now, basically -- and three of these five, possibly four if you want to include Facebook maybe but I wouldn't yet, three of these five have long-term recurring revenue; something that we look for and something that Bryan is going to talk about. Long-term recurring revenue which feeds into our goal of compounding returns and then Intel we just recently have turned into an income position that yields 3.6%. Unfortunately we don't see much growth there in the coming year. Now, a company doesn't need to grow to go up. Intel hasn't grown its business much for several years but the stock is up 20-some percent for us which is, ah, you know ... but we're going to use options on it to turn it into a greater income position and that, again, feeds into our goal of absolute returns every year or every rolling three years at least, every year would be great too.

So, the point is for every position you have some reason to own it. You have some goal behind it. Now, let's talk about risk! *Pro*, of course, has unique risk and reward and how have we done? The portfolio since 2008 has averaged, and it's actually a little lower than that, but just using the last three years it's averaged 70% market exposure and it's earned more than 100% of the market measured by the S&P of its return. And when we started out we had even less exposure in 2009, we had 50% as the market was rebounding and we took our time because our goal wasn't to take big risk it was to steadily grow.

So, that's a great result. Most funds that are long and short have done horribly the last five years and I think that's because their goal has been short-term returns and that's how they're measured. They want to make something every month or at least every quarter; that's how they're rewarded; horrible results for anyone who invested that way. Our goal, as you know, is a three-year outlook and then five-year and then 10-year, so we're able to invest in a way that is based on core stocks that we believe will compound from the prices that we buy at and that we hedge around them to get a sort of result that we have gotten.

How has our math worked out this way? How has it turned out? Well, one thing to realize is if you just outperform the market by 1% or 2% a year that adds up a lot over time, over 10 years, let alone 20 because that 1% or 2% compounds so if we can just -- it might not sound ambitious, but if we can be only 70% exposed and make 1% or 2% more than the market per year on average we'll have an amazing result over the longer term and all along the way we'll have cash in hedges that we ideally can put to work when there are great dislocations either in a stock or the whole stock market.

Now it just happens that we haven't really seen that since 2008 or '09. Since 2009, we've seen things steadily rise but when we get a big hit we do have cash to put to work, we have a flexible portfolio. We won't be stuck with our hands tied.

Now, the next slide ... I'm breaking a rule, I have way too many words on the next slide, but we're going to talk through it together. Okay, not this slide. Let's talk through this together, way to … So this is how we've -- 80% long, invested in stock and it's fluctuated a bit between 70 to 90 but average 80, about 20% cash and that of course fluctuated from 30 to 10% and 10% hedged, on average, for the most part. That's how we got to our net 70% long and that's a pretty simple formula is now on this overwhelming slide. This is how the math worked behind it, our thinking behind it, and it's great that we're now five years in because we can see it working.

We assume and we measure the weighted average beta or assumed volatility of our stocks, of our core stocks and it came to, or it comes to, about 1.25. So that implies the average stock that we own will be about 25% more volatile than the S&P 500. We have that on 80% of our assets, which, of course, gives us 100% market volatility so we've got the upside exposure, great!

We add this 10% low-drag index hedge which we've had much of the time and that lowers us down to 90% volatility. Now, you guys know it's not perfect, the options that we use are frequent spreads that need some time to come to fruition but if at the time of expiration they work as they're implemented to then this is what the exposure comes to precisely and we've seen it a few times when the market has fallen right around our spreads, expirations.

So now we're down to 90% volatility. We have less exposure with this hedge downside than the market and we have 20% cash to invest on downturns, plus our hedges when we need them create more cash in a downturn to put to work and, again, we have these low-drag hedges for the most part that won't hurt in an up market. And as a result of that because you're 80% invested, that's it, at 1.2 beta you have 100% upside potential. If you get our performance from just some of your stocks, and I sure hope that we do, your portfolio will go up more than the market in a rising market as *Pro* has but you have 20% cash and you have option hedges for when it declines and you sleep better too and it's more fun because you're waiting for a downturn.

So this is the equation that, although we haven't advertised it much on the site, maybe on some board posts here and there that get buried, the equation that has driven *Pro* through this market. And it felt appropriate in a market that had a lot of uncertainty, it feels appropriate if you have absolute-return goals every couple of years or if you're nearing retirement or not adding money to your portfolio anymore, but of course you can adjust it as you need to. If you want less exposure, if you're feeling much more defensive, you can adjust it really quickly. You can throw on another 10% or 20% index hedge just by using options on SPY or the Russell 2000 or shorting it directly as we've done in the past with costlier results in an up market. That does become a drag but even when the index goes up 20% in a year or two that's a far cry from shorting the stock that goes up 100% so shorting the index directly is an option. But say you want less exposure, say you want much less, only 40% -- you can go 60% long stock and have 40% cash and maybe you're sailing around the world and just don't want to think about it and be 20% hedged and you will only have 40% market exposure which, in 2008 and '09 would have felt great!

The market went down, S&P went down 37% at one point. You would be down 18, 19, 18% -- not such a big deal! Plus you'd have all of this cash that you're hopefully putting to work and yet if your stocks are this higher-beta type of thing that Fools at large seem to cotton to, MasterCards and you name it, anything that's a little more volatile than the dodgy old S&P. If they're 1.25 beta and your hedge is low, a low-drag option hedge, you're exposed to 75% of the market's upside in this scenario and only about half, 55% of its downside due to your 20% hedge. And you have, again, this massive 40% in cash for opportunities or just if that's all that you want in the market, you've reached a point in your life where you want to have the safety of cash, this is one way to construct a portfolio that gives you ideally a long runway for your cash to work for you and not to mention your hedge, 20% hedge, which will grow cash for you when the market falls.

Now, we're just talking about shorting, or hedging, market indexes. There's also for the more adventurous among us -- and *Pro* is included in that -- shorting stocks directly as we've done with Sony in the past and that's possibly where *Pro* is headed now, now that the market has lifted all boats. The past three or four years of the market, the sense has really been clearly very steady and very strong, and that's lifted even weak companies. And so fortunately we've avoided shorting most anything directly, we just use these lower-risk hedges to short, but when we're ready we can be more of a long-short portfolio, long with our core stocks and shorting companies directly that we don't see a good future for and that will allow us, if we want to, to increase our long exposure even more. For example, we could be, say 90% long, we could even be 100% long if we wanted but we do like cash. It could be 90% long and short 40% of the portfolio's value in weak companies directly like Sony, like others we're considering.

And I almost said one but I better not. It's a short, I don't want you to jump in. And so if we do this, 90% long, 40% short weak companies we only have 50% net long exposure and yet we have 90% invested in great companies and 10% cash and, of course, it goes without saying but if your longs and shorts are both on the whole, successful, you'll earn much more than the market's return if you care about that in this construct. I mean, if you have longs working for you when the market is going up and shorts that work for you whether the market goes up or down you have a very flexible portfolio that should win very well over time.

Now, why even talk about the market? As you know, in *Pro*, beating the market isn't our goal. Our North Star is our goal, but the North Star has, unfortunately or fortunately, beaten the market since the 1970s. So if we want to be anywhere near our North Star goal we realize we probably have to beat the market too.

All right, but today we're just talking about index hedges for the moment and to avoid being incapacitated in a downturn we're talking about having a flexible portfolio. Flexible is stronger than something that won't bend and flexibility usually includes some cash. Do any of you, no I don't want to say it that way … What are some direct benefits of having cash, can anyone share a benefit of having cash in your portfolio?

Pardon me? Pay your bills. Okay, so you can use cash for emergency or to pay your bills. Yes? Sleep well, very important, very important. What good is life without a good night of sleep? It's also there for, as we talked about earlier, capitalizing on downturns, adding calm to a downturn, focus on the buying opportunity when things fall. You're less likely to panic and make poor decisions.

In my opinion the key overall is reacting well to a downturn. You never want to put yourself in a corner as many of us were in 2009 where you can't react to a downturn in such a way that would help you and so you're compelled to react in a way that hurts you. So what are some downsides to having cash in your portfolio? This should be easy, you guys have got to hit this one. Lower return. Missed opportunities, losing to inflation, I agree with all -- you guys nailed it, that's all the three that I have.

But let's talk about that, a missed opportunity, yeah? But don't you expect to see some great opportunities eventually for that cash even if it takes a few years? Even if it takes five years and then you're able to buy, and I hate to say it because it probably pains all of us, you're able to buy Whole Foods at $7 in 2009 or Starbucks at $10 assuming you can wait that long. You may have bought at $20 but it would still work out in the end. The point isn't to try and time the bottom and -- but just to buy it at a good price.

So, yeah, cash, you might miss an opportunity, but *Pro* has had cash, we're still happy, we're still meeting our goal. It's really about your goal overall that matters and eventually you'll see some opportunity for that cash and the good thing is as your portfolio matures you're going to have positions that you're selling or being bought out as we've had with Pacer and BMC, and as you put your cash to work, more cash will be coming in. So to always carry this cash balance is something that we lean towards wanting to do as much as we can.

Warren Buffett always carries cash, he wants it for a rainy day and he generates more cash, of course, from selling insurance, his insurance businesses and we do that by writing options. So cash loses to inflation, it's a great true point but, of course, a losing stock can lose years' worth of inflation in a day or let alone a week or a month. Lately inflation is running around 3, 3.5% a year. Yeah, it's -- you'll lose a little to inflation if you have cash for too long you may lose quite a bit to inflation even these days of low inflation but when an opportunity comes along you could crush that inflation in really short order.

So, it brings us back to your Motley and your Foolish portfolio. And what I would ask today, what I would love to hear from you is how it would appear on this slide, what would you put there? And you can email it to me if you want. I want you to ask yourself what is your portfolio's goal at this point in your life? What is the goal behind your portfolio? What choices are you making to meet your goal? Of course, what do you own in your portfolio and does everything that you own align with your goal?

And finally, the big one that we talked about quite a bit, what is your risk, what is your exposure, is your portfolio flexible? Will you be in a good position when the market inevitably falls 20 or 30%, will you feel fine? Will you whistle down the street looking for opportunities?

And then everything in your portfolio says something about you. Think about what it's saying. For some it may say that you're disorganized or that you don't know yet what you're trying to do, and that's perfectly fine, but think about these four factors and your flexibility as you go forward and I think it may help you build a portfolio that you enjoy more and get more from.

So let's talk about one interesting figure, I have two minutes I've been told but I might go a bit over, an interesting public figure with a strong personality who we all know. He was a good investor, surprisingly I've never heard him get credit for that and you may not have thought he would have been a good investor, I wouldn't have thought so, but he was and it's curious to me what that says about him and it was Hemingway. Ernest Hemingway was -- when he died in 1961 his assets were worth about $1.4 million. That doesn't sound like that much for someone so world-famous but that's nearly $11 million in today's money, speaking of inflation!

So $1.4 million, nearly $11 million today. He had about a quarter of that in stock and so that's about $3 million in today's dollars in his stock portfolio that he managed himself. And he owned 36 stocks, very focused -- and what did he own, he owned things like Eastman Kodak, GM, AT&T, Bethlehem Steel and in the last five years of his life his dividend income exceeded ... his publishing profits and that's -- even though he earned nearly $400,000 in today's money from *The Old Man and the Sea*, he rarely sold anything, mostly he owned for decades. He was a buyer in the Great Depression with his proceeds from *The Sun Also Rises* and *A Farewell to Arms* and so what does this tell us about this tough guy author who had this adventurous life? I think he had more turnover in his marriages than he did in his portfolio.

All kinds of other problems and yet even as he saw friends panic many he wrote letters to, consoling letters in 1929 as they lost it all in the market, he was an investor who was buying and who let his portfolio be and grow. It's, to me, an interesting look into another part of his mind that we don't hear much about. He was a good investor! He was kind of like -- but he was kind of chaotic in life. He had many challenges in life. He was kind of like a careful doctor here who owns a lot of Rule Breaker stocks, kind of the opposite.

So your portfolio said, it's another dimension of you and yet its' a reflection of your life? So what does your portfolio say about you, what do you want it to say about you from here forward? What is the story and then finally what will be its legacy?

For myself, my portfolio began in the early '80s when I was delivering newspapers just outside of Chicago. I had mowed, I think, every lawn in the neighborhood but this was my first *job* job, seven days a week delivering that paper, I was up at 5:00 AM every day and I kept this job for three years and I don't know how my parents put up with it because I tried to be quiet but I know they heard me every morning, 5:00 AM. I'd have to go outside the front door to the driveway, get all of the *Chicago Tribune*s, lug them up, put them on the fireplace mantel and then drop them into a plastic bag if it's raining out or rubber-band them. Either way it makes noise. So I know they heard me and it was Chicago so there were some cold days. It took a really cold day though for my dad to help me and when he did, I'm of course grateful that he did, but I remember the 30 below, 40 below days where he would help me. He'd drive around and it may sound like an exaggeration but there are four-foot, five-foot high snow drifts and I'm drudging through them with these papers and throwing them – I wanted them on the doorstep and it had to be at the right side of the door so when you open the door you can just pick it up, you don't have to maneuver around. I have some issues!

I can still feel the cold on my face, I can still see my dad's face as he's driving and we're just frozen and I love that that is now part of my portfolio. Some of those meager savings, I think I was paid $200 a month to work seven mornings a week, it went into my savings and into my portfolio and now is somewhere in my MasterCard shares and that's just great that that's part of his legacy, that's where this legacy begins and where it ends. I hope it ends with helping more of my extended family and helping good causes and things like that.

I will say the worst part of delivering newspapers was after I watched *An American Werewolf in London*, does anyone remember that movie? Classic! In a way, a horrifying movie when you're 12 or 13 and you're out in the dark delivering newspapers looking over your shoulders when there's a full moon, forget it!

Man I literally, I've never admitted this before, ran when there was a full moon and I had that route done fast! So right now my portfolio says about me I like to own things that are profitable soon after they go public. There's MasterCard, there's AmTrust Financial, there's Google that I personally own. There's Facebook as well in *Pro*. It also says that I sold too many things far too soon. I sold Starbucks far too soon. I sold Amazon and I'm much less quick to sell today. I like recurring revenue as you guys know, I like to create income with options and I believe in the credit card networks creating more value for the credit card companies over time and there's a big Motley Fool imprint on my portfolio as well as my family, my parents, my dad, my paper route. What does your portfolio say about you? What are its goals, what are you decided to get there? How are you protecting yourself against risk and keeping your portfolio flexible for when adverse events do happen, that's what I want us to think about today and talk about more today.

So the best time to plant the tree was 20 years ago and it was 30 years ago I was delivering newspapers. The second best time is right now. Your portfolio, your new -- your portfolio begins today, anew every day and we're here to help you and watch you grow it and make sure all of the branches, or most of the branches, are growing upward and that you trim off the little sucker branches and have a *Pro* portfolio.

Thank you for listening! Couple of questions?

Man: Two.

Jeff Fischer: Okay, two questions we have time for and then we've set aside this afternoon a whole hour for Q&A and also a good half-hour for, we're really excited, a member panel Q&A. We will have *Pro* members up here an we'll all just get to talk.

Man: Only two so raise quickly.

Audience Member: That was great, thanks! One question is how do you incorporate tax efficiency into that overall picture that you just described?

Jeff Fischer: Great question. *Pro* -- we do try to be tax-efficient aside from our options. So with 80% invested in core stocks, as I would imagine most of you are or want to be for the years ahead, we want low turnover in those positions so that's another of our goals underneath of the bigger goals: to have low turnover to own compounding machines that we ideally won't touch, and then we also have income, which helps us not need to sell a stock. If we think something is overvalued for a while, we might write options on it to monetize it for a while, or we just write options in general for extra income and then hopefully we don't have to sell our stocks that have really compounded and that we still believe in and that have these large capital gains. But, of course, hedging and shorting in a regular account is always a short-term tax gain or loss.

Audience Member: So I had a question about selling, so maybe not so much a question as a comment. We have had some growth stocks in our portfolio, namely DDD and I know another company, I forget now, but yeah, maybe -- have you considered making valuation less of an issue with growth stocks as compared to maybe some of the other stocks, having different models for different types of companies?

Jeff Fischer: Great question and the short answer is yes. We -- with Facebook, for example, it reminded me a bit of Google in 2005 and '06 valuation-wise. And as long as the valuation is reasonable enough that you can earn a good return on it compounded we'll consider it. 3D Systems is a really interesting company, of course, and *Pro* was the first service in The Motley Fool to buy shares of 3D Systems so I felt a little bit like I was betraying ourselves and our company or 3D Systems by getting rid of it, but every quarter the results were getting weaker when you really looked at the numbers and the stock kept going up. So that sort of disconnect concerned us and we wrote covered calls on it and that -- and we rolled, I think once or twice, but eventually we got to a price where we let it go. But I think the lesson there was don't cover a volatile growth company because, in a way, that ties your hands anyway, just sell it when you think the price has well exceeded what you're seeing in the results. And the problem there was the results, we just didn't like what we were seeing.

If they were getting better every quarter, I think we would have let it run, but they have an earnings quality issue and we may see that keep coming to light. That said, long-term I would still believe in them but given *Pro*'s goals, it didn't fit in beyond a certain price into *Pro*'s goals. Good question!

Bryan on "Worldly Wonders, Albert Einstein, and *Pro* Core Stocks"

Bryan Hinmon: Hey Fools! We have a hard stop -- wow, it's narrow back here. We have a hard stop at 12:30 so I was planning on some time for Q&A, hopefully I will leave some but no promises on that. I've been with the *Pro* team for four years now and I consider myself to be pretty lucky to have that post, and while I know that you all signed up for … Hello? I know everybody signed up for the *Pro* track to see all Jeff Fischer all the time, and he is superhuman, but he does need bathroom breaks and water breaks, so Billy and I are going to give him a little bit of a reprieve, so stay with us.

My talk today is called "Worldly Wonders, Albert Einstein and *Pro* Stocks." The first worldly wonder I want to talk about actually is *Pro*. I truly believe *Pro* is the greatest investing service that exists and that is, in part, in no small part to you our members. So, before I get into things I just want to say thank you for being great members and thank you for being here as well.

So, a few years ago the New 7 Foundation came out and said, hey, we want to solicit nominations for mankind's greatest. So they had plenty of responses, ultimately they (coaled) the list down to a few finalists and put it out to a vote. They opened it up to the world, there were over 100 million responses and on 7/7/07, fittingly, they announced the new seven wonders of the world. Now, hopefully some of these images will be familiar to you. Hopefully you've been able to be in the presence of them, the pyramids of Chichenitza of the Yucatan, Christ Redeemer in Rio de Janeiro, The Great Wall of China. I heard I had a laser on here, is that true? Oh yeah!

Machu Picchu, the Petra in Jordan, the Taj Mahal, the Roman Colosseum; they're truly, truly breathtaking, they're truly marvels. But rumor has it that the voting was really close and they had already named it the New 7 Foundation so they knew they could only pick seven, there were the seven ancient wonders of the world so they were pretty much locked into seven. But the eighth one was pretty dang good and so I used my Google-fu to find out what the eighth wonder of the world was and as it turns out it's compound interest!

Well, so obviously I'm fibbing a little bit about that, but Albert Einstein was a fairly smart guy; he knew that compound interest was a forced to be reckoned with. And even though it's not a new seven wonder, we're Fools here -- it should be near and dear to our hearts, and more importantly, it should be near and dear to our wallets.

So for the rest of the presentation I want to talk a little bit about compound interest and the basics of compound interest, which doesn't sound very exciting but then I want to tie it to business and say how it's, in fact, the business principle more than it's a math principle, or as much as it's a math principle, and then finally I want to take the last leap and show you how compound interest actually plays a role in *Pro*'s investing process.

So, for the example that I'm going to walk through, we're just going to think about a very simple investment here; $1,000 invested for 10 years where you earn an 8% return. Nothing fancy here. Compound interest basically captures the idea that the interest that you earn on your principal can be reinvested and turned into an interest-bearing asset itself. Said way more simply than that, your interest can earn interest. It's fairly magical and we'll walk through why that is.

So, when you think about returns from compound interest they come from three sources. The first source of return, not very sexy here, your principal. You invest $1,000 in the beginning for 10 years, you get back your principal of $1000 -- that's a pretty lousy return, [and] it's worse ... if it went backwards.

Second source of return is called simple interest. Now, you remember that we're paid 8% in this example on that $1,000 interest every year; 8% of $1,000 is $80. Over time those $80 payments accumulate, 10 payments of $80 is $800. Not so bad -- at the end of 10 years, our $1,000 investment is now worth $1,800. Don't worry, Fools, it gets better!

Instead of using those $80 checks as coasters or decorations, what we can do is choose to reinvest it. We can essentially roll this red portion here, we can roll that back into principal and reinvest to earn and additional 8% on that. That's the interest on interest, that's compound interest.

That's represented by the green sliver here. Now, that green sliver looks fairly small but you'll notice that our investment has grown into a sum of $2,159 so we've earned an additional $359 earning interest on interest; essentially magic.

$359 is no chump change in this example, it's nearly half of what the simple interest paid us, so it's a pretty big force. The key takeaway here is simply that compound interest, the ability to reinvest interest, to reinvest money that we're paid back into our investment, is sort of like rocket fuel for our returns.

This is really where the magic begins. This is my favorite slide. Everyone thinks that this was a Photoshop job. This is just a dinner party. This is actually what Jeff looks like when he comes to the office most days. No, so the real magic comes when we try and optimize the rate of return at which we're able to reinvest and the length of time that we're able to reinvest for; so time and rate. When we optimize those things it's really when the getting gets good!

So let's look at each of those, time and rate. So, for time what I've done here in this chart is simply extended the time horizon. So back here was our original 10-year investment. Let's say we're able to reinvest for 40 years. So our 10-year investment, not bad, turned into $2,159 for a nice 116% return. Adding 30 years, you'll see that we still have an additional 900%. The benefits of compounding improve the longer you're able to reinvest. Ignoring the numbers, right, ignoring the fact that here we had $2,100 and now we have $21,000, 10 times as much.

Ignoring the numbers, simply look at the color here. The green has completely taken over the graph. Compound interest over a long period of time is our friend. So the second one that we want to talk about here is rate and this should be no surprise. The higher return that you're able to earn, the more money that you're going to have at the end. So again, 40 years, this represents what I showed you on the last slide, an 8% return over 40 years. If we're able to, instead, earn 12%, the red line, 50% more, you see we have 358% more money at the end of the period.

So optimizing time and optimizing rate are key when it comes to compound interest. So at this point you're probably saying thank you very much for all of the math, thank you for the simple compounding interest lesson, what the heck does this have to do with businesses? What does this have to do with finding the investments that are going to make our account do this?

Well, thankfully the principles port over really pretty well and we can lean on a friend of ours to get there pretty simply. So this is a quote from Warren Buffett's 1989 shareholder letter that really encapsulates the time and rate concept. He's basically saying, if you've got a moat, that means that you can earn higher returns and if you can earn those high returns for a long time, wonderful things are going to happen to your account value.

Warren Buffett's wisdom, folksy wisdom is wonderful but I'm sort of a numbers guy so I like to put this to the empirical test a little bit. So I'm going to walk you through now, very exciting, two academic studies that basically provide some data to support what Buffett so eloquently says. I apologize you're probably not able to read this but I will do my best to walk through it as well as possible.

This study was done, it's a 25-year study or so performed by Fidelity. And what Fidelity did was at the beginning of every quarter for 25 years they took the S&P 500 and lopped it into two portfolios; one portfolio was what they called good businesses and one was bad businesses. It doesn't matter how they split it up -- it was return on assets. They basically drew a line in the middle and if you were above the line on return on assets you were a good company, below the line you were a bad company.

And basically then they said, OK, so for every time we form a portfolio we hold that portfolio for 25 years or 24 years or 23 years or five years. And whichever portfolio performed better, the good businesses or bad businesses, they gave you a green bar. So essentially what we can see here is a couple of things; number one is good businesses outperform bad businesses about 75% of the time; high-return businesses outperform low-return businesses in terms of profitability 75% of the time. There should be no surprise there.

We can also see here, it wasn't -- bad businesses didn't start to win until really late in the period here, so the second takeaway that we can have here is if you're going to invest in good businesses and you can hold them for a long period of time, it's a near certainty that you're going to win.

I want to draw the parallel here between good businesses being high rate of return businesses. The second study here is really about duration, the length of time that we can invest for. This study was performed by McKinsey and they took the S&P 500 and divided it into five portfolios, again, based on by a metric of good or bad, high return, low return, return on invested capital.

And then they followed that portfolio for 15 years and basically we can see here, again, is high-return businesses are above 20%, maintained their good returns over time, and bad-return businesses stayed bad-return businesses.

So if we find those good businesses to invest in, chances are they're going to stay good businesses over time. Now, capitalism works and you see those returns are competed down and everything is mean-reverting here, but good businesses stay good businesses and bad businesses more often than not stay bad businesses, but you can earn those returns over long periods of time; so high returns and investing for a long period of time.

That should dovetail really nicely with something that is near and dear to all of our hearts and that is *Pro*'s core stock philosophy. We have basically said that core stocks have three main characteristics. They have sustainable competitive advantage, they're good businesses. They have strong compounding dynamics, they can reinvest those high profits for a long period of time and then they have great management. So they have the people in place to make the right decisions about where to invest that money and how to invest that money.

Now, Jeff wrote a Memo a while back that outlined our core stock philosophy, our great editor Ellen Bowman turned it into a one-page takeaway. If you do any sort of searching on the Fool or the Internet you're going to find a lot of talking about competitive advantage and you're going to find a lot of talking about management.

So what I want to do for the last few minutes of my presentation here, 10, I want to talk about strong compounding dynamics because it may be a concept that is not as familiar to you as competitive advantage or great management.

So the first characteristic of strong compounding dynamics that we look for is what I like to call easy earning. Now, this harks on the fact that business is really hard. Customers are fickle. What we want to find are structural characteristics that make the sales process as easy as possible, as close to a slam dunk as it can for our companies.

So, some telltale signs of easy earning are business model characteristics like a subscription model like we have in Oracle, where the customers are billed every month or every quarter depending on how they've signed up, and it's almost automatic; or a high-transaction model like TD Ameritrade, where it's basically like a tollbooth -- you have to pay the toll to get access to the service that you want. A contract model like American Tower where for years we know what our profits [will be], the business knows, and [what] revenues are going to be to a large degree. Or one that may not be so obvious, when your product is so good and so dominant and meets the needs that you're trying to fill so well that it's become the de facto standard and there's no reason to have to turn elsewhere.

Now, that's like GenTech's auto-dimming rearview mirrors. Now, these telltale signs are great, you may be able to find them but what I want you to focus on here is why we care about this. We care about it because if we know that the near-term is under control, it allows the management teams, it allows the employees who are running this business the mind space, the open space to think long-term, to think about how they're going to strengthen those advantages -- to think about how they're going to grow their business, to think about how they're going to do even better and make their customers even that much more happy.

So the second characteristic of strong compounding dynamic is ample reinvestment opportunity. Now, this refers both to the ability to reinvest, you have access to the capital and a runway to be able to do that. So, some things that we look for are a growing core business. MasterCard is such a great example of this because, still, to this day, 85% of transactions take place using cash.

They have plenty of runway to reinvest in their core business. The next best thing is natural piggyback extensions. It's the next best thing because what we like to see is we like to see a company building upon its competitive advantages. Anytime they go slightly outside of their circle of competence there's a risk that the competitive advantages don't (work), and we don't ever want our companies to be playing on a level playing field.

A company that has exhibited this really well is Broadridge Financial Solutions. Broadridge has done a great job of expanding its circle of competence, expanding its business lines at the margin, only when it's able to use the competitive advantages it already has in place.

Finally, when we think about ample reinvestment opportunity, we like companies that have multiple possible futures. Ones that are totally even unaware to us at this point, and a great example of this in the *Pro* port is Facebook. When Facebook came public they basically had no advertising revenue for mobile and now it's 50% of their revenue and growing like weeds. Could they enter the payments or video game industry, who knows!

It's a possible future that we don't even know about. We look for these because we like that they're -- it gives them the ability to either dig their moat deeper or dig their moat wider, and if the company can reinvest in its business it doesn't have to pay out dividends that trigger taxes for us.

The third dynamic or characteristic of a compounding dynamic that we like is a relevant product to a large market, and this goes back in our discussion of compound interest, this goes back to time. If you're going to reinvest in your business for a long time you have to have a product that's going to stay relevant for a long time and so one of the ways that we can achieve this is if you operate in an industry that has a modest pace of product or feature change.

Now, you're probably not going to find this too often in a tech company but in an industry like Valmont that makes sprinklers and poles, things aren't changing too quickly. So we believe that the money that Valmont does earn it's going to reinvest in its business and it won't be subject to disruption very quickly.

Starbucks is a great example of product relevance in massive markets. We also like a respected valuable brand that can transcend geography like Apple. A brand that can leap geographic boundaries probably means that it can compound for a longer period of time.

And finally what we like to see is we like to see a company that has its reputation built on excellence. We spoke earlier about word-of-mouth advertising and the net promoter score. A company that has a wonderful reputation gets a seat at the negotiating table for their sales, for their sales process. It is far easier to win a sale with a good reputation than a bad reputation.

So we care about this because market tailwinds without boundaries lengthens the amount of time that we're able to reinvest at high rates of return in the great businesses that we find. But the real magic is when we find elements of all of these in our *Pro* companies and I'm proud to say that we're really happy with the *Pro* portfolio. We really like the companies that make up our core stocks and we think that they obviously exhibit many of these characteristics.

With that I think I have-- yeah, I have a few minutes for questions if we want to open it up for questions?

I think we have a microphone coming.

Audience Member: Can you name a stock with these characteristics?

Bryan Hinmon: Can I name a stock with all of those characteristics? Not with all of -- whoops, that's going the wrong way. Not with all of the compounding dynamics but I will say that, man, this one is easy because this is most of the *Pro* core stocks right here. In order to gain a meaningful allocation in the *Pro* portfolio it has to have -- the companies have to have this as an example. So, we just go right down the line here. Oracle has strong compounding dynamics in that it's a subscription model. We believe that they have a competitive advantage in database and middleware businesses, in their database and middleware businesses.

And they have a guy running the show and an incredibly deep management bench that have proven to make really wise capital allocation decisions even though most people don't think acquisition is a very good strategy; Oracle has proven time and time again that it knows what it's doing on the acquisition front.

So I think Oracle meets all three of those. Every company that I've highlighted here, two, it's a spectrum. Not every company is going to be as strong as possible in each one of those but we like to see characteristics of all of them in our companies.

Audience Member: If you were starting from scratch today would you just invest in the portfolio as it stands or do you have another way of starting?

Bryan Hinmon: Man, pin me down! Disclaimer -- OK, so you asked me. If it were me I would have to answer the question, how closely am I following the *Pro* portfolio? If I am not concerned about following along closely I would probably pace myself for sure. I would start with the Buy Firsts, obviously, and feel very comfortable buying them today. The second thing that I would do is I would look through the list of Buys and look at which businesses resonated with me, which ones I understood, which ones I agreed with the thesis right away and I would probably buy those and then I would pause and then I would probably start to learn more about the companies that I hadn't chosen to buy and go from there. I would cross-reference that with any existing investments that I currently had so maybe there is some industry overlap there, I don't want to get overweighed in a certain industry. But that was sort of my answer.

I think that the broader answer that I can give that's more helpful is it is futile to try and time the market. It's so easy to second-guess yourself with hindsight by saying, I should have gotten all in at the beginning, or investing 30% up front has turned out to be a disaster. You can't play that game with yourself or you're not going to make it for the long term. So what I would do is almost try and take your emotion out of the game and I would set up a schedule probably for myself and say, I want to get invested in four installments and, you know, arbitrarily choose four dates over the next calendar year or whatever. The first installment I would do just as I said. The second installment I would do just as I said because there will probably be different Buy Firsts, new Buys that I might be familiar with. And then I would just start biting the bullet and add a few more companies to get myself more aligned with the *Pro* portfolio each time.

***Pro* Stock Talk (with a brief Q&A)**

Billy Kipersztok: My name is Billy Kipersztok, I am a research analyst for *Motley Fool Pro*. I started here in April of this year. I'm part of the Analyst Development Program which is spearheaded by Bryan Hinmon who is our very own [senior] analyst and also Nick Crow who was formerly on *Pro*. So I'm excited to be here and I'm glad that you guys are all here and I'm going to be talking about American Tower today as a great example of one of those core stocks that Bryan Hinmon was talking about in his presentation earlier.

So this is going to be a little bit more in-depth and kind of with numbers and financials so bear with me here but hopefully it'll be -- you'll learn something from it.

So American Tower, you guys are probably familiar. Most of you guys are probably *Pro* members. What they do is they lease tower space to wireless cell phone carriers such as AT&T, Verizon, T-Mobile, etc., but let's go a little bit more in-depth and let's talk about the industry and what exactly is a tower and how do these things work and how does American Tower make money?

So a cell tower is a site where antennas and electronic communications equipment are placed usually on a radio mast tower or other high place to create a cell in a cellular network. Now, it's important to note that they don't have to be towers, they could be on top of roofs or on some other structure but we traditionally refer tot hem as cell towers for simplicity sake and the majority of American Tower's portfolio are towers.

So, the towers are cells in a cellular network so what is a cellular network? These are the things that you're placing your phone calls on. It's a wireless network distributed over land areas called cells served by at least one fixed location cell site like a tower. So, with respect to the tower asset, who owns what? What exactly is American Tower's responsibility and what is the responsibility of the tenant which would be the carriers?

So this red right here is the tenant responsibility and you can see that in the pictures and then the grey is American Tower responsibility. So what you see is that American Tower owns the land and the space around the tower, the physical tower structure itself, whether it be a tower or, like I said, a rooftop or some other site and then the tenant is responsible for putting up the equipment, they own the equipment, they have to put it up themselves, American Tower does not do that and they pay American Tower for the space on these towers. So basically it's just a real estate business; you have space and you're leasing it to your tenants.

98% of American Tower's income is generated from leasing its properties. The other 2% is sort of consulting or development type of arrangements with its customers.

Now, the tower structure can support multiple tenants per tower. This is a very important part of American Tower's business story so make sure that you keep this slide in mind later but basically what happens is once you've built the tower structure it can support not only one tenant but two tenants or three or four or even more.

Now, you're constrained in most markets because if you think about the United States, how many wireless carriers are there? There's probably four big ones, AT&T, T-Mobile, Verizon and **Sprint** so really you're only going to be able to get as many tenants as you have carriers in your market. But, again, remember this slide as we go forward. This will be important.

And then as far as the U.S. tower industry, now this is U.S. specific, American Tower does own towers internationally but I'm going to just talk about the U.S. tower industry because the data is a little bit easier to find and it's a more developed market.

As you can see 39%, well as you can see the top three, **CrownCastle**, American Tower and **SBA Communications** represent about, what is that, 82% of the entire market so that is a characteristic of kind of an oligopolistic market structure where you have a few very dominant players and then the rest is very fragmented. That 18% you can see the top one operator among that 18% is **U.S. Cellular** at 4, Verizon at 1.2, T-Mobile at 0.8, **Time Warner** at 0.8 so the rest of that is very, very fragmented and you have those three main players at the top and what you'll see is that allows those three big players a competitive advantage versus all of these smaller operators as far as operating their business and expanding their advantages and I'll touch on to that a little bit later.

So, with the overview of the industry and what is a tower and all of that, why do we think American Tower is a Pro core stock? The three characteristics that I have up here are the things that Bryan talked about in his presentation, does it have a sustainable mote? I believe that it does, check! Strong compounding dynamics? Again, check! Skilled management, that's Jim Taiclet, the CEO of American Tower right there. I believe that he's skilled. They have the lowest debt profile in the industry, highest margins in the industry and intelligent capital allocation. So that gives us a check there.

So I'm going to go into each of these, actually no, I'm going to go into just the top two sustainable mote and compounding dynamics and go a little bit more in depth and show why American Tower is a great example of these types of attributes that we look for in a stock.

So, one of the biggest parts to American Tower's mote and it has several aspects that give it a mote is switching costs. So, the way that American Tower's structures its lease is that there's an initial five to ten-year non-cancellable term which is followed by multiple five-year renewals periods after that so if you have a five to ten-year non-cancellable term you've just locked in a revenue stream for five to ten years.

In addition to that locked in rate there are annual embedded escalators so each year the contract rate that the tenant is paying is escalated at a rate of, in the United States, it's about 3.5% on average and as most of us know inflation, the current environment, is around 1.5 or 1% so you can see that they're able to increase just from annual rent increases in excess of inflation.

Now, internationally their escalators are fixed based on local inflation which is generally higher; Africa, Europe, etc., those can be up to 6, 7, 8% escalators depending on the local market.

Now, in addition to just the lease structure which creates switching costs for the tenants, there are labor costs to remove equipment, say you want to cancel your lease after the initial five to ten years well you have to put the equipment up on the tower and you have to take it down. So there are costs to that as opposed to just renewing where you wouldn't have to do any of that and there's no time or anything like that. Additionally all of these tenants operate networks. So if you move equipment and you don't renew at a tower that may adversely affect your network quality and that's not something that the tenants want to do and then thirdly, if you decide to move your equipment from one tower there may not be another place to put your equipment so that you can keep the quality of your cellular network.

So what does this lead to? It leads to, as you can see on this graph, a recurring long-term revenue stream and very high renewal rates! One to 2% historical turn on its contracts and as you can see from this graph this is the tenant lease renewal schedule; 81.3% of their leases are set to renew in 2018 or beyond so they're locking up their contracts, they're locking up their revenue streams, many, many years into the future. This is exactly what we want to see with our investments as far as the reliability and the predictability of its cash flows and it gives management a lot of flexibility in that they know what their financial picture is going to look like moving forward.

In addition to switching costs there's also another part to American Tower mote which is barriers to entry. You guys may have heard of this acronym NIMBY, it stands for not in my backyard. So if somebody wants to erect a tower and you own a house and it's going to be right in your backyard you're going to say, hey, hey, no, we don't want that! So there are NIMBY concerns with towers. There's also zoning and permitting restrictions. You can't just erect a tower anywhere, you have to work with the city commission or the local governments. Typically it takes up to a year to lease, permit and build a tower site depending on where it is. And then again, there's a high capital cost to build meaningful skill; the big three incumbents that I mentioned, SBAC, American Tower and CrownCastle have invested billions of dollars in creating this network of towers and if you want to immediately be able to compete on the same cost profile you're going to have to spend billions and billions of dollars to build similar scale. So that's another aspect to American Tower mote.

Just as I mentioned, economies of scale is the other aspect to American Tower's mote. You guys remember this graph; big three incumbents with low fixed and maintenance costs it's a big advantage to have more market share and be able to attract customers to a bigger degree because when you attract more customers and you gain more market share you're able to spread your costs out over a wider base and it makes you more profitable and what that does is that means that these little operators are at a disadvantage and we would expect to see the big three operators expand share over time.

Now, beyond sustainable mote the second aspect of a Pro core stock that we look for is strong compounding dynamics. A relevant product to a large market, that was on aspect to strong compounding dynamics. So, it's American Tower, does it have a relevant product to a large market? I believe the answer is yes. So the question here is what drives demand for wireless tower space?

So, networks need to invest or carriers need to invest in their networks and that is what is driving demand for wireless tower space. So as demand for carrier networks increases, demand for towers increase. And this graph right here does a great job of showing why we can expect that the demand for carrier networks will increase over time.

The blue is 2012, the green is 2017 expected. This came from a CrownCastle presentation which, in turn, came from a **Cisco** presentation on data use and things of that nature. You can see top part is smartphone, bottom part is tablet. Smarphone users are expected to double. Monthly uses per devices is suspected to 6X, total monthly traffic and petabytes, which is one times ten to the six gigabytes for all of you guys counting is expected to 10X to 2017 and then for tablets, similar trends.

So data growth is exploding. I'm sure you guys all know and you guys use, some of you use tablets and things of that nature, access the Internet remotely, wirelessly, that kind of demand is going to continue to increase meaning that the carriers are going to continue to need to invest in their networks which means that they're going to continue to need American Tower towers to build out and densify their networks.

Additionally, relevant product to a large market; more evidence that the carriers need to invest in their networks are carrier capital expenditures and these numbers are in billions and these are expected, again, from a CrownCastle investor presentation. This includes AT&T, Clearwire, Leap, Metro PCS**,** Sprint, T-Mobile, U.S. Cellular and Verizon. Some of these have consolidated since then but basically the overall capital expenditures for the carriers is expected to grow slightly or remain a little bit constant but that's a lot of money being dumped into expanding their networks and building out their network quality. It's clear that the demand is there for this service.

The next aspect to strong compounding dynamics is ample reinvestment opportunity. If you can't reinvest your cash you're not going to be able to compound quickly over time. So, you can see this is American Tower's capital allocation, year-to-date 2013 through the first three quarters. They haven't reported their fourth quarter yet, they report the end of February but as of the first three quarters you can see that the vast majority of their capital allocation has gone towards acquisitions and now why is that? It's because they're reinvesting in their business because each time that they reinvest in their business they're increasing the profitability of the business and this is what we want to see, we want a lot of places to put your money and we don't want to see companies where necessarily they're allocating out all of their cash towards dividends because they can't find places to reinvest. 87% of their allocation was towards reinvestment towards acquisitions so that's a good sign for us.

Now, why should they reinvest in the business and why is American Tower putting 87% of their capital towards reinvestment? It's because the profitability of that investment is off the charts and I'll explain it to you, here's why! Remember this slide that I told you to keep a look at and remember? One tenant, two tenants, three tenants, each additional tenant is virtually 100% profit. You don't have to pay anything else to add another tenant. You've already paid for the infrastructure of the site so each tenant is incredibly profitable so it leads to something that looks like this in a financial picture. You've got the construction cost, tenant revenue, operating expenses, gross margin, margins, good, 40%. That's for one tenant. Return on investment 4%.

But look what happens with two tenants and look what happens with three tenants? You have no additional costs, your gross margin conversion rate, that's whatever revenue that comes on that goes down toward profit, 95% of the revenue that comes from a new tenant is converted to profit and the returns on investment quickly rise; 12, 20% to three tenants, four tenants you can imagine it would be even better and in some markets where there are four carriers you will see four tenants on towers.

So basically what that gets to is that we want to see, over time, American Tower growing their tenancy ratio. You want to see 1.5 to 2 to 2.5 to 3, ideally that number goes up over time. So what have we seen in the past?

Well, this is tenants per tower for American Tower's Brazil operations. These are sites in the portfolio since 2002 so that means that over the last 12 years they've had an opportunity to lease up these towers and gain more tenants and you can see the line is pretty linear and they've been able to increase their tenancy ratio at a pretty healthy rate.

What does that do for return on invested capital? I just showed it in the previous slide and what would you expect that it would do? It would rise and in fact it has. This isn't from 2002 but it's from 2007. This is overall returns on invested capital and it's risen over time as you would expect as they increase their tenancy. This is something that we expect to continue as they make acquisitions, the tenancy ratio is low, they attract more tenants, they get more profit and you should see returns on invested capita rise, that's key to our thesis for American Tower and it's been playing out recently but we want to make sure that it continues to play out.

So all of those things that I talked about, the sustainable mote, the management, the compounding dynamics, the large market, all of that has led to very strong historical financial performance. You can see the tower count has grown pretty steadily over time, the revenue growth has grown pretty steadily over time and I think also it's interesting to note that even in 2008, 2009 where if you were to look at this graph for most companies it would look like this, boom, boom and then go back up, very steady, very consistent growth.

EBITDA growth which is basically a little bit of a rough proxy for cash flow gone up on the same trajectory and then finally relative stock performance. This is a little bit of a confusing chart, there's no axes but basically it's -- if you were to have invested the same amount of money in American Tower and in our North Star, even though you can't invest in it, what would the returns have looked like over time? Even with starting in 2008 when the stock price faltered even though the business didn't falter you would still end up with higher returns from American Tower, 13.2 annualized since 2008 versus 8.3 annualized for the North Star.

So American Tower is an investment that satisfies a lot of our core stock criteria and it has been shown to beat the North Star over time and we believe that it will continue to do so.

So that's it! Question?

Audience Member: (Unclear)

Billy Kipersztok: Sure, yeah. I think you kind of hit some of the points there. Yeah, so the question is, a lot of the same characteristics that American Tower has you might expect its competitors to have; CrownCastle, right? So if the graph of the industry looks like this and it's an advantage to be big, why wouldn't we want the bigger one?

Well, it's a combination of the things that you said, I think that management of American Tower is more shrewd. Their debt profile is lower which gives them flexibility to pursue more deals overtime. I don't know if you've been following American Tower recently but Dave made two big acquisitions recently and I think that they have more flexibility than the other tower companies to make these acquisitions because of their debt profile which is lower and they don't have to worry about servicing their debt.

Additionally their margins are higher and, like you said, they're investing more in international. So, this kind of obscures the real picture which is that American Tower has the majority actually of its portfolio overseas and it's grown pretty rapidly over time and they're really the only tower company to be investing very significantly overseas. SBAC is also doing it but it's at a more measured pace. The reason being, SBAC is more highly levered, like I said, so they don't have the flexibility to acquire as many towers and do it as quickly as American Tower can.

Additionally, a good thing about the international segment is that they're able to pass on some of their revenues, excuse me, pass on some of their expenses to the tenant. So it's actually more profitable to American Tower to have tenants overseas than it is to have them in the United States so this is why they're investing overseas so heavily is because they get a higher return on their investment.

So it's for a variety of reasons and hopefully that helped to answer your question.

Audience Member: With American Tower, does most of their tower sites, is that owned property, do they own real estate holdings or is it all leased property, leasing a farmers field to put the tower up so you would have that increased cost for them later on as they have to renew those lease contracts?

Billy Kipersztok: Yeah, that's a good point. They own, I believe, so you're talking about the land underneath the tower or just the tower itself?

Audience Member: Whatever the tower is sitting on. The building …

Billy Kipersztok: Right, yeah. I think the owned versus lease ratio is about 30%. So they own about 30% of the land or whatever it is that it's sitting on. The rest of those leases, they're very careful and they structure the contracts and the roll-offs of the contract carefully such that it doesn't -- you don't end up where now we're in a situation where we need to renew no matter what and we're under pressure and it's going to cause an increase in price. I believe up to 75% or more kind of like this slide here, they have a very similar slide in their presentation that's not tenant lease renewal but its land lease renewal and it looks very similar in 2018, 70% of their land leases are set to renew or more past 2018.

So they're careful about that and they understand that that's a risk and I think management does a good job of mitigating that.

Audience Member: Are we competing with the other companies or is American Tower competing in the same geographical area or is it one -- American Tower comes in they own the entire city, county, neighborhood or geographical?

Billy Kipersztok: I think it depends on geography but in many geography's you'll have multiple tower operators operating in the same place but it doesn't -- you won't find necessarily a CrownCastle tower right next to an American Tower, tower because it just doesn't make much sense. What will happen is American Tower will have some of the network density in one area and then in the same geographical space CrownCastle will have some of the density there.

Audience Member: (Unclear).

Billy Kipersztok: You mean relative to competitors?

Audience Member: Yes.

Billy Kipersztok: Yeah, no, I mean, I don't think that American Tower has any specific advantage with respect to over its competitors in terms of pricing. But I do think that the way that the market is structured, all three of the big incumbents, SBAC, CrownCastle and American Tower should -- not one of them is going to have an advantage over the other but all of them together are going to have good bargaining power against the carriers because it's such a consolidated industry.

Audience Member: So there are other costs associated with running a tower like the landlines that come in to support the communications and so forth, is that all born by the tenants or does American Tower -- does that factor into what their costs of operation are?

Billy Kipersztok: Yeah, so American Towers is not responsible for the equipment or the lines or the electricity or those things, that's all paid for by the tenant. The only thing that American Tower is responsible for is upgrading the structure itself, making sure that it doesn't break or fall and then paying the lease for the land that it's on if it is leased or not owned and then a certain portion of their costs, like I said, internationally are passed on to the tenant but in the United States they're not so certain portion of the cost maybe.

Audience Member: You showed a slide that projected data usage going out a number of years and I thought that it combined cellular data and Wi-Fi data. Those aren't exactly the same thing. Do these towers have anything to do with Wi-Fi and if not if people start using Wi-Fi more than cellular could that undercut some of the prospects?

Billy Kipersztok: Yeah, that's definitely a concern and that's something, a risk, that people raise about American Tower all the time is increased Wi-Fi usage. To be honest I'm not intimately familiar with the technology regarding the towers themselves whether it's Wi-Fi or not but I do know that investors have raised that concern and the typical response that I've heard from management is that Wi-Fi is going to be something that's important and it's in kind of denser urban areas but it's not something that's going to meaningfully adjust the usage patterns of data, cellular data, across an entire country. Maybe in very specific locations it may reduce the demand for towers but overall it would have a minor affect. But to be honest, I'm not extremely familiar with that but that's just kind of the answer that I've heard.

Audience Member: This shows a tremendous increase in traffic but how does that traffic actually transfer to their revenue? Do they need more towers?

Billy Kipersztok: Yes.

Audience Member: Do they put more equipment on the towers?

Billy Kipersztok: Yep, so it's both. Let's see here. So what happens is in this cellular network the cells are a certain size, the broadcast can reach a certain area. Now, as the throughput of data increases the area that the cell can reach decreases and that's just a matter of physics etc. So as more data flows through the network the network itself gets smaller. So what happens is they have to do what's called cell splitting which is where this may have been one cell, now we're going to make it two cells and we've got two towers in there. So that increases demand for the tower itself. Additionally, kind of like you said, there's add ons that you can use so if you have equipment on the tower you can add additional equipment, more technologically advanced, it allows more data throughput, different frequencies, etc.

Audience Member: Do they get paid (unclear).

Billy Kipersztok: Yeah, so in the contracts it's called amendments. If you add a certain amount, I'm not sure exactly what the structure is, but then there's an increase in rate.

Audience Member: I'm curious how many, I mean, who are the largest tenants?

Billy Kipersztok: Largest tenants in the United States are the cell phone carriers which are Verizon, Sprint, T-Mobile and AT&T.

Excuse me? Yes, all four of the carriers do business with American Tower. It doesn't exactly break up in the way of market size. So the biggest carrier doesn't necessarily represent the largest portion of American Tower's revenue, it's dependent upon geography and where their markets are but all four of them are significant customers of American Tower.

Audience Member: So I would have expected that the number of towers in the United States would be saturating and that's what your bar graph showed but internationally it's still going up. So can you anticipate the level where that will go up and then saturate?

Billy Kipersztok: Yes, management has stayed at -- let me start also by saying I'm being told that I have one minute left so that is probably the last question or maybe one more but management has stated on their calls and things of that nature and I mean of course you don't always take what management says at face value but they believe that the adoption curve in non-developed markets, obviously there's some wiggle room here is about five years behind the adoption curve in developed markets. So where we're seeing big increases in 3G, 4G, developed markets are just now getting into 3G. So five to ten years I think saturation but then again just because there's smartphone saturation doesn't mean that data growth doesn't still occur.

Make the Most of *Pro*: Jeff and Members

Jeff Fischer: Now, I'm going to talk a bit about making the most of *Pro*, but more exciting is we're going to have four *Pro* members come up here and we're going to talk with them as well -- big conversation. So if you're in the back you might want to move up during that time unless you can hear no problem and we'll be passing microphones around.

The idea is to share best practice, share ideas, for how we all use *Pro* to make it more useful to us, profitable for us and work in our particular situation. We know from our surveys, which may be a little too shallow, especially after hearing this morning's talk, our surveys of some of you that the majority of you answering these surveys do not follow the *Pro* portfolio exactly by any means. Most of you, according to these surveys, own stocks across many different Fool services or outside Fool services and *Pro* is one small part of it.

So one of the challenges we always have that we enjoy tackling is how to help you make the most of *Pro* given your particular situation. As we talked about earlier this morning too, everyone has different goals, different risk profiles and different needs basically. So my short talk about making the most of *Pro* is going to be three site tips from the *Pro* team. Afterwards we'll go into our illustrious *Pro* member panel discussion and finally this hour, Jim Gillies will share thoughts on using *Motley Fool Options* and then we'll take a break at, just so you know, just before 3:00 we'll take a short break and then we come back and we have a full hour of Q&A with all of us so we'll just have an hour to discuss.

So think of your questions because I think one of my favorite things about these events, of course, is interacting and hearing your voice and hearing what you have to say and then trying to answer in a helpful way hopefully.

So let's see, tip number one, and I'm keeping these simple I hope. Tip number one is the recommendations page on *Pro*. That has everything current, all of our current guidance is there. So if you wanted to start using *Pro* in five minutes you could go to this page and start to use it because it has what to do and that is: always current Buy Firsts ... the recommended allocation, which by nature is always current because we look at the portfolio every week if not every day to make sure that allocations are where we want them and if they weren't we would change them. So even as they move around, we're comfortable with them and if you're starting today we would tell you to match our current allocation.

Of course this page has a few other things that we need to talk about; fair value and consider adding more. Now, before I skip forward, can anyone tell me what fair value means?

Phil: Fair value to the buyer and seller.

Fischer: Thank you, is that Phil? Thank you Phil! Fair buyer is a fair price, yes…

Phil: In addition to that you expect more North Star-type returns from that price or where you're at (unclear).

Fischer: That's a good *Pro* addition to it, very good! That's a better answer than I had. So, Phil said, fair value is a fair price for a buyer or a seller, or said better, for a seller or a buyer. So many people, too many people, view fair value as a sale price. Oh, it hit fair value, I need to sell it! That's only if you only want to own stocks at a discount to fair value with a so-called margin of safety which, for most of us, is not important. We want to own a stock around its fair value that we think is going to compound from that fair value today at a rate that we favor; our North Star or better. So in our case it's 10 to 11% compounded is what we're looking for from the fair value today. And fair value is a range, it's a price but it's a range, it's -- we come at the fair value evaluations through these kinds of cash flow models that have a range of poor scenario, average and good scenario basically. So it's a range of prices and we kind of average it out.

Now, one thing to keep in mind with fair value if we think MasterCard is going to grow 15% a year and that's our model and then they end up growing 18 or 19% a year, our fair value is blown out of the water quickly and we'll adjust for it as we see that playing out but keep in mind with *Pro* we use what we believe are conservative fair value estimates. We're not swinging for the fences, they're conservative. So frequently a stock will run up beyond our current fair value and that's just the result of us trying to be conservative with how we value that business. It still is most important to follow ... what we do; the Buy or Buy First, and we only put things on Hold that are under review where we're thinking about changing the allocation in a meaningful way.

So the next thing on the recommendations page is consider adding more and that's a price where we will reconsider our allocation. If a stock falls so much below our fair value that something's going on, we need to either add more to it, get our allocation back up, or if we're missing something we need to figure that out and our reconsideration of allocation may be to sell it down to zero.

So, consider adding more could also be just consider, consider what's going on, consider your thesis but our bias is towards adding more as long as we continue to believe in the business.

So sorry about this page but I just wanted to point out, at the bottom of the rec page is the glossary of all of these -- consider adding more, fair value. A lot of people, it seems, don't see this but it's at the bottom of the recommendations page, the big recommendations tab on the *Pro* site and there it also has our annualized returns and some good Fool yesterday was asking for historical returns and we have that on *Pro*. We have annualized since inception and the past rolling three years and then year-to-date.

The bottom of the recommendations page on *Pro* also shows, you can't see it here, just the bottom of it, are exposure, our exposure table at any given time and we update that whenever we make a significant change in it or every month.

So all on this recommendations tab you get the whole current snapshot of *Pro*, what to buy and what amount and you can click through any ticker to get to the trade reports on that company and you get our returns and more. So that's one tip, everything on that page is current and here now we're looking at *Pro* site again.

Tip number two are the Monday Memos which arrive to your inbox every Monday at 4:00 PM Eastern Time assuming the servers are working and they usually are. And the Monday Memo every week summarizes what happened in the past week in *Pro* as well as giving where we can lessons or thoughts on current companies, thoughts on the market, thoughts on the economy sometimes, what we believe every year we lay out in the Monday Memo. So the memo is your touchstone every week and now to some of you that may be obvious but, again, our surveys show that only about half to sometimes fewer than half of *Pro* members read the memo and then we see, I assume, those *Pro* members on the boards asking what happened to this or what happened to that and it was outlined in the memo.

So one key takeaway is read this memo every week that you can, it's every Monday, just once a week and it's pretty short, usually you'll take five minutes to read, maybe 10 at the most and it outlines everything from the past week, all the trades we've made, guidance changes, links you to all of the earnings coverage that we've done and so it's your touchstone every week to summarize the past week while your recommendations tab is your current look at everything today.

Those two things you could say are all that you need to follow *Pro* but there's one more that's outstanding and that's the community, that's all of you! Now, I will say, again, according to our surveys almost the majority of *Pro* members don't visit the community, slightly more than half do and that's among the best of any Fool service. Across the Fool, in most services, a pretty good majority don't visit the discussion boards for whatever reason, time or they don't know how to get there, but the community is great and it's your way to plug into thousands of other investors and ask any question that you want and typically get a great answer in a short amount of time so it's a whole different value to you and service for you because you can ask about almost anything that you can imagine and get an answer out there. So I really encourage you to use the community tab.

When you click it you get this general page and then you can click on the top left and, again, this is PowerPoint if you think it's helpful to you, if you haven't navigated the site before and want to come back to this, it will be on the site, it will be on *Pro*'s site, this PowerPoint.

So then you click there and get all boards and then it gives you a list of all *Pro* boards because you're on the *Pro* service and then you can click any of those and I clicked in the *Pro* philosophy board and then clicked the heart. I'm assuming a lot of you don't know this, click the heart to make it a favorite and then it tracks for you -- as long as you're signed, in it will track for you and you can come back to it anytime by going to community and then favorites and replies and you just click there and all of the boards that you've favorited are now yours for the easy reading and very easy to get back to. You can bookmark this link in fact and just come back to the boards whenever you want and whenever you do it will just show your list of favorite boards and how many posts there have been that you have not read, and I circled SPY. I made this three days ago or so. I was wondering what was going on, on the SPY board so I'm like, oh, 23 posts! I need to get on that board and see what people are saying or I could just click mark read and zero it out which I honestly never do.

So those are three quick tips to making great use of *Pro* in short order. The rec page, it's all the current guidance, the Monday Memo summarizes the week and use your community. It's a great, great value to you and speaking of that, that is what we're rolling into right now. We have a *Pro* member panel and let me introduce, I need to get to my slide and they will come up here and we will ask questions and talk about how they use the service and we want to hear how you use it as well. All right, well we have Ned who has been a *Pro* member since 2008 -- since Day 1!

And for privacy reasons I'm using the first name only but Ned -- when I realized that Ned joined on Day 1 I realized that we need to do something for you, a gift of some kind. John, (JSergeant) who joined on Day 3 of *Pro* has been here since 2008 as well and we have Lon, proLon, who I haven't seen yet today but I hope Lon is here. Lon, there you are, excellent! Lon joined in the past year or so, a year ago, but it seems much longer because Lon, I'm sure you've seen Lon on the boards, he's extremely helpful and very thoughtful and Foolish as with all of these members up here and the next one is Phil, philsylvester, also a member for the past year and a half, two years.

And all of these screen names when I see them on the boards I am excited to click in and read and see what they have to share because it's always good. Now the four of you, I've never hosted a panel like this before so we'll see how it goes. We need the microphones and we need member questions and I will get us started by asking you each to briefly share, as briefly as you can, it's not an easy question, how you use *Pro*. Do you use it for your full portfolio, do you mix it with other portfolios and we'll go from there.

Phil: I'll start since I was closest … Is this guy on? I'm maybe in a little bit of a unique situation that I'm kind of managing two portfolios, one for my parents and then one for me and due to our different time horizons and different balances I manage those differently in conjunction with the *Pro* portfolio. For example, because my time horizon is a little longer I tend to not do the hedges in my accounts like I would in my parents' accounts where they, if there is a big drop, they don't have necessarily the time potentially to recover that I would as to having a longer time horizon but I just love analyzing businesses and I'm actually -- the stock picks themselves are kind of secondary to me in the *Pro* service. I think that's OK to say since …

Fischer: That's OK!

Phil: I heard Jeff say. I'm more here for the philosophy, developing the right mentality, forming a portfolio, how to look at businesses to identify the right types of businesses, how to come up with a thesis for a business and apply the right financial tools to that business that fit, And we've seen a lot of different types of businesses from a 3D Systems which is more the high growth, high flyer, to an Intel which is more the steady performer, the leader, that's been around for a while and you apply different strategies and different circumstances so I appreciate learning about the philosophy and how that works.

Fischer: Thank you Phil, we'll go to Lon.

Lon: OK, my situation is a little complicated so a year ago I started moving things into the *Pro* portfolio along the way learning not just from Jeff and Brian and Billy and Jim for options but also paying attention to other community members and tip of the hat to, I don't know how to pronounce, Aleax, but the comments there about debentures and I've started building that into my portfolio. And I'm getting to the point where I've got a goal in terms of percentage allocations between *Pro*, *Options*, debentures and what I'm just calling speculative which is really old stuff that I haven't bothered to liquidate yet or I'm in the process of doing very slowly perhaps because I like it too much for one reason or another or because the timing's been wrong and I'm waiting for it to reach prices that I like.

And then I had told the tale on the boards, which unfortunately is entirely true of George and Martha, George is one of my siblings, oops! And I'm now managing George and Martha's account as of about a month and a half ago and now I need to start shifting them as well. So it's a very slow process. The goal is kind of the same but it is a journey and I'm very grateful for the amount that I'm learning because the last thing that I wanted to do is a knee jerk, OK, let's just sell everything and get it all in *Pro*. That's got to be a losing proposition, it's got to be done carefully and that's a lot of work that I'm learning.

Fischer: John?

John: OK. Well, I guess first of all I'd have to say that I have followed Jeff for a long time back when he was originally on The Motley Fool when he moved to run, along with Tom Jacobs, the Complete Growth Investor, and then when he came back to The Motley Fool I followed him back. I really appreciate what I have learned from Jeff about using options and if there's one thing that I think people should take away from maybe this conference is that I have to say that using options wisely as part of your investment strategy can really make an enormous difference to your returns. And I don't know how many of you have come across my posts on The Motley Fool -- I do a lot of tracking of my options portfolio performance, my regular portfolio performance so you can find it mostly on *Stock Advisor* but I also do post things on *Pro* or I've done that recently updating where things are.

I don't follow all of the Pro portfolio although I do have a number of the picks. For example, I do own American Tower. I have other of the picks that I probably owned before Pro did like **Apple**. I tend to be a story stock person so my big investments have been Apple, **Netflix**, **Tesla**, currently **Solo** (unclear 21:13) so a little different from some of the type of picks that are in Pro which I think are probably a lot safer and more conservative.

Fischer: Thank you John and Ned?

Ned: How's everybody doing? See, I came to The Motley Fool I guess early 2000 through some of the free content online and I think it was 2003 I signed up for *Stock Advisor*. When *MDP* came out I signed up for that and I think it was *Pro* not too shortly after that, I signed up for *Pro*. I signed up for *Pro* because I wanted to learn about options. I had heard about puts and calls, I had no idea what they were and I don't like not knowing about stuff so I figured this might be a good chance to learn and after, I'm going to say, a year or two I kind of realized *Pro* might be all that I need so in my mind I made a plan to start just kind of transitioning the things I had bought in *MDP*, *Stock Advisor* and some older positions I had owned and just move towards the *Pro* portfolio, I would say, all the while learning about options and I'd say I'm about 75% aligned with *Pro*. I still have some older positions, companies that I like and believe in that some day that may change but I'll hold them until that story changes.

I think *Pro* I just, when it comes to options especially, is an amazing service the way they teach options. I don't think you're going to get that kind of delivery in other services anywhere. I mean, the fact that they don't talk about the Greeks and certain things like that, I mean, it's there if you need it but they really … For a guy like me in layman's terms they make it understandable and it's been a big benefit and it's fun. I mean, its entertainment for me too; I just enjoy it and I like going to the boards and seeing what people have to say, getting my questions answered and I might come to a board two weeks after the last post and just read it then and make a post, say, sorry I'm late guys but here's what I've got to say. So it's been great.

Fischer: Thank you Ned, thank you, all of you, we appreciate those kind words as well. I'll just touch on options for a minute and we'll open it up to more questions too. So, John, you mentioned how options have really changed your financial situation. Can you share your favorite strategy and then anyone else here who uses options please just share your one favorite strategy?

John: I would have to say my favorite strategy is writing puts for income. I've been doing that since 2005 and I do that every year with the aim of trying to improve my portfolio returns by about 20%. I don't always get to the 20% but I've done 10 to 12% or above every year since 2005.

Fischer: And John has posted that on various sites. And writing puts for those who don't know is selling a put option into the market, you are agreeing to buy a stock at a set price, typically a lower price so say a stock is 25 you would be happy to buy it at 22. You'll sell a 22 strike price put option, you're agreeing to buy the stock at 22 and you're paid for that agreement. If the stock doesn't decline to your price by the expiration, the option expires, you've made that income, you can do it again. It's also the strategy I've used most since 2000 by far because it's a simple -- it's very similar to setting a limit order on a stock that you want to buy at a price that you want to buy, except getting paid while you wait to see if it hits that price, and it's a great income strategy.

More, John?

John: Well, I also have used covered calls occasionally. I don't like them so much. I used them at the very beginning and I think they're -- in some ways they're a deceptively safe strategy for beginners, but too many times you end up losing a lot of the upside of the underlying stock, so nowadays I only really use covered calls if my intention is to be ready to sell the stock, I'm just seeing if I can get a little more from the sale.

I do use some other things. I've used spreads occasionally, the bull call spreads. I've used synthetic longs occasionally and occasionally I just outright buy long calls and every once in a while … One of the things about options is apart from the long-term investing strategy it probably satisfies the gambling need. So occasionally I'll buy like I have some calls on Tesla right now that expire in two or three weeks that if Tesla stock performs particularly well it will run up to earnings, minimally I expect those to double and possibly do much better than that but it's a small enough amount of money that if I lose it, it doesn't matter.

Fischer: That's a great point too about options kind of scratching the itch for short-term returns. I think all of us do desire short-term returns, I'm not ashamed to admit that, and by writing put options you can generate income most months very steadily and meanwhile the good benefit of that is you're not touching your stocks because you're taking care of that desire for a return next month with an option which is made for that and you let your stocks be.

OK, Lon?

Lon: It's interesting because about half a year ago I would have had one of those answers that covered calls or the puts and the thing -- but I'm not a gambler. I mean, I've never bought a lottery ticket in my life and I won't. I'm a math geek and I know the odds. I've read the statistics, I understand what's going on and I love it when people buy lottery tickets because they offset my property taxes, please buy lots of them, but I'm not going to.

So, the gambling thing is not for me. I'm also, and even more so lately, terrified of margin. It's not that I don't have margin, I believe it's a tool, but it's a tool that has to be managed very carefully and, again, I've recently dealt with George and Martha who could have financed their first daughter's college which starts this fall in what they paid to a certain brokerage in a margin loan that they didn't know they had.

So I have a very strong bias there. So my favorite option strategy, I'm really getting to answer your question, at this point because I like the idea of leverage but I don't like the idea of margin I'm really becoming fond of diagonal calls.

Fischer: Jim Gillies is applauding there!

Phil: I've mostly written puts as well though I really found the back ratio spreads that we've done for hedging was a new concept for me that if the market continued its tear upward, which at the times that we wrote it, it did, that it wouldn't drag returns but that you had a bit of a cushion to give you some cash for if some other investments got to more attractive prices. I thought that was a really effective strategy that I hadn't thought of before and in some of the low volatility that we've had over the last year or so I've done some synthetic longs and used a bit of leverage to my benefit. We did some purchase calls, I know, with Facebook in *Pro*, I did that as well. I did the same in Google and making sure that they were good allocations that if it dropped below, in terms of the written call, that it wouldn't take too much of my portfolio. But I'm using leverage in that way expecting that in a higher volatility market that the time value amounts would be larger.

Fischer: Thank you Phil! Jeff?

Man: Jeff, we've got a question back here.

Fischer: All right and then we'll go to Ned.

Jeff: Just along the lines of how you take care of your accounting for -- let's say you write a put and it expires or you get assigned, same with a call, how you keep track of the cost basis or do you keep track? Do you just carry it as cash or do you somehow affect the cost basis of that stock because I don't think the scorecard thing doesn't really aid in that other than to just the purchase price and the sale price kind of thing. Does that make sense, that question?

Fischer: It does make sense, do you mean for the *Pro* portfolio or personally?

Jeff: Well, these guys are all doing …

Fischer: For themselves, how do they keep track of it? OK, great.

Ned: I can kind of tell you how I do it, I can't guarantee you it's right, maybe somebody will tell me if I'm doing it wrong. I have a -- yeah, auditors close your ears. I have a three-ring notebook about three inches with tabs in it that I have for each of my positions and when I opened one five years ago I put the date and wrote what I was thinking and my cost basis if I bought it then or if I wrote a put, which I write puts a lot probably my main thing, I write what I collected for it and I just kind of carried down the right-hand tab of those pages, every time I collect some income from a put, you know, I note that that was a credit. If I end up getting assigned shares I deduct that from the cost of the stock at that time and from the strike and then if I write more puts I continue to just carry that down.

You know, tax accounting and all of that stuff, it doesn't really matter it just encourages me in my mind and reminds me that if someday I write a call on it and it gets called away what really all the income I've collected against it and what my theoretical cost basis was and it can be encouraging when you think maybe things didn't go as good because the stock came back down after going up. You realized well, man, look at all of this income I've got writing puts or calls or whatever so that's the way I do it.

Fischer: I use -- TD Ameritrade has a very good gains tracker, Gains Keeper I think they call it. Year by year they list it out, you can sort it by ticker, by strategy and it keeps, clearly, an accurate count of your gains and losses. When you do sell a put option, when you get the shares, when you get to buy the shares you deduct that single put option, what it paid you, and that lowers your cost basis for simple record keeping.

Yes?

Audience Member: So I want to -- I do something similar to Ned but I then keep a second spreadsheet which my CPA told me how to set it up so he can handle it and it's totally different because it does not track, it does not keep it going other than if I sell a put that is then assigned, where I'm assigned the shares, that does offset the cost basis according to what my CPA told me what to do. I'm not telling you what to do, I am suggesting that if you have a tax advisor make sure that you keep track of it in the format that they like.

Fischer: All right, so here is an unfair question and you don't have to answer because it's personal but after this morning if you know offhand do you care to share the exposure of your portfolio, how allocated are you overall and how do you think about the flexibility of your portfolio?

Phil: Different for the two, well the one for my parents is less, it has a lower exposure and I think one of the harder things with doing options right is measuring your portfolio allocations and your exposure. One you start adding options I use a pretty extensive spreadsheet in Google Docs to do that that I've created. I don't know if it would make sense to anybody else but it does to me to look at that but my parents' account it is 75% long. I have the hedge on IWM that was recently released, is that what you're asking, market exposure?

Fischer: Yep, yeah.

Phil: Whereas my account is much more -- it depends on how you look at it. I look at some other things. I look at Delta exposure for my -- meaning the expected change for as the market changes the expected change in price for each position in my portfolio based on where the strike is relative to car pricing, etc., to the underlying. But all of that to say I'm much longer in my account, I'm more like 90% long and I don't have a hedge but I do have some covered positions that are hedged out essentially because the current price is above where my covered call strike is. So they have a ways to come down in some cases. So I have a little bit of a built-in hedge there.

Lon: So I have two answers also. I've got about 70% in my personal stuff long and another, I'm guessing because I'd have to really look, probably about 18% short and about 30% cash for George and Martha who I'm now managing. They are down to about 98% long and up to about 1% short as they're selling covered calls to slowly liquidate certain positions.

John: Yeah, I guess I'm probably in my non-retirement account I'm about 85% in the market and the rest is basically cash. At the moment I don't have any other hedges except for various options that give some hedging. I did my retirement account probably like 95% in the market I would say.

Fischer: And are you guys all comfortable with where you are?

Ned: I'm pretty closely aligned with *Pro*, probably 70% long. I want to say I have about 25% in cash right now and I have a few written puts. I'm just starting to write some deeper in the money calls like on Coke which was a recommendation. I converted some of my Netflix to some in the money leaps. So you know, pretty closely aligned with *Pro*. I don't have the hedges because I have the cash but just coming back to how you use *Pro*, I mean, I wouldn't even have known how to think about all of those kinds of things if they hadn't outlined it for me in terms of if you have this much cash maybe you don't need to participate in this hedge. If you're this long maybe you need to consider a hedge and now I have all of that kind of thinking that goes in. I have a spreadsheet like these guys do that I try to track all of that. It's not really easy, it's not automatic. I mean, you have to think about, well, I'm in the money on -- I've got some deep in the money calls on this, I'm getting some leverage and it gets a little tricky but I don't worry about making sure it's to the half a percent, I just get it close. So I basically feel comfortable. I hope the market goes down to be hones with you so we get some good opportunities. I mean, it's just been up and up and up, it's kind of depressing in a weird sort of way.

Fischer: It has, the anguish of things continuing to rise, there's a certain anxiety to that too, it doesn't feel quite right. Well, thank you for answering the reason I asked is it's a small group but it's a much respected group and, yes, maybe it's a biased group given that we're all in *Pro* but it's interesting that you're all in the 70 to 80%-ish exposure range on your portfolio and I've just found that over the years to be a comfortable measure for most markets as well. So it's good to hear, I know many people who are 120% invested and they're usually new investors.

So a quick round of if you have any single tip or secret or advise for how to use *Pro* or the Fool at large, something that you have found over the years to work well for you or to benefit you in any way?

Man: I actually made a list of some things but …

Fischer: Great!

Ned: I don't know that they're in any particular order but I think learning how to use options if you're considering joining the services you'll really like it, it's not that hard. I would say take your time, don't be in a hurry. I've been doing it for five years and I still feel like I'm just beginning to learn what to do. I think *Pro* -- after being in The Motley Fool, not certainly checking out all of them but *Pro*, the way they deliver the message and incorporate it into kind of the whole approach to living is just outstanding. It's amazing to me and I think it's something that everybody should experience. It's pretty cool and see if I have anything else here.

I mean, I use it to help me think about risk and asset allocation. That's probably one of the biggest things that I didn't get anywhere else that's real important. Of course I do use *Pro* to find companies to invest in and to help me think about how to think about owning a company. That's something that changed, I think, as I started to listen to *Pro* and think about what it means to own a company to believe in the story, who their customers are, all those details. I mean, it's the whole soup to nuts thing.

Fischer: Thank you Ned.

John: Yeah, I think probably the biggest thing that I would say, which Jeff has already said I guess but just to re-emphasize it; if you haven't been online or don't go online and actually spend time reading the boards you really should do it.

I think that the *Pro* boards and the boards for the other services, I subscribe to most of them, they're just a phenomenal resource, there is some incredibly knowledgeable and experienced investors out there and apart from what you learned from Jeff and his team you can learn an incredible amount from the other people that are posting on the boards.

Man: My number one tip would be to just repeat what John said. Read the messages on the discussion boards and I have taken to reading almost every message that's posted now and my purpose is not to jump in as often as I can but I'm learning a lot often from the banter back and forth of, well, what do you all think of this? Well, I think that's a bad idea because of this. Well, what about this? Those discussions are fascinating and there's a lot of, pardon me to use a phrase from a different service, there are a lot of hidden gems in there, a lot of wisdom that's not where you always expect it to be.

The other single one which is the only frustration I have with the discussion boards that I would mention is don't panic!

Man: And prices do move after alerts come out. Expect it! No. Just a little bit of a clarification there for some of you that might be sitting out there thinking that you might not have time. There's massive amounts of great educational content on there but it's not forced content, right? Whatever amount of time you have, you can do different things to customize it that maybe one week you don't have as much time so maybe there are certain people that you want to make sure that their board posts, that you make sure that you see. So you can favor an individual that may be, that week, if you don't have time to go through all of that maybe you just go into the boards in the community area, you can actually look at your favorites and it's a list of posts by different people that you can follow and so maybe one week you only have time for that or maybe as you get more time you go more into some of the different one-pagers on options and then you go into the message board if you have more time and post some questions that you come up with.

So the beauty is that you can do it to whatever extent or level are just. There are some of you that are going to come to *Pro* and say, these guys are phenomenal investors, they've got great educational content but frankly I don't have the time to do any of this so I'm just going to make my portfolio look exactly like theirs and put it on autopilot and for some of you that's what's great for *Pro*. Then there are others of us, most of the people sitting up here, that we love this. This is our hobby and I listen to conference calls in the shower, literally, of businesses. I have a Bluetooth wireless speaker and I listen to conference calls while I shower regularly and I love it.

Fischer: You just raised the bar! That's just …

Man: And while I mow the lawn and my wife loves *Pro* because it saves her from listening to all of my blabbering about all of these businesses and all the stuff that I learn about them. So some of us will delve in deeper, we'll read everything that's on there that we can get our hands on and so you can kind of adjust it to what works for you. Some of you will want to take a more active role, some of you won't and that's great because it's not forced, nothings forced on you but you have a great community backing you up and if for nothing else than when those times hit to be able to see other people to have that temperament when you're in that risk panic mode to see other people reinforcing those values and the philosophy so that you've thought of it before that happens. If you think it through and you have a plan for when it happens then when it happens it's much easier to follow through on things rather than to do the impulsive actions that usually are really bad decisions.

So I guess that's what I would …

Fischer: Great answers all of you, thank you. I was listening so intently I don't have a question lined up next. Does anybody in the audience have a question? Yes?

Audience Member: Diagonal calls, what kind of characteristics (unclear)?

Fischer: Jim will be up here soon.

Audience Member: And what kind of timeline? I mean, you're looking at when it's dropping down, going up, earnings …

Lon: The answer to the question on diagonal calls is best going to be given during the next segment when Jim Gillies is up here. When I say I love diagonal calls, I don't say I love them because I know how to plot them out and choose them myself, I know how to follow excellent advice from Jim.

Audience Member: There's a monthly memo where he lays out the characteristics though. Weekly memo, excuse me. There's a weekly options memo.

Lon: Options Weekly.

Audience Member: Yeah.

Audience Member: Just a quick one, most of my money is in IRA, mine and my wife's but we can't do shorts. What we can -- I have a small brokerage account and I have a couple of shorts in it that you've recommended over the years but you mentioned that you might be doing more shorts since things are getting pretty serious it looks like in the middle of the year but if that's the case then I've got it in my brokerage account, I've got to sell some of those stocks so I can have more money free. Are we going to do that where we have more shorts?

Fischer: That's a great question and in a traditional -- in a margin account, of course, shorts are easy to set up and beneficial because you don't have to sell anything to short. In an IRA though, of course you can't short but we will, wherever we can, offer an alterative and it could be a bear call spread or a bear put spread, something that you have limited risk and a pretty good reward the way that we'll set it up. So we are very IRA conscious and we'll always put in an alternative where we can but I don't … We were talking during lunch and I don't know if we'll sell anything as we move our way to shorting more and that's one great thing about a portfolio, of course, it evolves over time. You have a plan but then it evolves on it's own as you follow valuations.

Some of your businesses may become priced such that you do sell and meanwhile you're adding shorts at the same time and your exposure can change pretty quickly and steadily just by taking what you see the market giving you and implementing it.

So we may not sit here and say, oh, we're 70%, 80% long now and we want to be 60% long by the summer but that may just happen naturally as the prices seem to dictate so we'll see but we'll always try to offer alternatives for IRAs.

Do any of you use IRAs within *Pro*? All of you. We've seen, again, from our great surveys which may be better than I give them credit for, a majority of members are investing at least some of their money with *Pro* in an IRA so it's high on our radar to offer alternatives and make that work. Good question!

Audience Member: I like the writing put philosophy but my concern is if we have a major downturn all of the sudden I own a bunch more stock and I have a bunch less cash. So I've kind of minimized that. You talk about whether that's a correct approach to minimize the number of written puts?

Fischer: John, do you want to talk about that?

John: I mean, as I said, I've been selling puts since 2005 so basically I've sold them through the 2007, 2009 downturn although what actually happened was that as the market conditions deteriorated I pretty much eliminated put selling. If a market is obviously falling apart it doesn't make sense to sell anymore. So I didn't really experience too much portfolio damage from it I would say.

There was a period, I think it was almost, I know I wrote that up, I think it was almost two years or a year and a half that I didn't write any puts.

Fischer: It's great to hear that. That was my experience too and it was in CGI as well, the former service where we just stopped writing puts as things seemed to get rocky. So the key then is to never be too exposed, we're back to exposure, at any one time and if you're always in that position then you can just let up and still have room to maneuver. If you're always, you know, over exposed when it hits there's nothing you can do. So yeah, the answer is to write puts in a reasonable amount and as John has done for so long, his numbers also add up to what I've found over the past 14 years now, 13 years, 10, 12% a year you can make with this sort of strategy with reasonable risk.

I have mostly written puts on things like large caps really. That has some volatility but for the most part mid to large caps and we have time for, it looks like, one more question. Yes? Two more questions.

Audience Member: I guess this is for the panel, as you've become more comfortable with option strategies have you started doing your own options trades not based on what they come up with but just what you find interesting?

John: Somebody asked me that on the boards the other day. I think basically personally I have been doing mostly my own options trades for a long time. I mean, I learned and understood the basic ideas from Jeff and I was able to apply them to stocks that I was interested in. I will say though that I do follow though quite a number of The Motley Fool options specific trades, for example, diagonals which I only really -- I guess the light bulb went off on those last year and I've been following those now. So there are some official recommendations that I do but most of my options trades are just my own.

Fischer: That's a great point too, you can start with just one strategy and just do that one simple strategy for years, that's all I did and mostly all I still do.

Man: I'll just add briefly that, yeah, I use options with a lot of my holdings that are not in *Pro* and were never in *Pro* so I think once you become comfortable particularly with writing puts, maybe covered calls, buying some deep in the money leaps or something, when that's appropriate you think you'd kind of understand that, yeah, you'll be able to do that with other companies.

Lon: I'll add that there are a couple of strategies where it's very, very safe to jump into the options on your own. So if you have a stock you're looking to sell and you don't think it's going to be going down, right covered calls to liquidate it where you're going to end up making a little more money than you could at today's price plus getting the premium on top of it; icing on the cake so to speak.

Similarly there's a stock that you really want to buy, it doesn't happen to be in *Pro*, there are some other good stocks occasionally and if you're convinced it's a good one puts may be a good way to have -- and this is the way that I look at anything I try to choose for myself with options, I only do it if I think there's a win/win situation. I'm going to win because I get the premium and darn I don't get the stock or I'm going to win because I get the stock and I wanted to get the stock. If I have a win/lose thing I don't want to go there.

I don't like gambling. I want my choice of winning scenarios.

Phil: Yeah, I use options on some of my own, in fact, I have written put on National Oilwell Varco right now. So we'll hear from the CEO so I definitely have quite a bit over the last few years. I actually was an undercover *Pro* member for the first couple of years and then my dad joined later and then I took over his account. So I actually only have a gap of maybe a year but they didn't know that because of the different name that it was under before.

Fischer: Sneaky, yeah!

Phil: Which is why I went by my dad's name for like the first year that I was on here again even like signing his name on the boards. I was like, this is ridiculous. I've got to change this. So it was a confusing email chain with Jeff and I where he's like Chuck, Phil …

Fischer: I remember that now. Anyway, glad it just sorted out for me right now.

Phil: How well that happens.

Fischer: One more question we have time for?

Audience Member: Yes, I just want to know whether you have any special recommendations for Roth IRA?

Fischer: For Roth IRA, any special recommendations? Are any of you using a Roth IRA?

Lon: I'm using a Roth, I use it -- let me say this, different brokerages treat IRAs differently. The federal law has what Jeff was talking about before, there's specific limitations on any retirement account where you cannot short. You cannot end up in a situation where there's a margin loan because there's no margin available in a retirement account. But then brokerages may set tighter rules. So I had been with one brokerage I ended up changing because I was only allowed covered calls in my Roth and while that was a good start because that's all I did for a little while but I wanted to be able to do more and many brokerages allow more flexibility; there are a lot of complicated reasons to check out what potential brokerage you move to very carefully, all the fees, all of what's allowed, the trading platforms, etc., but you should be able to do most other things there and I'm going to go back to one other thing, make sure if you are adding to a retirement account, etc., you're checking with your tax advisor and making sure everything is okay and the IRS doesn't get upset.

Man: I do income trades more in the IRA, Roth IRA and I do more leverage things like a synthetic loan doesn't make much sense in an IRA because it's cash secured anyway, the cash is held aside for the put part of that anyway so it's equivalent of owning the shares or the diagonals and things like that. So things where I'm intentionally trying to use leverage I'll use a regular brokerage account and I'll use the IRA for more income generation, strategies, writing puts and things like that for tax purposes.

Lon: Diagonal calls also.

Man: Yeah, that's true.

Man: So I guess it depends because you are writing on those as well, that's true.

Fischer: Well, Phil, Lon, Ned, John thank you so much! We owe you all a great amount of gratitude and all of you, when you're on the boards, look for these guys, they're very helpful, very Foolish and we just really appreciate that you're here and that you've participated today and on the boards all the time. Thank you very much!

Make the Most of *Pro*: Jim Gillies on Using *Options* Alongside *Pro*

Jim Gillies: Thank you, I'm happy to report, or perhaps you'll be happy to hear, I have nothing original to say. I think I've heard pretty much every point that I was going to make in here so are there any questions?

Can we have the next slide or I've got the clicker here I guess. Good, OK. You've probably seen this, I didn't realize how close I was to the edge, I'm going to fall off at some point, anytime I've ever done any kind of options presentation with a Foolish audience or an audience that I'm hoping are going to become a Foolish audience I always kind of start off with our seven rules of using options Foolishly so you've probably seen this. I hope you've seen this, it's on the Web site, this is how Jeff and I do approach a service and manage the service we have different approaches very much; apparently I like diagonals, apparently Jeff likes written puts but the principals underlying everything are the same and the last couple of, we'll say month and a half or so, I've really – if you've read today's *Motley Fool Options* weekly column, I kind of touch a little bit on this.

The first two principals are really kind of, I think, need reminding and people need reminding of these. So the markets been kind of nasty the last month since we had a great 2013 and now people -- how far has the market fallen in 2014 so far?

It's actually below five. It's below five given the strength the last two days. I mean, this is nothing. I think Morgan Hauser wrote a great article where he basically cited the statistic, the market has fallen on average 10% or more every 11 months for a century so we've had an unfortunate month but sometimes people get a little bit angsty and it doesn't help in the options world, I mean options are averaging instruments so a 5% market move might be a 15, 20, 25% option move and if you're doing pure leverage with a synthetic long it might get – you can get a little bit anxious but we are really pushing the first two principals here and we're very much thinking long-term and the topic of today's weekly was the fact that you should always have a planed weekly where we talk about our positions that are expiring every month and how a company, Blue Nile, which has been in the service for two years had a very bad day yesterday and yet it's been in the service for two years, the valuation approach has not changed, we have been writing puts on it, we've never put a dime out, we've pulled in $13 or $14 I think and we're just going to continue doing it and I would be happy if that company, which I'm not thrilled about the company but I actually love their option premiums if we could just keep it in there for another ten years but we are very much going to – what do we think a stock is worth first of all and we have different approaches to that and then always keep in mind that the long-term approach when we're using even the short-term strategies and for our purposes, all our strategies are short-term including diagonals which last two years, for example. We'll get to the diagonal question in a minute.

But, you know, so because this is really *Pro*'s show and I'm just a guest here I have an opinion on *Pro*, it's a complementary opinion on *Pro*, as individual investors we do have Peter Lynch talked about how we have advantage and Buffett has talked about how we have advantages and our advantages are the fact that we are able to sit quietly and do nothing when everyone else is panicking or you somehow think you need to do something, you've got that itch! I've got to do something! And I think Buffett's famous quote from 1999 basically IQ and investing, once you hit a certain level you're fine. You don't need a higher IQ, we don't need the math wizards of Wall Street who invented the collateralized debt obligation, have much higher IQs than me and tried to blow up the Western world.

Basically it is our temperament and in my opinion, apologizes to Tom and the Everlasting Portfolio, in my opinion *Pro* does the best job of teaching temperament around The Motley Fool. I like the long/short aspect, I know, I know, I was just fired folks. But, no, from …

Audience Member: (Unclear).

Jim Gillies: From a temperament point -- I like the five-year hold in there believe me. No, but I think for my money, and I do follow some like yourselves, I don't follow religiously everything in *Pro* but I have a few shall we say *Pro* holdings that are in my portfolio because my good friends Jeff and Bryan said do this, great, fantastic!

That you are able to teach the temperament and to teach people you're never too high when the markets going euphoric, you're never too low when the market's falling down. We're always looking for opportunity and I think that's a good message to send and I think that that's the proper message to send because as we've seen over the past five years the proclivities towards greed and fear are very strong. People forgot 2008 pretty fast but -- and that's kind of what I've talked to people before, well, the subject is everyone thinks they have the temperament to invest in 2013. Absolutely everyone, absolutely I have the temperament!

How was your temperament in 2008? And a good friend of the long-term Fool, Bill Mann once told me he says, you know, if you're not basically puking when you hit the buy button you're paying to much and so I'm like, okay, okay I like that!

But the -- it's sometimes a lesson that we have to learn the hard way and that's where I -- I've already quoted Buffett's, I'll pull out my favorite Charlie Munger quote, which is man is too soon old and too long stupid. It takes some of us a little while to learn and there is a column in The Motley Fool weekly archive that talks about my early forays into options and the best that can be said is thank goodness I wasn't too long stupid.

But there are, again, proclivities towards greed and options are a great vehicle for putting greed into action and that might not be the best thing.

So because I'm occasionally accused of being mathematical I felt the need to throw a formula up there but, no, using options alongside *Pro*, I mean, you've heard it before; Jeff has said it, Bryan said it, we are a complement. We are an a la carte idea service, they are additive. It doesn't take away from the long-term investing and long-term thesis that is *Pro*.

So basically the simplest thing is -- if everyone is religiously following only *Pro* no one is playing with Motley Fool One Everlasting Portfolio or *Hidden Gems* or *MDP* or what have you, that formula. *Special Ops*! Don't tell Tom this, one of my largest personal holdings is a *Special Ops* company. Shh …

FFNW for anyone who wants a real good read that is outstanding. Anyway, and that's all Tom and Jim Royal's fault, not mine.

Anyway so where was I going with that. So basically if you are just playing in the *Pro* and *Options* pool I would suggest that, you know, ring fence your portfolio to the extent that you're playing with at least 80% *Pro* money and then play over with the remainder in options; some from Jeff, some from myself because even though we do have very different, or even though we use the same rules and guidance for the service, we have very different approaches. You'll never see Jeff do a broken wing condor I don't think. But, by the way, did everyone find out what the -- you saw the broken wing condor trade right? Did you find out what the alternate name was? I didn't know this and I'm like -- I was crying I didn't know this; Billy?

Billy Kiperstock: Jade lizard.

Jim Gillies: So when you see a jade lizard come out because you know it's going to come like it's going to come, absolutely, but Jeff and I have very different styles but the same operating principals and I think they work well and I think they're complementary in and of themselves but essentially then you have to -- and there's no right answer for how much money you should have in only *Pro* versus *Options*. What are you backstopping your *Options* side thing with? Are you backstopping it with just pure cash, maybe that's not bad, you can increase your holdings. Are you backstopping it with shares that you've held long-term in say Starbucks that when the market correction comes and everything falls and all of your puts come due and you have to sell some stock to buy something else and so now you sell your Starbucks stock which is down 30% as well but you've still got a big capital gain so you're paying a big tax bill in addition to taking a large hit on your options.

Unfortunately there's no real good answer for everyone. The other thing is, and this was mentioned earlier, are you tracking your look through exposure? Are you tracking your written puts? Do you know how much you have, do you know how much you are particularly on the hook for if things go pear-shaped? Because if you're not may I encourage you strongly to start because 2008 shows up and like John Sergeant, like Jeff, I don't think I sold a put between February of 2008 and maybe June of 2009. Like things were getting bad enough that you kind of stop and let what you have roll off but still there are days. Blue Nile yesterday got waffled on earnings and we have a put expiring in two weeks and so there's at least one member who, this morning, was assigned already.

So, from the posts that went up, the person might not have had the cash or wasn't expecting to own those shares, we'll put it that way.

And then what is your evaluation basis for anything that you do? And, again, going back tying back to our first principal, valuation first which is like 90%, 90% of our work is on the business and the valuation and everything, 5 or 10% is on options.

Are you -- do you have your idea of what something is worth and why you think its worth? That's almost as important because you ask me what a stock is worth. What do you want it to be worth? I can make you a model that will give you any number you want. So the issue isn't the quality of the model, the issue is what are the quality of the assumptions that go into the model and realize that there are certain stocks that are frankly too hard to model. If you want a precise number for Netflix look elsewhere. It depends on what the subscriber growth rate is. Well, what's the subscriber growth rate going to be? I don't know! There's a whole range and we've got a model, I borrowed it from Jim Mueller, TMFGebinr. I can give you any number that you want from 50 to 500, well that's a useless model!

So know why you think something is worth what you think it's worth and that valuation, that understanding of valuation will give you an additional margin of safety for your option work because the number one thing that we want you to do with options is complement to Pro is know what risk you have, know what your exposure is. So in the event of the black swan or at least mildly grey swan that you won't panic and get all upset.

So that's my whole three slides but someone asked about diagonals so you get one more quick one for free before we -- are we going to break first and then a panel? OK.

Diagonals; great strategy, love the strategy. I have two minutes, I can do that. Basically there is an options weekly that you can look up, it is dated June 14, 2013, but everyone understands what a diagonal is. A diagonal is the purchase of a long-term in the money call option as long as you can get. So right now you'd be going to 2016 leaps and then you sell -- and that's a buy to open. And then you sell to open a near-term, say three months out, out of the money, higher strike call against it. It's very much like a covered call except instead of buying stock you are buying a long dated deep in the money call option.

And what this does, this allows you to lever up the returns that can be achieved with a covered call. So if you're going to do a covered call on Berkshire Hathaway, you know, big bloated and massive but excellent maybe that gives you 5% a quarter, maybe, that the equivalent diagonal would give you maybe 10 to 15% a quarter. So it allows you to lever up your potential ROI but there are certain criteria that you want to look for, in my opinion, you don't -- anyone who say had a diagonal on 3D Systems going into this week learned a lesson they could learn no other way this week.

So basically you want to kind of have a certain target. My criteria that I generally use, big profitable industry groups, consumer staples, healthcare materials, industrials. I would advocate avoiding banks, that you can go off message on that but that tends to be my one thing. You want a big company. You want an ocean liner, you don't want a speed boat so start your bidding at $25 billion or more which, again, would disqualify 3D Systems. You want a company that's not going to run into any leverage problems so, again, banks. So debt to capital below 50% please. You want a history of strong returns on equity. You want Walmart you don't want Tesla. I love Tesla but you don't want Tesla.

Ideally 12% year-in-year-out for a long period of time. You want an equally strong history of free cash flow and earnings growth in generation and finally you want to have a valuation model where it's trading at or below fair value because you would much prefer that the stock runs away from you and you have to close early for a profit then the stock drops 10 or 15% because you started with an overvalued target and it ruins your long-term owned (call).

So, with all of that said, Anne already shot me a negative sign, so we can I guess adjourn for five minutes and come back for a panel? Groovy, thank you!

Jeff on Portfolio Construction With a *Pro* Blueprint

Ellen Bowman: I am Ellen Bowman, I am the editor, publisher, general cook, bottle washer for *Pro* and *Options*, and I am here to take your questions for these gentlemen and help to make sure that they answer them in the time we have allotted, which, I am holding my phone because we have a hard stop.

Sir?

Audience Member: I have a question for Jim, Jim are you still a seller of puts or are you just kind of holding fast?

Jim Gillies: It depends on the put.

Ellen Bowman: They must have heard you.

Jim Gillies: Yes, yes, I'm a seller of puts.

Audience Member: Still even with the …

Jim Gillies: It depends on the company. I am not a seller of puts in say Green Mountain Coffee Roasters. I am a seller of puts in Barnes & Noble. There are two psychoses implicit in that one statement.

Ellen Bowman: I have a couple of starter questions here that I can start with but if anyone has something to say please -- hello!

Audience Member: Particularly for, I think Jim probably uses the most options, how do you track your portfolio allocations given -- I have trouble with it because I can look at it in a lot of different ways, right? You can look at the look through amount. You can look at your initial capital at risk, you can look at delta percentage …

Jim Gillies: Why do we have to talk about the Greeks?

Audience Member: Yeah, sorry. You can look at your actual dollar amount that's in each position and in a lot of cases you're going to come up with very different percentages of your investable money in each of those cases. Do you consider all of those things? How do you…

Jim Gillies: Yes!

Audience Member: OK! But I'm doing it like you.

Jim Gillies: Excel sheet, track your look through basis, compare against your valuation estimate because there's no perfect valuation. Again, I've already referenced Barnes & Noble so I'll do it again. Barnes & Noble at $14.00 assumes that two of the there divisions are worthless, one of those is a good assumption by the way. Two divisions are worthless and the third division bleeds it's free cash flow at 11% per year forever and ever amen. I think they'll do better so that's it; look through basis, valuation estimate, overall portfolio and Excel.

Bryan Hinmon: So this is an open call to all *Pro* and *Options* members, we realized that we, I don't want to say do a disservice by not providing that tool for you, but it's hard and it's imprecise and there are a lot of ways to do it. Everyone in this room does it in some way. We should all do a better job figuring out how to share that I think, so open call to everyone to share spreadsheets, no judgment, we will help you get your formulas correct and kindly point out when they're wrong and you will do the same for us but I think we should share them more.

Audience Member: I have a question, earlier today I think it was Jeff who was talking about some of the companies that have been selected by *Pro* and you briefly mentioned Sony as being a weak company. Am I remembering that right?

Jeff Fischer: Yes, we had shorted Sony in 2012 I believe and we closed it last year.

Audience Member: OK, so my question is the following. Since I was a little kid Sony's always been this great electronics firm and I haven't looked at the financials at all and so I guess there's something wrong. I'm wondering on what basis is Sony now a weak company in your mind?

Jeff Fischer: Sure, and this speaks so highly to, or so well to the perils of investing in tech where everything changes so quickly. Sony of course missed the boat from -- they used to have the Walkman which was everything for music and iPod just started to destroy it and on computers as well. They weren't into mobile in any timely fashion with phones or tablets. You know, like everybody, **Apple** took their market share there but mainly what's really hurting them is their TV business which used to be extremely profitable and it's just become unprofitable. TV's just became commoditized across the board. There's cheaper competition in Korea and that just hurt a lot of Japanese technology companies and so Sony just saw its profits -- it didn't have a sustainable moat and therefore its profits went south and it began losing money for a long time at the same time as being a highly leveraged business with a lot of debt.

So we shorted it, we made money on it while the market went up so that was one good example of a short working but they have a big turnaround plan in place. They're selling divisions left and right where they can to focus on their music and entertainment business and try to turn TVs around. So we don't have a position now either way.

Bryan Hinmon: I'm going to jump on top of that and just say that just like we look for companies to invest in that have those competitive advantages, a great place to look for shorts are the companies that don't. The most common competitive advantages are network effects, intangibles like a brand, cost advantages or switching costs for some reason.

If you look at Sony through that lens you might be able to -- or the common thinking is that they have a brand. It's true they have a brand but their brand doesn't allow them any premium pricing. So we looked at basically that rubric and said, hey, these are where competitive advantages are found. Sony has none of these, there's no reason that they should be able to earn reasonable profits going forward.

Ellen Bowman: Anybody?

Audience Member: I do a lot of selling of put options and I'm highly sensitive to earnings time. In fact, I've learned that the month before earnings time is often fraught with peril because at any point the CEO or CFO can come out talking about earnings before the actual public announced date. So I have this tendency to look at things from a perspective of if I have an expiration date, let's say in April, I'm already starting get out of that position anywhere from 30 to 60 days ahead of time and I also have a tendency to avoid having a position where it's expiring a couple of weeks after earnings. I never buy just before earnings. I'm just wondering what your commentary might be on worrying over earnings dates and company events in terms of thinking about when to get in and out of options?

Jim Gillies: A couple of things; you must learn to stop worrying and love the bomb basically. One of the things that -- first of all, if you're buying back your puts ahead of earnings what you're going to often see … So option prices are positively correlated with volatility premiums or volatility assumptions and what you're going to see in the vast majority of cases is volatility in an individual stock with actually rise ahead of earnings and then plunge immediately afterwards or am I going backwards? Canadian!

I'm going back to two feet of snow apparently on my front yard. So basically by buying back you are perhaps actually buying back at a premium that you don't need to be buying back at frankly. You're overpaying for something just because the market realizes the uncertainty, the same uncertainty that you're worried about.

So that's one thing and the other thing is what is your valuation because valuation is not going to change; valuation isn't stock price. The stock price might do whatever it's going to do after – again, Blue Nile yesterday is a perfect example. It was $43 on Monday, it was $34 yesterday. The valuation really hasn't changed much. Before this thing I thought it was kind of low to mid 30s, I still think it's low to mid 30s unless they actually are capable of growing larger than 5% a year which they have done in the past, maybe they'll do it.

So it really is just a case of just, you know, you must chill! I think I wrote today's weekly, you must chill out! Just don't worry about it. Sorry, that's mine.

Jeff Fischer: Thanks Jim, I'll add that personally a lot of the put options I sell or write are one month, and that doesn't play so well in a service, but personally one month and then it expires and then the month of earnings I typically don't write on companies that are reporting that month. You can find ones that report off months and then write on them. But this is just to be clear, put writing for income where if you get the shares you'll take them but that's not your main objective. So for income put writing I'm looking monthly and avoiding the earnings months.

Audience Member: This is kind of a follow-up question to both of you guys because I'm less experienced with options. I just started this year. Can you read into an increase in implied volatility prior to earnings and say, you know, the magnitude of the increase of the volatility is greater for this stock than it is for this stock so is this earnings report more risky than something else? Is that reasonable or feasible?

Jeff Fischer: This is the Greek known as Vega. No!

At some point yeah, it will just happen but it very much is the macro-theme of the market doesn't know what its earnings going to do so that's why it rises. It might not be worth any more than that analysis than to say, okay, its ahead of earnings and then, of course, after the earnings come out whether good or bad, the volatility and the option plunges typically too.

Bryan Hinmon: I'll let Jim answer that question, I'll just chime in on the first one. The more you worry up front, the less you have to worry on the back end. So if you worry about selecting the right stock and being very comfortable with the valuation the less you have to worry if and/or earnings quarter is bad or the market reacts poorly to what you think is a perfectly reasonable earnings score.

Ellen Bowman: Somebody over here? Here you are.

Audience Member: This question might be for Jeff but all of you are welcome to comment. This concerns WisdomTree Emerging Markets position, recognize that that was an initial position that I took when it was recommended. I wasn't able to successfully trade for the put where we were going to double the position. I recognized it's unlike a lot of small cap funds, it pays almost a 3% dividend which has been a wonderful thing. There's been so much attention with emerging market volatility for a variety of reasons. I know Jeff you've written about the cycle or the investment cycle for emerging markets lasting, you know, maybe five years or more and you need to be in for the full cycle. My question is, what is your thinking with where we go forward with that and to any folks that might not have been able to get in on the original put. It seems like now would be an opportunity but I guess I'm personally trying to figure out how to sync up a little bit more with *Pro* and what your latest thinking is on that.

Jeff Fischer: Great question. WisdomTree Emerging Markets is a dividend small cap fund that owns small caps that pay dividends in emerging markets. I bought myself some time there. The stock is a buy and we have written puts, as (Mark?) said to potentially buy more and we assume we'll take those shares and double our small position to around 3% so it starts to become a more meaningful position.

I like having it in the portfolio right now and I like that emerging markets are so out of favor and haven't gone up at all for a couple of years, so their valuations are more reasonable in a lot of ways, most measures, than ours in developed markets so you're getting an investment class that's very unpopular that's less expensive than the popular ones and that's generally where you want to go. That said, we don't know how soon emerging markets will start to recover or when the stocks will because the two may not go hand in hand. So I'm glad that we're starting small and I don't think we'll grow it beyond 3% anytime soon. It's -- to speak to something that David Gardner has often said, he likes to see some results before he adds more money so he'd rather pay up before adding more.

So we may wait to see some recovery or some good signs from the emerging markets and then maybe go a little beyond 3% but right now we're comfortable with our allocation and with that well-run ETF. It's done much better than most emerging market indexes.

Bryan Hinmon: Yeah, I think too if you look at the construction of that ETF you find that the companies in emerging markets, fragile markets, new markets, companies that are able to promise a dividend, tend to be of a different ilk than what you might think of for an emerging market stock and so this isn't the bleeding edge of frontier market stuff that we're talking about.

We can handle some bumps in the road. These companies can handle some bumps in the road and backstopping that if you look at the look through valuation on the companies inside of this ETF it's actually incredibly reasonable. So we're not all that concerned. It strikes me that people -- this is the risk (unclear) is the troubles in emerging markets. But if you look at the *Pro* core stocks and the amount of their revenue tied to emerging markets we can't forget that almost every company has identified emerging markets as a critical growth area going forward. No one is changing their mind on that. It's just going to be bumpy. We're okay with that!

Pablo: Hello, I have a portfolio which it's mirroring *Pro* so unfortunately I don't have that much money to have 100% of *Pro* in assets but I have like 20% of a real *Pro* portfolio and I'm mirroring exactly every move that you make and then the question is, if I have more money to throw in, how should I do it? Should I do it on the best buy first and then I will be totally unbalanced with *Pro*. Should I just write puts on every single stock that I want to increase my percentage on or should I buy – (unclear) which could be using less money to increase my whole *Pro* portfolio.

Ellen Bowman: Take it away!

Bryan Hinman: Well, the first question asked I think is what makes you most comfortable. The first place to look is at our exposure. I would, if you're trying to mirror the *Pro* portfolio the first thing that you should try and mirror is the exposure so don't worry about constituents but worry about matching the long and the cash or the short. So that's Step 1. Once you do that the place that we tell people to turn to is buy firsts. Look at the buy firsts first. If you're going to have allocations that are out of whack with what we have, we want your out of wackiness to be in the stuff that we feel the most strongly about at that moment. That's' an okay position to be in and realizing that being out of balance is sub-optimal in some ways that's sort of the best of the worst. And then you can march down form the buy firsts through the buys and get merged into the *Pro* portfolio over time.

Jeff Fischer: And I would say Pablo flew in from Madrid for this weekend so welcome! I'm going to tell the Fool really to make things easier for you, next year's event should be in Spain.

Ellen Bowman: Yes it should!

Jeff Fischer: Better weather, yes. And Hawaii, Hawaii would work as well. Anywhere warm. I lost my -- OK, so I like Bryan's answer. I would just say that if you -- I think you said you're following the *Pro* portfolio pretty exactly with his money so I would look to match up the allocations if your commissions are reasonable and anywhere that you're off at the time that you're investing your incremental capital, match it up so that you're matching what we own.

Ellen Bowman: Somebody else over here? I'll do you first and then the gentleman in the collard shirt right behind you.

Audience Member: Pacer, I have it to sell at $8.95 but I just wonder, I keep hearing a few things. It's still okay to hold on to it until it probably will go back up?

Jeff Fischer: Yeah, so the buy out offer is around $9.00 per share and so we, of course, want to get as close to that as we can on Pacer, P-A-C-E-R. It's done in the *Pro* port so don't go buy it. They're being bought out at $9.00 but we're trying to sell at $8.95 to get as close to that as possible. We're still talking about whether we'll take less, $8.90 just to get out and get everyone's capital freed up or if we're really going to hold out for $8.95. I think that's something that we need to just weigh the risk/reward of that nickel and decide what we want to do.

The other dilemma that we have slightly is if we go out and say, okay, take $8.90 now the price may go down lower than that when people try to sell so, bottom line though, is, yeah, it's good to sell it and free up the capital. So, hopefully we'll get near our price.

Bryan Hinmon: Yeah, I'll just say generally speaking when we get in these buyout situations the price of the stock that's being bought out approaches the price, the offering price, it doesn't get all of the way there most times because there is always the outside chance that for some reason the deal will fall through. Now the deal can fall through for many reasons, the most common reason is the company announces earnings that are horrible and basically it triggers a clause in the buyout contract that says, hey, you weren't up front with us with what was really going on in your business, we're going to pull our offer.

Now we just went through that with Pacer and there was nothing to worry about. The other reason that the deal might fall through is because financing of the acquirer falls through. The company that's buying Pacer is called XPO Logistics and they are financing partially with stock and partially with cash. So we don't really have any financing risk to worry about there.

I could go down a rabbit hole here but I won't. So anyway the closer we get to the deal going through which should be the second quarter, you should see the price converge on $9.00 over time. The interesting spot that we're at is we're now up on our 30-day window where we said we were going to sell our shares at $8.95 and we haven't gotten that price so we need to either sell them at below that or communicate that we're going to change our mind.

Audience Member: What are good characteristics to look for, for a company to short?

Jeff Fischer: Great question! Companies to short, that we prefer to short, are ones with no competitive advantages that remain or they're being encroached upon by other companies, ideally no profits to speak of and no visibility into profits anytime soon. A poor balance sheet with a lot more depth than cash and if they pay high interest rates too, great!

I guess it might be instructed to say that some of our best shorts have been the one example that we were talking about just a few minutes ago before this panel, Trump Hotel Casinos and Resorts which is our real estate entity of Donald Trump that owned resorts in Atlantic City and had billions in debt and no cash and was trying to pay $50 million a month in interest and the whole thing just toppled, they went bankrupt.

So looking at balance sheets of companies that are highly leveraged and at the same time not creating any cash flow themselves is a sure sign that there may be trouble ahead as long as the market hasn't already beat you to it and beat the stock down to a dollar.

So I hope this answer isn't too generic but companies that lack advantages out there lack profits and have bad balance sheets are a good place to start.

Bryan Hinmon: Jeff's favorite shorts are called buzzard bait so they look like they've already died but they still have a lot of room to go in their death. So this is an awesome question and a great time to bring up Charlie Munger who cites the mathematician, Jacoby. He says invert, always invert. So we just gave -- we spoke a lot today about what we look for in a company so if you flip that on its head you should be able to tell what we look for in a company to short. So the three things that make up a *Pro* core stock are competitive advantage, compounding dynamics and good management. So if you find a company that does not have a competitive advantage like Sony that does not have good compounding dynamics like Sony and does not have good management, management was unproven at the time at Sony. You've got yourself a pretty good candidate.

Now, Tom Jacobs is in the room so I must say, pay homage, that if you're going to short it helps to be right on timing and one of the ways that you can put timing in your favor is to find a company that has some earnings quality issues. It just sort of puts the odds in your favor.

Jim Gillies: A couple of things just to add, one, shorting is hard so I'm going to second what Bryan said. Pick up a copy of Tom's book, Tom and John Del Vecchio's book. It will help you with earnings quality issues.

The other thing is, this is a small subset of shorting. When you find a company that just rockets like triples in a year or what have you, follow the insiders, insiders, executives, have to file what their activities are with the SEC on a Form 4. And don't follow the CEO or the CFO, or do follow them, but if you start seeing what we call lower echelon insiders like the controller or the treasurer. If you start seeing these people selling everything they have and moreover, you know, they've got like option grants that vest over a five-year period and every month they're selling 1/60th of that – this happened with Blue Nile in 2007. You could see that in real time they were getting out as fast as they could even though they got like nine years left on the option. That's a real big tell because the CEO who's getting paid millions of dollars and has penny options that's one thing but the treasurer who's making, I don't know, $80,000 a year and these options are like real money to her, that's -- follow that! That's a great sign, the person closest to the money is selling hand over fist.

Jeff Fischer: One more thing I feel I must add, I believe you are the youngest Fool member here no question about it. So you should spend 99 to 100% of your time finding great businesses to own and that will change your financial life if you buy some of those early and just hold on to them. So I would devote very little to maybe no time shorting right now.

Bryan Hinmon: Yeah, I just wanted to add maybe one thing, I mean, these guys did a good job of explaining most situations but I think maybe one more situation where you could short a company is in an industry where it's getting disrupted. Things like – you think of Circuit City, Best Buy, Amazon disrupted them. Things like long-term trends where you have a disrupted industry and then those competitors who are not able to adapt to the disruption. Sony comes to mind because they weren't able to adapt to, say, the iPhone or things like that so that's another area as well.

Audience Member: Speaking of shorts, AmTrust Financial seems to be recovering from the short attack, some of us wrote puts to take advantage of that. Have you seen anything to suggest that AmTrust might not come out of this problem?

Jeff Fischer: The short answer is our faith in AmTrust has not been shaken. We've done all of the due diligence that we can do at the moment. We look forward to seeing their earnings results next week, I think a week from yesterday so next Thursday. And the company has said they want to, within a quarter, and this was in December, share more financials with everybody even though they don't have to. They report everything as they should but to try to disprove the criticisms against them they are very open and we're very hopeful that they could through their auditors share much more by this quarter or so.

But it's a company that I've known since it came public in like 2006 and we had the good fortune of meeting management in December; Bryan set up a meeting with the CEO, CFO. It was a great meeting and that helps and we talked to them and we believe in the business as a real compounding machine. One thing a lot of people don't understand about AmTrust is it goes into insurance niches that are ugly and struggling and it goes in because it can buy them cheaply and turn them around but it makes it kind of a black sheep of the insurance world and an easy target. But the short answer is we still believe in it, it's still rated by, and it's actually our largest position at 5.4% but price-wise it's had a great run. It's still up quite a bit for longer-term owners if someone bought it last year, of course, but we believe that it will continue to do well over the long-term but it could remain volatile for quite a while.

Bryan Hinmon: So the punch line here is, no, I don't see anything different that would change my mind from what I said, hopefully clearly on the discussion boards but I do want to call into question simply the idea of anchoring just because AmTrust traded at $43 a share doesn't mean that's the right price for it to have traded at in the first place. The stock had consistently been above our estimate of fair value and we were perfectly okay with owning it as it had that rise is now falling in the wake of the short attack, it has fallen much closer to what I had estimated the companies fair value at and so there's one way to look at it here is simply that the premium that was placed in the stock has been sort of eviscerated now because people are questioning it a little bit more but I don't want to anchor on the fact that there is some magic number, $42, $43, that we will recover to simply because time passes or simply because the company releases more information.

Now, I don't mean this to sound dour on our outlook for AmTrust Financial or that sort of thing but we just have to be careful not to anchor on what the stock price is, or what the stock price was before it fell. What I do believe is true is that there's fundamental misunderstandings about AmTrust's business and more than an insurance company it is sort of a hedge fund with a developing recurring revenue fee business and so I don't know that looking at it as an insurance company, anymore, is the right way to value it.

So, I'm not sure at this precise moment what the exact right fair value for AmTrust is. I suspect that it's higher than where it is now but I don't know that it's the $41 or $42 or $43 where it was before the attack.

Jeff Fischer: I'll just add while Ellen's -- anything we own and (rate by?) we continue to believe it will challenge or top our North Star at the time and if that changes you're the first to know about it.

Audience Member: Hi, I have a couple of questions, I'm just wondering whenever there is a new recommendation coming out, do you all review it and agree upon it first?

Jim Gillies: I don't!

Audience Member: You don't, you're just *Options*.

Jeff Fischer: Jim and I work separately even though we complement each other well, I like to think. So we just do what we do, Jim in Canada, I wherever, and the team is involved -- everyone sees the alerts before they go out, of course, but Jim and I -- our responsibility is to make the decision and we'll go to Bryan and Billy for feedback and ideas most of the time but it's on us to make the decision. In *Pro* it's on me to make the decision and so that it operates the same way there but when Bryan or Billy have an idea we will all talk about it in-depth for quite a while, quite a while. Some buys we're working on for months on end but the important thing is early in the process we all agree, this is a compelling candidate and so no one is wasting their time on it. So when Billy or Bryan bring an idea we agree early that it's worth pursuing and then whoever has that idea pursues it. Bryan very recently Parexel was all a Bryan idea that he's been following and researching for at least a couple of years and that's all Bryan but we all agree at the same time, yeah, let's make it a 3% position.

And that was after Bryan pitched it to us. The Fool is very big on stock pitches inter-team, within the team, so just like we offer it to you we'll offer it to one another and share the idea.

Audience Member: That's great. My other question is what is your take on Chipotle Mexican Grill? I mean, it just went up and up so fast and it's still going up higher.

Jeff Fischer: My take is I wished we owned it. Yeah, it's -- the company has always looked expensive but I think what's happening is those who own the stock have been right to estimate how much it can grow and those who said, oh, it looks so expensive have been wrong on how much it can grow and that they're still growing same store sales so strongly, 9% last quarter and they're still a pretty small footprint restaurant. They have, I think, 1700 locations and they're on track to double that in the next X number of years, five or seven years I think.

So it's still an early story and though it trades at a premium price you're also getting a few other food ideas that they're rolling out, the Asian Chophouse and the pizza idea too. So they may be the new king of fast quality food. I don't want to oversell them but right now they're in that position and after last week's earnings I'm looking at it again because I don't want to keep missing it if it can do a North Start type return or better we may want to be in it.

Jim Gillies: As I've just been reminded I love crappy restaurants and I really do! And I'm also happy that I am actually in it but that's another story. The thing about Chipotle, just to reiterate some of what Jeff has just said is the -- and Tom talked yesterday about having co-CEOs, Chipotle probably does that better than anyone else out there. They have Moran on operations and Steve Ells I believe his name is. Yeah, he's more of the strategy and the concept.

So they have a visionary and a guy who gets it done. They have – from the perspective of the growth runway I'm just outside Toronto. Toronto is the fourth largest city in North America. We've got something like eight million people in the greater Toronto area and I think we have six Chipotles. I mean, there are neighborhoods that have six McDonald's and that's just Toronto. I think there might be – I think there's less than 10 Chipotles in Canada. If Canada can support 3,000 Tim Hortons we can probably support 300 Chipotles and how many can the U.S. do and how many can England do? And how many can the Middle East do? And then where you take the Asian Chophouse and then where you take the pizza offering, so I've unfortunately sold some of my Chipotle along the way up but I haven't sold it for a number of years because I kind of realized, you know, whatever -- I can't put a pin in their growth.

The other thing for Chipotle is they are at the forefront of a broader societal trend towards healthier eating. I don't know if you've seen they're got a television show coming out on Hulu, Chipotle has a television show! Its exploding cows and agribusiness, look it up, it's coming! And they are at the forefront of eating healthier, the food with integrity movement so no antibiotics in your dairy, no antibiotics in your meat, organic guacamole, etc., that's something that people in aggregate society and aggregate care about right now and I think that's only going to grow and so not only do you have this growth runway ahead of you but you have a societal trend pushing you from behind and so, you know, I probably came across I kind of like the company. A little bit!

Ellen Bowman: Gentlemen, we are down to almost five minutes so I'm going to take one more question and Jeff, I did not mean to interrupt you, please go ahead!

Jeff Fischer: All I was going to say listening to Jim speak so well, the trend of healthier food clicked in my mind, well, what's going to be the mote there? How many people are going to come along and try to copy Chipotle? First of all, it's location that's part of their mote but not eternally a mote so it's just an extra thought like, yeah, healthier food is becoming a trend, is that a mote that you can sustain and build profit margins on or once it becomes the mainstream what happens?

Ellen Bowman: All right, sir, I think I skipped over you before for which I apologize.

Audience Member: Follow-up to the gentleman behind me on shorts, every time, well not every time, but almost every time I get into or think about shorting I find that the stock has already sunk a whole lot so it's kind of the opposite of what you were talking about, how much lower can it go? And even sometimes this seems impossible because there seems not to be any shares to (buy?) or there's likely to be a short squeeze. Do you have any comments on like how to shorten that situation or should you shorten it?

Jeff Fischer: Yep, when it's impossible it's usually best to walk away because the short squeeze may happen next and even if you do get some shares on a lark you may get called out of them right away. So really illiquid things are risky even riskier to short. You could maybe buy put options to profit when the stock falls but they'll usually be expensive so you have to really think the stock has further to fall.

A final point, good news about shorting something that's fallen a lot is the most that you can make, of course, on any short is 100% so whether you shorted 100 and it goes to zero or seven and it goes to zero like we shorted Sirius Satellite around 7 and closed it around 3. You're still the most that you can make is what you can make so sometimes buzzard bait we like to see things fall quite a bit before we do short. We like to see that it's really flailing or failing.

Ellen Bowman: All right, that was more succinct than I expected. One more anybody? Sir?

Audience Member: I'll squeeze in a couple. What are your thoughts on the short on euro that's been dragging on for a long time?

Jeff Fischer: It has, speed round here. Shorting the euro, I still like it because I think the risk/reward is skewed to the short side. Sorry Pablo, it's hard to see the euro take off.

Pablo: I'll show you the euro (unclear).

Jeff Fischer: One caveat that I would add though is if you're shorting FXE, the euro ETF make sure your fees are low because we don't want to pay a lot every year to short it, 0% is great. 1% maybe. You don't want to pay a high fee on what may be a low probability short but our thought it is something really does go awry in Europe it could be a nice profit on the short and once interest rates go higher the dollar should be stronger.

Audience Member: And the other quick one, O'Reilly is way above fair value but it's still a buy first, thoughts?

Jeff Fischer: That's not fair, it just jumped yesterday. It was up 10% yesterday on earnings about, it's been a great stock. We bought O'Reilly, so boring right, so boring! It's up 50% in about eight or nine months since we bought it last April I think. It's due for a fair value re-evaluation, the year just ended and I need to go through results and raise that but it's a great lesson that fair value is a range and an estimate. It's been above our fair value for quite a while but it stayed buy first because we thought the risk/rewards was still, especially looking forward three years, still very good.

So, we still like it and we'll have an update soon!

Ellen Bowman: What are you thinking, one more, can we squeeze in one more? All right, I'll sprint.

Jeff Fischer: Jim has a plane to catch.

Jim Gillies: I have a plane to catch in two hours and seven minutes.

Audience Member: Yeah, I just wanted to sneak in a question for myself. Two companies that I'm really interested in investing in are SolarCity and Tesla. It seems to me they meet a lot of the criteria that *Pro* has as good investments. I'm just curious if you looked at them and what your opinion is?

Jeff Fischer: Looked at both of them early last year. Here's where everyone gets out their tomatoes and can throw them at me.

Ellen Bowman: I forgot to provide those, I'm sorry!

Jeff Fischer: Ellen!

Ellen Bowman: Sorry.

Jeff Fischer: We even talked about briefly setting up a little Elon Musk basket like 1 or 2% in each of these companies both of which he has a big hand in and we didn't because they don't seem to match *Pro*'s goal despite the businesses being very alluring and growing quickly in revenue anyway right now they don't have free cash flow to speak of and the valuation was not there or really impossible to measure. So it just didn't fit with our North Star goal. If you're a Rule Breaker type investor it may fit better there and the final thought, if they do become, on a valuation basis attractive enough to put them in *Pro* then we would and we don't think we would have missed the boat at that point. So many companies, once they do reach that point, then go on to compound for a long, long time. So we'll keep watching!

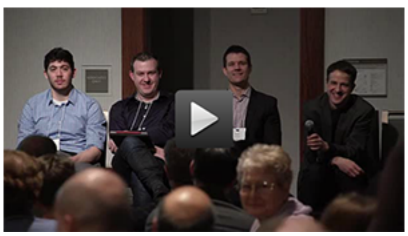
Ellen Bowman: OK, they are about to start dismantling the walls Anne says so I have to stop this. I did bring some printouts of some of our PDFs back there so there's one on *Pro*'s core stocks, there's one on selecting option strategies and there's one on writing covered calls. They are on the table in the back if you want them and thank you very much!

Jeff Fischer: Thank you everybody!

FoolFest 2014: Video Archive

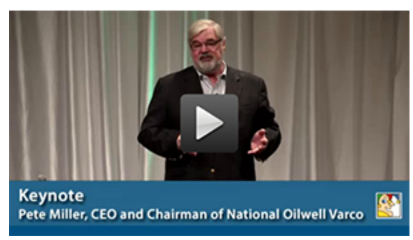
Published Feb 19, 2014 at 12:43PM

The Motley Fool hosted a member event early in February featuring speeches, interviews, and Foolish conversations with visitors and denizens of Fool HQ alike. Videos (and trasnscripts) of the event are available below, with the *Pro* team's presentations at the top. Enjoy!



The *Pro* Team's Presentations: Jeff discusses portfolio construction, Bryan tackles Albert Einstein (not literally), Billy takes on American Tower, and our members share their tips on making the most of *Pro*. Plus, a Q&A with the whole team, including *Options*' Jim Gillies. Watch the videos >>

Malcolm Gladwell: We were thrilled to have acclaimed author Malcolm Gladwell sit down for an interview with Tom Gardner. Watch as the two talk about Gladwell's latest book, *David and Goliath*, and why many people would rather "lose conventionally than run the risk of catastrophic loss unconventionally." Watch the video >>



Pete Miller: National Oilwell Varco (NYSE: NOV) CEO Pete Miller both entertained and impressed our audience of Fools at February's member event. Watch as he talks about how his company's oil rigs are reaching new markets, the recent spinoff, and what's next for this company. Watch the video >>

Fred Reichheld: Reichheld, the creator of the Net Promoter System and a longtime partner at the consulting firm Bain & Company, goes in-depth about how companies can capitalize on feedback from their customers, measuring customer loyalty, and how simple changes can make a big impact on companies' success. Watch the video >>

Eddy Elfenbein: *Fool One*'s Morgan Housel introduced Elfenbein as "one of the wisest investors I've ever come across" — and you'll soon see why. The editor of Crossing Wall Street, Elfenbein talks about the big trends he's seeing in the stock market, how people really make money investing, and what he looks for when he's researching a potential investment. Watch the video >>

Michael Kitces: Award-winning financial planner and writer Kitces turns many of the ideas you have about saving and retirement on their head. Watch as he lays out what's changing in the world of financial planning and how you can take advantage. Download his presentation and watch the video >>

Tom and David Answer Your Questions: Topics include why Berkshire Hathaway isn't in the Everlasting Portfolio, David's long-term take on SodaStream, why Tom hasn't recommended The Container Store — while David has — and more. Watch the video >>

FoolFest 2014: Tom and David Gardner Answer Your Questions

Published Feb 19, 2014 at 11:51AM

Watch as Tom and David Gardner take the stage together to tackle your questions at our February member event! Topics include why Berkshire Hathaway isn't in the Everlasting Portfolio, David's long-term take on SodaStream, why Tom hasn't recommended The Container Store — while David has — and more.

CHRIS HILL:

(Picking up from Tom's three EP lessons learned talk.) Tom, 30 seconds or so. We've got a question about ...

TOM GARDNER:

LinkedIn's earnings? Hey, does anyone want to buy LinkedIn under $200 a share? You'll have an opportunity tomorrow morning.

CHRIS HILL:

Very nice. Question about — oh, Berkshire Hathaway and the Everlasting Portfolio.

TOM GARDNER:

Sure. In a way, Berkshire Hathaway is the everlasting company, so it does provide a lot of the evidence that this type of investment works. Buffett has pretty much never sold a share. I mean, he's dedicated his life to the company and that's what I like to find. It's kind of the Lew Frankfort scenario a little bit. Just succession. You'll remember that there was somebody who was kind of one of the lead dogs who's no longer at Berkshire and left without a great ending to his time at Berkshire.

Succession just concerns me. I do totally believe what Buffett said recently, which is that — I don't think he took it to this extreme — but of all the companies that have been created, his is probably the one that's best set up to be a trillion dollar market cap someday. He didn't express it to that extreme, but he did say he's been creating the company so that it is diversified in a way that it can be in a lot of different industries and have a huge market cap.

So, I may very well add Berkshire Hathaway. I may. Just the succession question is one that lingers out there for me and I guess in the end, what I would like to see in succession at Berkshire is what I like to see in many different companies and that is a much younger leader who's going to be the CEO for the next 30-plus years just as Buffett was ... rather than the right-hand person who's maybe in the last five years of their career. I don't like that dynamic, as much. And, of course, we don't know who his successor is yet, so that's just pure musings on my part, but great question.

CHRIS HILL:

We will go to the audience in a few minutes, but first the questions that came from the Fool One board. The markets shook as Fool favorites Coke and Green Mountain are now linked and some are suggesting bad things for SodaStream as a result. Give us a Foolish perspective, please.

DAVID GARDNER:

Sure. I own SodaStream. I also have recommended SodaStream and Green Mountain Coffee Roasters, thanks to my good friend Rick Munarriz, who is such a wonderful stock picker for *Rule Breakers*.

It was really interesting to watch SodaStream close up about 9% today, I think. I have admiration for what the company's doing. I like companies that improve our world. I believe that a bottle-less world is a better world, whenever possible. I've enjoyed my SodaStream machine, lo these three years or so, of regular usage. I don't really buy the syrups — it's just carbonated water for me — and I sure did enjoy Green Mountain Coffee Roasters' stock today.

Initially, it sounded like after hours, which I don't really follow much, it was down yesterday. So, it closed up today. It's a little surprise. I think this is a valuable space, and when you have a big company like Coca-Cola come in and make an investment in a company that's playing there, I think it definitely raises the tide for all boats in my mind. I don't think that SodaStream is going to go out of business, now, because Coke and Green Mountain can work together on a Green Mountain soda machine.

I think so often we tend to think in binary terms, when the truth of business is, more often than not, everybody wins. If you're playing the game well, you're going to win, too. If you're investing well, you're going to win. It's all about winning. I don't think it's a zero sum. I don't like phrases like "iPad killer." I've ranted before in *Rule Breakers* columns on this. I don't think it's zero sum. So, I'm glad to see SodaStream up. I'm sorry to see it down. I've owned shares, too. It's been a laggard, no question, over the last year. It's one stock. Those are my quick thoughts.

CHRIS HILL:

Another question. After two years of investing reserves into the Everlasting Portfolio, expecting to have $500,000 per year is impossible going forward. My portfolio might end up in uneven allocations. Any recommendations on how to handle this?

TOM GARDNER:

I think we owe it to *Motley Fool One* members to follow what has been created in *Supernova* in the Phoenix portfolio. I think that was a great innovation that *Supernova* brought to The Motley Fool and it is the portfolio that is not adding new capital, essentially ... so, it teaches you to manage the everlasting way ... in this case with a finite amount of funds. So, I think you're going to see us create something similar. I don't know that it will be exactly like Phoenix, but I think Phoenix is a brilliant addition at The Motley Fool portfolio of services.

CHRIS HILL:

My question for Tom is what is your strategy for using the cash accumulating in the Everlasting Portfolio?

TOM GARDNER:

So, we have about $6,000 and so it's a very small ...

CHRIS HILL:

Round of drinks for everyone?

TOM GARDNER:

It's less than 1%, but we're being paid dividends and overall I expect to reinvest that. It's difficult to figure out how to demonstrate to all of you how I think about being fully invested because with $100,000 a quarter coming in and a $100,000 wild card round — which given where the market is, I wouldn't be surprised to see that coming relatively soon — that's a half million dollars of new capital each year.

So, really if you look at our *Million Dollar Portfolio* and Everlasting Portfolio right now, we're 50% in cash just in terms of how much cash there is going to be invested this year. So, if you actually look at the pathway of new capital coming into the *Everlasting Portfolio*, you would really say that the portfolio, even with a million dollars with $6,000 in cash on the sidelines is actually primarily not in equities because of the income that we have coming forward.

I don't know if you watched the Jack Bogle interview, but I love what Jack said, for example, about social security. You have to view that as a cash portion of your overall portfolio. So, I would view future income coming in as cash, as a cash position in your portfolio that's not invested. So, that's probably not comparable to everyone out here and everyone watching the stream.

I guess I'll just say think of us as being opportunistic with the wild card round, but pretty much having the mentality that we're going to invest all our cash whenever we like it and at this point, $6,000 is just not significant enough for us to have rolled it in, but I wouldn't be surprised to see it get rolled into investments in the next six months.

CHRIS HILL:

Two more questions, and then be on the lookout for Dan Boyd and Susan as we'll go to the audience for questions. Could the Fool please post one-year, three-year, five-year, 10-year and since-inception performance numbers for its newsletters?

DAVID GARDNER:

I have no direct reports at The Motley Fool, so let's find out from our CEO.

TOM GARDNER:

[Laughing] I have one very serious report that I have, and that's the co-chairman of our board I report to. So, I'll say that I have mixed feelings about it. I definitely like showing everyone how everything is doing and making that very clear. I don't like to emphasize shorter time periods when I think that the biggest mistake that individual investors are making is to trade too frequently. I've said before I think the number one way to improve your returns right now is to double your holding period. I think it's just a simple way that will start to change your mind-set — have you look for companies differently out of the gate than you're looking for and you'll do better as an investor because of it.

So if we start reporting last three-month returns, last six-month ... I know you didn't ask that, so it's unfair for me to go with shorter time frames. But I can just tell you. In the Everlasting Portfolio, I want to have since-inception in trailing five-year returns. We're just not in the trailing five-year period yet. But given that you've been persistent in asking that question, and I know you have a passion for it, I have to believe that we can provide that and we've got Xander.

I just recently saw the question — so now that I hear it, I think it makes sense and we'll find a way to do it.

DAVID GARDNER:

I'll just add that at the outset of *Motley Fool Stock Advisor*, we weren't really thinking of it in terms of a portfolio or wanting to compare ourselves to mutual funds or index funds. In some ways, I object to the notion because at least in *Rule Breakers* and *Stock Advisor*, where I've been picking stocks from the outset for a dozen-plus years in one of those services and ten in the other, every single month, month in and month out ... I'm basically doing it on like the third Thursday or something like that, every single month, month in, month out.

That's very different from what a mutual fund manager does, and if the intent of asking what our one, three, five and 10-year performances are is to compare it to your mutual funds ... just realize that we at the Fool are really playing a different game ... so that kind of gives a lingua franca connection of what we do to what they do, when what we do is fundamentally different from what they do.

And I think what we do should be serving you better than what they do. I can at least tell you you'll learn a lot more through us which is — I see a lot of heads nodding because you are and you get that. So, on the one hand, I think it's very misleading for us. On the other hand, if you actually do the numbers, smokin' hot. Smokin'. So, I never shy away from anybody wanting to run those numbers and put them up there. More than happy any period. One, three, five, ten ... And when it's red, which it has ... I like people to see that, too, because you know that we're losing right along with you when the market goes down and sometimes I lose worst of all.

CHRIS HILL:

Final question — then we'll go to the audience here in the room. This relates to the Everlasting Portfolio and its current lack of long-term dividend growth plays. I'd enjoy hearing Tom comment on the role of dividends in a buy and hold strategy and their effect on Everlasting Portfolio selections.

TOM GARDNER:

Sure. I don't look for dividend-paying companies as a factor that's important to me. There is one case when I do, but in general, dividending is a use of earnings ... so if that's the way the company would like to use those earnings, I don't favor them or disfavor them for that. Obviously they're choices that are being made there to not reinvest that capital in the business. Or in some cases, you're providing dividends to large shareholders and they have a real interest in that. So, there are a myriad number of reasons to pay a dividend. I don't view it as a positive or a negative as an isolated factor — but I know that some people like to generate income from their portfolio, as it goes, and would prefer to do it via equities.

My favorite dividend payers are small cap companies, because I think a small cap company that's paying a dividend is communicating something important. And, of course, you need to pay attention to the payout ratio. And what James Early does, and has done with his team ... beating the market with income investing stocks all the way through ... has been awesome.

But with an excellent payout ratio, a small cap company that's paying a dividend is doing something pretty remarkable as a David in an industry that likely has at least one Goliath ... and that is they're choosing to return some of their earnings to their shareholders. That could mean that they feel they have no future growth prospects, but just as often, what it means is that the company feels it's got a dominant position in its niche. It feels very comfortable there and it's indicating to the marketplace that it can afford to pay some of its earnings out rather than reinvest it all in the business.

Case in point. A company became public in the early 1970s at a $30 million market cap. Within the first year of its IPO, its stock was down 50% — from a $30 million market cap down to $15 million. When it had a $19 million market capitalization, it began to pay a dividend. I mean, a $19 million market cap. Obviously, money was different in the early 1970s, but we're still talking about a tiny, tiny, tiny microcap of a business began paying a dividend at the market cap of $19 million. Its first year as a public company. That company is Wal-Mart. It ended up being one of the greatest-performing investments in American history.

So, I think combing — if you're doing your own research — the small cap universe for dividend-paying companies ... Again, it's not a single factor. Some of them are doing it because their founder owns 72%, he's treating the company as a piggy bank and he's a semi-fraud. I've seen that. It's happened to me as an investor. So, I'm not saying, "Hey, all small cap dividend payers will succeed." I just think that's an interesting factor to follow, and if you see a great, really well-run business doing that as a small cap, that's a very strong indicator for me.

CHRIS HILL:

And with that, we'll go out to the audience for any questions.

TOM GARDNER:

By the way, thank you Dan for jogging around the arena.

CHRIS HILL:

We'll go down front here and then back there.

MALE:

My question concerns The Container Store and my statement is great CEO, bad balance sheet. So, walk me through your decision to The Container Store. Either one.

DAVID GARDNER:

Sure. To me, The Container Store represents a company that is still early stage, but has been around for a couple of decades. So, you're right. Even after an IPO and raising a bunch of cash, they still have a lot of debt ... but, sometimes when we focus in too much on one or two numbers, we don't want to exclude the rest of the story. And to me, most of my great stocks in companies ... I feel like I'm buying a culture.

Culture's kind of an overused word these days. In fact, I'm almost starting to think that my Rule Breaker self is starting to... I want to be the anti-culture guy because I hear almost how too important culture is — but I'll just say that for ten or fifteen or twenty years now, I really have been trying, as best I can, to invest in culture and The Container Store is a very strong culture. And I believe that with still not even full U.S. coverage and with international possibilities, that it represents a better-than-average bet, a probable market beater three to five years from now.

All that said, my money's where my mouth is. It's right up there on our score sheet, and if we're wrong ... And we were right the first month and wrong the second month so far — then it will be an also-ran. But I'm confident in The Container Store, and Tom, obviously, has a great sense of this, as well. Has gotten to know Kip, as have I. It starts with the people, and I just think Kip Tindell is an amazing CEO.

TOM GARDNER:

I will say that I have not recommended The Container Store up to this point. They're only a recent offering. Kip is unbelievable. I think The Container Store has been a remarkably great business. It was private equity restructured, in a way, in 2008, and that meant that the IPO capital went to the private equity firm rather than to the company's balance sheets. So, that would be a reason that they're not flush with cash after their IPO. You can view that as a very unfortunate thing or just view it as a reality of the way that they financed their business and now they're good to go and run their business and generate the cash out of it.

Amazon could be a big competitor to The Container Store, too. So, I haven't made my mind up, yet. I've learned to believe in my brother's investment philosophy, so the fact that he loves Container Store here is a very strong indicator for me, but I just haven't gotten to a place where I feel comfortable enough with it. But I love Kip and I love the stores and the business, although I'm not at all organized and I don't have a ...

CHRIS HILL:

Yes, in the back ...

TOM GARDNER:

... any use for the products, but I admire people who do and if any of you would like to come over to my apartment and help me out, that'd be great. I'll take the closet. I'll take the travel stuff. I'll take the containers ...

MALE:

I own stocks in AFSI — AmTrust Financial Services — and I believe they were a recommendation of the *Special Ops*. About a month ago, there was an article ... It was in *Pro*, I'm sorry. There was an article in Seeking Alpha, unsigned, that it was kind of a "hit job" somebody called it. And the stock hasn't really recovered from that. How do you see that playing out? Do you have any insider information?

TOM GARDNER:

I love that. Love that.

DAVID GARDNER:

Well, let me say first of all that, that is a *Pro* pick so Jeff is standing up and waving his hand. So, during the cocktail hour ...

TOM GARDNER:

Right now with the microphone ...

DAVID GARDNER:

Or right now, Jeff wants to speak to us ...

TOM GARDNER:

Sure. In song.

DAVID GARDNER:

We've got the advisors here. We've got the stocks and your questions.

JEFF FISCHER:

I almost broke into song about, "We love AmTrust ..." but that could come back to haunt me if it doesn't go well. AmTrust is a company I've known since it went public in 2006. Bryan Hinmon and I, on the *Pro* team, visited management in December, soon before the Seeking Alpha article was released.

We talked to them subsequently since then. We've gone through the reports. We've gone through all their financials that we can. We believe AmTrust is going to release greater detailed financials very soon. They said that's what they were hoping to do. But to be clear, they already release everything they need to as an insurance company. They're going to release above and beyond that to disprove what the so-called short sellers are saying.

So, long and short is we've kept our position the same size. It's actually *Pro*'s largest position at about 5%. It's something I've known a long time. It's an insurance company. There's risk, but we believe in it for the long term.

DAVID GARDNER:

I would like to add only something about articles and not about that interesting company that Jeff obviously has his money where his mouth is. And that is I would encourage all of us to be selective about what we read, retweet, quote and be influenced by. And I think the number one thing I'd be looking for is someone's real name signed to anything that I'm going to be influenced by.

And the second thing I'm going to look for is any public track record that convinces me that, that person is worth listening to. I'm much harder core on this than I was 20 years ago. Twenty years ago, there weren't as many people writing, and there weren't as many fast money movements in our markets. But I think we're only hurting ourselves if we consult sites that feature anonymous authors and who have no track record attached to what they're doing.

I think one of the reasons we're all in this room — and I know we have a lot of people on this live stream — is we get a lot of stuff wrong at Motley Fool, and we do get some things right, but one thing's for sure. You know who we are and you know exactly how we're doing and how we've done. We feature a Motley array of writers. We have lots of people with different viewpoints. But what's important to me is signing your name and having a record.

So, I challenge every other investment source — Internet or not — to adhere to what I believe is the only standard that you and I should be guided by 2014, going forward.

TOM GARDNER:

Yes. Vote David Gardner, two thousand ...

FEMALE:

Could you both give us your most exciting "Best Buy Now?" Thanks.

TOM GARDNER:

LinkedIn at $199.

DAVID GARDNER:

I have approximately 171 stocks under active recommendation in my two services, so I start to struggle when you ask me what my best one is, because I think my best one is that there is no one. I'm not going to dodge the question, though. I'll throw out a couple of companies that I think are worthy of our attention. I've already heard a bunch today. When Matt Argersinger opened up his mouth and talked about MercadoLibre, I think that, that is a company that I believe in, as does Matt.

I find interesting companies all the time. I'm like a kid in a candy store when I have to recommend three new stocks every single month. I have more than that, that I would recommend. And so to me, it's never about one company or one great stock story ... even though in our marketing, that tends to be what people look for and in fact at events, that tends to be a natural question and I would ask the same question, too.

But I think the real story is having 15 to 30 ideas and making sure you're invested in them. So, Bank of Internet, OpenTable, Yandex, 51Job. iRobot. Those are all companies I don't think I've heard mentioned at all in the conference today. And those aren't probably my favorites, and I'm not sure they were on our "Best Buy Now" list in *Rule Breakers* last month, but I like to nudge those kinds of companies forward, because I think of those as the leaders of tomorrow. In some ways, they're leading today. OpenTable is definitely the leader at what it does today.

I think I'm feeling a little edgy today. I don't know what it is. For example, I almost don't want to talk about Apple anymore or 3D Systems. They're wonderful stocks. We own them. We've made multiple times our money on behalf of our membership in those companies. Some of them are volatile. Some of them aren't. LinkedIn is another good example. But it's about much more than the headline stocks.

And the good news is I think The Motley Fool has a good long-term record of getting our members into these stocks, often well before they hit the headlines. But then we end up getting asked those questions all the time about those companies once they're in the headlines. So, just nudging forward, those aren't my best plays now, but those are good companies. I think I own each of them, and I would recommend those for your attention. And thanks for the good question.

TOM GARDNER:

Yes. Full disclosure. He is on our board of directors, but I think Whole Foods ... John Mackey, the co-founder and co-CEO ... I think Whole Foods is an attractive buy. It's $54 now. It was $51. It may have even gone below $50. I think these are attractive prices long-term for Whole Foods. Of course, we're always going to say this. Who knows what will happen in the next year?

But I think looking forward five-plus years, I think Whole Foods has done something that many companies should seriously consider, and that is co-CEO. I think that's a really elegant approach to leadership. And Goldman Sachs, in fact, has done studies to show that the best form of leadership you can have is co-leadership. It's just that if you don't do the work beforehand to get it right, it can be the worst form of leadership. And Whole Foods and Walter Robb and John Mackey have worked together for decades. They're purpose driven. We're conscious capitalist believers.

I think they have new competition — I mean, it's been around. There's emergent public company competition now and awareness that there's competition to Whole Foods. So, alternatives mean they don't have as much pricing power, perhaps ... but I still think Whole Foods has a great position in the market. A lot of growth. There are a lot of people who are learning to eat healthier, and I think that's a trend that's going to continue forever from here, because the Internet helps us be much more informed about what we're putting into our system. So, I would think Whole Foods would be a very fine investment now. And LinkedIn.

MARK:

Hi, David.

DAVID GARDNER:

Hi, Mark.

MARK:

Tom. Chris? All right. I want to put you on the spot.

TOM GARDNER:

We weren't already?

MARK:

No, you guys look too comfortable.

DAVID GARDNER:

This is a little bit of a loungy couch. I just don't see myself standing up, but go ahead.

TOM GARDNER:

One they gave you the microphone, I got very uncomfortable.

MARK:

Tom, you talked about right and wrong. David, you mentioned wrong in a context. And so I want to ask about that. It sounds like that is a bipolar kind of thinking about a stock. Once we thought Apple was fantastic at $700 and I'm not talking about the media. I'm talking about our community. And then they go down to $400 or $385 and they're terrible. And our thesis is broken. And Netflix. The same thing happens, and there's conversation throughout. SodaStream. Tom, you're not wrong today, are you?

TOM GARDNER:

I'm not sure ...

MARK:

So, is that what it is? That we go back and forth? We're right, we're wrong, we're right, we're wrong. But as Ron says, is the thesis broken? And maybe today it is, but our long-term view may not be.

TOM GARDNER:

Someone who is great on this point — Mark, thank you for asking that question. I think David's going to have a better response than I do. That's why I'm jumping in first so you get the real great effect — that and clean-up.

But I'll say Tom Engle, TMF1000 ... you know him in the community if you've seen him. He's done extraordinarily great work in showing — started in *Hidden Gems* in 2005 with us, I think, 2006 — that you really should just pretty much hold what you have forever and look to add along the way with the dips and the rises and falls of the price of the company. Expect that businesses are going through difficult twists and turns and that you just stick with them and that if you have that as your mind-set, you're going to get better investment results. You're going to learn a lot more along the way. We had some of these concepts discussed earlier in my talk.

I would say that I believe that you are coming at this the right way, and it's a very fair and challenging question. At the same time, as a business evaluator, I do look at certain situations and challenge whether or not it would be a good investment now relative to the alternatives. And that can happen when a stock has risen high. I would not personally buy shares of Google now, even though it's been incredible. It's the greatest business in the world, and I'm delighted that we bought it when we opened the Everlasting Portfolio. But at today's valuation and the size of the business, I wouldn't add to it.

I'm not making a moral judgment about them, nor do I need to make a critical series of points about SodaStream. I just don't think it's as good an investment right now as the alternatives that are out there. It's how I felt about Apple in June of 2012. I just didn't feel like it was as good an investment alternative as Google and other companies that are out there, given that it was the largest business in the world and it had a new CEO, and there were some questions that I had. In that one case, I was right, but in many other cases, I'm wrong in that thinking. So, I guess my answer to the question is I think you should stay active in evaluating your businesses and have your disposition that you should be willing to stick with the companies and learn from them over time.

DAVID GARDNER:

Right and wrong come down to the game that you were playing in the first place and the rules that you set up if you did, to define what rightness or wrongness is. So, Mark, you gave an example of our community. Almost the vox populi always getting it wrong — being excited at the top and wrong at the bottom. And that's natural that you would see that or expect that to happen, especially with a lot of new investors.

The Motley Fool has a wonderful ability to inspire and switch on people to investing for the first time. It also means during New Years' times of year where resolutions are kept and lots of members join that you'll see some knee-jerk posts along those lines from people who really are new and it's their first stock and it dropped 15% and it's horrible for them. Whereas for me, I barely noticed it ... not to minimize the importance of any drop.

So, that's the vox populi kind of thing. But I think, at least for me ... and there are any number of styles represented that you've already heard from today ... for me, from day one, every stock pick ... I'm in the batter's box. I'm taking my best swing that particular month — usually three swings through the month — and my aim is to beat the S&P 500. And so, for every single stock that I pick, for me right is that I beat the S&P 500 and wrong is that I lost to the S&P 500 and it's as simple as that.

And I don't get down on myself too hard. In fact, I try to almost forget that I'm wrong. As Tom pointed out in his comments earlier, if you're an investor ... which I know you are ... and you tend to add to your winners, which I do ... your losers actually become almost irrelevant. Not totally, but if they really lose, then the percent that they occupy of your portfolio becomes smaller and smaller and you're like, "Why am I spending that much time bemoaning this?"

So, I think that right and wrong is fine. I like a world with right and wrong. But it all comes down to how you want to set it up ...

TOM GARDNER:

This is wrong.

DAVID GARDNER:

Somebody is persistently trying to dial me on my cell phone. Sorry. So, that's how I think about it.

CHRIS HILL:

We'll go here, and then over there.

MALE:

One of the first stocks that you recommended was Baidu, and it came out and I got it in $25. I bought it and I bought it right on down to about mid-$80s. And I'm really happy with that. A stock nobody seems to talk about anymore, and it's been totally flat, but I'm wondering what you could say about it, is Markel.

TOM GARDNER:

Oh, yes. And by the way, I love Baidu here, as an investment, in the $150s. I wish I had added to it when it dropped. It's an extremely well-run company. A great leader running Baidu. I'm glad you own it and I'm glad you held and added to it along the way.

I think Markel is a very fine investment here. I think this would be an excellent investment. Tom Gayner continues as the chief investment officer there. He's in his mid-fifties.

They're digesting a huge acquisition, still, in Alterra. I don't know if you saw the Tom Gayner interview that we did — this would be 18 months ago now in Richmond with Tom — and he said basically if you look at the historical performance of our stock, after every acquisition we lag, because we're digesting and transitioning that company to our culture ... which is expensive ... to get them to change their practices.

And we embrace that. That's not a problem for us because we're not sitting here worried about our stock price or our quarterly earnings announcement. So, I would say that we're still in that zone now, and I would not be at all be surprised to see us add to that position in the Everlasting Portfolio in the next couple of rounds.

CHRIS HILL:

Over here.

FEMALE:

In the Phoenix portfolio, Panera Bread is back down to about $169, its buy-around price. I was wondering if you have any current thinking on Panera as a good investment right now? It's one of my favorite places to eat.

DAVID GARDNER:

You know, Roslyn, I certainly am glad that we recommended Panera when we did in *Stock Advisor*, and that Phoenix has it because I think it's very appropriate to the Phoenix 1 Mission in *Supernova*. Tom has interviewed Ron Shaich. I got to meet Ron a few years ago. He kind of unplugged from the company a little bit and then came back — almost a Howard Schultz move there. I think that's promising. And overall, I don't have any strong feelings for or against it right now, other than having generally good feelings about it.

You know, Panera is a company that if you look at the clientele, it's mainly women. And there's something that I've always liked about those companies, because I always feel like Wall Street won't quite get it. I still feel there's that male macho vibe to Wall Street and the media that surround Wall Street. And so, I always think they won't really understand Lululemon or Panera. Not to say they can't, because these are really consumer-facing businesses that are almost overexposed in terms of how much we hear about them, but that's something that I just like about Panera.

But, you know, we've had some really good active discussion on our discussion board about Panera and I would encourage you — you may well participate — to plug in. Because one member just announced that his Panera is closing. That reminds me of how much I appreciate our discussion boards, where I hear things that won't come out for press releases a month later. And I'm not used to hearing a Panera closing. And certainly the stock, as you point out, is down some. I try to maintain a very even keel for those kind of businesses — Container Store another one — where we're definitely buying the business. I like owning that business and I think the stock will be an outperformer over the next five years.

CHRIS HILL:

In the back?

MALE:

I wanted to make more of a comment than I have a question, but I'll get there with it and it goes to the discussion of the short-selling articles before. I really wanted to thank your teams in the efforts they put in on the boards when something like that comes out and the stock drops hard — kind of looking at that and providing the analysis.

I think it really helps — I know with my temperament — in just not reacting, maybe, to outside news of these sometimes very strong claims ... to the point where at times I start to rethink about it. Is this now, instead of a bad thing, maybe a good opportunity to either invest a little more or start an investment in a stock and I guess I'd just like to get your thoughts on those events and looking at it positively versus negatively and some of the pros and cons with that.

TOM GARDNER:

Sure. I'll take a shot. I guess I think that anytime a stock or business that you're following sees its valuation drop suddenly for something that isn't really material, that presents an opportunity for you to validate and affirm your position in it. Of course, sometimes those rumors are right. Sometimes a shadowy post from left field is a whistle-blower at a business or the person who spotted Enron early on. Remember. Enron had a lot of affirmation about that business. That was an incredibly successful stock.

In fact, I've taken the blame for this although if Mac Greer is here ... Mac, you know you're the one that fed me this question. But when we interviewed Ken Lay on the floor of the Houston Chronicle Newspaper Conference, in our questions to ask him, my question next on the list, unfortunately forever captured in audio that can be replayed (as it was at my 40th surprise birthday party by Mac, who said he would never do it) I asked Ken Lay if he would like to be CEO of The Motley Fool. So ...

DAVID GARDNER:

A classic audio archive.

TOM GARDNER:

Audio gold. So, I don't believe in so overweighting a position that you're just blindly adding and assuming that everything is wrong out there. But yes, if the information that's coming in can't be verified, it's usually an opportunity to look and think, "Wow. Am I so thankful that this absurd point has been made?" Remember, this one was actually named, but it was David Einhorn, who's a very bright person, comparing Chipotle to Taco Bell and saying that Taco Bell's new burrito was going to take out Chipotle and that's what got us into Chipotle in the Everlasting Portfolio at around $260 a share.

So, I don't know I can be angry at him or make fun of him for being wrong. He's been right in a lot of other situations. But in this case, I'm thankful that he was wrong in a very public way that brought the price so far down that we've basically been given a double in Chipotle because of it. So, yes, I think that your disposition is right, and to look at those situations where there isn't something really verifiable that's been said and the price has come as an opportunity to add ... but also to remain vigilant and to see if maybe there's something about the thesis that you haven't come up with that is at least worth considering.

CHRIS HILL:

We'll take one more question and then we'll throw it over to David.

MALE:

This question isn't specific to stock picking. Obviously you guys are very good at what you do. I appreciate you guys giving us the good and the bad. I don't think anyone would be in the room if they didn't have some confidence in your ability and your team, so thank you for that. It's more in the portfolio composition specific to the Everlasting, taking into account ... and I may be off ...

TOM GARDNER:

I see you looking at notes, meaning that you prepared, and I'm backing up on the ...

MALE:

... but it seems like when we're taking a look at the Everlasting Portfolio ... a Zillow, which is killing it and then conversely, a SodaStream. And it looked like — and again, I'm not speaking for you — that they're still both at holds. At what point in your portfolio composition do you take into account opportunity cost and cutting losers?

I understand your five year, but when you almost get cut in half, you've got to have 100% year to get back to even. When Zillow, or some of your other likes, or perhaps adds ... why not replace and move forward? Or do you guys take into account the opportunity costs? In more of a stagnant portfolio, obviously, you're adding as well. That was my question.

TOM GARDNER:

Sure. I guess the first thing is that, that would assume that I'm right about the "loser." That would assume that I'm right that they should be sold. I believe Xander — if you haven't gotten to meet Xander, who is the NASA rocket scientist behind the tool that we've been creating — Xander has gone back and done analysis of Motley Fool selling and found that we do not sell well in aggregate as a company. And we've thought about that and why is that, and it's often that you sell after the bad news has hit and after the price has gone down.

I mean, I can't sit here right now and say that Coach is just terribly unattractive at $44 a share. I think it's pretty attractive from a valuation standpoint. But from a five-year business-focused hold, I can't yet see the market share losses in the U.S. hitting a floor that makes me feel like the business is now solidified and the valuation is attractive. So, I'm not going to buy something where the business feels uneasy, even if the valuation is very low, if that makes sense.

So, I'm not directly answering your question in that it goes back to my commitment to the five-year hold which is SodaStream is a sub-2% stake in the overall portfolio. It's not going to have a big impact reallocating that money and I think we're going to learn more and possibly find some winners out of our losers that we're thankful we held all the way through.

Really and truly, if you want to know my answer, I would never sell anything in the Everlasting Portfolio, period. I'd Shelby Davis it, and teach the world that this is the way to turn $50,000 into $900 million over a 40-year period. I'm not going to get as good returns as Shelby Davis, nor are you, unless you're using leverage and you have the ability to get margin in a very cheap way, and you're willing to ride the huge ups and downs that Shelby Davis did, but he got 24% a year for 40 years and turned $50,000 into $900 million by never selling. Died with 1,200 stocks in his portfolio. Pretty much never sold.

So, I just think that discipline is so important to teach. That there need to be more and more portfolios out there and more and more investors out there in this financial media, short-term circus that exist showing that investing isn't nerve-wracking. You don't have to be on top of it every day. You can put your money into businesses and let them ride with the leaders and the cultures and the products that are being created by the people at those companies, and it's better to have that perspective than to constantly be trying to rejigger your portfolio. That's my answer. Maybe we'll talk more in the cocktail party hour and go a little deeper on it.

CHRIS HILL:

And with that, Tom and I will exit the stage. We will wrap up day one with some closing remarks from David Gardner.

FoolFest 2014: Tom Gardner's Kickoff and 3 EP Lessons Learned

Published Feb 19, 2014 at 11:46AM

Watch Tom Gardner kick things off at our February member event; then, see him discuss the three biggest lessons he's learned from both the success and failures of the Everlasting Portfolio in *Fool One* so far.

Tom's Welcome

Run time: 38 minutes

Transcript: Tom's Welcome

TOM GARDNER:

Good morning. What a great turnout. What an exciting day and two days that we have together. The first thing I want to do is just thank you for taking out of your schedules and lives to come spend time with us and with each other.

I just was walking up the stairs ... Anyone who works with me knows that it's surprising that I'm anywhere near on time in life. So, I was jogging up the stairs, just moments ago, and talking to Pablo who flew in from Madrid to be here for this gathering. I know some other people have come from different parts around the world, around the U.S. and it's just great to get a chance to spend some time together. So, thank you.

I also want to thank all the Motley Fool volunteers that you'll be encountering at different points along the way today and tomorrow. We've got a lot of people that are putting in some extra time, so thank you all, Fools all, for helping out.

We've got a great program. Really looking forward to the interview with Malcolm Gladwell. If you've never encountered Eddy Elfenbein, he is a force on Twitter and a real advocate of long-term investing. Pete Miller tomorrow — National Oilwell Varco. We just have a great collection of speakers and it's going to be a great two days.

It's been an incredible year — 2013. Let's reflect on just a few things that happened here. The market up 30%. That's unbelievable. Our services are beating the market, extending their lead over the market, one service after another. This year, as you may have heard, for organizations with an employee count between 250 and 1,000 in the U.S. ... and there are thousands and thousands of such organizations ... The Motley Fool was named the number one best place to work on Glassdoor among all those companies, which is exciting for us.

We're a stakeholder-focused company. What you see in our business reflects our beliefs and principles in 21 years of being Fools — but also all of the amazing things that we've learned from our members — from the organizations that you've created. From the companies that we follow and think about investing in. Best practices across stakeholders helps us think better about the company that we're running, but helps us find better investments for you. So, it's been a great year.

But that means it just gets a little tougher, because it's a little bit more difficult to readjust your expectations after a 30%-up year. There's no way we're going to be up 30% this year. We're already down 5%. If you've been following along in my reports and coverage of our portfolio and new selections, you know that I'm cheering for the market to go down another five percentage points ... hopefully today ... because if it doesn't, I'll be getting on my treadmill desk five days in a row and walking a marathon each day.

When I made that promise, I didn't really consult anyone, so I've had a few people, a couple of members, a couple of people that work at the Fool let me know ... You know, day one, you should be fine. That's probably about a 10-hour walk on your treadmill. Day two, actually, you'll be feeling a little stiff, but you'll make it. Day three, you're going to start wondering if you can make it to day five. Day four, you will be in pain. I have no prediction for you on day five. So, I've never wanted the market to go down so much as I do right now.

And, in fact, I actually think that's a good perspective to have. Certainly, in my earliest period as an investor ... I know I'm in a room full of investors. Many of you have invested for more than five years, more than ten years, more than fifteen years, more than twenty years. I've been investing about 25 years, really seriously about 22 years. And in the first year, if I saw the market go down 5% as it has now, I'd be very worried. I'd be looking at my stocks frequently throughout the day.

In fact, that's how the financial media ... The financial media covers the stock market as if they are a first-year investor. That's why you see things like, "Stocks Cratering!" "Dow Down 140 Points!" with no real perspective on the percentage decline of the Dow and, of course, no larger context. And that's why having someone like Morgan Housel working with us in *Motley Fool One* is so important. He's been such a great addition. Morgan's here in the back of the room. You'll get a chance to talk with him. He'll be on a discussion group today and he'll be around all day and tomorrow.

And just Morgan providing that guidance that may have ruined my year — the guidance that the market goes down 10% on average every 11 months — it's pretty evenly distributed going back 150 years. More. So, you can pretty much expect a 10% decline every year and what you choose to do with that, as an investor, can either hurt or help your portfolio. In our case, we're going to choose to use that as an opportunity to add. We're going to look forward to those 10% declines and hopefully, as I said, we're going to get it this year.

We have a lot to achieve for you today. We have a lot to achieve for you in the year ahead. You will learn from Malcolm Gladwell's book *David and Goliath* as we discuss it — if you haven't read the book yet — that one of the things that Gladwell looks for in great disrupters like David versus Goliath is that they are disagreeable. They're very open-minded, they're very persistent, they're very driven, they're relentless ... but they're also disagreeable. They're never satisfied.

And I can tell you that we're nowhere near satisfied with *Motley Fool One* today. Nowhere near. We're excited. We're thankful for where we are, but we've got a lot of new offerings to improve your experience as a *Motley Fool One* member in the year and years to come. So, you're going to see some of those right after me. Nick Crow and team are going to get up here and present. And Alex Pape and Ally are going to present some of the things that we've been working on.

But, we need to improve the tools that you have — the portfolio tracking tools. Hopefully some of you have gotten a little glimpse of it and you'll get more of a glimpse on our upgrade to our scorecards, and we have a lot of big dreams about that.

I'll just throw one example out that's not yet part of the tool just to show that although I'm extremely excited by what we've worked on and what we've developed, there's going to be more to come. I'm excited about the ability to publish your scorecard to the community without dollar amounts visible — so just percentages — so that you can get a review of the community ... about how you're doing and a commentary below it that you can respond to.

I know that we have some people here in the room or that are streaming live, watching us, and/or watching the tape that have a huge position in their portfolio in a company that they worked at. Sometimes as much as 60% of someone's portfolio is in a single stock. If that stock ends up being Google, awesome. You are buying us drinks this evening. If that ends up being Enron, that's disastrous, and that happened to people, of course.

We want to help you think through the allocation of your portfolio as a company to Motley Fool — and as a community, we want to give you the ability to work with each other on that. I think that's a very exciting additional element to that tool that you're going to see some of ... the work that we've been doing today. So, we need to improve the tools that you have as an investor.

The second thing we need to do is we need to meet you on your terms, more. The technology allows it. All of the dangerous worrying things about privacy have a counterbalancing reality that the ability to create greater convenience and better personal care for your interests as an investor are sort of multiplied, right now, by the technology. So, just two examples.

Some of you want to spend a couple of hours a day investing. Maybe most of your day investing. Some of you would like to spend no more time investing than the time you're spending with us today. In fact, the majority of people in the U.S. and around the world would like to hit the space bar and have their financial life taken care of. So, I know that that's not typical to our team, our group here ... but there are folks among us and there are going to be more and more people in your family, also, who just haven't taken the interest that you have. And we need to create tools and services that make it very easy for you, wherever you are down that continuum.

I remember a great email we got from a member earlier this year who said, "You know, I'm all in pursuing mastery. I care about investing. I love watching the CEO interviews. I love studying businesses. But I've just taken a new job responsibility and I really have to put this on autopilot now, and I don't see a way to do that." So, our position as an investor can change at different points in our career and we need to meet you on your terms more.

The final thing I'll say is we need to continue to pick better and better investments and avoid SodaStream. By the way, SodaStream is up today. I'm kind of shocked by that — I've got to say. Yes, let's hear it. Thank you, Jim. I see that high-hand applause back in the back row. Yes, SodaStream, there's a rumor ... I love the headline I remember. I think it's "Deutsche Bank sees slim possibility that SodaStream will partner with Pepsi," following yesterday's partnership announcement between Green Mountain Coffee and Coca-Cola.

So, we need to avoid more losers and pick more winners for you as investors, and that's always going to be true. We're going to talk a lot about that today and I'm going to have a talk a little bit later today about three things I've learned from the Everlasting Portfolio this year — sort of my annual talk at each gathering.

Those are some of the challenges we face, but I want you to know that we're incredibly excited about tackling those challenges, and I know that pretty much everyone here has a suggestion for how we can do what we're doing better for you and we want to hear them. So, you've got a notepad, a pen. Please feel comfortable writing down all the questions you have or suggestions you have and handing them to any Motley Fool employee that you see.

We'll be gather those trying to respond to some of them in real time over these two days — but really committing in full to answering them on the site. For example, if you literally sat and wrote 14 or 39 questions down over the next 2 days and handed them in, we're committing to answering those questions for you on the site. So, that's going to help us get better at what we're doing.

One example of what we're going to be doing, before I turn it back to Chris, is we're a company now that's right on the cusp of being 100% internally held with no debt. You would be happy if you looked at our financial statements right now. You would think, "This is a great situation. They can reinvest now. They can really build on the service that they've created thus far."

Here's an example of an investment that we're making. Probably at each annual gathering, we'll have some special announcements. Here's one of the special announcements for this gathering and that is that working with some of the *Motley Fool One* members — some of you that are out there in our whole family investing folder — you know that it is our desire, and many of your desires, to figure out how to get your whole family investing.

So, you're going to see some additions to your service here over the next couple of months that are going to allow you to include some of your family members in different ways that we're very excited about. We know that many of you want to get your children invested or your grandchildren — your nieces and nephews. So, we are investing $250,000, beginning today, in Fool Junior, getting young people in your families to start investing alongside you and we're pumped about that.

That's something for us to circle some ideas around here over the next two days, because as we know, money doesn't solve all problems. We're making that investment, but we've got some good ideas. We've got great ideas out in a discussion group. We've got a great team of people that are interested in it internally and in the community, so that's something that we're very excited about.

So, there's a lot coming your way here over the next two days. I'm looking forward to talking to every single one of you, but you probably have heard this from us already. I think some of the most important connections you'll make of new ideas and great people here are actually other members — so please feel free to introduce yourself to anyone. Most of us don't know most of us, so let's spend the next two days getting to know each other better and having fun, pumped up. Chris Hill. This is where I throw the mic to Chris. Let's see how he does.

Transcript: 3 EP Lessons Learned

TOM GARDNER:

... so I want to share three lessons learned from the last year. This is what I did at last year's gathering and I think I want to do it each year — just looking back over the 12 months that were and see if there are any lessons that we can draw that help us as long-term thinkers and business-focused investors. So, we're looking at a discrete amount of time. I may laugh a little bit about the SodaStream investment and then maybe it will be acquired for $93 a share in two weeks and I'll be here going, "Let me tell you why SodaStream was built to last."

I mean, we're all learning as we go, and there are going to be some ground rules for my three lessons, so here they are. You may write these down if you'd like to follow along, and hold me accountable and also I want to reiterate what Chris said. We are changing our mentality on Q&A at The Motley Fool and we are starting to build ourselves up to be able to answer any question you have at any time. That's what we're aspiring to.

So, when you go home, and you're in front of your device that you're accessing the Fool from ... right now you maybe navigate your way into the message folders and maybe you feel uncomfortable posting something in public. So, that makes it harder and harder for you to get answers to the questions that you have. And what we want to do is to begin to build the wheel that allows us to answer them continually and to build up a database of answers that we can share with you, as well, that's searchable. So, every question you ask helps us, truly, and if you drop them in the box, David and I can answer them later today or we'll answer them on video on the site.

So, here are the ground rules. First of all, by the way, we're about two hours away from LinkedIn's earnings. I can't wait ...

So, it's three factors. They're principles. I am considering making them mandates, requirements, as investment principles. I do that rarely — and I will say I'm only considering it — but I am considering it. These are lessons that I've learned. The goal is to optimize our long-term performance from them.

I believe that these three lessons are more important than the valuation of a business, and valuation matters to me. But we talked about this a little bit in our last event and video — namely that when you're a long-term, business-focused investor, valuation is not as important as other factors. So, we'll talk a little bit more about that, but I'm advancing that these three matter more to me than valuation.

And finally, they're not clear reads. It's not like, "Oh, OK. Obvious. Check, check, check, check. This one's going to be a winner." So, rarely they are clear, but sometimes you have a good sense of them.

So, last few basic bullets before going into the talk. As you know, from reading at The Motley Fool, we're going to be right like six or seven times out of ten. Maybe five or six times out of ten. That's just the nature of the game of investing in stocks — making sure that we're all building our portfolios for those few losers that congregate in every 10 selections that we make. It's just the nature of the game. Now, some of you may be sitting there thinking, "You know what? I'm actually at about 90%," in which case I'd like to talk with you afterwards and jobs.fool.com is open to you.

Second obvious statement is there will be blood in the markets, as we know. We've seen it five years ago. We've seen it thirteen years ago. It happened in the early 1970s. Happened on a single day in 1987. We all have to build our portfolios and build our temperament to handle downturns and here we are just five percentage points down —

even less — because the market, unfortunately, is up today. And we see the headlines. So, people are being trained to get emotional by the media and we have to counterbalance that in our investments.

I said this last year. The best investments, in my research, fall 40% twice within a decade. You see the volatility of a company like Tesla stock — you can expect that one is going to get cut in half at some point in the next decade. I would guarantee that, in fact, and yet a lot of us at The Motley Fool — found, recommended and invested in that company before I did. Here we were at $146 in the *Everlasting Portfolio* and it's at high $170s now. It's a short-term return, but obviously we believe in Tesla.

Finally, you will be right and I will be wrong frequently, so that's how we're going to learn together.

So, here are my three principles:

1. The first one is that I think every month that passes, every person that I get to interview, every business that I study ... I become more and more certain that looking at the leader is incredibly important. I'm going to make a few recommendations on a couple of factors to think about when you're evaluating a person.

The first is what is their tenure in the industry? And I don't want you to get too caught up on *they've been in the business for 31 years* because you couldn't say that about Mark Zuckerberg. So, I'd like to know what's the tenure in the industry as a percentage of their professional career.

And overall, you probably know I'm not excited about CEOs that jump from one industry to the next. There are some of them that are excellent at it because they're turnaround specialists, and so I might look at their industry differently — like their industry is turning around businesses and they know how to do it. So, that would be an example of an exception to this rule. But overall, if I'm not finding somebody who started the company and is running it, I want to know that they've really been in the industry and they care.

Selim Bassoul did not found Middleby. He discovered it broken, but he was not the founder of the business. But if you look down the top 12 holdings in the *Everlasting Portfolio*, which makes up 75% of the portfolio — the top 5 companies make up 50% — you're looking at one founder CEO after another.

You've got Monty Moran at Chipotle. Mark Zuckerberg. You've got John Mackey at Whole Foods. In fact, Jeff Weiner was not a founder of LinkedIn, but I see him in the industry going back to his days when he came out of Wharton. So, I really want to see the tenure of the industry — that essentially, pretty much, their entire career is in that industry. Tomorrow, Pete Miller, National Oilwell Varco. Graduated from West Point, 1980. Was in the Army for five years and has been in oil and gas ever since. I love to see that and we'll be learning more from him tomorrow.

The second is that there's a clear demonstration that they're on a mission. They have a purpose that's driving them. You know, the more that I look at these qualities as I wrote them down, the more I thought, "Gosh, it's just Elon Musk. It's just obvious. It's just sitting right in front of us. It's so obvious." And what a great job by David and his team finding that stock. Alex Scherer in our *Stock Advisor* team putting it on my side. Elon Musk is demonstrating all of these qualities, but a number of the CEOs in Everlasting Portfolio are, so number two, they have a mission. They're aspiring to change the world for the better. That doesn't happen in every CEO that I meet. I don't get that feeling in every CEO that I meet.

The third is that they have an ownership stake that matters — so, their capital is on the line. Once again, I'll just say Elon Musk. Gosh, didn't he own enough Tesla already to not have to go out and buy more in the public markets? And that's just a really great sign when you see that happening. Warren Buffett has said he loves to find a CEO that is managing that asset as if it's the only asset that their family will have for the next hundred years. So, really looking and seeing if we have that type of person running the business that we're investing in together.

And finally, from a business standpoint, I would say I like to find the youthful founder CEO on a mission with a big equity stake. Mark Zuckerberg, in 20 years, will be the same age as Jeff Bezos is today. He's got 20 years in his professional life to impact the world. Now, returning to one of the ground rules, I'll be right six or seven out of ten times. Mark Zuckerberg may step down as CEO of Facebook this year or the company may fire him in four years as Apple did to Steve Jobs.

We don't know what's going to happen, so we're playing the probabilities, but I think finding those qualities in our leaders is really important, because what we want to find is somebody who cares more about their company than we care about the investment we've made in their company. In fact, what a sickening feeling if you ever have that sense and have had that sense — which I have in my investment career — of wow, I'm not sure the CEO cares nearly as much about the future of this business as I do about the money that I've invested into it. That's not a great feeling to have at all.

It's easier and easier to get that read on what's happening out there in the business world and how passionate and purposeful the leadership is. And let me mention an example of where this has worked against us. That is that in my interviews and interactions in the time I got to spend with Lew Frankfort, the founder of Coach, he demonstrated everything that I look for.

And I was talking to Selim Bassoul, about four weeks ago, about different companies in the *Everlasting Portfolio*, and he was saying, "You know, the thing about Lew Frankfort is that think how uniquely great you have to be to deliver the results that he did in the fashion-fickle business. Just think how brilliant he must be. Therefore, his successor ... it's going to be very tough." And I've written before in the past that it's actually when you are the successor to a company like Coach — that business is larger, more complex than at any point in Lew Frankfort's leadership of it — so you actually need somebody who's going to be better than Lew Frankfort running Coach.

So, the transition point on succession is increasingly important to me and really trying to understand do they have a culture that's going to produce a leader that's ready to be as great or better than the present CEO. So, that's where leadership and culture start connecting.

Those are some of the factors that I see in leadership. The Ron Shaich interview — if you got a chance to see it from the Conscious Capitalism Conference itself on *Motley Fool One* — Ron talks about his investment approach. He's the founder and CEO of Panera, or actually he's the founder of Au Bon Pain which bought Panera and then spun off Au Bon Pain and they went all in behind Panera. And basically Ron said — at one point we were talking about leadership — and he goes, "Oh, yeah, yeah, yeah. When I invest, I invest in founder run. I want to know the person is there and this is their life. They're passionate about it."

There are enough of these companies out there in the public markets that they at least deserve our serious, serious attention. In fact, it is my aim to make the Everlasting Research Center the number one place to study and understand founder-led companies and CEOs with ownership mentalities. So, we're going to be building out that in the year ahead.

So, there we are. We've got Selim Bassoul. We've got Mark Zuckerberg. We've got Monty Moran, John Mackie, Frank D'Souza at Cognizant, Spencer Rascoff, Pete Miller. These are ownership CEOs. Whether they founded the company or not, they're all in and I love to find that. That's point number one. I kind of feel like maybe I should mandate that — that those are the only companies that earn their way into the *Everlasting Portfolio* — the companies that meet the criteria that we're developing about leadership and culture.

2. The number two important factor is pricing power. Does the company have pricing power? How many of you watched the Bruce Greenwald interview? If you did, you saw Bruce attack everything about my investment approach, which was very fun for me. Bruce is a professor at Columbia University. He's kind of like the anchor at Columbia that still says you can beat the market in the major wave across academia that's trying to just present that it's impossible to do and you might as well passively index. Of course, we're fans of passive indexing, but I love people like Bruce who are standing out there and demonstrating that you can be above average. And so, Bruce and I debated my investment approach and we talked a lot about pricing power, but I want to go through a few principles for identifying whether or not your company has pricing power.

This is Warren Buffett's number one factor. He said that he looked back across all of his best investments over the last 50 years, and the single factor that connected with each of his best investments is that they had pricing power. And if you saw the Jim Sinegal/ Costco interview that we did, Jim said, "Yes, we feel that we have a lot of pricing power at Costco, but we never actually put it to use." Like it's even better to have pricing power and to not have to use it, but you want to find companies that do have pricing power. So, one of the easiest ways is to look and see a product that you think is just overpriced but you, yourself keep buying it. There's an alternative that's less expensive, but you're just not willing to really consider it.

Bernard Baruch, the great investor, was asked by a woman at a party to name a few stocks that she should go home and buy, and he said, "I'm not going to give you a few stocks. I'm going to give you a few principles. Just use these and I think you'll end up succeeding." By the way, this woman, who started with a small portfolio, died with more than $15 million and about $10 million of it in one stock. And she did it all based on his principles, so he totally changed her life at the cocktail party with these three factors.

They were only invest in companies whose products you buy every 30 days or less, throw them away and buy them again. Those companies have pricing power because they have your habits, they have developed a brand. There are many great household product companies. There are many great beverages. Starbucks is a great example of this. So, having that mind-set of, "Wow. I'm repeatedly buying from this business and there is a less-expensive alternative, but I'm not really willing to entertain it." And then more important than that, of course, is broadening beyond your own view and observing what's happening in the world. There is a less expensive phone, but no one's buying it.

And then, of course, you might start looking at your company and seeing there's a less expensive alternative and people are starting to buy it. How innovative is my company to go to the next product where they can maintain or develop pricing power around that product? So, the world is always evolving. Pricing and competition are always changing. The incredibly unique offering of today could be the commodity of three years from today. So, it's not an easy, clear read. But trying to figure out does my company offer something that's truly unique? Is it offering it in a way that I am repeatedly using it and/or other people are repeatedly using it and/or buying it? So, repeated, habit-driven use or purchasing.

And, I guess the last thing ... I don't know that I've ever seen this term out there, so maybe I'm coining a term right now, but probably somebody's used it, and that is, is there a brand flock? Are people flocking to that brand? Just look at the line at Chipotle. Just look at the enthusiasm that people have when they hear that one of their friends has a Tesla and they might be able to test drive it. I mean, who here would test drive a Tesla right now if we had one out front? Hey, David Gardner, in the back row. Don't you own a Tesla? Out front? I won't do that to you. I won't say that.

Try and see what you're excited about. People celebrate a Chipotle coming to their neighborhood. We have contacted Chipotle and said, "Please open one near our office." So, whatever your neighborhood is getting excited about or you're getting excited about that offering coming your way, that's a sign of something unique that can develop pricing power.

I don't think SodaStream has any pricing power. So, it would be good to maybe mandate that we look for businesses that are gaining or maintaining pricing power, and of course, referring back to the original principles, we'll be wrong three or four out of ten times. But I think that what Buffett said, as is often true, makes a tremendous amount of sense, and that is that pricing power really matters.

And one last point on this. Things are always changing. I don't think it's good news — the announcement that Starbucks just made. I think it was a smart move with their executive shift — that they've placed greater emphasis now on the world's changing. There's a seismic shift, as Howard Schultz said, in retailing and that is going to negatively impact Starbucks.

The repetitive demand that Starbucks gets by being in malls and other retail areas will be drawing smaller crowds because people will simply be ordering more and more things online. That takes away some of the natural foot traffic that Starbucks gets just from people being out there. That's not a good thing for Starbucks. I think Starbucks is smart in making some shifts to focus on the future. Maybe we'll be getting our Starbucks delivered to us in a self-driven, driverless Google car. Brought to you by Uber. Delivered to your door. Who knows? But Starbucks is right to be thinking that way.

In fact, one of the interesting things about having pricing power and habit and repetition is that you actually can lose that sense of innovation in your organization and start to just assume you've got it made and that's, of course, when you're starting to look like Goliath and a David is going to come along and disrupt you. So, these are some of the challenges that businesses face out there, but I know we want to find businesses that are gaining pricing power.

3. So, the third lesson that I've learned. I guess I'll say the first two lessons — I like to learn as much from my failures as from my successes, and I like to learn as much from my successes as my failures. I would like to place an equal emphasis on both. If you forced me to try and learn more from one than the other, I would say my better long-term returns are going to come from learning from my successes ... just sitting and studying what are the patterns and factors that have led to these great businesses and how can I find more of them. And if I'm trying to preserve wealth and reduce the volatility of my portfolio, I'm going to learn more from my failures and try and figure out how to avoid the mistakes that I've made.

So, if I look at the failures of the first two principles, I would say when we talk leadership and culture, we have a turnover in leadership at Coach at a crucially competitive time with Michael Kors and I think that is definitely one of the primary reasons that I have not added to Coach. Even though I know from a valuation standpoint it may look attractive — as I said, these principles are more important to me than valuation. On the pricing power front, I don't think SodaStream has pricing. It doesn't matter to me how big your market opportunity is. In the long term, if you don't have pricing power, it just means you're ultimately going to be undermined by somebody, and that worries me. So, those are my learnings from my losers.

If I'm to learn from my winners, I'll just put Facebook for both of them. I think Facebook has a lot of great leadership and culture as business, and I think it's gaining momentum. Obviously, there's questions about teen usage in Snapchat and that will be an important factor for them, but the bulk of people are using Facebook a lot and advertisers are more excited about being there than they were a year ago.

So, my third factor is simply a reminder of a prior factor and one that naturally will always be questioned, and I understand why. And I remind you that you don't have to follow this or any factor that I present. But the third factor is, this past year I've learned how much I love, even more, requiring that I may not sell within five years, because I have a friend who, through our recommendations in *Rule Breakers* and *Supernova* has bought 3D Systems. She's up. She's very happy. But we saw what happened yesterday.

And she sent me an email — an exchange she had with her financial advisor — and it reads like a playbook as to why you should hold a stock for a minimum of five years and have that mind-set. Because the amount of anxiety that went through that email because of the big single-day drop — it's just too easy to confuse volatility in pricing with long-term business performance.

And I'm not here to predict right now whether 3D Systems is going to succeed or not from here. I'm just saying that the entire conversation that happened about that stock and that email I saw was about short-term price volatility. It wasn't like, "Hey, I've looked at the business and the leadership team and I have some questions about it." It was, "What should I do now that the stock is down 20%?" I totally understand that. That's human nature, but it doesn't lead to better investment performance.

So, here are a few reasons that I love the five-year hold. I encourage you to follow me in this. I would encourage you to even double it to a 10-year hold. If you're feeling like you want to improve your returns, I would go even longer-term. Warren Buffett's sixth largest holdings — one of them is IBM, which he bought somewhat recently, so we'll kick that one out. The other five — the length of the holding period of those five companies — twenty years for Warren Buffett. So, I'm suggesting ten years. Best investor in American history — 20 years across his largest holdings.

So, these are some of the reasons that the five-year hold is so important to me. Number one, let's talk about the losers, the ones we want to sell. The beauty of holding SodaStream for another four a half years is that I will learn this lesson every month and there may be other great lessons about SodaStream. It may succeed. So, I still have skin in the game. I made the commitment to start, so I'm going to learn.

And let's say it doesn't work out. Let's say SodaStream falls to $19 a share and it's just sitting there four years from now. I was able to learn some very important lessons about a tiny portion of my portfolio. That's what your losers become. They become insignificant percentages in your portfolio. So, the ratio of important lessons learned to actual cost of learning them is very favorable by holding onto your losers. I know it's a contrary way to think, but I truly believe that.

Number two and far more importantly, it starts to develop the discipline in you to hold your winners, which is the most painful way to lose money. So, you've heard me say it in the past, but I bought Dell in 1995. I know Dell had some troubles here in the last five years — but all in all, as a public company, it was an incredible stock. I bought Dell in 1995. Stock went up 25%. I celebrated. I was like, "Wow. Twenty-five percent in six months?"

I ran my valuation numbers. I sold. Let's say the stock was at $25 and I waited for it to return back to my original buy price of $20. I was like, "Sweet. Got it." Stock dropped to $21. Never got to $20. I was waiting for my price, sure that my valuation was right all the way along and I'd make 25% in less than a year. Then the stock went up 40x in value. So how many losers would I have to sell in order to make up for the money that I lost by selling Dell too early? So, the mathematics suggest the most important thing about long-term focus is that it teaches you to hold onto your winners.

Final quick points. It separates environmental, large macro issues from the strength of your business that you're invested in. It separates volatility in pricing from the strength of the business that you're investing in, and it basically, finally, sets you up to add more along the way to those companies. In some cases, the price has gone down, but you've researched the business. You love that situation.

Interestingly, I have added to none of my biggest losers and none of my biggest winners in the *Everlasting Portfolio*. That's what I've done. I'm pretty sure you know the answer, but should I be celebrating that or should I be bummed out by that? The answer, I guess, is at this point we don't really know, because we'll see how the businesses play out over time. But if we took a snapshot right now and this is where we were, and this was it ... then far and away the worst thing mathematically is that I didn't add to my winners.

So, I can celebrate that I saw the problems with the losers, but I haven't seen enough of the opportunities in our winners, and I think really committing ourselves to being business students focused on leadership, pricing power and long-term commitment to our investments opens the possibility that we'll learn enough to realize where we should add along the way. And the beauty of it is, with all these mistakes, here we are in the *Everlasting Portfolio* up 25 percentage points. What we're trying to do is get better and better together and apply these principles and see where it takes us.

I think there is maybe three or four minutes left and I can take a few questions and/or we could break early if you wanted to.

FEMALE:

You call the losers, or the ones that you consider as losers now "losers," but with a long-term time horizon, they may not be losers. So, maybe it's too soon to call.

TOM GARDNER:

That is true. Definitely, Roslyn, true. So, I called the losers "losers," but here we are. If we had only started in the spring of 2012, we would have called Baidu a loser at one point. Now we call it a winner. So, depending on when you purchased LinkedIn, you may be calling it a loser right now, or you may be calling it a huge winner. That's what time horizon allows us to do, is to widen the lens, and it is very easy for the human brain to focus on what's happening right now, including my brain focusing on what's happening right now.

However, I would say that in the context of Coach and SodaStream, I have to see some profound change, now, to their situation for me to believe that they're going to be successful investments. I may be proven wrong. Succession planning at Coach may go incredibly smoothly. I have a bet with Alex Scherer, who I don't think is here right now ... When Michael Kors and Coach were pretty much right around the same price — I think in the low $50s — we made a five-year bet and he has to buy me dinner in New York City if Kors is better, because I think Michael Kors is a better situation. Michael Kors is at $91 now and our Coach is at $44.

So, you might say, "Well, why didn't you just make that flip?" Because, again, I think the lesson is going to be more important in that investment. But, you're right. Those two companies may end up being winners for us. I see fundamental business problems for them.

FEMALE:

[00:28:19]

TOM GARDNER:

Let's hope so.

MALE:

[00:28:38]-[00:30:07]

TOM GARDNER:

At this point, just enter the sound of a question mark. I agree with many of the things you're saying. How do I do valuation or how do I think about valuation? A few of the points that were made were you've got Michael Milkens out there. You have companies that are frauds that, that concerns. How do you think about the time horizon and the principles that you're applying to look for a great business?

I guess I'll say that each of us has to figure out how to set our portfolio up. I think what we're trying to do, when we showcased our financial planning tool earlier today ... that has a fiduciary, SEC set of rules applied to it ... is we're trying to set an example for you of how to create a balanced portfolio. Whether you choose to use that tool or not is up to you, but we want to show and provide context, and I think some of the lessons and principles I'm sharing here are trying to help set a context for how to think about the individual businesses you're choosing to invest in and then how to set your portfolio up to accept the natural ebb and flow that's going to happen in the market — rather than feel that you can time it one way or the other.

I think my portfolio view, from a technicals or from a perspective of when to be invested or not ... I'm fully invested. My approach is to be fully invested. To invest the money when I have it. To take the Shelby Davis approach of just buying stocks and using it like a bank over your lifetime, accepting that you're going to make some mistakes. And valuation is important to me, but valuation is just as unclear as the principles. Each situation comes along. We try and figure it out, and if you're me, you're like, you know what? No, I'm not going to buy Under Armour here at $49. I'm not going to buy it here at $82. It just looks too expensive. And here it is at $105.

And so, the way that my mind works is to say, I'm not actually going to let myself walk away from that. I'm going to go back and look at it, and try and understand why I was wrong. Not to assume that the market was wrong, or other investors got lucky, or that's just a style I would never embrace. Even if I won't embrace a particular style, I'd love to understand it more and more.

The study of Under Armour is going to be a very fun one for me this year — to understand why have I missed a company whose leader meets all the criteria, which has pricing power pretty solidly at Under Armour ... although I will say that I slightly misread that. So, all of these principles I'm trying to apply to literally every company. I definitely love to study the companies that I've missed, which are often because I placed valuation too high on the list. It's the Buffett line — it's better to pay a fair, full price for an incredibly great company than to get a great discount on trash.

FEMALE:

First, I just want to thank you for the extraordinary day that your team has set up for us here. This has been terrific. And given some of the things you're talking about in your lessons learned and your principles are really about discipline and thorough thinking. So, having said that, why have you chosen not to add to your winning positions in the EP?

TOM GARDNER:

I think that probably valuation crept in a little too much. Now, we live in a particular point in time. There may be a moment where, all of a sudden, dare I say it, Under Armour's at $67 a share and it's like, "Wow!" But I will probably never be glad that I waited and didn't buy it when Jason Moser did in the $40s.

So, I like to keep resetting to the present day and trying to modify my principles to understand where they've been wrong while recognizing that my principles may actually have been right. They just haven't played out that way, yet. So, that's some of the multilayer complexity of being an investor, is trying to figure out, "When do I tweak my principle because it's actually not working? Or when is it just a matter of time until it does work?"

You could have been sitting there in 2000 going, "Why have I not purchased JDS Uniphase? Why have I not bought the stock? It's gone from $15 to $340 while I've been watching it." And then in 12 months, it's below $3 a share. And you're like, "Wow. Was I ever right." Hey, by the way. Who did own JDS Uniphase and was talking to me for the last 18 months? Oh, I wasn't meaning that in any specific way. I had plenty of those.

My point is that sometimes given enough time, your principles play out. Other times, you see enough evidence that your principle isn't right. And I think that David, for growth companies, has the right principle that valuation. My dad has said to me something that's been profoundly helpful for me over the last 10 years, and that is, "It's not a good idea to be a value investor in disruptive growth companies." You've got to look somewhere else. You can be a value investor in other industries, but saying, "Hey, this is awesome. The cheapest company here is Dell. I'm going to buy that," when Google, Facebook and real disruptive growth businesses are in early phases of their trajectories. So, I just think I applied valuation a little too tightly on some of my winners and hopefully that will play out differently.

MALE:

I recognize your five-year hold period — that's a rule that you're following — so you're down on SodaStream and Coach. And if you're a portfolio manager, and you're trying to maximize returns, and that's the position you're in, do you sell or do you hold?

TOM GARDNER:

If I'm trying to maximize my returns over a short period of time, I'd probably sell. If I'm trying to maximize my returns over the next 20 years, I hold. That's my belief. The mathematics may not support it, but maybe some unquantifiable, educational truth is out there that learning as much as I did from Select Comfort got me into different types of companies and out of different types of companies because I stuck with it and had to eat crow and die my remaining hair, at that point, green because Select Comfort did not succeed. So, I think that there's a bigger value reward for staying in it in the long term than the monetary award of getting out and into something else quickly.

There are a lot of questions, and I see time's off in the back. We're here together for the next two days, so I'm happy to answer everyone's questions along the way. We do have the resolution table with the box. I am personally committing that we're going to answer your questions, so I love that you have them. Sorry that we don't have enough time to answer them all right now, but I look forward to doing so over the next 36 hours together.

FoolFest 2014: Eddy Elfenbein of Crossing Wall Street

Published Feb 19, 2014 at 11:42AM

{% ooyala id="hnZjBuazoDmMP6vrgBXjEGFDwuCtSLNr" width="580" height="326" %}

Run time: 55 minutes

At our February member event, *Fool One*'s Morgan Housel introduced Eddy Elfenbein as "one of the wisest investors I've ever come across" — and you'll soon see why. The editor of Crossing Wall Street, Elfenbein talks about the big trends he's seeing in the stock market, how people really make money investing, and what he looks for when he's researching a potential investment.

Transcript

MORGAN HOUSEL:

The worst position that any speaker can be in is having to go onstage after Malcolm Gladwell, I think, but we're going to try this. My name is Morgan Housel. I'm a writer for *Motley Fool One* and I write for Fool.com, as well. I'm here today to introduce our next speaker sitting next to me, but first I want to talk about something that's near and dear to my heart, which is the intersection of finance and the media — so the news articles and the blog posts that we read learning about the market and learning about stocks.

I did some research at the Library of Congress this week. I wanted to see how has the financial media changed over the last century. So, I found some numbers. In the 1920s — it's almost a century ago — there were about 7,000 news articles and magazine articles published every year that had to do with investing that contained the words "stock" or "market" or "bond" or something like that. Seven thousand per year. By the 1960s, that was up to about 18,000 articles per year about investing. In the 1990s, it rose to 48,000 per year. And does anyone want to guess how many investing articles were written in the last 30 days? It's not talking years anymore. In the last 30 days, how many investment articles were published? That's everyone. All news sources. Everyone. Yes.

The answer is 890,000 in the last 30 days. So, we publish, in every 90 minutes today, we publish more investing articles than were written per year one century ago. And in many ways, I think that's great news because that's the democratization of publishing. There are thousands of investors today that have a voice that would not have even five years ago — and that's wonderful, because there are so many brilliant investors. They're not journalists. There's investors — people like yourselves in here — that everyone can learn from. But there's also a point where that's just completely overwhelming. If you wake up in the morning and you want to read financial news, and there are almost a million articles published every month about investing, where do you start? That's the classic drinking from a fire hose. There's even no place to start.

So, I think today, more than ever and growing by the day, it's important to have some sort of filter on what you read, and to have a list of people that you know you can go to consistently to find the best news information. And for me, over the last several years, one person who's been near the top of that list is this guy sitting next to me, Eddy Elfenbein.

Eddy is not a journalist. He runs a blog called CrossingWallStreet.com. If you're not familiar with it, write it down. Bookmark it. You won't be disappointed. He's an investor. He has a track record of outperforming the market. He's one of the wisest investors I think I've ever come across. He's one of the best and funniest writers that I've come across, as well. So, I hope I didn't set the bar too high, Eddy, but I think you're going to enjoy him today, so please welcome Eddy Elfenbein.

EDDY ELFENBEIN:

Thank you, Morgan. Thank you for those generous words. As I thought about what I wanted to talk about today, I could come up and talk about stocks and P/E ratios and dividends and things like that ... but instead I want to take a step back and talk about some of the trends going on, on Wall Street and in the economy that affects us as investors, and things that are important and shaping how we think about our investments. And I see two particular trends that are tied together that are impacting the investing world.

One aspect, one trend is we're seeing the dispersion of knowledge and twinned with that, we're seeing the concentration of authority. Another way to think about this is it's the dispersion of expertise and the concentration of power. And these two happening at the same time — and I think in many ways reinforcing each other — are causing frictions within the investing world.

Probably one of the best examples — this would be one way of looking at the financial crisis. It's the divide, you may have heard, between the suits and the geeks. At many of these large investment banks, they just didn't know what was going on with the structured products. It was a whole new world. The managing directors — they had no idea what was going on with all the formulas and the quantitative analysis and the rocket scientists. Another way we can look at this is what happened with the Obamacare rollout and the website and the problems with that. It's this divide between the suits and geeks and the dispersion of knowledge and the concentration of power.

We see this happening on Wall Street where we used to have the large, big banks and the cult of the analyst. Do you remember years ago the analysts would come up and they would give their view of a stock — and it was so important as far as hitting earnings or not. A lot of that world has really changed. The banks have cut back on their research departments. They just don't have the coverage. They'll cover the larger companies, but the smaller companies, the up-and-coming companies ... they really are not covered by a lot of Wall Street. This really changes the investment landscape. It also changes how we think about risk and what goes into investing.

Now we see some of the most important names —when they give their advice on a stock — we see the rise of the active managers. You may see this on CNBC. These are people like David Einhorn and people like Bill Ackman. We had Carl Icahn. Just think about this. He tweeted his opinion on Apple — this was a tweet — and it moved the stock $17 billion just off one tweet. The role of the analyst has fallen dramatically. We see people like Jeffrey Gundlach. Many of you people may know him. He's one of the bond experts.

But who are these people? They're not from the old Wall Street. Gundlach is one of these people — maybe you've known people like this — one of these people who's superintelligent and sort of bored by this, bored by that. He had near-perfect SAT scores. Went to Dartmouth and was kind of bored, so went to Yale for graduate school in theoretical math getting his PhD program. And he wanted to, for his dissertation, his idea was he wanted to prove that infinity does not exist. They said, "Maybe this isn't the right place for you being in the graduate program," so he was like, "Okay," and he went off to Wall Street and made an incredible fortune. But it's these kinds of people — these are the people who have the voice now on Wall Street. These are not the kind of people that you would see many years ago if you saw Louis Rukeyser.

I'll give you another very good example. On the first season of *The Sopranos*, Carmela Soprano — she decides she wants to learn about the stock market. She sees that her friends and her neighbor, in their tony neighborhood ... they're into the stock market and she wants to know about it, too. She doesn't go to Morgan Stanley. She doesn't go to Merrill Lynch. She certainly doesn't go to Lehman Brothers. Do you remember where she goes? What was that? That's right! She went online and you could see she was on Motley Fool. These are the kinds of things that did not exist years ago. These are the dramatic democratizations, as Morgan talked about.

Another good example. This happened about 30 years ago at Salomon Brothers, which at this time was a private investment bank. So, they had their managing partners and the firm was bought out by a public company. So, the head of their equity trading division was a man named Michael Bloomberg, and Mr. Bloomberg was told on the same day, "Here's $10 million and you're fired." He was no longer needed at Salomon Brothers, but since he was a managing director, he got part of the buyout. So, he took his $10 million and was never heard from again ... No, no. He started Bloomberg and he's one of the wealthiest men in the United States and the entire world.

But think about this. His fortune was not through inventing a new company, a new consumer product. It was financial news. That's what he was providing. Everything flows from those Bloomberg machines and Bloomberg News and Bloomberg TV. It all started with those Bloomberg machines. It's giving news to investors. We live in a world where we're drowning in information, but there's not enough news, and this changes how people think about their investments. It changes how people think about what is risky and what is safe.

Now, let me give you a good example. I'm going to talk a little bit about NFL football, but I'm actually talking about the same themes. There's a man named Brian Burke. He lives in this area. He was in the Marine Corps. He was an F-18 pilot flying the Hornet. Those are the guys — they certainly have the right stuff. And when Brian left the Marine Corps, he was into numbers and football, and he dissected football and exactly what goes on in the game.

And his theory — and he's not the only person who's developed it. He's probably the most prominent — but he says that in the game of football, coaches don't go for it on 4th down nearly as much as they should. They should go for it on 4th down far more often. Now, I'll skip over the technical parts. You're not a sports fan. But basically he said, if it's 4th and 3, you should be going for it. And unless you're really backed up inside your 20, or it's 4th and very long, should you punt ... but your punter should be doing a lot less business. In fact, even field goals, you should always be ... If it really comes down to it, you need the ball to score.

Now, this is exactly how we think as investors — what is risky and what is not. It's management of resources — forecasts of different moves — if you do this, they do that ... and it's risk/reward. It's exactly how investors think. And what he's saying is it's all wrong. But then we see this exact suits and geeks divide. NFLs, who are you? Who are you to tell us this? You're just a geek running your numbers. We know what's going on. These are players. We know what's going on. Authority always argues from a position from authority.

And Brian has had absolutely zero success in changing the game of football. He's talked about this now — he has a space at the *New York Times* and nobody listens to him. The NFL coaches just go on doing what they're doing. Now, some of you may remember there was money involved where that had an impact on the game, but actually that was on the game. That was at the GM level. This is different, because it's actually going into how football is played.

And it's a fascinating aspect because there's something about the human brain that just doesn't get statistics. We just do not understand probabilities. It's so much against our instincts and how we think, and we see this happening on Wall Street all the time. Fear and greed are not the same. One of the deep truths about the market is bull markets tend to rise very slowly. Bear markets tend to be very sharp, very sudden and very painful and that's because it reflects something about human nature. In the earlier discussion, they were talking about short selling. Short selling is very, very difficult but you can make a quicker profit if you get it right because it's much more common for a stock to drop 50% or 70% in a day or in a week than it will to rise that much.

I'll give you another good example. Some of you may remember this. This happened in the late 1970s. There were two brothers. They were named William and Nelson Hunt. Some of you may remember this. And they had a plan. What they wanted to do was they wanted to buy silver. Actually I undersold that. Their plan was to buy all of the silver in the world. Every ton. Every pound. Every ounce. All of it. And once they did that, then they were going to set the price. Their father was a famous oil tycoon billionaire. These were the wealthiest people in the world. Actually one of their brothers was Lamar Hunt, longtime owner of the Kansas City Chiefs. One of the founders of the AFL. The AFC trophy is still called the Lamar Hunt trophy.

So, the Hunt brothers went in their plot to corner the world's silver market. When they started, silver was between $1 and $2 and they bought massively. Now, you're thinking, "How does someone possibly buy all the silver in the world? How can that possibly be done?" Well, what you do is you buy all the futures contracts more than can possibly be delivered, and the only silver that's not owned is on Grandma's china cabinet. Outside of that, they have it and they bought massively. And it went from $2 up to $3 up to $4.

But then people caught word of what was going on, so there were traders who slid in behind that and they had the safest trade in the world because they were riding behind these billionaires who were just buying silver. And we're not talking about years. We're talking about days when silver went up to $5. Then it went up to $7 an ounce. At that time, Tiffany took out a full-page ad in the *New York Times* that said, "This is outrageous. How can we let this happen? This is against the public interest." It's always interesting how the public interest sort of merges with their private interest but ...

Silver eventually peaked at $50 an ounce.

They made billions, but they were borrowing heavily. Now there's something about a futures contract. In stocks, you can double up with margin. In futures, you can go up tenfold. So, the Hunts were borrowing huge amounts of money to buy futures which they were, in fact, borrowing to borrow money and they were making astounding profits. But the Hunt money, the people riding in ... they were making the easy money.

But then something happened. The COMEX changed the margin rules on the Hunts. Very slowly, people got nervous and they started to sell and silver went down. Then as silver went down, people got nervous, and they sold, and silver went down. Then people got nervous, and they sold, and silver went down. It happened very slowly. Then on March 27, 1980 — which we now call Silver Thursday — the bottom fell out and silver crashed and the Hunt Brothers were wiped out.

But worse than that, the Federal Reserve had a problem on their hands, because people had lent the Hunt Brothers so much money. Tell me if you've heard this story before or if this sounds like anything you may recognize. And so the Fed had to go in and try to rescue ... A lot of money came from the Saudis who lent them money through their oil connections.

But we changed what is safe — what is risky. So the people who went in, early on and just rode behind them — they had the safest trade in the world. The people who lent them money — they thought they were making prudent loans. What was so safe was then risky. What appeared to be risky could have been safe. It's exactly what we see on 4th downs in the NFL. People are afraid to do it.

I think one of the reasons — it's like people just don't get the math. About the 4th downs, it's not that you're going to convert. It doesn't say the odds are in your favor of conversion. What it says is — and this is what people don't get — it's the benefit of the conversion versus the cost of not converting. So think of it this way. If you have a one in three chance of getting that 1st down, the benefit is five times, so therefore it's in your favor. People don't get that. That escapes them. They will always go with the more conservative view, and they will not risk what they have.

Now, there's a famous instruction in game theory where ... It'd be a room like this. A room full of people and the exercise is to ask them to write down any number between zero and one hundred. And they'll say, "We'll give a cash prize to the person whose number is closest to two-thirds of the average of all the other numbers." So you think about this. Well, OK. If people are going to do zero to a hundred — well, then the average will be fifty. So two-thirds of that would be thirty-three. That's what I'll write down. I'll write down thirty-three.

Wait a minute. Wait a minute. What if everybody else says thirty-three? So, ah! I'll be a step ahead of them. I'll do two-thirds of that, so I'll say twenty-two. Wait a minute. I see a hole in this one.

Well, people run this experiment. This is a fascinating experiment. Now, there may be some of you who say, Ah! I know the answer. It's the Nash equilibrium — people taking too much math. I know what the answer is. It's zero. That's the answer. Very good. You get an A for the day, but the problem is you applied rationalism to human behavior. Big mistake.

It turns out when you run this experiment for whatever reason, the winning number is about 21.8. It really makes no sense at all why that is, but that's how people act. And it shows something — that in finance, there's an attempt to quantify things that aren't so easily quantifiable. The reason is in finance, the participants know what the score is.

I'll give you a very good example — is in horse racing. People have studied, looking at horse racing, what are the best horses to bet on and what are the worst ones. It turns out that the favorite is the best bet — meaning you lose the least betting on the favorite and the absolute worst is the long shot. But here's the interesting part. Why do people bet too much on the long shot? They over-bet on the long shot and they do it *because* it's the long shot. And if you think about that, "Yeah, sure. I'll put some money on the long shot. It's kind of fun. Get a big payout." But they're aware of the odds, where people don't think about that for the other horses.

Same thing happens in the movies. We know studying the return on equity by ratings of Hollywood movies. Do you know what the highest ROE is by rating? It's the G movies. It's the G movies by a lot. And they're even better because they have the lowest variability in returns. Now, I say its ROE is lowest [sic], not the box office. The biggest box office draws are the R-rated, but it's the same thing as lottery. It's swinging for the fences, because then you have the huge bombs. It's the variability versus the consistency. It's the same things we see — how risk is played.

Now, I'll give you another example actually from the world of sports. In the 1970s, some of you may remember there was the ABA. This was the rival franchise to the NBA. And the NBA said, "We're going to merge, and we're going to have four teams come in." I think it was the Nets — now in Brooklyn. The Nuggets. I think the Clippers and I think the Spurs. I could be wrong on that, but I think those were the four teams. Actually the Will Ferrell movie was vaguely about what had gone on. Most of the rest of the teams — the franchises and the ABA — they weren't very strong. The others they paid some money to go away.

But one franchise said no, we're not going away, and this was the Spirit of St. Louis. Their announcer was a very young Bob Costas. They said, "We're not giving in." So, the NBA made a deal with the Spirit of St. Louis and they said, "What we'll do is we will give you one-seventh of the TV revenue for the four teams coming in and we'll do it in perpetuity. Forever."

The owners were brothers — the Silvas. Last year they got $15 million. Over the course of the last 35 years, they've been paid $250 million and the Spirit hasn't played one minute of basketball. They've done absolutely nothing. They just get this check every year. And every couple of years, the NBA says, "Okay. We'll buy you out. We'll give you some money, and then we're good." No, no. That's not how it's going to be. And I found out finally — this just happened very recently — that the Silvas finally agreed. $500 million.

But what were they thinking in 1978? It's a risk/reward. Are you going to take the time or are you going to take the money? Who would have thought that? It's always how we're thinking as investors — managing risk, looking at time horizons. Same thing we see in horse racing. You've probably heard stories of an art gallery. They have a painting that just won't move. They triple the price and it sells the next day.

The problem is that human beings — we're not entirely rational. We're vain. We're egotistical. We have no short-term thinking. And this impacts the market. A good example is — and I hate these discussions — but in finance, it's the capital/asset/pricing model. I wish these things would finally die. But the idea is that risk and return are related. The more risk an investor takes, the better return they'll have. This is a beautiful theory. It has one problem. It's never showed up — *never!* I mean, there's absolutely zero real-world evidence, but it's a beautiful theory, I'll give you that.

We've studied looking at beta. We've looked at bond yields. We've looked at high-yield bond yields. We've looked at futures. We've looked at options. We look at everything and it's just not true — higher risk does not bring greater returns. There's a very slight — from the lowest risk up to moderate risk — you get slightly more return but then it's flat and at the highest risk, just like the horse race, it's the worst.

Again, this represents human psychology being brought to the market. And what happens is within finance — basically I think there's an inferiority complex — and finance wants to be a science. They want to have these grand equations and formulas and Nobel Prizes. And they are beautiful, but in chemistry if you put boron in a tube, it's boron. It doesn't know it's boron. But just like I talked about with the two-thirds of the average, people know what's going on. They watch the scoreboard. People want to bet on the long shot because it's the long shot. The very worst stocks to buy are the most volatile — the names you hear of most in the news.

One of the things as investors we have is an enormous opportunity to look at unfollowed stocks — stocks that are not as well-known, and I think it's a great advantage that there are companies out there that aren't followed by many investors. I'll give you an example. I'm not recommending this company, but I was able to get in the ground floor many years ago — a small company called Nicholas Financial. And Nicholas Financial is a publicly traded, very small company and they make car loans for used cars. And during the financial crisis, the stock got completely clobbered and basically people thought it was a subprime lender.

The good thing was they're a very, very well-run outfit. They have a very good portfolio of loans, but everything that vaguely was like subprime was thrown out the window. The stock at one point got to $1.60 and that was about their earnings two years later, so they were trading at 1x — not one year forward earnings — but the year after that. That's how cheap it was. It was trading at pennies on the dollar and I'm happy to say I did buy it.

Nobody followed the company at all. I got the 10K reports. I got the 10Qs right off the Internet and then I did something that a lot of investors never think about doing — I called the company and I talked with the CFO. A lot of these smaller companies — you say, "I'd like to talk to you about what you do for a living." A lot of people they aren't asked that, and they're happy to talk about it and also you can tell which are better-run companies. Of course, they'll tell you about what's going on. You can talk about the quarter and ask questions about what's going on. Nicholas Financial was just recently bought out at $16 a share — so at tenfold where it was at the height of the financial crisis.

I'll give you a good example. When I go to a hardware store, I ask the person behind the cash register, "What's moving? What's selling?" They'll tell you. People don't think. That's how investors think. They'll tell you what's popular and what's not. If you're thinking about investing in a car company, you shouldn't be reading *Barron's* and the *Wall Street Journal*. You should be reading things like *Car and Driver* and *Consumer Reports*. That's how you have to think as an investor, because the world has changed and the big banks — it's not the world where we can sit and watch Louis Rukeyser and we just hear a few major mutual fund companies. That world is gone.

Now, I'm going to tell you a few other anecdotes about how risk and reward get oddly related. One of these — and we just recently celebrated the 50th anniversary of this — and this was the Great Salad Oil Swindle. Some of you may know this. It was a man named Tino De Angelis, was his name, and he had this plot. What he was going to do was he was going to borrow huge amounts of money from a new company called American Express and as collateral for his loans, he was going to have salad oil — enormous vats of salad oil. But he didn't have enormous vats of salad oil. He had a tiny, tiny bit of salad oil. He had water. And what does salad oil do on top of water? It floats.

So, these enormous vats — the pipes underneath they filled up with water and the salad oil floated up to the top. So, the auditors came by and they saw full tanks. Then they would go to the next tank. The water would drain out, go into a pipe and fill up and the salad oil would go up. And he borrowed tons and tons of money. It was a great, great scheme. I don't like the Jordan Belforts. I like the really clever scams — people who have to think about it.

And things were going very, very well for this scam. It was mid-November, 1963. What could possibly go wrong?

Well, then there was some unpleasantness and there was a break in the market and very quickly, the scam fell apart. And American Express was hugely embarrassed by that and the stock plunged. But that wasn't the end of the story. As American Express plunged and the stock went to a very small fraction of its book value, it was bought heavily by a young investor from Omaha, Nebraska. Actually, he's not from Omaha. He's from Washington, D.C. They don't say that. He's a product of D.C. public schools, but we'll say Omaha, Nebraska. And Warren Buffett was about 30 years old and that was his first big killing — in American Express. Again, we see these things. It's the patience and the discipline to look for good values.

A few other things. This is how we can fight or stand opposed to the trends of knowledge and expertise. So often, when people talk about the market, they do what I call investing from 40,000 feet. Well, first it will be about the Federal Reserve. What's going on with the Fed? What's going on with the macro economy? What's going on with partisan politics? And these really have very little to do with what investors need to know. In the broader market, absolutely the Fed is important ... but there are lots of great companies that it really just doesn't matter whatsoever.

I'll give you a few examples. Has anybody heard of Raven Industries? The ticker symbol is RAVN? I see some of these have. They're fans. This is one of the best-performing stocks of the past several generations. It's outperformed Apple hugely. It's outperformed the market by many, manyfold. This is a larger company. Maybe you've heard of Danaher. The headquarters is in D.C. What do they do? Industrial supplies? It's nothing really fancy. They do what they do, and they do it well.

It always comes back to Johnny Cash — do what you do and do it well. People think that to invest they start at the top and they think, "Oh, I want to do something that's going to be really big. What's going to be big? Oh, it's biotech." So, then they work down. Or they think green energy and they work down. Or China. What's going to work down? You could probably have an IPO of a company called China Green Tech Cloud Solar and investment bankers will just start running down the street throwing money at you.

But that's not what we need. Money can be made anywhere and has been made anywhere. Sometimes some of the dullest companies are the best investments. Colgate. Look at the long-term chart of Colgate. It's been a huge winner. Vornado, the REIT has been a gigantic winner and it's done far better.

Here's another one. Hawkins. It used to be Hawkins Chemical. Now it's just Hawkins. It's a small company in Minneapolis. It's a chemical supplier. If you need lye in Fargo, by God, these are the guys to call. And they've been doing it for decades. The thing about Hawkins that's interesting is that every couple of years they have a stock split of 11:10 or a 5% stock dividend. So people don't realize just how well this company has done over the years, but it's been an enormous winner, and these companies aren't followed on Wall Street whatsoever.

Another good example of where investors should be going is in the lowest-volatility stocks — the stocks that are not traded often. There you can see enormous potential for gains, precisely because people are not involved in that. You don't get the frenetic level of trading.

Well, that's about the things I have to cover. Do we have time for questions?

MALE:

When you talk about Wall Street, what about some of the other exchanges — stocks that, for instance, are on the Philadelphia exchange or the American exchange on the West Coast. Are those companies on dual exchanges? Are they not followed as closely as Wall Street stocks?

EDDY ELFENBEIN:

No, they're not and that's another good area. And also this ties into the consolidation that we see of power and authority where the New York Stock Exchange has really muscled people out. The American Stock Exchange is good for ETFs, but we really don't see the regional exchanges. Where years ago there were true competitors to the other exchanges, we just don't see that. And the New York Stock Exchange is becoming more and more dominant. Internationally in places like London, their dominance has become all the stronger.

I think that's actually a problem. I would like to see more of that refracted through the larger economy — and also in places like the Federal Reserve where the Federal Reserve Bank of New York is the largest among equals. I think it's gotten far too powerful and I'd like to see that broken up. But they are great areas of finding smaller companies in niche areas. I think it's an important development and I hope we will see more of that.

MALE:

I'm not much of a sports guy, but I was fascinated by something in both Mr. Gladwell's basketball story this morning and your football story — that these are both cases where people running teams are pursuing less than optimal strategies to keep from looking dumb. They want to comply with conventional wisdom.

But the other thing is that in both of those cases, the people who are pursuing the suboptimal strategies ... while they compete to win games, they collaborate to keep people watching games, and there's a perhaps justified fear that if some of these conventions changed, the game would become less watchable and the big game of keeping people watching and buying beer and all that would fall off.

What kind of parallel do you see in the world of American business to that sort of situation where a number of nominally competitive players or actors in the market have interests to keep the status quo going and where do you find the disruptions in that kind of system?

EDDY ELFENBEIN:

I would actually say that in the larger economy, I think they're much more accountable, because there are always the disruptions happening ... maybe not as fast as they should be ... but they do eventually bubble up. I mean, why are there three car companies and none is younger than 100 years old?

But we come back to the baseball with the story of *Moneyball*. Why did that happen? What was the necessity spurring a change for what the Oakland As did? It was economics. They were getting outspent so much by the other teams, they had to do it. They were forced to do that. In football, it's not as much, so they don't see that.

But in the larger economy, I think they do a much better job of getting disruptions. I think we do see that in the pharmaceutical business. Now there are areas, I think, in financial services where I think we're going to see greater disruption. I really think at some point a company like J.P. Morgan will be broken off and spun off into smaller groups. I think that could happen with Citigroup and perhaps Bank of America, as well.

MALE:

One of the things you just talked about very early was dispersion of knowledge and the question I have about that and the question that bothers me about that is that you've got a lot of knowledge that's out there but how you do you qualify whether the information is of any validity? You can go out on lots of different forums, besides The Motley Fool, and find a lot of useless information. So, I'm not very comfortable with the dispersion of knowledge because I can't quantify its quality.

EDDY ELFENBEIN:

The classic answer would be the best mechanism to aggregate information, disperse knowledge, is the markets. That is classically what has been the question, that information is conveyed through prices. I just think of something like looking at college majors, where it used to be history and English and math. Now you go to a college campus and look at the graduate level — there's a gazillion levels of different majors.

And look at the different job titles we have of things that didn't exist years ago — things like social media strategist or chief information officer where the expertise is being spread so thinly. And in specialization, I think that's an important driver when we talk about inequality in the economy and what defines the modern economy ... people becoming specialists in one particular field. That's a great way where people in their own careers set up and protect themselves and create their own career.

But as far as deciding what is good and what is bad, I don't think there's any good way. The market is ultimately the judge, but I think that's something we're going to have struggle with as information and the expertise is spread everywhere. There really is no good answer when you just have to take the market's judgments as ultimately the final one.

MALE:

One point you mentioned — that macroeconomic factors may or may not be a real big deal in your evaluation of how you want to invest. I'm just wondering from a broad perspective not what particularly is going to happen in the next three months of broad macroeconomics, but the fact that the latest round of financial engineering that's been occurring at the macro level doesn't have a historical precedent. Does that affect your thoughts about the macro environment in general or does it have any particular effects in particular sections of the financial world?

EDDY ELFENBEIN:

It does at a certain level. I think, for example, I always keep a close eye on what the yield curve is saying. In a larger sense, I'll look, because that tells us the level of risk in the economy. But as far as like particular things about quantitative easing and the strategies that the Federal Reserve is undertaking right now ... no, I really don't. We say while it's unprecedented — it's always different. It's never the same. There's always different levels of what the Fed is trying to do and different circumstances for the macro economy.

Now there are certain levels ... I absolutely will look if I think equity prices are too expensive or if I think there is a great bargain in bonds or bonds are too expensive. But as far as flying at 40,000 feet and trying to make these broad pronouncements about the economy — I generally try to steer clear of that. It's because even if you're right, it doesn't necessarily pay off for you. How does that transfer to a small company like Raven Industries or a small company like Hawkins? As an investor, I just don't see the payoff.

MALE:

I got the impression that you had a disparaging view of traders and I was just wondering if you thought that traders tended to give false values to stocks.

EDDY ELFENBEIN:

I don't have a bad view of traders. I have a bad view of me doing trading. I think it was Malcolm Gladwell who said this: I've seen people who can trade, and they can do it and that's great for them. It's something that I don't think I have the inclination for and when I talk to people about getting investing, I hear very often that people want to get into day trading, and I think it's a big mistake going in for that.

One of my very first jobs in the industry was working for a company not too dissimilar from Stratton Oakmont, and I saw the kinds of things that went on and lives that get ruined by that. If people can trade and they can do it well, more power to them. I'm not worried about their impact on stock prices because I invest for the long term. I understand that prices bounce around in the short term — but in the long term, I think that's where the true value shines and that's the side that I like to be on.

MALE:

I've got a couple of questions, if you can indulge them, but I'll ask one at a time. I think the conventional wisdom now seems to be that given the great blow-out year in 2013, one shouldn't expect very much of the market this year. And on the longer-term basis, I think there's also a growing conventional wisdom that the returns that we've seen in the past few decades aren't going to continue in future decades. You're not going to see an 8% annualized return — maybe half that in the future — and that we're foolish to make plans based on those historic numbers.

But I've seen at least some comments you've made indicate that you have a much more sanguine outlook and I wonder if you could share your longer-term outlook and on what you base that view.

EDDY ELFENBEIN:

I do agree. I think that the historical numbers we have — the 7-8% historical real return on the stock market — those are the accurate numbers. The problem is that's from the American century. Everything went America's way. We won two world wars and we went through the Great Depression. Enormous postwar prosperity. I think the problem is that people have looked at this level of data — it usually begins in the 1920s with the advent of Wall Street in a modern sense — and they say, "Well, this is a stylized truth. This is what we're going to see in the future." And I don't think we're going to see that.

I'm not saying problems, but I'm saying I would expect real returns — this is including dividends and capital gains and after inflation — will probably be, I think we can expect, about 5% going forward. I think probably about half of that will be 2.5% from the growth of real GDP and the other from dividend yield and the growth of dividends. So, I think that's a safe assumption. I'm not saying that that's accurate. I'm saying that's what we should assume when we plan as investors. Another question?

MALE:

This past year was a wonderful year, and I'm heavily invested in Motley Fool stocks. I've been fortunate enough to actually do a bit better than the Fool, primarily by over-allocating in some areas and not buying certain selective stocks ... and perhaps being a little more fortunate on timing.

What I wonder, as I read your work ... I wonder how I, as an investor, could take the Motley Fool universe of stocks that I've depended on for a long time as my investment ideas and combine that with some of your insights regarding trends, perhaps, and help myself with timing a bit or determining when to sell some of these stocks? Do you see a way for the two views of the world? We're very bottom-up, long-term buy and hold sort of investors here. How can your philosophy, your view of the market help us improve?

EDDY ELFENBEIN:

I guess the simple answer is basically my view and the view of The Motley Fool is very much the same, so I don't know in a direct way or how any particular stocks could add to that. And also, it's one of those things people say, "How can I goose my returns?" And I think that's always the beginning of some trouble.

Let me just make a closing with a couple of things. We really come back to the old virtues of being well diversified, not being rattled in the short term, focused on the long term, realizing that bear markets do happen, corrections happen. It's not a mistake. They just come. Focusing on high-quality companies. Focusing on cash flows. Focusing on dividends. These are the strategies that have worked and these are the strategies that will work.

I always think of a quote from Sir Isaac Newton, actually, a lot of people know. He was the warden of the mint in Great Britain years ago. He did the Recoinage Act and he lost money in the South Sea Bubble. He famously said, "I can calculate the motion of heavenly bodies, but I can't calculate the madness of men." If he can't do it, then we can't either and we focus on what works.

So, thank you very much for your time.

FoolFest 2014: Net Promoter Creator Fred Reichheld

Published Feb 19, 2014 at 11:36AM

{% ooyala id="VvdnluazqC1TdlYG5a3RWnt0U8SG9eA1" width="580" height="326" %}

Run time: 46 minutes

From our February member event, watch as Fred Reichheld, the creator of the Net Promoter System and a longtime partner at the consulting firm Bain & Company, goes in-depth about how companies can capitalize on feedback from their customers, measuring customer loyalty, and how simple changes can make a big impact on companies' success.

Transcript

FRED REICHHELD:

I've been working on the same subject for almost 40 years now — 37 of those years at Bain & Company, a consulting firm — and I'm going to try and condense what I've learned in that period into 40 minutes or less, which means I better talk really fast.

I'd like to start with this notion. It's something — if you've gone to Davos in Switzerland where all the captains of industry and mucky mucks go, you would have heard that loyalty is completely irrelevant in business today. And that's not a new idea. Some people ascribe it to the Internet, millennials, young people — but loyalty has been dead for many, many years.

So, when I come here to talk to you about loyalty, I realize that there will be some skeptics and some people who think it is, maybe, less relevant to their future than they'd like on this nice morning in February. So, I'm not going to talk about loyalty, although it's what's I've focused on for my entire career.

Instead, this is bait and switch. I am going to talk about growth. Today's lecture is going to be on growth, because it turns out that the only way to grow a sustainable and profitable business is to earn the loyalty of your customers and employees. I'll show you some evidence of that.

We could talk about loyalty or we could talk about growth, and you'll see they're essentially the same thing. The evidence that I give you is at Bain, where we have been studying this for many, many years, we find that the company with the highest customer loyalty in its sector is growing at about a little over 2.5x the rate of its competition. And as you know, growth is precious. Growth is rewarded by the stock market. Growth is what makes a place good to work because there's opportunity and you get the idea.

Well, if loyalty leaders are growing this fast, why is it? Well, it's so obvious. In fact, if I ran a little quiz, and I said, what are the four things that loyal customers do that would indicate proof that they are loyal, those are the same four building blocks that create profitable growth — and let's see how many of the four you can get.

Well, one, loyal customers come back and buy again. They repurchase. Two, they buy more stuff because they get to know you and vice versa. There's a relationship that can evolve. They bring their friends and four — many people miss this last one — they give feedback.

Now, is feedback important? Well, of course it is. That's getting good ideas about how to improve and positive feedback to energize your employees so they feel proud of their job and reinvest themselves and go the second mile. This is what business is about, I think. It's creating a community where people want to invest their time, their energy and their resources, because that's what creates growth.

But even though some of us know this intuitively — how many of these four building blocks of loyalty and growth are measured according to generally accepted accounting principles — is the right answer. So, the measurement, the science that we've built to understand business, to track its progress, to set budgets, to reward bonuses and so forth completely ignores this underlying reality of there's only one way to grow a profitable business, and it's treat your customers so they come back for more and bring their friends.

And because we forget it, businesses do things to their customers and employees that destroy their loyalty, make loyalty a joke and make many people come to the conclusion that loyalty is irrelevant in business today. Well, it is, unless you want to grow a profitable business, in which case it continues to be the core of these great companies.

Now, what I think the problem is, is the fellow on the left ... you probably recognize the chief financial officer of your firm. Well, he's a tyrannical gorilla ... not because they're so powerful, necessarily. It's because they have science behind them. Accounting has been developed as a science since the Middle Ages in Italy — this notion of double-entry bookkeeping. I think it was in Venice. They've sort of gotten a little better every year at this. The point today — there are crowds this big in accounting who are worried about how you should amortize software investments. So, it is a science, and that gorilla has some really good metrics behind him or her.

Well, of course, most companies have this puppy dog, the satisfaction survey or the customer engagement survey. Loyalty — if you want loyalty, get a cocker spaniel. That's a little inside joke. But this little puppy — imagine. The CEO is talking to the head of marketing or the head of HR who's thinking about employee loyalty, and they're having a good conversation and the gorilla stomps into the room. You know what happens? The puppy wets the floor and runs away.

In some ways, it's a good thing because the techniques — they don't have a science for measuring this. It's not taken seriously at all. They use surveys. What a joke! These people — you want to know how loyal your customers are. You send out a hundred-question survey. Three percent of the people respond to it and you wonder, "Who are these three percent? Don't they have anything to do with their time? Are they lonely? Are they bored? Are they just compliant?"

And that little population sends back a survey and then we pretend that they have anything in common with the 97% who have something useful to do with their lives. We take their answers and extrapolate through very sophisticated statistical techniques what the truth must be about our customer loyalty. It's horrible and I'll show you it's wrong — and it has led to a diminished focus on loyalty.

Now, I went around criticizing surveys for all these reasons. You know, it's wasting our time. It's ridiculous. And then I ran into Andy Taylor, the CEO of Enterprise Rent-A-Car, who had grown from a little niche player in St. Louis, Missouri to the largest car rental company on earth. Somehow had bought the largest fleet of automobiles of any private purchaser in the world without ever having to go public. His dad was not rich, by the way. They did this on internally generated cash flow. And you wonder.

Well, I went up to St. Louis and I met Andy. I said, "How did you do this? It sort of broke all the rules that I learned at Harvard Business School about, first of all, never try to compete in a commodity business like car rental." And trust me, they're all renting the same Chevrolets and Toyotas. A total commodity. Never try to gain share. Oh, and it's low growth and almost no margin. That kind of business is not really where you want to put your heart and soul and try to gain market share. That's a formula for bankruptcy.

I read in Forbes that the Taylor family is worth somewhere between $10-20 billion today. And you go, "What is in the water in St. Louis?" Well, I went there, tasted the water, asked Andy how he did it. And this is where he said, "Fred, there is only one way to grow a profitable business. You treat your customers so they come back for more and bring their friends."

Duh. And actually — oh, did I mention? They measure it. He said, "We used to have a puppy dog. We'd measure satisfaction. But no matter what I did, because we pay our people based on the profits they earn, the profits in the branch where they work every week ... and these are young people, so they care about how much they earn every week ... they were listening to the gorilla and treating customers in a way that made me ... I was humiliated because this is my personal reputation. This is my company."

He had to change that. So, he changed the puppy dog into a very different beast and he said, "Stop making fun of surveys, Fred, because that's how we did it. The most important management tool that we have developed at Enterprise ..." The thing that Andy would give credit for — among all of the other developments for getting them past $2 billion in revenue and shooting off into wherever they are, $10-15 billion in revenue today, largest in the world ... it was this survey.

And I said, "Oh, Andy. What do you get? A 10% response rate?" And he said, "No. A 90-95% response rate." I said, "Whoa. You must have taken 100 questions and shrunk it to 12." He said, "No, it's two questions.

"That changed my life, and we took it seriously. The reason that dog has teeth is we started by measuring it scientifically. We spent a lot of money to measure how happy our customers were and then we would rank order our branches from best to worst every month and now every week.

"And if you're in a bottom-half branch, you can't get promoted. And, well, it's an up or out system at Enterprise, so that is the nuclear switch and therefore, so much of their focus ... Yes, of course they care about profits. That's what they get bonused on, but they know they can't grow their careers at Enterprise unless they're finding ways to delight customers profitably and it's that balance that I think has transformed Enterprise into the powerhouse it is today."

The one other thing they do with this feedback where they're asking customers one or two questions — when they get a failing grade — they ask if the branch manager where they rented could call them. Eighty percent of those people say yes — and they close the loop. So, it's the branch manager who is talking to a customer, apologizing, probing for the root cause, understanding in context what do I need to do better at my branch ... and this is not a PowerPoint presentation from headquarters where they're doing statistical samples through PhDs and then great presentations three months after the fact.

And everyone in the branch is saying, "Was this one of those nutty customers we lose money on, or is this a good customer with reasonable expectations?" No, no. That's the stupid approach. The smart approach is from the branch, call the next day while it's still fresh in everyone's mind and, "Oh, it's Suzy. This is the third unhappy customer. I have a training or a personnel issue." So, you get relevant, granular learning and it's changed the world for them.

This raised a question for me. I'll bet you this would be a good idea for any company — actually getting serious about measuring loyalty at a granular level so you could actually drive learning and priorities. And I started searching for what's the one question you could ask, and I found the answer. It's pretty consistent. *How likely is he to recommend us to a friend?*

And why does this work so well as a litmus test of have I earned your loyalty? Am I worthy of your loyalty? Well, because you don't recommend to a friend unless it's a good idea. It's logical. This is good value, good price, good engineering. But that's not enough. There's a higher standard for recommending to a friend.

It also has to make sense to your heart. This has to be a group of people who you trust. Who are going to fix problems the right way. They share my values. That's a Harley tattoo. There's a quick story. I have companies who think this loyalty stuff is important. Harley was one of the early adopters. The guy at Harley said, "Fred, we don't measure this retention rate and all this stuff that you write about." He was sort of teasing me, but it was funny.

He said in their annual report, they claim to have the world's most loyal customers at Harley, and so I pushed him on that. I said, "So, is this made up by some marketing/PR guy or do you actually have something to back this up?" He said, "We measure the percentage of our customers who have our brand tattooed on some body part." So that is a Harley tattoo.

And if I'd listened more carefully, when you recommend to a friend, you are tattooing the brand that you're recommending in a very public way. You are co-branding your personal reputation with that firm. And I think that's why recommending is almost a sacred thing. Enthusiastic recommendations mean, "This has my name behind it," and it's a big deal.

And when you cross that threshold — this is why I developed the Net Promoter System. I wanted a universal language that people could start speaking around the world to get this loyalty thing to become real. And so, we said one question — how likely to recommend us to a friend on a scale from zero through ten. No confusion of whether aces are high or low. It's not one through ten. It's zero. If I say you're a zero, you don't say, "Does that mean good or bad?" It's just obvious. And same thing. "She's a ten." Everybody knows what ...

So, language that everybody gets without overtaxing their brain and it turns out nines and tens are the true assets of your business. They are out there building your reputation, making your employees proud, giving you the best ideas. And until the Net Promoter System, they were sort of just hidden there in the shadows where really smart leaders understood that, but not in big businesses where metrics are vital in how you communicate and how you set bonuses.

This notion of a Net Promoter is just taking the percentage of customers that you touch who give you nines and tens. Those are the assets. Subtract the liabilities — the zeros through sixes — and you find that you have a bottom line, like net worth or net profit, that you can focus on and learn on and hold people accountable for and build a big dog system around.

And that's what companies have started to do. When I started this — it was actually the 10th year anniversary. I wrote a *Harvard Business Review* article. Shared my brilliant insight. "Fred invented the Net Promoter System, and three people paid attention."

GE — I don't know how GE found out about it. I worked with Intuit, the software firm. The founder and I were friends at Bain in the old days, and he loved this idea because his whole thing at Intuit was, "I don't deserve another customer until I delight my existing customer." I sort of like that philosophy. And when he heard about Net Promoter, he said, "This is what I've been looking for." It turns out that the CEO that worked for him at Intuit used to work at GE. So through back channels, GE found out about Net Promoter.

I write this *Harvard Business Review* article. There's only two companies in the world that are actually using it — but we made a strategic choice. We made this an open-source system. Instead of having to pay Fred every time you use Net Promoter, we thought that if we just made it available to everyone, that we would have creative experimentation and it would have a bigger influence and it had the chance of becoming a universal language.

Over the last ten years, that has come true. There are thousands and thousands of organizations that have begun to adopt Net Promoter. I think if you did the math right now, you'd see that over half of the world's large companies use Net Promoter as a way of measuring customer feedback, customer loyalty at this point. They don't do a great job, but they are at least starting.

Now, this created a problem because I had written a book that explained what this ultimate question, "recommend to a friend" was. The red book — it was a book of theory. I had two companies in the world that were actually using it. Within five years, there were thousands, and I had to rewrite the book to one of practice. *The Ultimate Question 2.0* is the book that shows what companies are doing as they're experimenting with Net Promoter and turning it into a science.

NPS used to be the Net Promoter score for most people. Today, NPS stands for Net Promoter System because it is an entire system. Some people call it the Net Promoter Spirit because as you'll see, it takes a certain philosophy, and what you believe about your life, to make this the center.

Has it had an impact? Boy, for some people. I'll just show you a couple of examples. Entrepreneurs, like the fellow who founded 1-800-Got-Junk said, "This is the most important decision we made since deciding to franchise." I said, "That's a little over the top." But as you'll see, it has transformed businesses, just as it transformed Enterprise Rent-A-Car. It was Enterprise's idea, not mine, essentially. Keep track of your promoters, your detractors. Close the loop with your detractors. People who are good at creating customers who are promoters — promote them. Make them rich.

It works on the Internet. Tony Shea — who sold his company for a billion dollars to Amazon — they continue to use Net Promoter to figure out how many of their customers are being wowed ... and how many of their employees. And, as you'll see, many of these companies in the open-source community are using Net Promoter just as heavily on the employee side ... people whose loyalty is vital.

The guy who runs Intuit today — Brad Smith. Very capable guy. He said, "Thank goodness we've got this Net Promoter system, because now it's a framework that makes sense in the world of the Internet. You've got all these promoters and detractors out there on social media, on Amazon. We actually have a language, a framework, a measurement process at Intuit that helped us manage according to that."

And it's true. This system, even though it was invented before social media, I think was built with that same set of ideas. Your reputation is everything. Your reputation is not just a fuzzy subject. It is the number of promoters that you have out in the world compared to your competitors.

Apple is one of the companies. Apple retail has done one of the best jobs of adopting Net Promoter and extending it way beyond any idea I ever had, but there's so many examples I could tell you. The guy who founded the Apple stores said, "Our mission is to enrich the lives of our customers and employees." You know, a lot of people adopt these high-minded missions and they're just baloney.

He was serious. He said, "I've got to measure this." And the reason he picked Net Promoter was he said, "Suddenly I have a way of measuring if I invest the money to get the system to work — I can tell of all the people I touch in the branches in my stores, every day, every product, every team — how many lives are enriched. Because if I get a nine or a ten on how likely I'd recommend this store to a friend from my customer, or a I get a nine or a ten from an employee who says, 'I'd recommend this store as a great place to work,' I know of the lives that I've touched, how many are truly enriched." And that turns a fuzzy, well-intentioned mission into something that actually becomes a basis for running a business, driving learning, setting priorities, rewarding people.

They also are using it as a science, because what is innovation? Well Apple's really good, but when you think about the retail stores, it's astonishing. Think about the cool things they do in those stores. One example, to show you how they use this. Because they're measuring every day, every store ... you'll get a situation like their NPS dropped by seven or eight points after the holiday season a few years back. And they have their management committee meeting and they're all arguing about what their pet theories are.

One guy's theory was, "Well, it's the color of the shirts. We use to have holiday shirts. It makes it easier to find our employees. Now they like going back to black shirts because that's cool. That's what all their customers are wearing and therefore they can't find their employees. Well, let's take five stores, put the bright shirts back on and see what happens to Net Promoter."

Within a week, the entire world was wearing bright shirts again, because this experiment demonstrated that those stores with the bright shirts popped right back up. Now apply that by all of the cool ideas that have either succeeded or failed so that their learning cycle at testing innovations in the Apple stores is so much faster than the Best Buys of the world, and look what happens when you innovate faster and have real facts about is this a smart innovation or not.

Now, let's bring the gorilla back into this equation. I gave a talk like this — it was actually a little bit bigger room — I was the entertainment for the Apple store annual gathering a couple of years. The CFO was sitting right there. I said, "Do you use this Net Promoter?" And he said, "Oh, yes. Think about the iPads — when we had people out in the line. We just couldn't get enough iPads made to service the market.

"We had some stores that decided, creatively, they were going to take people with their iPads and get them on the activation table and give them some extra training so they'd download an app, make sure they can use their email. Test drive." But that's stupid to the typical gorilla. Get that employee off the activation table and on the cash register line because we want to sell more iPads. That's what Wall Street wants.

But they didn't do that, and the CFO was one of the biggest fans for not doing it because he said, "We keep track. When someone buys an iPad and then has the activation table experience, we know how many turn into promoters, and that lets me do the math. And I know what a promoter is worth — how many thousands in extra they buy per year so we can figure out the cost per promoter created. The activation table is one of the best investments we have."

That's why every store in the world encourages you to go to an activation table when you buy your iPad or whatever the next product is — even if they've got people out in the mall standing in line to buy more — because they're not trying to maximize growth of revenues. They're trying to maximize the growth of promoters that they can serve profitably. So, their objective function is cost per promoter. It seems like a subtle difference, but it makes all the difference in the world.

Zipcar adopted this several years ago, and they've come up with a language they call "frugal wows." They want to find ways to delight customers. And by the way — nines and tens don't just fall of trees. You have to do something special that gets someone enthusiastic. That means innovation, so you test things. They discovered one of the best things they could do at Zipcar was for those customers who were good customers (returned the cars on time and clean. You're supposed to put gas in the car. If it goes below a quarter of a tank, you fill it up. Now Zipcar pays for it, but you're supposed to do it).

If you've been a good customer and followed the rules — each anniversary, they will upgrade you to a BMW or a luxury car as a thank you. And it turns out their community just loved that. And they figured out the cost per promoter. A very smart thing to invest in. That kind of progress is what more companies need.

American Express has recognized this. Well, I'll take you back two or three years. American Express saw this. They've known Bain very well over the years and they've looked at all 2,000 touchpoints for a credit card. Which touchpoint are you going to invest in to wow your customer? Someone says, "Well, it's a very emotional experience when you're applying for a new card. Let's work on the welcome part of the new customer."

And so, they had teams experimenting, and one team came up with the idea of, "Don't just mail the card with the 800 number that activates the card. Let's have an outbound phone call to welcome them and let's do it before they even get the card. And whenever we can, we give them a higher credit limit than they asked for."

So, we bring this good news through a phone. *Oh, and if you have a couple of minutes, let me explain the card so you get the value. You're going to Europe. Thank goodness you told me, because you would have been on the fraud alert on the second charge. They'd cancel your card. Now I will put that in your record.*

But this costs money, right? Fifteen minutes on the phone. Well, let's see how many promoters we created, which they did. It was very promising, so they've invested that and rolled it out. And, of course, they then look at real behaviors like share of wallet and retention rates which are reinforcing what this Net Promoter metric indicated would happen. The cool thing about Net Promoter is it's real time. You can get information now and then make sure you're doing it in a wise way that does connect to the behaviors, like spend, that will drive cash flow.

Airbnb has adopted Net Promoter and is off the charts. When I talk to organizations trying to get better about Net Promoter, they have identified ... You know who Airbnb is? No, God, well. You're like me. You're just like me and Enterprise Rent-A-Car. I was doing this talk years ago and Enterprise said, "Oh, you know, we should talk because we use this system you're talking about, but we actually have it." And I didn't know how impressive ...

Airbnb rents hotel rooms, but they're owned by people — houses, and so forth. So they're a clearing mechanism for getting spare rooms and spare beds, and they've grown so fast that they now have 50% more rooms to rent than the largest hotel chain in the world and soon it will be dozens of times. Airbnb is a phenom. They continue to get better because they look at all of the touchpoints of renting a room from Airbnb as well as the renter — there's two sides to this equation.

They've drawn up little cartoons. They call it Snow Whiting, because Snow White was the first movie where they had moving pictures. And then all of the employees focus on innovative ideas — they put yellow stickies — that would delight customers or the renters that they can then test and then use Net Promoter as the quick litmus. Is this the smart test that we ought to roll out or not?

Now, the really interesting thing. This is so obvious, right? You guys are bored thinking how could one guy take two Harvard degrees and focus his life on this and this is all he comes up with. Loyalty's a good thing and gee, you should measure it.

This is the chairman of the board of Rackspace. I'm not a big fan of serving on boards of public companies. You save up enough money to have a good life. You don't want to risk it with some crazy scheme and get sued. But Rackspace convinced me that they were the kind of company that I would be willing to publicly ... When you serve on a board of directors, it means something. I did join their board, after several years, and they are very serious about making Net Promoter the core of what differentiates them.

Their chairman drove me to the airport in San Antonio and he said, "Fred. I'm sort of disappointed. We've had you working on this for a long time. Board level attention. Why is this still so hard? Every time we turn away and get our attention focused on something else, it seems ... What's going on?" And it made me think very hard. And here's some answers.

Number one. Too many companies — they've got this new toy and they fixate on the score. It's not about the score. You don't want to go from a 70 to a 75. The score is a way of letting you understand whether this innovation or this experiment is working. The key is to delight more customers profitably and the score is a way of testing out whether that is taking place.

But then it gets worse, because so many companies are just measuring this in the most slap-dash foolish ... They take that market research survey that I made fun of that gets a 3% response rate and they use that — but they ask, "How likely are you to recommend us to a friend," and suddenly they have a Net Promoter score. And if they can get a high score, they advertise it in the paper. They have press releases. Maybe you've seen how high some of these scores are. Well, let me show you how silly this is.

This would be a typical company — this is a really good company, by the way — who says, "Let's see. I'm going to survey a bunch of my customers. Sixty percent of the responses were promoters. They were nines or tens. I only had a few, 10%, who were detractors. Therefore sixty minus ten is fifty. Net Promoter score of 50 is darned good. It's almost in Fred's Hall of Fame." And so, you're feeling really proud and you call your PR department to issue a press release.

Well, the response rate on this survey — let's be generous and let's say it's 20%. What about the 80% who ignored your survey and didn't think it was worth their time to invest in this relationship? What about those people — because they're the preponderance. Well, when Bain teams go out and interview those customers who don't bother to respond to surveys, they tend to look something like this. They're mostly detractors and passives.

And so the true Net Promoter score of the population of customers, if you do the weight average, is minus 22 ... whereas some nut in the PR department is saying we have the world's highest Net Promoter score in our industry. It's plus 50. And that is not the basis for a big dog with teeth — at least one that doesn't make a lot of messes that you'd like to get rid of. It's a horrible ... The measurement would make an auditor blush.

We have companies who really love Net Promoter, and then they put bonuses based on them and then discover that they have no audit-worthy system. Somebody at PWC or Ernst asked them for some proof that this is a reliable system and then they're dead because they tend to be people in the marketing department who just aren't familiar with the rigor that the person in the CFO's area is comfortable with.

What else goes wrong? Linking incentives to these flimsy metrics. Oh, this is a joke. In the Bain's New York office, you go down to Penn Square. There's a Kmart store. This was in the window, so it's a lousy picture because it's on an iPhone. This shows you what happens when you link flimsy measures to bonuses. It's sort of silly, right, but you've seen this all over the place.

Car dealers do this kind of stuff all the time, because they care about the score. They don't really care about turning you into a promoter. It's all about them. When they are saying, "Yeah, I know I lied and I cheated, but can you please give me a top-box score, because if you don't, I'll get in big trouble and lose my job." What is that about? That's what people are used to. Low integrity.

Not establishing a financial linkage. Remember I told you the Apple CFO — they knew what it was worth turning someone into a promoter. This is something Bain has published so I can use it easily. You just look at the cash flows and turn them into a net present value for retail banking. The detractor is a negative net present value. Why are bank market values so horrible? Well, they've got a lot of detractors and true cash-on-cash, that's a negative. If you say passives are indexed at one, promoters are worth 3.4x that, so you can say, "Gosh, I know how much I can afford to invest to wow customers."

But this, of course, has to be by segment. If you looked at the high net worth segment of bank customers, probably this group ... turning those people into detractors is 10x as valuable as leaving them as a passive ... and then you can start making wise investment decisions to start innovating. Banks haven't innovated because they've gone down the path that the gorilla has shined a lot on. Get unit cost down. Charge fees when you can get away with it — which abuses loyalty and destroys growth. And, you know, the stock market's not stupid. If you understand that a promoter is worth 10x or in this case 3x, you know how much you can afford to invest to make someone a promoter.

What else goes wrong? They don't have this closed loop with the branch manager calling. Apple stores do this. Apple has an app on their iPhone where every day, the manager will sit down at the Starbucks or whatever they do before the opening huddle. They'll go through the responses from customers the previous day. They've got the little grumpy and smiley faces like I showed you and the verbatim explaining why. And they say, "Oh gosh, there's a couple of detractors." Push the button twice. The phone rings. Calls the customer. Store manager apologizes, probes for the root cause. Tries to fix it.

But then, when they kick off the opening huddle, everyone is talking not about attach rates and how much you can sell more computers. They're talking about, "Here's some detractors we had yesterday. Let's group problem solve and figure out how we can make this happen less frequently. Oh, and Jarrod at the Genius Bar, you got a ten. It was 11:15 in the morning. Mrs. Smith. Do you remember her? Can you tell the crowd what you did?" You get the story for everyone and you're learning what creates promoters. Then at Apple, they give a standing ovation, because when you get a ten from a customer, that's what you get from your peers, and that is the right thing to get. And in fact, a ten is a standing ovation from a customer. The thing is, you can't hear it if your company isn't measuring tens in a reliable way that gets the credibility of your work force, your managers.

This leads me to where I think the cutting edge, the frontier of the Net Promoter world is today. Maybe one of the most interesting ways to think about it is as an investing tool. If you want to have a great Net Promoter score, that's 100 faces, so you just go through the math. It's an easy way to communicate. A seventy-five percent Net Promoter score, which is what Apple has — you're never going to earn that kind of loyalty from customers when it's delivered through a work force that looks like that. It might be a zero. And that's the problem most people face today. Most CEOs know they want loyal customers. Duh. They've seen the Andy Taylors of the world, but they don't recognize what they have to do differently with their teams, especially frontline teams, to get them energized and excited.

I'll show you what we're doing. I think the basic thing you're managing — and should be measuring, of course, in business — is this. When you put an employee next to a customer, whether it's on the phone, or on the Internet, or face-to-face ... you want that employee to be able to serve that customer and make their life better. Really enrich it. And when you've got a Net Promoter system, that ten is what fuels the fire of good employees. Martin Luther King — we can't all be rich, but we can all be great because we can all serve. Well, just serving somebody isn't great, but when you get a ten, you enrich their life, you made it better, and I think that is the true bonus for a good person.

And when you get this loop going — then you get some economic advantages that I've written about in my older books — you can pick the best employees because good employees want to work in an environment when they can earn tens from their customers. People like standing ovations. They stay longer. They get to know their customers and their colleagues, which is the basis of innovation and learning and, of course, productivity. So you've got all of these things that drive cash flow, but it's all centered on have I put my frontline employee in a position where they can earn a ten, and how often do I do that versus my competitors.

Now, that team is vital. We'll talk about it in a second. Most companies when they get big, they think, "Oh, I'm at the center." The reason that's a little puzzle is because the frontline calls it the "puzzle palace." The headquarters. You know, I've got all the engagement surveys and all the things I'm trying to do to make the customer service better. Let's hire some crazy consultants to figure out how to fix this. What you've got to fix, for most situations, is I've got a bunch of disengaged employees on that team, and if I want my employees touching customers to really stay energized, I better have a different approach to running this business.

This is where I sort of admit failure, because if you were to think about my strategy of an open-source system for Net Promoter, the customer Net Promoter metrics and methods and vendors has just been a successful explosion of possibilities. I'm very proud. I give myself an A. On the other hand, on the employee Net Promoter ... yes, there's some daily huddles and Agile Scrums if you're in the software business. There's annual engagement surveys. But think of the irony. Our most important asset is our employees — therefore, we measure it once a year. Come on. You don't make decisions once a year. We don't have weekly, monthly rhythms of measurement.

And this is where over time I've been so frustrated and decided a little over a year ago, I'm going to fix this personally. I'm going to invest my own money and create a business that is going to solve this problem. I've learned a lot from the Apples and the Bains of the world because Apple has the app on their iPhone for their customers. Well, I'm creating that app on the employee side. So, what I did was study the companies that had the highest customer-employee loyalty that I was aware of. Most of you probably haven't heard of Bain or maybe you did because Mitt ran for president, but what does Bain do?

Bain is the best place to work in the world, and not just because I'm 50% Bain. For the last 20 years, I've been a Bain fellow, so this is the non-Bain half. Just look at the facts. They've been the best place to work in consulting forever since they measured it. Best place to work five years in a row on Glassdoor. Do you know what Glassdoor? It's company employees talking about their company anonymously. In 2014, Bain was number one in the world. So, they're good. But so is Apple retail and so we're into it.

And I've taken these methods that the companies have used that I have been most impressed with and turned it into a tool called Huddle Up, which is just an app, but it bottles some of those best practices and it's based on this simple idea ... what I observe when I see great companies and great leaders. They don't tell their people what to do. They just make sure they're asking the right questions at the right times, and that gets ownership.

What Huddle Up is, is an app that lets teams — whether they're on an iPad or a phone or their computer — have a conversation. It asks two or three key questions to get the huddle off on the right foot, and it makes people spend five minutes preparing for the huddle and scoring things or rating them. How happy are you with progress of delighting customers, zero through ten? And it takes out some of the noise because, "Oh, I don't remember what I scored last week on this." Well, it shades in the seven. It says, "That's what you scored last week, so, if you feel differently this week, let's get all signal and no noise." But that, then, leads to a productive conversation at the team level.

That's what Bain has done for years and years and years. What the app does is just makes it easy. "Oh, and give a shout-out to the team member who deserves to be recognized for helping the team succeed." You know how most big companies — they reward people who are good at kissing up and kicking down — real political baloney. Well, how about if a team gives out stars that are serious — it's anonymous — but it's the team who's recognizing who's helping the team succeed.

Oh, and high response rates — because this is no good without high response rates. Even though it's a secret ballot, this is transparent who bothered to vote. And so, if Fred hasn't filled out his little three-question poll, his teammates are going to put some pressure on Fred. We've got to have our meeting. Let's go. And so I expect ... Well, in fact, in the beta, we've got very high response rates. And then this thing just sits in a cloud configuration, so it lets you customize.

I'm not so bold as to say I have the eight magic questions or the twelve magic questions that will tell you whether your teams are engaged. I think it's different for every industry, for every team. If you're in a turn-around situation, that's different. But what it does do is it creates a cloud of data and lets you have all of the questions that the great companies are asking so team members can pick it.

And then you sort of picture it. Well, if I'm at the center of the company, I can ping a question or a template or a library of questions that I want my people to choose from. Oh, sure, and they can customize their own. I've got a team leader and he wants to have a weekly huddle. He can customize. It goes out to his team. They respond and then they share the results at their huddle in real time. Some people do this at the beginning of a meeting, but you can imagine the rigor.

Oh, and I can track progress. Over time at Bain, teams ... Oh, and this becomes part of how we run the place. At Bain, we rank order all teams. Just like Enterprise rank orders their branches based on customer scores, Bain rank orders all of its teams on how likely they'd recommend their team leader as a person to work for — and how proud they are of the results they're getting for their clients.

So, those become the barometers of progress that let you know where you've got problems, where you get best practices. So, I won't go through this in any depth except I think this is a revolution waiting to happen on the team front, because suddenly we can get the power of Net Promoter in the hands of teams.

What are the questions that most of these companies are asking? Well, on the center, they're using the Bain question. *I'd recommend my team leader. I'd recommend my company as a great place to work.*

So, the reason I share this with you is a) it's, I think, where the Net Promoter movement is going but b) if you had an investor's mentality, would it be amazing to be able to get into the scores of what the employees really feel about the progress they're making at delighting customers? I would. That's one of the reasons I built this app, and I think it will have that investment, the insight along with real benefits to the center of the company, real benefits to the team leader and benefits to the team.

So, that is the cutting edge. I hope you'll be reading and hearing more about Huddle Up. The way that we're doing it is sort of an open-source movement. Eight or so of the companies who are real Net Promoter leaders are in a beta with this tool and using it, rolling it out. We'll be going to a second wave later in the year. There's room for one or two more companies, but by the end of the year, it will be a commercial app that any of you could use in your own businesses.

So, in conclusion, think about this goal of Net Promoter as delighting customers profitably. And if delighting customers is your goal, it is a team sport. And Huddle Up to Win is my little tag line — but that, I think is where investors ought to be focusing more of their time.

Now, I've got question time here, but I'd like to put one question in your mind before I take your questions. Why isn't Motley Fool offering you reliable Net Promoter data on some of the industries that might be a good leading indicator of what the growth rate and how energized the employees are? It just seems like they owe that to you — but that's just a rhetorical question. But let me go back to where I'm supposed to be and open up to any questions in the audience.

MALE:

Big fan of all of your work and I've been studying it for a long time. I think what you're doing with Huddle Up is really intriguing and I'd love to beta test it with my company. The flip side is while you talk about the open nature of the Net Promoter score, is there a simple way for small businesses to do this?

FRED REICHHELD:

Yes, there are. There are a number of vendors on the customer side who have very low-cost mechanisms to ping out to customers. One that comes to mind is called Delighted.

MALE:

Delighted ...

FRED REICHHELD:

Yes. Delighted.[net].

MALE:

Thank you.

FRED REICHHELD:

Airbnb uses them, for instance. Next question.

MALE:

Yes. I have to jump on this use of Net Promoter scores, Fool publishing scores, things like that. I have to ask myself whether I would trust it or not, or would you get into the same syndrome you were talking about using satisfaction scores to reward managers and that sort of thing? How are you going to ...?

FRED REICHHELD:

Can you trust a Fool?

MALE:

Yes — could be trusted.

FRED REICHHELD:

I think that's exactly the right question, so before I'd pay much for that, I'd want to understand the rigor that they're using to get reliable data, and I think we know how to do that. It takes an investment. You've got to go carefully, but it's a great question.

Are we down to the ultimate question? There's people staying, "Stop. I'm wasting my time." Okay. The ultimate question. Well, I'll make the ultimate question, then.

I hope, in this open-source community — go to NetPromoterSystem.com. There are an amazing set of resources there for free that will help you understand Net Promoter, see the organizations who are doing the best job on this. Maybe help you if you want to embrace it in your company and also maybe push you down this path of could we use this as a tool for investing in the companies that are going to grow faster and will make more money.

But I love the way David described his mission — I mean he implied this, at least to me. We want you voting with your dollars in the companies who are our future. And if I were you, I would want to put my votes behind the companies who believe that it is vital that they earn the loyalty of their customers and employees and that reputation, that concept of serving others is at the basis of all good things. And if I had votes to give, I'd like to know that I was putting them with the right people.

And with that, thank you very much.

FoolFest 2014: Pete Miller, CEO of National Oilwell Varco

Published Feb 19, 2014 at 11:29AM

{% ooyala id="8wZDBuazpOQy5jEoLQ-tCWMgjh9Jw2-I" width="580" height="326" %}

Run time: 57 minutes

National Oilwell Varco (NYSE: NOV) CEO Pete Miller both entertained and impressed our audience of Fools at February's member event. Watch as he talks about how his company's oil rigs are reaching new markets, the recent spinoff, and what's next for this company.

Transcript

PETE MILLER:

Thank you all. I really appreciate the opportunity to talk to you. I'm not too excited, though, to be the last speaker before cocktail hour. That kind of sucks, but I'll try to get through it pretty quickly for you.

What I want to do today is a couple of things. I want to familiarize you a little bit more with who National Oilwell Varco is, but I think more importantly, I want to tell you a little bit about the oil and gas business. I want you to see what's going on around the world, what's happening in the industry and hopefully it will allow you to make a few more educational decisions about whether or not you want to be invested in the energy arena. There's a lot of turmoil. We're all high beta stocks, so you can make a bunch of money. You make the right choices and it really kind of works out pretty well. So, that's my goal today — to try to give you an understanding again of us and of the oil industry.

First, I'll tell you a little bit about the NOV growth story. We've grown pretty well, but we do it really through four ways. First one and probably the biggest one for us is M&A. We think we're very good at M&A. We do it. There are a lot of opportunities out there, and it really is worldwide M&A. Of course, then you have organic growth, I think new market entry, and believe it or not, there's still a lot of new markets in the oil and gas business. And finally, new product introduction and new service introduction and really pressing the envelope on technology. And I'll talk about each one of these today to give you an idea of what it is that we're trying to do and the way we do things.

The first one, on the M&A front, take a look ... and here are some of our bigger deals. Since I've been the CEO, we've actually done about 300 deals. Some of them have been very small. Some of them have been very large. The one that was more or less transformative for us was back in 2005, and that's when National Oilwell and Varco came together. That was a big deal. We basically doubled the size of the company — but more importantly, each one of the companies brought products together that really made a lot of sense and really did things together.

We bought Grant Prideco, which was a bit and drill pipe company in 2008 and you can see some of the other things that we've done. Each one of these had a very specific, strategic reason for doing it. One of the things that we wanted to become was the manufacturer of the oil field. Nobody else wanted to do it. We wanted to do it. We didn't want to be Slumberj. We wanted to sell to Slumberj. We didn't want to be Baker. We wanted to sell to them. We didn't want to be an E&P company. We wanted to sell to them.

A lot of people didn't want to do that, and I will tell you the key to business is getting involved with the uncontested marketplace. If nobody else wants to do it, that really leaves a lot for you to do. And so, we bought a lot of these companies when things weren't that good for them, but it really, really made a lot of sense for what we were doing and how we built this company. I get too jumped up here.

We're always looking, and I think here are the keys when you're sitting there and really talking about doing a lot of M&A. We keep our balance sheet very clean. I believe debt is a four-letter word. We try to make sure that we do everything with free cash flow. This year we've generated over $1.5 billion in free cash flow. The good news is I'm not a big capital eater. You know, when we buy companies, we use it, but we don't have a lot of things like a Slumberj that has to continually reinvest in their equipment and everything. My big capital are things like buildings and machine tools. That doesn't take anywhere near as much with a lot of the other stuff that we do.

We have unparalleled access to capital. And you know why? It's because we don't have debt. We've got a little bit of debt — but our capital, our cash actually outstrips our debt. That's where we want to be. It gives us flexibility.

But I think the most important thing to realize in the M&A game is you have to be patient. I don't think people realize, many times, what M&A is all about. You just don't wake up one morning and say, "Oh, I'm going to go buy Varco and go do it." It takes a lot of patience. To give you an example, we concluded the Varco deal in 2005. I had my first conversation with Varco in 1998. It took that long for the moon and the stars to align. Grant Prideco we did in 2008. I had my first conversation with them in 2005. We kept going back to the table. We kept saying, "Here's what makes sense," and ultimately the stock prices and the valuation came together so that we were able to do it.

And we were able to do it because we kept our balance sheet clean, we had a lot of free cash flow and we could strike fast. That's what you have to be able to do. And a lot of people ask me today, "Well, who'd you talk to two years ago so we know who the next target is?" And I'd have to shoot you if I told you, so that's the problem.

You know, as you take a look, M&A is a big deal. The other one that's really huge for us is getting into new markets. And even new markets are not new, necessarily, but they offer new opportunities. You take a look at the shales — and I'm going to show you something on the shales in just a moment. If you look at the Permian Basin — in the United States today, the Permian Basin is one of the oldest oil fields around — yet it's one of the most exciting plays today because of our ability to drill horizontally and to be able to get into shales and things we never thought we've have an opportunity to do. And so, while it seems like that can't be a new market, it absolutely is a new market.

But you take a look at this world map — and where I'm flashing up those big stars right there — that's where shale plays are all over the world. And you hear a lot about shales here in the U.S., but I tell everybody God didn't just put shales in the U.S. They're all over the world. Actually, in Argentina right there, where you see the big one in South America ... one of the best shale plays going. Russia is ultimately going to become one of the best shale plays going. China — they need it. There's so much pollution in China today, the quick and easy solution is natural gas. They're going to exploit those shales and I'll come back to that in just a moment and talk a lot about it.

Shale plays are also equipment eaters. Here's a list, on the left-hand side, of all the equipment that you have to have when you're drilling shale wells. You look at that, and I'd like to be able to tell you this ... we build everything that's on that left-hand side. And that's why shales were really kind of created with us in mind. So, there is divine providence in this world. But when you look at everything that's up there, that's what you have to have around the world. And a lot of what you'll hear today are people saying, "Well, we're going to exploit shale a little bit slower in the rest of the world because we don't have all that equipment." And my answer to that is, "Golly. I build all that equipment," so it works out pretty well.

And let me show you, really, what the shales are all about. You know, we're able to take a look at this rock that comes out and our scientists were able to figure out that if we blasted that ... that if we hit it hydraulically with water and brine and a few other things ... that we would release oil and gas molecules. And that's a hard rock. When people think about shale, it really is. Now you see all the equipment that's associated with it on the surface — but you couldn't have drilled shales unless you had these fixed cut bits because you're going in and ripping that ground horizontally.

So, we were able to develop these bits and develop everything you see in that drill string. You have to have downhole motors so you can actually turn that bit at about 400 rpm. This is a coil tubing unit. You know, coil tubing has always had a lot of promise, but never a realization. We finally figured out how to use it. These are perforating guns. This is when you go down and you perforate the casing so then that hole can get the fracturing fluid through it, and that's what releases those molecules in the oil and gas and the rock. And here's all the fracturing equipment that you see on the surface.

So again, what you see here is the equipment intensity that's necessary to be able to drill these shale wells, and all of that there, fortunately, is built by me. And we're able to do things with that all over the world that really enhance our business. And you notice all the different wells you can drill from that one pad. It's very economically sound. We go down, we make the turn, we fracture that, and away we go. In the old days, you would have drilled one well on each one of those. Today, you can notice we've probably got about 24 wells and we're figuring out every day how to do even more.

So, that's why the shales all over the world are such a great story. They'll continue to be a good story in the United States. We basically, almost can become energy independent because of what we're finding in the shales, but it's also going to enhance the rest of the world as they go through the same processes that we've gone through.

One of the areas, when I talk about new areas and where the shales are, is Mexico. The stars are aligning in Mexico. That's a quote from President Nieto down there. And I believe, and I would offer up to everybody in here as you're looking for investment ideas, think Mexico right now. It's a very enlightened leadership. We have the NAFTA benefits. They just changed their constitution when it comes to energy. I think you'll see a lot of cross-border investment in Mexico and today we believe that that's really one of the best spots in the world to be. And I'll show you something a little bit later, and I'll have you think back to this particular slide because there are a lot of really good and positive things that are going on in Mexico today that I think really will lead to awfully good investment opportunities.

There's some risk. You may have heard about some of the violence down there. No question about it. But our experience — and I have a lot of operations in Mexico — the violence doesn't come looking for you. If you stay out of the wrong areas, you're going to be OK. But there's some tremendous opportunities in Mexico.

Then you've got new products and services introduction. You know, I think this is a key element to anybody that's going to do well in the oil and gas business. We're always pushing the envelope. You've seen what we've done on shales. You're going to see more and more later on different things that we can do. One of the things is the FPSO, and I believe this is the next growth step for National Oilwell Varco. The FPSO is a floating production, storage and offloading vessel. It's really the approved solution for the way that you produce the deepwater reservoirs that we're finding.

I tell everybody — and I'll show you a drill ship a little bit later — but these drill ships are out there drilling in 8,000 to 10,000 feet of water, and they're not drilling for practice. They're drilling to find oil and gas. And when they find oil and gas, the approved solution on being able to produce that oil and gas is the FPSO. The problem is we don't make them cheap enough, so we put our engineers on this. We bought a couple of companies that do it and today, we think we're online for being able to reduce that $750 million level down to a much lower level to make it much more affordable for the E&P companies so they can continue to explore.

This is an example of what you see. It used to be an FPSO could only be used in benign waters. The benign waters were West Africa, Brazil. You don't get the storms that you get in the Gulf of Mexico or the North Sea or the South China Sea. But we were able to design something here, and that's the turret that you see going up here. And this turret is connected to the manifolds on the ocean floor. All the oil and gas is being developed through that turret or produced through that turret.

Then that turret, in turn, moves the oil and gas down through the compression systems. They're able to take a lot of the water out, some of the other impurities. Then they're able to put it on tankers and take it back to the shore. Now if a storm comes in, what we've developed is we can actually drop the turret and then the ship, just like a drill ship, can now get out of harm's way. So it's able to sail away with the turret floating underneath the water — not to be bothered by the hurricane. Once the hurricane goes through, you go back in, regrab the turret, and away you go. What that's done is it's opened up every part of the world for the ability to be able to use the FPSOs.

So, I would offer that when you take a look at this market, I think over the next seven or eight years, you could see as many as 200 of these things built because we need to have them. That's the cheapest and most efficient way to produce the deepwater reservoirs, and I think that's going to be pretty cool to see that.

Another thing that we've been able to do is we look at game-changing technologies. One of the things you'd really like to be able to do is get seismic well drilling. Today, you've got to take your seismic stuff out. You've got to thump the ground or you've got to have noises go down in the ocean so you can figure out what the formations look like. If we could actually drill in there and get real-time data back, it's kind of the Holy Grail of being able to look at production.

So, what we've done is we created what I would call a superhighway with drill pipe in which we can actually get information, on a real-time basis, from the bit back up to the surface to be able to tell people what's going on. And that really looks like this. It's called wire drill pipe. Drill pipe comes together 30 joints at a time. We've wired it, we've made that connectivity so that it works ... so that now what you can do is actually get that information up to the surface and be able to make critical decisions as you're drilling the well, which is exceedingly important.

So, now we've got sensors in this bit that are feeding that info. It's gone all the way up that drill string, and so when it gets to the top, it tells you, "Here's the formations that we're seeing." The driller sits there. He's looking at everything. He can make decisions about what he wants to do, and then he can lower the weight, speed it up, do different things that allow him to drill past areas that he doesn't want to drill into. And you can see that here, in the old days, you just would have drilled straight down and hoped. Today, with things like this, you can go straight down and you can start to deviate and you can do different things and it gives you a much better opportunity to actually find out where your oil and gas is.

So, I think the new product development is huge when you take a look at the things we're doing. We're changing technology every day. The oil and gas business, I think, is one of the best at being able to adapt to things and figure it out, and it's because of products like this.

Now, we also look all over the world for where can we get organic growth, and those of you that know what the BRICs are ... Goldman Sachs, a few years ago, said they were going to be the most important element of what we did in the world economy. That's Brazil, Russia, India and China. How's it worked out? Not so much. But when you think about it, for us, it's still a pretty big deal.

Here's Brazil. Brazil is probably one of the biggest oil basins in the world. I would offer Brazil could use every rig that we've got in the world down there on that East Coast that you see right there on the second slide. But you also look at the economic activity. That's the blue line. And then the bar graph — and that's the one to concentrate on right now because that's the exchange rate. That's the Brazilian real.

The bad news is the economy has been very, very up and down. The good news is the dollar's going further than it did before because the exchange rate's really improved toward the dollar. Brazil's a big deal to the oil business. It's a big deal to NOV. We've got over 20 drill ships that we're building in Brazil today. But the economy has let us down a little bit and you have other issues associated with training, education and things like that, that make it a fairly difficult place to do business. However, it is where there will be a lot of growth.

Russia. Again, you take a look at the blue line and you see the big dive that it had after the financial crisis in 2008, and then you look at what the ruble's doing. Again, the dollar's getting stronger than the ruble. Much like Mexico, I would offer that Russia is going to be the next great place for the oil and gas business. And you think about the size of Russia — the United States is four time zones wide. Russia is eleven times zones wide, so think of the opportunity. And when you see all those basins right there — many of those are virgin basins. They have not been touched.

Today, the big effort in Russia is to be able to go in and have local content. I'm currently building about a $150 million plant in a town called Kostroma, which is just a little bit northeast of Moscow. The one thing you always figure out in Russia in the oil field — if you build it anywhere, you've built it in the wrong place. It's just too damn big. But we've made the decision this is where we're going to do it. I think this is going to be a tremendous opportunity, but you can see it's not been that line just going up and to the right the way everybody had anticipated.

And you look at India. India is probably more valuable to the oil and gas business as a consumer of oil and gas than it is going to be as a provider of oil and gas. But you see again the rupee — the dollar is very favorable toward that. You look at the different basins that they have. But again, it's the world's fourth largest consumer of petroleum today. I would offer that's going to do nothing but get more and more and more. As more people in the country — as the middle class expands, that's going to be a big deal — and it's a bigger deal to us to be able to actually manufacture in India and export that product than it is to actually think about things going into India.

And then finally China. And you take a look at the Chinese story. Again, the blue line's gone up and down, but you'll note, it's still well over 8% growth. That ain't half bad. But here's the key to this one. Look at where the renminbi is on the exchange rate. When we started our factories in China, the exchange rate was about 8.2 to 1. Today it's more like 6 to 1. And what that has done — I showed you the Mexico slide earlier — it's cheaper for us today to manufacture in Mexico than it is in China.

And so, we're starting to move a lot of what we did over there to other places around the world. The nice thing about my business — a lot of it's fungible. I can move it around. But you can see, with that exchange rate right there, China is becoming a more and more expensive place to do business. We actually build stuff in the U.S. and ship it into China. Imagine that. But as a manufacturer — the coil tubing unit I showed you earlier? We build those and move them in. It's amazing, but that's what's going on over there right now.

Where China is though, big, is the consumer. They will continue to use a lot of oil and gas. They've got issues with air pollution. I mentioned it earlier. The real solution to that is natural gas, and they have some tremendous shell basins. All the stuff I showed you on shale we're going to be doing in China — we're starting to do in China right now — and I think the opportunities for the oil and gas business are pretty amazing.

So, they're slowing ... but they're still very important. So, you can see the way it's kind of bounced around. I think the BRICs are very important, but there's other parts of the world that are equally important. I would tell you South Central Asia — I would tell you Southeast Asia are areas that are going to be every bit as important as the BRICs were when everybody said that about ten years ago.

North America's going to get stronger. I think those of you that follow the oil business know that North America's a little flattish today, but it will get stronger, and I think one of the real reasons is technology. You've got a bifurcation of the rig market. Everybody wants the best technology. You know, rigs rolled. When you take a look at the rigs that were built, most of them were built in the late 1970s, early 1980s. Think about your car. You might like your little Ford Mustang that was built in 1964, but you like to drive it on a Saturday morning ... not to and from work every day. And these guys want to have the best rigs that are out there. That's why I think you're going to see North America come back.

The second reason you're going to see North American gas come back is LNG. As the LNG facilities open up on the Gulf Coast, they're going to need to have feedstock. That feedstock is going to come from places like the Haynesville. It's going to come from Fayetteville. It's going to come from Oklahoma. It's not going to come from Marcellus or anyplace up in the Northeast because we don't have the infrastructure to get it to the Gulf Coast. That's why you'll see a resurgence down in Louisiana, Texas and Oklahoma — because they've got to have that LNG feedstock.

Deepwater drilling rigs — this is another area. We're in the process of building a bunch right now, and everybody says we're probably building too many. We're not. Rest assured of that. I mean, think about the world. There's 150 rigs working in the state of Oklahoma. They're drilling one well each. There are about 150 deepwater drilling rigs in the rest of the world drilling one well each. So, people need to get their hands around the fact that the world needs a whole lot more of these drill ships and I'm there to help them. So, when you take a look at it, the economics are still very compelling today, and it really is a unique piece of equipment.

This is just a chart that shows you that a man — on the left-hand side, the little blue — is what was there. The right-hand side shows you what each area's going to need. I actually think this might even be a little bit outdated. We're probably going to need a lot more. And this means an awful lot to NOV. Every drill ship that's built — my take on it is about $250 million.

And this is what it looks like. This is the Stena DrillMAX which is one of the best ones. We built this in Samsung in Korea. Everything you'll see on here I manufacture, but you also see the technology. You see the fact that there's no one around the rotary table. Very few people are here. The driller is running everything out of the driller's cabin. We're using robotics and automation as much as we can. Just like a plant that builds cars, people don't want to do the real hard work that's associated with being a roughneck, so we've tried to take that out of the equation. We've tried to have it so you can have this sort of technology, you can move things around pretty quickly, and they're doing it all with the control system that you see right there in that chair. Now, that's pretty neat stuff.

We've built about 100 of these since 2005. There's more to come. We're changing the technology every day. We're at the point today where we can drill in 12,000 feet of water. We also can drill in pressures up to as much as 20,000 PSI. That really means you can drill just about any place on the planet with the exception of the Marianas Trench. But the fact is that we're going to continue to push that envelope and you're going to continue to see these drill ships built. So, when you add the drill ships and the FPSOs, life looks pretty good for NOV, and I really think it will be as we push forward.

Jack-ups. Those are another thing. They need the same sort of retooling that I've talked about. Now, when you think about the jack-up rigs, 57% of the fleet is over 25 years old and again, the technology advances that are made are really incredible. And in that bifurcation of the rig market, today you see a lot of people continue to order jack-up rigs and most prognosticators say we're ordering too many. We're not. The reason is because the bifurcation, the new rigs are getting the work the old rigs are not. You're marginalizing old rigs.

This is an example. If we were to maintain the 25-year average, we've got to build about 20 new jack-up rigs a year. It takes about two years to build a jack-up rig. And you can see the age. Even if we built more than that, we barely dent the average age. And again, the technology differential on those older rigs is incredible versus the newer rigs, and because of Macondo, today you just can't run the risk of not drilling the rigs unless you have the best possible equipment. That's why we like where we are in the food chain. That's why we think you're going to continue to see a lot of good things happen.

Then reality is the proof is kind of in the results. You see in 2000 what our revenues were and you see where they've gone today. You can see the profits that followed. That's been, I think, the thing that we wanted to make sure that whatever we did, we were growing the company and we built it. You can notice even going from 2008 to 2009 there was just a short dip. That's because we had a big backlog. Even though the price of oil got very low, the price of gas got very low ... we were able to weather that storm quite well.

And the one thing I think most businesses forget about is cash is king. You know, when I was in grad school, an old professor of mine said, "Miller, you can do a lot of stupid things, but the only one that's terminal is running out of cash." And I believed him. So, you can see the free cash generation that we were able to do over the years. You've got to have that, and you've got to make sure that you're generating cash. You can have some years that you might not generate as much as you like, but gosh darn it, why are you in business if you're not in business to generate cash? That's what it's all about.

This backlog — that's really been the key to our success. If you notice back in the third quarter of 2008, when the world fell apart financially, I had about a little less than a $10 billion backlog and you can see I lived off that for the next couple of years. Today, my backlog is much higher. So again, we've built that to be able to withstand it.

I'll tell you just one cute story. A couple of analysts back in 2008, when I had my backlog sitting out there, said 75% of it was going to be cancelled and I'm like, "They don't quite get it. We get prepays. We've got hard contracts." We ended up having 3% of our backlog cancelled. And the good news is I made more money in that 3% because I didn't give the equipment back to them. I sold it to somebody else, so it worked out really, really well.

But you can see the same thing today. You can see the build of the backlog which gives us tremendous visibility into 2014, 2015 and 2016. We're still a lot of orders coming in, and if you talk to folks, that really is the key to what we're doing. That backlog gives us the certainty that the things we're doing are very positive.

Financials — you see what we've done with margins and I would say, as a manufacturing company, to get 20%-plus margins is pretty good. I think there's a lot of them that would like to do that. Our dividend today is about a little less than 1.5%, but we've raised it. We doubled it this past year and we'll probably raise it significantly again as we move through this year.

One of the things that we're doing is I'm going to spin off the distribution business. What's happened is we've got a really good distribution business and it has the size today to be able to live on its own. And so, we're going to spin that off to our shareholders on a tax-free basis. I think it's a great business. It's one we're going to be able to grow. And when I first told distribution I was spinning them off, they looked at me and they said, "Well, you're just trying to get rid of us," and I said, "Well, that's not the case." I said, "There's something I can't tell you yet."

Two months later I went back and said, "Oh, by the way, I'm coming with you." And so, I'm not going to be the CEO of NOV anymore. I'm going to go over and become the executive chairman of the new distribution business. So, I have a guy ready to take my job and this way I can keep my finger in the pie ... but I think this is going to be a good deal. I think when people see this — when our current shareholders get this — they're going to be excited about the products that we're giving them. About the company that we're giving them.

When you take a look at what we're doing — again, we use a lot of technology here, as well. When we go out in our distribution business, it's really kind of selling ... it's like any distributor. We're a Wal-Mart. We're a Home Depot. We're a Costco. We're out there selling the products that these guys need in the oil and gas business. But our folks have come up with really unique ideas. This is RigPAC right here. And what we do is we actually take a warehouse out to the rig. We're able to put it on the rig on a consignment basis. We have a great computer system. All of our distribution business is tied together through SAP and we're able to know where everything is at any one point in time.

We can take the barcode readers out there, just like at Wal-Mart when you buy a tube of toothpaste, you take it through the cashier. They wand it. They immediately tell their warehouse, "Restock the toothpaste." We do the same thing here on these drilling rigs. We're restocking them as soon as they use the product. But more importantly, we can go to our customer and we can say, "Oh by the way, your rigs are using too much. The rigs down the road aren't using the same amount, and so there's something going wrong here. You need to take a good look at it." And many of the folks go, "Oh, gosh. We didn't know that."

So, we're able to work with them through this RigPAC concept and that's value added. And as we can add that value, it no longer looks like a distribution company. It looks like a company that can go out there, take care of your needs, be able to add that value and the result is we're going to get a higher margin. So, I'm excited about this business. I think it's going to be a good spin for our shareholders and we're going to be pushing forward probably sometime in the early second quarter with this.

A couple of other things I just want to touch base on and then I'll make sure you can all get to the Happy Hour. The first one is we are still a cyclical business, though. You've got to know that. The price of oil and gas don't keep moving up and to the right. I think as you take a look at what you're trying to do, you need to make sure that you're planning for all contingencies. I think there's going to be an up and down in the gas business. It just happens.

You can say, "I think that it's going to be the high price, I think it's going to be the reference or I think it's going to be the low price," but make sure you build your company to be able to take advantage of that. I think that's the most important thing. That's one of the reasons I don't like debt — because when you've got a lot of debt and you get into a cyclical business and you go down, it hurts you. When you've got a lot of cash in a cyclical business and it goes down, you're not hurt anywhere near as badly. And you combat the cyclicality — leverage, liquidity, dividends. What we've tried to do is build this company to withstand the cyclicality as best we could, knowing we could never get rid of it, but at the end of the day have higher highs and higher lows. We think that's the most important thing that you can do.

And you want to be everywhere. You want to be all over the world because if the United States is down, maybe the Middle East isn't. If the Middle East is a little soft, maybe South America isn't. So, at some point in time, you're going to be hitting someplace on that map. We've got 1,250 locations around the world in 65 countries. That means I'm everywhere, and so the cyclicality can really be abated by that.

And the other thing is have the best technology — just absolutely have the best technology. That's winning the game today. Not only are you seeing it in the tech arena, but you're seeing it in our arena. This goes back to what we were showing before. It used to be everything you see on here was done manually. There were tongs. You had men that were up there just making these things bite. It was a backbreaking job. Today, everything you see up there is being done robotically because we're able to control everything that we have. We're able to control the system. We're able to do the things that we need to get done, and we do it through the best technology.

And people want to work on the rigs with the best technology, so it makes it easier on our customers to be able to really recruit employees because they bring them in there. They're able to come in and see this, and this job is a heck of a lot nicer than a job on one of the old rigs that doesn't have anywhere near this level of technology. So, you keep that technology up-to-date.

And the other thing I'll tell you is our engineers did an ergonomic study when we were building this, and the chair that we use for the driller is the chair that comes out of a Porsche 911. When that driller is sitting there, he thinks he's going real fast, so it works out very, very well. But the best technology wins.

When you look at the things that I've talked about today — financial flexibility, being around the world, technology, increase your offerings — that's what makes a successful company in the oil and gas business. I love this quote because this is what we try to do. Wayne Gretzky, when I asked him why are you so good, he said, "Others skate where the puck is. I skate where the puck's going." And what we try to do at NOV is figure out where the puck's going. I think that really sums up our strategy very, very easily and very quickly. That's what we do.

So, that's a little bit of an overview of what's it's about. I think it's an exciting business. I think today there are some real bargains in the oil and gas business. I think E&P companies are depressed. I'll tell you — all the drillers are down. And you look at companies like Ensco and Transocean and Noble — a couple of years from now, their share prices will be way up and it's because today everybody thinks that it's never going to get nice in an oil field again. And then about two years from now, it won't ever get bad again.

So, I think those are great opportunities. As you look at this industry — it's a fun industry, it's an exciting industry and it's one that's not going anywhere. I understand we're doing a lot of things with renewables, but Socrates once said, "Only the dead have seen the end of war," and I would suggest only the dead have seen the end of oil and gas. The world needs it and it's going to continue to need it for a long, long time.

So, that's my story, and if anybody has any questions, I think I'm doing good on time. I knew that the drinks were waiting. Yes, sir?

MALE:

You touched on a couple of things that I was wondering about in that there's a lot more shale plays throughout the world that aren't necessarily being taken advantage of to the extent that they are in the United States. My question to you is that as those plays are taken advantage of, does that drive down the cost of oil and gas? And if the answer to that question is yes, how does that impact the future of the renewables industry because one of the issues that we've always had is the cost of fossil fuels versus the cost of renewables such as solar or any of those other wonderful things. Could there be a slowdown in the conversion to renewables as a result of the drawdown of the cost of the fossil fuels?

PETE MILLER:

I think absolutely. I think you're seeing it today. As you take a look around the world — Germany just came on and they're starting to cut back on a lot of the subsidies that they're giving. I would offer — and again, I'm not trying to make a comment one way or the other — but the price of natural gas being at the level it is today makes wind, solar, a lot of the different things that you're seeing out there that much less viable without government subsidies. And so, I think that clearly is going to be an issue. But I would also offer that I think things like natural gas offer some real advantages when it comes to the carbon footprint. But you're absolutely spot-on. The lower those prices go ...

I mean, why do you think the United States is having a renaissance in manufacturing today? It's because of the price of natural gas. If you go back four or five years ago, natural gas could be over ten bucks in mcf. Today, we're delighted it's at $4.30 in mcf. A year ago or two years ago, it was $2.20 in mcf. But anything that's below about $5.00 in mcf is really a boon to manufacturing, it's a boon to most of us that heat our houses with gas, but it does impact the race to renewables without question.

MALE:

Good afternoon. Sheik Yamani from Saudi Arabia once said that the Stone Age didn't end for lack of stones. From your point of view this oil and energy market — how long will it take before technology like electricity in electric cars take over? My expectation is three to four years. Could it be more?

PETE MILLER:

Well, it could be. But first off, to go back to part of your question ... the electricity in electric cars — have got to have the generated electricity in electric cars. They get that from oil and gas. Mark Twain once said, "The rumor of my death has been greatly exaggerated," and I think the rumor of the death of the oil and gas business has been greatly exaggerated. It's a business and we're finding ...

I'm sure you've heard of peak capacity. I'm not the youngest guy in the room, but the world's been running out of oil and gas since I was born and today we're finding more oil and gas because of technology. It goes back to what I'm talking about on shales. We had no idea. So, I think the oil and gas business is going to be vigorous for quite some time.

MALE:

I'm a very proud shareowner in your company ...

PETE MILLER:

Thank you.

MALE:

... and I see you're spinning off your distribution system. Is that going to be a partnership? Or how are you doing that?

PETE MILLER:

No. We're giving it completely to our shareholders.

MALE:

Oh, so I stay right in that.

PETE MILLER:

And we're giving it tax-free. If you own ten shares of NOV — and we haven't figured out the exchange rate yet — but you'll get shares of the new distribution company.

MALE:

I really like tax-free.

PETE MILLER:

And you get me with it.

MALE:

First, thanks for the really nice presentation. My question is more along the steel line. You talk about coil tubing. Where do you produce that?

PETE MILLER:

Actually, one of the things you'll see when I answer a lot of these questions is we're the world's largest manufacturer of coil tubing, and we do it all in Houston, Texas. What we do is we get flat plate and then we roll it together, we bend it, and we have a seamless weld in it. And we've made coil tubing strings as long as 30,000 feet. So, think about that. And if you come to see one of our plants, it's about a quarter of a mile long. We start on this end with flat plate. We come out on this end with about 2-3/4 inches of tubing like that.

MALE:

Would you ever consider coming to Pittsburgh?

PETE MILLER:

Well, sure! No. Actually, I have a lot of operations in Pennsylvania and we have some operations in Pittsburgh. I hate to tell you this, but I have to buy my steel from Sumitomo, because that's the best grade of steel. And you can imagine that coil tubing. It's going through a lot. You put it on the reel. It's going down the well. We're working with U.S. Steel right now to see if we can certify their steel. The other thing is the big steel manufacturers in the U.S. — it's about tonnage. It's not about specialty steel, and my coil tubing's more specialty. But we'll keep looking and I'll come look you up when we go on to Pittsburgh.

MIKE OLSEN:

Kind of interesting, but I would presume that among the Fools here, how many National Oilwell Varco shareholders are there here?

PETE MILLER:

Well, thank you very much.

MIKE OLSEN:

You are in fond company. I guess that in mind, I've followed the business for quite a while and I know having the distribution business coupled to it made a great deal of strategic sense. So, I'm just curious as to the rationale in separating it. And then, not to get into your dinner table conversations, but I guess I will. Why did you decide to go there?

PETE MILLER:

First off, the distribution business has worked very well being part of NOV, but it also had some downsides because there's a lot of equipment out there to distribute that other people didn't want to use us as a distributor because we were NOV. We took a look at it, and we'll continue to distribute most NOV products, but, we'll also be able to distribute other product. Plus, whenever the distribution folks came in to see me with a good idea and they wanted to expand and do stuff, I would just push them back and go, "I'm sorry. I've got better uses and a better rate of return on my money."

And so we think for our shareholders number one, you're still going to have the meat of NOV but secondly you're going to have new stock in a company that I think is going to grow and is going to grow fast. And so for us, it was a win-win for everybody ... a win-win for the shareholders and a win-win for, we think, the two companies that are going to be there.

The second part of it — the reason for me going. One of the things that I've worked with my board on, every board meeting for ten years, is succession planning. And my position on it — my board was always told if I get hit by a truck tonight, something happens — here's the guy you ought to promote to CEO. And if something else happens, here are the other people. And I go up and down the line. Every one of my top managers, I have a succession plan for. And the time is right. I've got a young guy named Clay Williams. Clay has worked with me as the CFO. He's been my COO for the last year and a half.

He's ready, and I've always said I'm not going to stand in his way. I don't want a guy hoping that I have a heart attack so he can get promoted. So, he was ready. I've worked my entire life — since I was about 14 years old — and so I thought this is a great opportunity for everybody. My board wasn't too excited about it initially, but I think they've come around a little bit, too. So, that's the reason. He was ready. You're going to get a great leader in Clay and I think those of you that hold the stock of NOV now, you're going to find that's going to be a great company, as well and I'll be the executive chairman of that with a great CEO. That was the rationale.

MALE:

My question is a little off topic, but you're talking about a drilling company and a lot of new technology, and we have refinery capacity issues in a lot of these fuel sources bringing a different quality of fuel. Are you seeing more demand for your products to do more separation and cleaning?

PETE MILLER:

You know, for the most part, most of the things that we do ... It's a great question. I've stayed upstream, for the most part. I've done that for a lot of reasons that I won't go into — but I've kind of stayed upstream. But the midstream and downstream really do need new products and they're getting new things for the separation. And I think as you look at companies like Dresser ... I think if you look at some of the compressor companies and some of the other — those will probably be good investments because they have to retool, as well. They have the same thing that these drillers have. You've got some refinery that's 40 years old, and it's not real efficient. And you're seeing a lot of retooling done right there.

MALE:

A couple of questions. How do you compare the political roadblocks of doing business in the U.S. compared with Mexico, Russia? And are you applying any 3D printing techniques in your manufacturing?

PETE MILLER:

The first one is every part of the world has its own problems. You've got problems building plants in the United States depending on what states you go into. If I go to Pittsburgh, it's a little harder than if I'm in Texas. I didn't say that, but ... In most countries, it's tough. I mean, Brazil is real tough. There's a big bureaucracy and you've got to get a lot of things done. Russia — there's a big bureaucracy. That's why when people tell me they're going international, I just kind of chuckle.

Our experience on going international is don't shoot your way through the door. Go buy it. And you go buy companies in these countries because they know how to handle all the regulations and the rules. But each place has its own issues. And if people say it's easy doing business in the United States, I would say, "Au contraire." There's other places in the world that it's harder, and there's other places that it's easier.

On 3D, that's a great question. Just to show you how connected I am in my company, I'm sitting there watching something. I think it was — what is it? The 3rd Rock from the Moon or one of those shows. Anyway — no. It was *The Big Bang Theory*. So it shows you what I do at night. I've got an exciting life. So I'm watching it, and I see this 3D printer on there. I came into my guys the next morning and I said, "This is cool. We are going to go get some 3D printers." And my chief technology officer said, "We already have ten of them." And I just drank my coffee and said, "I knew that. I knew that."

So, I'll tell you where the 3D printers come best for us is design and getting something off of the design table and into the manufacturing process right away. We wouldn't build any parts with 3D. Our parts have got to be a lot stronger, ultimately, than that. But boy, I'll tell you what. You go in there with a new BOP design and if you come to my office in Houston, I've got all kinds of little models around there, because I want to show I'm connected now. But I've got all these things that we built on 3D printers. It is magic. It cuts engineering time on designs by leaps and bounds. The biggest advance we ever made was getting off the drafting board onto things like SolidWorks and being able to design on computer — and just as big is being able to take those computer designs, build a model overnight and be able to take a look at it. It's big-time stuff for us.

MALE:

Similar to 3D printing, you mentioned automation as a big part of your business. If you can discuss what companies are you working with, with respect to automation and how do you see that factoring into your business going forward?

PETE MILLER:

Interestingly enough, one of the things we've discovered ... We've put venture capital into some small companies, but more importantly, we do it on our own, because we've seen that a lot of the companies that specialize in automation don't get our business, and they don't get the fact that you've got drill pipe like this that you're smacking around out there and you've got to tighten it up. So everything you saw in here, like on the very last one ... that chair, and all the automation and all the software are done in Norway.

We bought three companies in Norway and Norway is our center of excellence for electronics. I discovered when I want to hire an EE in the U.S., they want to go to work for Google or Yahoo! They don't want to come to work for NOV. But in Norway, the oil and gas business is still the big deal, and so we get all of our electrical engineers over there out of schools like Trondheim and Bergen and some of the really top European schools. So, for the most part, we're doing it all in-house.

FEMALE:

[00:51:40]

PETE MILLER:

You're asking me. I'm the guy that didn't even know I had them, OK? I actually don't know. I don't know the brand name.

FEMALE:

[00:51:49]

PETE MILLER:

Absolutely.

FEMALE:

I'm also a proud National Oilwell Varco shareholder ...

PETE MILLER:

Thank you very much ...

FEMALE:

... and now even prouder after your superb and impressive presentation.

PETE MILLER:

Well, thank you.

FEMALE:

I was wondering if you could share with us, from your deep knowledge in the field of fracking, your insights into the problems surrounding frack water cleanup and how might that impact your business going forward?

PETE MILLER:

Sure, that's a great question. First off, we've been fracking since 1949. Earl Halliburton invented fracking — consequently you have Halliburton Company. We've been doing things, actually, awfully good and then we came up to Marcellus and got a little bit closer to the Northeast. Down in Texas and Louisiana, we handled it pretty good, but not so much ...

But, I'll tell you this. The industry is doing a great job. Today we're looking at different concepts on fracking with brine water, because a lot of times you have to use fresh water, but I think we're making great strides. I just bought into a company that's really got a cool reverse-osmosis system that is small and compact that you can actually put on location and be able to clean the water up real well.

The biggest issue is reducing the amount of water we have to use. That's the biggest issue and I think people from Halliburton, Slumberj, BJ, Baker Hughes ... they could talk much more eloquently about it than I can ... but I will guarantee you. The same industry that figured out how to go out and do that horizontal drilling and figured out that the Permian Basin had a lot more oil in it than we thought, and figured out that the Marcellus Shale had a lot more gas in it is also going to figure out how to do this with less water, if any water. I think one more. She's getting ready to pull me off stage.

FEMALE:

Is there a significant competitor in your equipment and technology manufacturing business?

PETE MILLER:

Do we have any government employees in here? Yeah, there's a lot of competitors. Okay, last question and not about competition.

MALE:

I have one question for you. This is a slightly different take. You said you had a lot of new technology that requires using computers. Are you finding that you have the labor to staff all of this new equipment that's trained and able to do that? It feels like a big shift in what you need.

PETE MILLER:

It's a big shift in the quality and the training of the individuals, no question about it. One of the things that we did — about eight or nine years we opened up technical colleges. I've got them in Houston; Stavanger, Norway; Singapore and Macaé, Brazil. What we're doing is we're rotating over a thousand people a year through these technical colleges, and it's specifically to address those issues.

What we're finding, though ... One thing is the oil field pays pretty well when you start taking a look at a guy who works out of one of those offshore rigs with a high school degree and a little bit of training's making over $25 an hour. Plus, if he's offshore, he's getting all of his meals paid for. If he stays away from the poker table, he's going home with a lot of money every tower, so he can do it. And we're finding that you have to make the commitment to train.

And the other thing that we're also discovering — we're a worldwide business and a lot of the engineers that we're getting today we're getting out of Romania. One of the reasons I talked about the plant that we're building in Russia in Kostroma and one of the reasons we went to Kostroma is it's got a wonderful college. It's a town of about 250,000 people and they graduate 2,000 to 3,000 engineers every year. And those engineers love to come to work in our business. So, we teach them English. We teach them how to do certain things.

So, we're finding if your goal is only to get employees out of parts of the United States, you're going to have trouble. But if you're willing to go worldwide — and we're a worldwide business — you're going to find the folks. You're going to find them.

MALE:

And that is it. Let's give Mr. Miller a big hand.

FoolFest 2014: Author Malcolm Gladwell

Published Feb 19, 2014 at 11:26AM

{% ooyala id="NiZzBuazrbX96RnSuD7lZTjQw3V1S655" width="580" height="326" %}

Run time: 60 minutes

We were thrilled to have acclaimed author Malcolm Gladwell sit down for an interview with Tom Gardner at our February member event. Watch as the two talk about Gladwell's latest book, *David and Goliath*, and why many people would rather "lose conventionally than run the risk of catastrophic loss unconventionally." The two talk about disruption, playing to your weaknesses, and how David and Goliath principles play out among some of our favorite companies, including Amazon and Facebook.

Transcript

TOM GARDNER:

Okay, so as our *Motley Fool One* members know, I have my questions on my iPhone in this highly, highly formal setting of Foolishness. By the way, what are the chances that my [00:00:12] slides off the back? That will be entertaining.

This is the David and Goliath of hair. So, I guess I have the unique advantage in this, given the great disadvantage that I have. But Malcolm, what would be great is just to have you start by ... First of all, thank you so much for coming and spending time with us. Just outline the overall premise of the book.

MALCOLM GLADWELL:

Well, I was interested in a book describing in asymmetrical conflicts ... or more generally in this notion of is our understanding of what an advantage is accurate? And that's the theme that runs throughout the whole book. So, if our understanding of what an advantage is, is so accurate, why does the weaker party in a war win as often as it does? Because the weird thing about it, if you look at the history of warfare, is that the "underdog," the much smaller party in any kind of conflict, wins an astonishing number of times, which suggests that maybe we're fixating on the wrong variables in explaining conflict. And then I run with that idea and talk about schools and education and dyslexia and all kinds of entrepreneurialism and all kinds of things along those same lines ... wondering whether our kind of intuitive accounting of these things is accurate.

TOM GARDNER:

What I'd like to do is just spot up some of the characters, some of the narrative of the book so you can just tell maybe a couple of short, little tidbits about each one. So, why don't we start with Vivek and since I'm going to mispronounce names, why don't I have you pronounce the full name.

MALCOLM GLADWELL:

Vivek. Runadiv ...

TOM GARDNER:

Vivek.

MALCOLM GLADWELL:

... who is the guy who founded Tibco, a software company in Silicon Valley. He's sort of the one who got me rolling on this because I ran into him at a conference once, and I really had no idea who he was. This is a problem that I have — that I have very, very poor facial recognition. In fact, parenthetically, I once was at a dinner at some conference. Sat next to a guy who, for the whole dinner— I thought he was a graduate student — and I made him discuss Michigan State basketball with me the entire time. Discovered at the end of the conversation that it was Larry Page. It was almost like, "Did you really get to talk to Larry Page?" It was like, "That was Larry Page? I thought he was a graduate student." So, I'm bad at this.

Anyway, I run into this guy Vivek, and I start talking to him, not realizing that he's the head of Tibco, about his daughter's basketball team. He had just finished coaching his 12-year-old daughter's basketball team, and Vivek being from Mumbai doesn't know the slightest thing about basketball. And so, he went to watch basketball to educate himself on this, and concluded that the way Americans play basketball was utterly insane.

He didn't understand why you retreated after you scored. Why do you run back to your own end and wait for the other team to bring the ball up? I mean, sometimes he will play the full-court press, but his whole point was why wouldn't you press all the time? Particularly for the weaker party — if you're the weaker party, why would you allow the other team, which is better at shooting and passing and scoring than you, to shoot, pass and score more quickly than they would otherwise? Why wouldn't you try and stop them from doing the thing that makes them good?

And particularly when you're talking about 12-year-old girls, you realize that if you play the full-court press with 12-year-old girls, they won't even get the ball inbounds. And furthermore, he realized that his team that his daughter was playing on was a team of girls from Silicon Valley. They were the daughters of people like him. In other words, these were not girls who went home every night and shot baskets. They were girls who went home at night and dreamt about becoming marine biologists. They had no talent whatsoever, basically.

So, he gets these girls together and he says, "Look. I don't know anything about basketball. You have no talent whatsoever. It's pointless for us to shoot, dribble, do anything. What we're going to do is get in insane shape, and I'm going to teach you how to play the most aggressive form of the full-court press." And so, they start winning games by scores like 6-0 and they go all the way to the national championship.

Now, the fascinating thing about that story is that it's the rational strategy if your team sucks. In fact, any team that is a decided underdog in any basketball contest ought to play the full-court press. Even though there's a chance that the other team can break the press, you're going to get blown out. But his point is, "So, what? You're going to lose anyway. Your only chance of actually winning is to do something radical."

So interesting that number one is why, then, do so few underdog teams play the full-court press? Why is there an unwillingness to follow a strategy that is in your best interest? And the answer is because it's hard and because people don't like it. And people didn't like Vivek when he was coaching this team.

TOM GARDNER:

Is it also possible that there's a mind-set that it's better to lose in a conventional way than to get utterly blown out in an unorthodox way?

MALCOLM GLADWELL:

Yes, but that's irrational ...

TOM GARDNER:

Absurd ...

MALCOLM GLADWELL:

It's absurd. But what's interesting with this is it is — we could go on and on and talk about this — but it's a perfect allegory for so many things in the marketplace. That people would rather lose conventionally than run the risk of catastrophic loss unconventionally. They would rather 100%, or a 95% chance of losing unconventionally, than a 40% chance of losing and taking a risk.

TOM GARDNER:

Let's hear about Caroline Sacks.

MALCOLM GLADWELL:

Caroline Sacks was a pseudonym. I got really interested in this literature on what's called *relative deprivation*. And so the question is if you're choosing a college, do you want to go to the best college you can get into? Everyone says you should. But there's reams and reams and reams of educational data to suggest, actually, that's not a good strategy at all. With some exceptions, you shouldn't go to the best school you can get into.

You should go to the school where your chances of finishing in the top third of your class are greatest. The psychological costs of being at the bottom of any class, particularly if you're in a competitive field like science, math or engineering, are so overwhelming that it's too risky. If you really want to get a science degree, you should go somewhere where you can feel smart.

Caroline Sacks is a girl who was really good at science. Got into Brown. Went, because everyone said that's the best school you should get into. Got to Brown. Dropped out of science, because she looked around at the other brilliant kids in her class and thought she couldn't do it. And realized, belatedly, that she was just in this absurdly elite environment. By any real-world measure, she was good at science, and had she gone to her safety, University of Maryland, she would today have the most valuable commodity in the marketplace ... a science degree. So, that's a case where, again, our obsession with a certain kind of advantage ... in this case, prestige ... completely distorts our rationality.

TOM GARDNER:

David Boies, the well-known lawyer, and his journey to the law.

MALCOLM GLADWELL:

He's dyslexic. He reads, at most, one book a year, and he is America's greatest trial lawyer. When I heard that, I was like, "Whoa!" So, I went and talked to him. I was like, "How do you even get through law school?" I mean, he can read, but really, really slowly. And this fit into this larger theory of if dyslexia is such a terrible problem, then why are such an extraordinarily high percentage of successful entrepreneurs dyslexic?

And the answer is that some portion of dyslexics compensate for their disability in ways that leave them better off. So, Boies said, "I got through school by doing two things. I developed my memory to the point where if you say something, I'll always remember it. Secondly, I learned how to listen." So, in law school, he would sit. No paper, no pen. He'd sit in the front row, focus on the professor, listen to everything the professor said and commit everything the professor said to memory.

He gets into a courtroom. All of a sudden, he's a dynamo. In day four of the cross-examination, he can say to you, "Wait a minute. On day one, you said X, Y, and Z. Now you're contradicting yourself." He's that guy. And that's not something he's born with. It's something he developed as a result of being denied the ability to read fluently.

And you can make the same argument for entrepreneurs — that deprived of the ability to succeed conventionally in school, you are forced to delegate. I must have interviewed 10 very successful dyslexic entrepreneurs. Every single one of them — what do they do in first grade? Identify the smartest kid in the class and make friends with them. Of course! How else are you going to get through school?

They also, by the way, all cheated ... which I didn't go through in my book. But I was actually fascinated by this. Cheating — but it's not cheating. Cheating, most of the time, is where, "I don't want to do the work, so I take a shortcut. I don't really care about school. I have a contempt for it."

These guys care passionately about school, but they can't do it constitutionally. And they care so much that they say, "You know what? I have to stay in school. I am going to come up with strategies that allow me — someone who is constitutionally incapable of reading easily — to continue to flourish." And so, they cheat. At one point, I had a whole chapter on the cheating techniques of successful, dyslexic entrepreneurs, but I left it out.

TOM GARDNER:

Let's hear about Wyatt Walker.

MALCOLM GLADWELL:

Hm. Wyatt Walker, my favorite character in the book. Wyatt Walker is Martin Luther King's shadowy, less-known deputy. He's the *fixer*. He's brilliant. So, King is like the saint, running the show. Walker's behind the scenes. I wrote a chapter on Birmingham — what happens when King goes to Birmingham to take on Bull Connor — the climactic event of the Civil Rights Movement in 1963.

And the question is, if you have been oppressed for 200 years, what do you learn through that process? What are the lessons — if you're smart and adaptive and resilient — what do you take home from being kicked around for 200 years? And the answer is, you get really, really, really, really clever and you learn how to play tricks.

King, in Birmingham, has nothing. He's got no money. He's at the lowest ebb of his ... He'd just gotten schooled in Albany, Georgia. He's being denounced by everyone, including the black press. He starts to hold marches in Birmingham at the beginning and 12 people show up. Bull Connor is looking at him and laughing. He doesn't even bother to send his cops out after King, because King's so pathetic. And Walker proceeds to play a series of tricks on Bull Connor that have the effect of defeating him. I won't go through all of them, and I'm not going to ruin the chapter for you, but I'll tell you the first one.

They have 12 people marching every day in Birmingham, which is ridiculous. Nothing. One day, they're arguing in the church before they go out on the march and they get delayed. And what happened is that after work, all of the African-Americans who worked in downtown Birmingham would come to 16th Street Baptist Church and just hang out to see what was going on. So, they're delayed until after workers got out.

So, they send their march out with 12 people, and the next day, Walker reads in the press that a thousand people marched in Birmingham, Alabama. He was like, "A thousand? We only had twelve." And he realizes, "Oh, wait a minute." To the reporters, they can't tell the difference (a black person is a black person) between someone who's just a bystander and a marcher. So, he's like, "Oh, duh! We're always going to march after work now!" And so in the press, from then on, it's like, "Twelve hundred people marched yesterday in Birmingham." He was like, "We had a dozen." And everyone is fooled. Even Bull Connor is like, "Whoa. All these ..." And it's hilarious. The story builds from there.

A lot of what people assumed were protesters in Birmingham were always bystanders. Some of the famous photos of the firemen turning the water hoses on protesters were not protesters. Wyatt Walker figured this out. They were bystanders who were really hot (it's Birmingham) who went to the firemen and said, "Turn on your hoses. We're really hot." So, then Wyatt Walker had all the photographers line up, take these photos. Then he said, "Oh, look what they're doing!" This man totally outsmarts Bull Connor. It's just a textbook case of how just because you've got nothing doesn't mean ... It's the same lesson as Vivek. Just because you've got nothing doesn't mean you have to roll over and die. There's all kinds of means available to you.

TOM GARDNER:

Use what you got.

MALCOLM GLADWELL:

You've got to use what you've got.

TOM GARDNER:

Let's close in the narrative section here with your version or your interpretation of the real showdown between David and Goliath.

MALCOLM GLADWELL:

Oh, yes. David — first of all — the sling is one of the most feared weapons in ancient times. It's not a child's story. The rock that goes from David's sling has a stopping power that's equivalent to a bullet from a .38-caliber handgun. When David decided to bring a sling to a sword fight, he's got superior technology. He's not messing around here. He knows exactly what he's doing.

Second, Goliath probably had something called acromegaly, which is a condition where there's a tumor on your pituitary gland, and so your pituitary overproduces human growth hormone. And many of the great giants in history had acromegaly. André the Giant — the great wrestler — acromegaly. Tallest man in history — a guy named Robert Wadlow — had acromegaly. He was 7'11", I think. Acromegaly makes you really, really big and tall. It also comes with a side effect that the tumor starts to compress the optic nerves and radically diminish your vision.

And if you read the biblical story of Goliath very closely, it's clear the guy can't see. He's led onto the valley floor, much more than this, by an attendant. He's the mightiest warrior in Palestine and he has to have a boy lead him by the hand to the battlefield. And then there's this whole thing about it takes him forever to figure out where David is and what David is doing — because David comes down from the mountain and doesn't have a sword. Doesn't have a shield. Isn't wearing armor. Duh! He does not intend to fight you in a sword fight. Why does Goliath take forever to respond to this? Because he can't see him.

So, here you have a kid who is really fast moving, nimble, has superior technology. Has changed the rules of the conflict without telling his opponent and his opponent is largely blind. That is not the story of an underdog. David holds all the cards, properly understood. And that's a beautiful example of how the stories we tell about advantages are just so screwy. Why do we worship size, for example, in all forms? Not just in warriors, but also in companies? We have this obsession. If something is big, it must also then be ferocious and a terrifying opponent. Wrong, wrong, wrong, wrong, wrong. And that's the lesson of the original story.

TOM GARDNER:

What I want to do now is search for patterns in your work, in the book, that might overlay nicely to looking for disruptive, smaller companies that might succeed — when we make the assumption that Microsoft will, of course, squash every business that gets in its competitive space 15 years ago and that doesn't end up happening. Or we assume that Apple must win because Apple is of the size and scope that it is today. So, we're going to look for more disruptive companies, smaller companies and see if these principles help us find them. Number one would be *occupy a spot off the beaten path*. So, maybe the story of the Impressionists and the Salon.

MALCOLM GLADWELL:

The Impressionists are a really interesting group. They come along at a time in the art world in Paris, France, where there was something called the Salon, which was the big art show every year. What every artist did was they competed to get accepted into the Salon. And the Salon was very conservative. It had very strict ideas about what was an acceptable painting.

The Impressionists were doing something radical, and they faced this choice. Should they try and get their paintings into the Salon — which would mean they would have to dumb them down and make them more conventional — or should they go off on their own, and give up all of that prestige and do their own thing. And they decide to give up on the Salon and do their own thing. They start their own little show — which in the beginning no one goes to — which is just in a little upstairs in some little room. And that ends up being the greatest thing they ever did, because they privileged the freedom to do what they wanted over conforming to, as it turned out, a dying set of standards about what art represented.

And that, you know, is a tried and true principle for revolutionaries — that before you can challenge the status quo, you need to leave the status quo. You need to find a safe haven where you can pursue what you think is the right answer free of the deadening constraints of conventional thinking.

TOM GARDNER:

Warren Buffett, Omaha, Nebraska. Leaving New York. Unable to get a job, in a way, in New York City and goes off to Omaha where he can carve his own space out. A little bit of the Ikea story in Poland.

MALCOLM GLADWELL:

Oh, yes. I love that story. Yes. Ingvar Kamprad who has this brilliant idea, which is if you make furniture and don't assemble it, you can ship it flat. You can save on assembly, save on shipping and sell it for much less. And then he gets shut down in the late '50s by his competitors. He's basically blacklisted in Sweden and facing bankruptcy — and he has this second great idea which is Poland, across the Baltic Sea. Really, really cheap labor. Lots of trees. And Ikea is ...

TOM GARDNER:

And Communism.

MALCOLM GLADWELL:

And Communism. He's able to pull it off. It's an extraordinary story of how he manages to build his first plant in Poland, because it wasn't easy to build a modern manufacturing facility in Communist Poland in 1961. And also, it's the height of the Cold War, and he goes to the enemy. It's like going to North Korea today, essentially. It's the same thing. But he is so convinced of his vision and of his business model that he's willing to thumb his nose at everyone and leave the country where he came of age. He's never really gone back.

TOM GARDNER:

So, we're outside the status quo and we turn for expert advice, and I want just a little riff on that in the form of Roger Craig, San Francisco 49ers running back and his sister. So, in other words, Vivek is outside the status quo, but he probably couldn't have pulled that all off by himself without turning to one of his employees.

MALCOLM GLADWELL:

Yes. Going back to the story of Vivek and his girls' basketball team, it turns out that Roger Craig works for Vivek and Roger Craig's daughter was an all-American basketball player at Duke. So, he recognized the fact that he only really knew cricket and basketball was a little bit of a foreign thing.

Craig's very interesting, actually, as an advisor, because the whole theme of Vivek's basketball experiment was to substitute effort for skill. And his argument, I think, is a very accurate argument ... that in many domains effort properly expressed is an adequate substitute for skill. More than an adequate substitute for skill.

And if you know about Roger Craig's career — that's his whole M.O. He's an effort guy — he's also a very skilled guy — but the thing that set him apart was an extraordinary work ethic. Roger Craig has run seven marathons since retiring as an NFL running back. Most NFL running backs can't walk after they retire. So, he knew what he was doing, in other words. He was bringing people who reinforced this really central notion which is that if you're willing to really work, that can make up for a lot of deficiencies.

TOM GARDNER:

So, third factor. *You don't overplay your greatest strength*. I phrased it that way from your discussion of the inverted-U curve. Maybe explain that concept. Should a David, even though he has a strength, not think about overdoing it or is he still on this side of the U curve and should be anchoring hard on his strength as far as he can take it.

MALCOLM GLADWELL:

The inverted U is a chapter where I talk about how I think one of the mental models we use to describe relationships between resources and outputs really leads us astray. We have this notion that if a little bit of resources (money) makes the problem better, then a lot of money will make the problem best of all go away the most. And the answer is no. In most situations where we look at relationships between what you put in and what you get out, the curve does not look like that. The curve looks like that or the curve looks like a U. That in the beginning, things get better, and then they flatten out, and then they get worse.

I use the example of class size. It is absolutely the case that if classes are very large and you make them smaller, kids will do better. But then there's a long stretch between probably the high 20s and the low 20s where you can make a class smaller and you will see no effect on kids' performance. And if you go too far below 20, kids are worse off. There's really interesting, compelling evidence of this — that it is not a good thing for a child to be in a class with 14 other students.

One, you cannot get a discussion going with 14. Not enough voices in the room. Two, one bad apple can totally ruin a small class, because there's nowhere for that person to hide. And thirdly, children who are struggling ... what they need most of all is not more attention from the teacher. What they need most of all is another person appear who is learning at the same pace as they are so they don't feel marginal and isolated. You need to have someone who's asking the same questions, struggling with the same problems. If a class gets too small, the struggling kids are just wiped out.

And that's a lesson that is so routinely violated. I made fun of expensive, private schools in my book because, I'm sorry ... they deserve it. They take $50,000 of your money and they boast to you that your kid is in a class with 12 other students. Whoever said that's a good thing? All they're doing is justifying the fact that they took $50,000 of your money.

TOM GARDNER:

And they have 20 Steinway pianos. That was the Hotchkiss School where you, I thought brilliantly, pointed out that a school like that is often serving its primary customer, which is the parent ... not actually the outcome for the student. It's to impress the parent that we have the very best of every piece of equipment times ten.

MALCOLM GLADWELL:

And by the way, where it is written ... I even find the whole notion that the point of a classroom is to maximize the attention that a student gets from a teacher insane. A student has to go through extended periods where they are forced to solve the problem in front of them by themselves. That's called *life*, right? The teacher should be there for when you are truly stuck and also should be there to get you to the point where you can solve it on your own. It is not a good thing to have the teacher hovering over your shoulder at all times. That's debilitating. We start to make the mistake where we push our use of resources well past the point where they are useful.

TOM GARDNER:

There's a business writer named Les McKeown, and he was the first person to make me see that a company with too much cash — that can be a weakness ...

MALCOLM GLADWELL:

Oh, yes ...

TOM GARDNER:

... because of course, as an investor, you're thinking, "Well, at least I know they've got this huge safety net of billions and billions of cash set aside." But in fact, one of the lines from the book — "shirtsleeves to shirtsleeves in a few generations" — having too much money actually can create a lot of problems and bad incentives inside that system.

MALCOLM GLADWELL:

I think this is at the heart of the R&D drought in big pharma. I think that they have overspent on R&D. If you look at it, it's really fascinating. So, we know, looking over the last 25 years, that the bulk of innovation in the pharmaceutical arena has come from smaller biotech companies who are spending, over the course of developing their products, a fraction of what the big companies are spending.

And the reaction of big pharma to that problem is to spend even more money as opposed to asking, "Does having virtually unlimited resources available for R&D change the nature of the questions you ask and change the nature of the strategies you pursue and change the nature of what you consider to be a worthwhile product?" I think that a lot more time should be spent on wondering whether they have gone too far.

TOM GARDNER:

One last David principle that we might apply to looking at leaders and companies — they truly have nothing to lose.

MALCOLM GLADWELL:

Yes. I'm always really interested by the difference in the strategies that you pursue when you are in a position of relative strength and when you are in a position of weakness — and there is a marked difference. We know that. We all know that intuitively — that when our back's to the wall, we consider a wider range of options than when we are in a comfortable position. And that's what we all know — that a cornered rat is a very, very dangerous opponent — not that struggling companies are rats.

But it's the mistake that the United States makes in Vietnam. It's a mistake we're making now in Afghanistan. We underestimate our opponent because we see that our opponent is relatively impoverished — forgetting that, that very state of relative impoverishment gives our opponent a huge source of strength.

TOM GARDNER:

Is it true that every Goliath was once a David?

MALCOLM GLADWELL:

Not everyone. In New York City, there are lots of Goliaths who are born Goliaths and will no doubt die Goliaths. No, but the most interesting trajectory is when people or companies go from one state to the next ... and the question is can you continue to embody the David values, even as you become Goliath?

On my book tour, I went to Microsoft, and I hadn't been to the Microsoft campus in Seattle for maybe seven or eight years. And I don't know how it's possible, but it's gotten even bigger. And this is not a good thing. I mean, it's like a huge city, now. Are there any vestiges that remain of that really hungry, nimble, innovative company of 20 years ago? So, it is a constant problem — the act of becoming successful undermines the very reasons why you became successful.

TOM GARDNER:

I wonder. What do you think the principles of a great Goliath are? I mean, I can guess one of them has something to do with empathy in the context of the story you tell about Belfast in 1972 and the use of police and power and the assumptions of what would work and what, instead, worked. Maybe through that story or any other examples — what makes for a smart Goliath?

MALCOLM GLADWELL:

Well, one of the things I've been thinking a lot about recently is that when companies become large, one of the things they need to do is to use their size and strength to become more tolerant of dissent, confusion, argument. To back off, in a certain sense. I always remember this. I used to work, many years ago, at the *Washington Post* in its heyday when it really was Goliath. There was a reporter there named Michael Isikoff. He's still around. One of the single, greatest investigative reporters of my generation. I mean, a legend. And also, I like Michael. A deeply obnoxious guy. But the point was he was a great investigative reporter *because* he's obnoxious. He's a pit bull. Doesn't take no for an answer.

And I remember that at a certain point that editors at the *Washington Post* got fed up with him and got rid of him. That is absurd. The whole point of being at the *Washington Post*, and having tons and tons of resources in a vast newsroom is that you ought to be able to find room for that kind of character. And that requires more work from management — dealing with someone who's difficult and who yells at you when you mess with his stories, and who goes off in quixotic things and disappears for a while. It's more headaches, right? It makes your life more complicated. But you have to understand — that is the price you pay for remaining on the cutting edge — is you have to deal with that.

Now, it's easy if you're a small company to deal with that because everything's chaotic, and you realize, "We have no choice. We have to be this way." When you're large, you fall into the trap of thinking, "I can make everything run smoothly now. I can have layers of comfortable management. We can all do things by the book." As opposed to saying, "No, no, no. You have to continue to find ways to shake it up — to have a kind of disputatious culture."

I write for Grantland, sometimes, the ESPN ... And Grantland's in L.A. and ESPN is, of course, in Bristol, Connecticut. And nothing makes me happier than when I read in some blog about how the guys in L.A. are denouncing the guys in Bristol. I just think that's why ESPN remains interesting and vital and important — because they argue, and they argue in public and they don't care. They're fine with having a public image as a company that is in a state of semi-turmoil.

TOM GARDNER:

A Goliath that's open to dissent ...

MALCOLM GLADWELL:

Is, I think, a Goliath that can stave off the worst parts of bigness.

TOM GARDNER:

And a Goliath that has a smooth tempo — total convention, marches in a line, everyone has a job description, EVP of this, everyone's got a role — you would prefer to bet on the seemingly weaker, smaller, chaotic, disruptive, niche-dominating opponent in their marketplace.

MALCOLM GLADWELL:

I've become more and more convinced, particularly from writing this book, but also just from my experience in this, that company culture is the hardest thing to quantify but the most important predictor of where a company is headed. And spending a lot of time in a large room of people from an organization gives you, I think, really valuable insights into how that company works and how it innovates. If you have that feeling that people have turned down the volume in their brain — then you know that there's trouble.

TOM GARDNER:

I want to talk about the leaders that set up cultures and throw three adjectives at you from the book. Maybe I'm slightly tweaking the wording, but open-minded, persistent and disagreeable. Why are those three important to find in a great leader?

MALCOLM GLADWELL:

Some wonderful work has been done on innovators, recently, and they looked at what is the prototypical profile of an entrepreneur/innovator/leader. The most obvious one is that they are open, meaning they are creative — and that goes without saying. You have to be someone who considers all. The second thing is that you must be conscientious — in the psychological sense of that word — so there are five basic character traits. Conscientiousness is one of them. Are you someone who can follow through on your ideas?

Now, right away we have an interesting situation, here, because there are lots of people who are open and there are lots of people who are conscientious. Those that have both those traits are rare. I can find in any coffee shop in Brooklyn lot and lots and lots and lots of creative people who can't finish their screenplay. I can also find in any law firm in America tons and tons of conscientious people who we don't want to think outside the box. We want them inside the box. They're not creative. But that overlap is rare.

Then add the third, the most important one, which is disagreeable, which is you cannot be someone who requires the approval of others in order to do what you intend to do. That's crucial and that's the hardest of the three because we're hardwired as human beings to want the approval of our peers.

I always remember when I was writing my book, *Blink*, I hung out with that guy who studied marriages. He was talking about the one emotion that a marriage cannot survive in the face of — contempt — because contempt is the emotion of exclusion. If your spouse argues with you, they are including you. They are saying, "I care about you enough to want to work this out." When they are contemptuous toward you, they are saying, "I'm done with you." And as human beings, we need that kind of approval so much that, that can end a marriage.

Well, the really great entrepreneurs, at some key moment, or innovators or leaders at some key moment ... as they are putting forth their vision ... need to be disagreeable. They need to not need that kind of approval — because the one thing we know is that there's always a moment in the birth of any great idea when the consensus is it's crazy. Find me a transformative idea that was not denounced and criticized at some key moment during its gestation. So, you've got to be that person who can stand up to — Kamprad is one of those people. He goes to Poland in 1961. He's denounced as a traitor and he doesn't care. And that's why Ikea exists. If Kamprad is normal — if he's like me — he whimpers and goes back to Sweden and is probably running a small real estate practice right now in Gothenburg.

TOM GARDNER:

Where do you see yourself in the continuum of David to Goliath, to the extent that they can both be put on a continuum? Where do you see yourself professionally? Where do you see your journey? Where do you see elements of the David qualities having shown up in the work you're doing?

MALCOLM GLADWELL:

Well, you know, I was clearly once David. What I used to do, as a young journalist, is what all young journalists do, is I used to write long, angry, vicious takedowns of prominent, successful journalists who I considered to be Goliaths and therefore worthy of my disdain. Now, of course, I'm Goliath, and what happens? Young journalists write long, lengthy, vicious takedowns of me. And I always read them and I just think, "I have become everything I once despised."

TOM GARDNER:

And as that person, are you an investor and how do you invest?

MALCOLM GLADWELL:

Well, my father, who is a very smart man, has many great qualities, but the one that I have learned the most from is that my father is intellectually humble and it's expressed in the following way. When he meets someone, he makes an immediate assessment of whether in the domain that they're going to be talking about, does this person know more than me or less than me? If the person knows even a little bit more, my father totally defers, which is a lovely trait.

So, here's a guy with a PhD in applied mathematics, and I have seen him deep in conversation with our Mennonite farmer neighbor who has a fifth-grade education. He has that element of humility. Anyway, he taught me this. So, when it comes to investing, my basic position is identify someone who knows more than me and just do whatever ... So, I have someone who manages ...

But, for fun, I have a little Schwab account and I play with it. And it has the wonderful effect of reinforcing that humility ... because try as I might, I cannot beat the market, even though I have a series of what I consider to be brilliant ideas.

TOM GARDNER:

What is your most recent brilliant idea in the form of an option trade?

MALCOLM GLADWELL:

Well, I was just telling you this. I had this whimsical notion. So, if I were to found an investment company, I would call it Stopped Clock Investments, because I have been right twice in my life, like the stopped clock. Once was — and I'm boasting now — I went all cash in 2007. And the second was, in a very minor way, in the beginning of January, I bought protection for my portfolio ...

TOM GARDNER:

Right now — just this month.

MALCOLM GLADWELL:

Right now. From January 1 to April, if the market goes down 10% or more, I'm in the money, I guess. Is that what the phrase is? But as I was saying to you, I only did it because I wanted to know what it felt like to short something, because I've always been fascinated by short sellers.

And I had done this big piece years ago on Nassim Taleb as he described the torture of betting on catastrophe. I was just fascinated by that, so I wanted to feel like it. What was it like? So, I bought my little option and then the market goes *drrr* for a couple of days. I had this initial surge of elation because my option has suddenly soared in value, and then I feel gross. And now I'm not sure I ever want to do it again. I don't know.

There's a reason why someone like Warren Buffett is so much more appealing than a short seller — not that he's a better person, necessarily — but what he's doing seems so much more consistent with how we want to think as human beings. Or at least a better way of saying it is, it's so much easier to think his way than that the things might fall apart.

TOM GARDNER:

And the mathematics really support that because in a short you can make 100% ...

MALCOLM GLADWELL:

Yes...

TOM GARDNER:

... but if you buy Netflix at $25 and it's at $350 a share, you've ended up making a multiple on your money. I want to throw out just a couple of company names for you and see if you have any reflections on them — David, Goliath, or any observation. Let's start with Google. Is Google a Goliath that welcomes dissent and is demonstrating some of the great qualities of how to be beloved?

MALCOLM GLADWELL:

Well, I don't know. That's a good question. It once was. I don't know enough about the kind of internal culture to know whether that spirit of giving people time to work on their own thing — that whole kind of thing that was so part of the original culture — whether that's still a powerful element. I'm also really curious to see how it manages that transition where you had that early stage where everyone's a millionaire and then that stage where the newcomers aren't millionaires in the same way — and I wonder how that changes the level of excitement in the company. It would be hard to believe they would feel the same as they did 10 years ago.

TOM GARDNER:

How about Apple?

MALCOLM GLADWELL:

Well, I've never been a huge Applite. This has nothing to do with the company. It has to do with a product, although it may reflect ultimately in the company. I like to work in coffee shops. Sometimes I get on my bicycle, I go into Brooklyn and I work in one of those hipster coffee shops. You walk into the hipster coffee shop where everyone there is doing something radical and edgy and interesting. They're in bands. They've done several apps. They have whatever — the cool things they do. And every single one of them has exactly the same Macbook Air and exactly the same iPhone. And if you talk to them, you would discover that their parents also have the same laptop and the same ...

And I just think, "In my day, if you considered yourself rebellious, you made a conscious choice to make rebellious choices, different choices in your personal ..." The badge of your rebellion was the objects you surrounded yourself with. Today's young consumer doesn't feel the same way. They're fine with all having the same phone, and I just find that weird.

And so, the business model of Apple is based on this very, very curious psychological and sociological fact that you can carve out a "rebellious premium position" for your product, even though you are ubiquitous. Has that happened before? I find that weird.

TOM GARDNER:

The Smurfs maybe was the closest.

MALCOLM GLADWELL:

Yes.

TOM GARDNER:

Two more companies, and then we're going to turn it out for some questions. What about Amazon? What are your thoughts? They're helping to sell a lot of your books?

MALCOLM GLADWELL:

Yes.

TOM GARDNER:

You're helping to bring a lot of people to their site.

MALCOLM GLADWELL:

Yes ...

TOM GARDNER:

To buy your books.

MALCOLM GLADWELL:

No, and I am a huge Amazon customer. My favorite line about Amazon is that they are engaged in "postal arbitrage." I can't get over how ingenious that is. I have never owned the stock. I'm curious to know what will happen if they ever attempt to make money. I don't know.

The one serious question I have is this. I don't understand how long the physical distribution model that they have — how long you can maintain that kind of hegemony. It strikes me as being more vulnerable than it looks for a number of reasons, but the notion now that when I'm wanting to buy something real or virtual, my default mode is Amazon ... that strikes me as something that may not be sustainable.

In other words, I feel like we are in the same kind of trajectory that we went through with the department store and the specialty store. That in the beginning, when that whole notion of modern retail was new, you had one stop. You went to the one big building where everything was all there. And then over time, what happened? That all got disaggregated and the department store went into decline and we were comfortable with the fact that I will go to this little place for my shoes and this little place ...

And I think that something very similar may happen down the road to Amazon. In other words, as much as I am in awe of where they are now, I confess to being a little bit uncertain about where they'll be ten years from now.

TOM GARDNER:

Last company — Facebook. And do you think they're a David or a Goliath right now? And any other impressions of Facebook?

MALCOLM GLADWELL:

I feel similarly about Facebook as I do about Amazon. When I go to L.A., I always stay with this friend of mine, and he has three teenage daughters. Now, they're scarcely representative and it's a sample of three, but their attitudes toward social media are really interesting and I'm sure any of you who have teenagers see the same thing. They're on Facebook, but their level of enthusiasm for it is quite low. It's not where the action is for them.

I'd be concerned if I was Facebook, by that, because I think in order to be something that is a commercial enterprise as opposed to a social utility ... I'm quite convinced it's going to be a social utility for a long time. But in order to be a commercial enterprise that actually generates a lot of money, you have to have a certain amount of cultural excitement around you — but it has to matter what is on your Facebook wall. Someone's got to realize they've got to go and check it out.

Now when the action's moved elsewhere ... Like, when I observed these three teenage daughters of my friend, they're just Snapchatting all day long. The excitement is somewhere else, now. Now, where I could be wrong is maybe there's more money in being a simple utility than I imagine. But I don't know. I think that they think that their future lies with something that is culturally exciting and I'm suspicious.

TOM GARDNER:

What's your time in the 1500 meter now? Because I know you were a competitive and successful runner ...

MALCOLM GLADWELL:

I'm fifty. Let's be clear. I ran a five-minute mile at the Fifth Avenue Mile last year.

TOM GARDNER:

Wow. (Applause)

MALCOLM GLADWELL:

The first time I get a sign of genuine support and emotion from the crowd is when I mention ...

TOM GARDNER:

In the back, first.

MALE:

I'd like to ask both of you about the future. How do you look at things in the future? If you look at our society, the only thing to point to that was successful as a future prediction is the Dick Tracy wristwatch. And I remember being at a conference in the 1980s called Network Supercomputing. It was in Research Triangle Park and this guy had the only viewgraph I ever remembered. We had the head of the postal service, the Postmaster General, saying the Pony Express would never be successful. We had the head of the Pony Express saying the telegraph would never be successful. The head of the telegraph saying that telephones wouldn't be, radio, TV, right down the line.

So, the one thing I learned from that viewgraph is the worst place to go for finding out where the industry is going or the future is, is by going to the people who are in the industry now. So, I'd just to hear from both of you where you go to find out about the future?

MALCOLM GLADWELL:

Well, I totally agree with you that this is the most difficult of all. I think the answer is to stop worrying so much about the future. It's pointless. Aside from relatively short-term things that you can plan for, it just makes no sense to worry about what's going to happen five years from now and to give any kind of long-term ... All you can do is to commit to processes that are predictable — but I don't think you can have any clear sense of where you're going to be. It's a fool's game.

TOM GARDNER:

It *is* a Fool's game. Honestly, I go to my brother's work and his teams, and I'll identify a few factors; but, of course, these are generalizations and these are only a few factors. But you all have studied and read the work that David's doing and I'm not going to pretend to speak for him, so I'll just put them in the context of how I think about it.

One of them is high-sales growth rates of small companies are some indication of future demand. Obviously, that demand can fall off the side of the table, but many of the great companies over the last 20 years that have been great investments — we've talked about Whole Foods, Starbucks, Apple, Google, Microsoft, LinkedIn — if you look at the early stages after their IPO, their sales growth rates are very high. They're not growing sales at 12% or 18%. They're growing their sales at 40% or 60% and obviously that's going to decelerate over time. But if you look at smaller companies with high sales growth rates, you'll get some indication of the future.

And then, I think it's a good idea to find a founder CEO, because in a way, that's the David who is putting his or her life into that entity. Of course, you're going to get that wrong, sometimes. Sometimes they are only there for a short period of time — then they're going to cash out or they're fraudulent and they're running the company like a piggy bank or they're just incompetent and they happen to be the founder so they're in a power position, but they're not very competent. But against that, you will find enough huge success stories like Jeff Bezos at Amazon, early on as David found. So, I think high sales growth rate and a founder is a good starting point for where the world's going.

MALE:

Reflecting on how you think that Goliath is broken, what's your take on Jeff Bezos buying the *Washington Post?* Is it a good thing, a bad thing or does it really not matter?

MALCOLM GLADWELL:

Well, it's a good thing if you work at the *Washington Post*. He bought it for so little that it's not like it's a great financial risk one way or the other. I'm very, very curious to see what his tolerance for losing money is, because I think in the short term, particularly as he tries to expand the editorial base of it ...

The one thing I don't know that any of us knows is whether he has a grander strategy behind that acquisition. I suspect that someone as smart as he is does — that there's something interesting he wants to do with that, and that's why I look on this purchase with a certain amount of excitement.

The news business is really, really interesting. I think it's in this period of transition which is the demand and the need for news has never been higher. More people read the *New York Times* today than at any point in the *New York Times's* history. You can express it any way you want — as a percent of population, as a total number. There is no question that some of these media portals have audiences today that dwarf their audiences in their so-called heyday.

It is just simply the case now that in this moment of unparalleled success, the business model has fallen apart. But I don't think that's permanent. I think all that's happening right now is that we are looking for a new way to create a business model behind this insanely successful product. If there's anyone who can figure out that, it's Jeff Bezos. So, I'm really, really, really curious to see what is up his sleeve, and I suspect he does have something interesting up his sleeve.

TOM GARDNER:

We have to close to let you get on your way, but could you just close by sharing a little bit about how we should think about our disadvantages in life? Anyone in the room that sees, "I have this weakness, I have this flaw, I have this thing that's held me back or this shortcoming." Or, "I see it in my child. I see them struggling with this." How should we think about disadvantages?

MALCOLM GLADWELL:

Well, it is a cliché, but as learning opportunities, you can learn by capitalizing on your strengths or you can learn by compensating for your weaknesses. The compensation path is far more difficult, it's far more rare, but it's way more powerful. The things you learn as you are working around or through adversity are lessons that are far more deeply felt than the things you learn because of your strengths.

I chose dyslexia in my book for a reason — because that is just about the most serious impediment you can throw in the path of a child, and the idea that there are lots and lots and lots and lots of really, really successful people who, when faced with that impediment at the age of six and seven, just were undaunted by it and just found another way to go about the business of getting through school and then ultimately through life ... that, to me, is such a beautiful example of how we radically underestimate our ability as human beings to deal with adversity. I think we're much better at it than we think.

TOM GARDNER:

No question. Malcolm Gladwell is a true Fool, and I think we need to get Malcolm in *Motley Fool One* and give him the service for free so we can help him beat the market. Don't you think we can? So, Malcolm Gladwell, thank you very much.

FoolFest 2014: Tax Expert Michael Kitces

Published Feb 19, 2014 at 10:20AM

More from our February member event! Award-winning financial planner and writer Michael Kitces turns many of the ideas you have about saving and retirement on their head. Watch as he lays out what's changing in the world of financial planning and how you can take advantage. **Download his presentation here.**

ROBERT BROKAMP:

Hello, I'm Robert Brokamp, senior advisor for *Rule Your Retirement* and part of The Motley Fool Financial Planning team.

You know, every once in a while you come across a younger person and you see them do their professional thing and you think, "Hm, there's some talent there." Then you see their name turn up more and more places. Websites, books, magazines. You see them appear in front of bigger and bigger audiences. And then maybe a really big audience. And you think, "Wow. That was something. I hadn't really thought of things that way. I hadn't thought of using the things that way. I'm going to remember this for a while."

Well, as I assume you know, I'm talking about Miley Cyrus. But our next speaker, Michael Kitces, does have a lot in common with Miley Cyrus, but I can't promise he's going to dance with a foam hand here — although he had a minor in theatre and you were an EMT in college, as well. He's also the treasurer for the Washington Improv Theater. But really what he has in common with Miley Cyrus is that he is a superstar, at least in the world of financial planning, and he began his ascendancy at a pretty young age.

Now, I don't want to build him up too much. We are going to talk about taxes, after all. Someone at the Fool saw that we were going to do taxes after lunch and they said, "Maybe we should call it Napxes." But if you ever read his blog, his books, his newsletter ... you'll see that he knows an awful lot about a lot of things ... insurance, annuities, estate planning, retirement planning, investing.

You may have seen him in *The Wall Street Journal* last week. It was an article about a study that he did with a fellow named Wade Pfau. What they found was people should lower their equity allocation as they approach and enter retirement to about 20% or 50% — but then, for every year afterwards, you should increase your stock allocation by one percentage point until you reach 60-80%. So, he's not afraid to question conventional wisdom.

He's a recipient of the Financial Planning Association's Heart of Financial Planning Award. Industry magazines have called him a "deep thinker," "part of the Power 20." He co-founded NexGen, which is a community, really, of younger financial planners and it's when I had to acknowledge that I'm middle age, because last year I asked Michael if I could join this group and he said, "I'm sorry. You're too old."

He's a partner with Pinnacle Advisory Group. They help oversee $1.3 billion. He was telling me earlier that at any point he could have five different monitors of various things going on at one time. That's how he gets so much done. And finally, for more than 20 years, he's been playing bridge at the same bridge club with his father. So it's my pleasure to introduce someone who is sort of like the Miley Cyrus of the financial planning world, Michael Kitces.

MICHAEL KITCES:

Thank you. Thanks so much, Robert. Welcome, everyone.

Wow. I feel like I can't follow my own introduction. We're going to be talking taxes. There will be no twerking.

My goal here with you for the next 45 minutes or so is just to take you through some tax planning ideas and opportunities about the current environment. Where we stand. Certainly since we're here talking at Fool Fest, we're going to have a tilt toward some investment-related strategies, although we're going to talk a little bit more broadly than that, as well.

Now, as we dive in, I always like to start off with this cartoon as a little bit of a caveat. This is the Lockhorns. They're sitting down with an IRS agent who says, "Don't think of it as an audit. Just think of it as our way of keeping it real." And I like to put this forward to make the point that I am what most people would call, in our environment, a relatively conservative tax commentator.

And that's not about whether I lean to the left or the right of the political aisle. It's that I tend to talk about the relatively conservative tax strategies — the kind of things where you will not be sitting down with an IRS agent who says, "I'm adjusting all the stuff you did in order to keep it real."

So everything we're going to be talking about today is about as real and straightforward as it gets under the tax code and you'll find, as we dive in — in this kind of environment that we have right now — there's a lot of planning opportunities and tax savings that you can generate just by using the black and white code as Congress has given it to us.

Now, when we really talk about today's tax planning environment, we have to set it in a little bit of context for where we've been over the past decade or so, because frankly where we've been has kind of been a roller coaster. So, the roller coaster kicked off when President Bush took office in 2001 and shortly thereafter passed the first of what were labeled his two major tax acts, the Economic Growth and Tax Relief Reconciliation Act of 2001 — or what we called EGTRRA for short, not that that's much shorter.

EGTRRA was the legislation that set in motion all the roller coaster of the estate tax that was rising, then it was gone, then it was back again ... and all the tax brackets that were going to sunset. Then we added on the 2003 Tax Act or JGTRRA. JGTRRA was the one that did the 15% capital gains rates and the 0% rates for the lower brackets again with the vanishing act in 2010.

And of course we never really thought we were going to go all the way until 2010 in dealing with this and then we gridlocked for the entire decade and we really did go to 2010 and turned it into the fiscal cliff of 2010 and then couldn't figure out what to do with it, so we kicked the ball two years down the road and made it the fiscal cliff of 2012, instead.

What was notable, though, when we finally figured this out at the end of 2012 is that when we finally passed the fiscal cliff legislation at the end of 2012, it was permanent legislation. Now, to be fair, particularly being this close to Washington, is we certainly know that permanent legislation doesn't mean it's what we're going to have for the rest of our lives. It's what we're going to have until Congress changes their mind and makes it something else.

But the reason why it matters is when the tax legislation is permanent, it means the only time anything changes is when Congress comes together, in bipartisan compromise, with their hands clasped across the aisle, to pass something new. Who thinks this is highly likely in the next couple of years?

The reality, when we look over the past decade is notwithstanding a couple of minor things we did along the way, we really only had two major pieces of tax legislation for a decade — fiscal cliff number one and fiscal cliff number two — and we got rid of the cliffs.

So, it's not to say that we don't have some fiscal issues. That we're not still dealing with a lot of other problems at the government level, but I view this as a new era of tax stability that we're in right now and that we're probably going to stay in at least through the end of this presidential cycle, where we may get a couple of loophole closures and a couple of tweaks at the margin ... but we're not likely to see really dramatic, reformative kinds of tax law change for the next couple of years.

Once we get to 2017, all bets are off. I have no forecast about who's going to win the 2016 elections, but depending on who wins and which way both the White House and Congress goes, we could get to some big reform legislation starting in 2017. You can kind of feel it in the air, that we're due. Like it's gotten a little messy now for where we stand on the tax environment.

Now, when we look at where we stand, we did have a couple of changes that came through last year as a part of the fiscal cliff legislation. One of the big ones was we added back a seventh tax bracket. So, we used to have six tax brackets that went from 10% to 35%. Now we have seven brackets that go from 10% to 39.6%. So, we took a brand new seventh tax bracket. I was going to say we put it on the top, but in my chart we put it on the bottom, here, that says we've got a new maximum threshold. And the amusing part of it in the process — we almost accidentally obliterated the 35% bracket in the process.

So, if you look down the column, particularly for individuals, your entire 35% tax bracket goes from $405,000 to $406,000. That's the whole bracket. While it would have been nice to have Congress send off a study for the Congressional Research Service to say, "Please determine the optimal place to create a new top tax bracket that properly balances long-term fiscal health and economic growth and fairness and responsibility," they plucked a number out of thin air between the number the Republicans wanted and the number Democrats wanted ... and then after they did that, they went back and looked at the inflation adjustments for the 35% bracket and said, "Oh! Thank goodness! We almost broke it." We didn't even know we were going to keep the 35% bracket until after the inflation adjustments came out after legislation and we found out it was going to survive with a whopping $1,600.

On the married couple side, it's a little bit better. It's a $52,000 bracket, but it's still kind of this winding path where the brackets get larger and larger. The 33% bracket is very wide, then the 35% is very narrow and then 39.6% applies for basically everything thereafter.

And, at a broad level, this is basically what we call, in tax parlance terms, a more progressive tax structure and progressive simply means lower tax rates on lower income individuals ... higher tax rates on higher-income individuals and we now have a more progressive structure meaning the brackets ramp up more quickly, more sharply and to higher levels. Which basically creates planning opportunity. Bad news — higher tax burden. Good news — more ways to plan on a higher tax burden. For people like me, it's an employment act, so we really appreciate it.

Now, part of what we still have to deal with this ... we still have a lot of the built-in challenges of the tax code. We still have the so-called marriage penalty, which is the challenge that married couples, at high-income levels in particular, end up paying more in taxes than two individuals would. So, if I wind back to my chart here, if I have two individuals that are each earning $300,000 ... they're kind of winding through the 10%, 15%, 25%, 28% bracket and a little bit of income in the 33% ... but if they get married and it's a married couple reporting $600,000 worth of joint income, a quarter of their income is in the top tax bracket instead of filling the bottom four. Same income, same two people, higher tax liability. We call that the marriage penalty.

Now, on top of this, layering onto the progressivity of the system, we also brought back last year the phase-out of personal exemptions and itemized deductions. So, when our income gets to a certain level, we begin to phase those out. We're going to talk in more detail in a few minutes. But what we see by the time we layer all these things on top — again, much more progressive system. Rates at higher levels and higher-income individuals ramping up more quickly and a lot of different layers.

So, it's getting harder and harder now even just to figure out what your actual tax rate is. Like at the margin, if I earned a little bit more money, what would I owe on it, because your bracket, your good, old bracket that we just looked at actually only tells a small fraction of the story between the phase-out, the new Medicare taxes, all the other pieces that layer on top ... as well as the fact that we have different treatment depending on whether it's wage income, self-employment income, investment income, non-investment income, ordinary income, capital gains. All of those have different treatments or different pieces that apply.

Now, when we look at how this begins to implement in things like portfolios, one of the biggest areas that we're seeing as getting sort of hotter and hotter as a planning opportunity is maximizing asset-location strategies. So, asset location ... We're familiar with asset allocation. So, I'm going to own a pie. It's going to have a lot of different slices. We call it diversification.

Asset *location* says, "Okay. Once I've got my pie with all the different slices and all the different investment holdings, in which accounts am I going to own them?" Because for many of us, we have several different account types. I have taxable brokerage accounts. I have IRAs. I have Roth IRAs. I've got other employer retirement plans. If I don't have access to some of those, I can get a non-qualified annuity and build a tax-deferred bucket. And so, this pressure rises to say, "Well, where should I own all these different things?" Because what actually emerges is there's opportunity for basically a little bit of extra free money and free wealth by making good asset location decisions.

And what we find as we look at this is that asset location is basically driven by two factors. The first and kind of the obvious one is tax efficiency. So, if I rate everything on the scale here from the most tax efficient on the left to the least tax efficient on the right, then I can line up my investments and it starts to become pretty clear. Like the really tax efficient stuff I obviously want on the left. That's where the brokerage account stuff goes. If I got something that's a stock with very little dividends and I'm just going to hold it for a really long time and I'm not going to turn it over anyways, so it's going to be tax-deferred simply under the standard capital gains treatment, and I get preferential capital gains rates. This one's pretty straightforward. Let's put it right there.

At the other end, we get things like the really inefficient stuff ... actively turned-over stock positions. Maybe that's certain types of commodity funds out there. Maybe that's even things like high-yield bonds where we're going to be kicking off more of a return and there's going to be a lot of ordinary income. There's going to be a lot of interest. There's going to be a lot of short-term capital gains or even if they're long-term, we're not holding them that long. Where all of a sudden we say, "Well, maybe this should tilt toward the traditional IRA," or if it's really high-return stuff, maybe we even put it in the Roth, or if we don't have those buckets, maybe we get a non-qualified annuity and put them inside of that as a tax deferral shelter.

Now, then we've got kind of the valley in the middle. The valley word doesn't matter. I find we have a lot of focus on things like, "Oh, I've got these bonds and they generate ordinary income, so I absolutely have to put them in my IRA." Well, as it turns out, you don't get much tax deferral value from something that only yields about 2.5%. You can't compound more tax-deferred growth when there's not much growth to compound in the first place. And it's not that it's necessarily bad to put things like bonds in the IRA, but this is a rather unique environment we're in where the bond returns right now are so low that except for exceptional things like maybe some emerging markets bonds and some high-yield stuff that's really generating more return ... that it just basically doesn't really matter where it goes.

And what we're finding is the optimal approach to asset location in this environment — if you look at this chart and you'll line up your investments beneath it where you've got the high-return efficient stuff on the left and the high-return inefficient stuff on the right — that the optimal strategy is basically you work from the outside in. So, find the most efficient, highest return stuff that clearly belongs in your brokerage account and put it there. Take the stuff that is rather inefficient, but high return ... maybe that's some of your more active strategies that are going to have shorter holding periods. Maybe that's things like commodities, high-return, high-yield investments ... or they're less tax efficient because they're kicking a lot of that stuff out every year ... that gets tilted heavily toward the retirement accounts.

And then as you figure out those investments at the extremes, you'll just start working your way in. And what inevitably happens — if I have a million dollar account balance and I've only got $100,000 in my IRA because the rest is in a brokerage account — I'm going to put the few things that are most important to be in my IRA inside of my IRA, and then I'll run out of IRA dollars and everything goes in the other account.

But that focus on asset allocation and in particular, I'm making sure the highest-return investments end out in the right place either because they're really efficient and they go to one side, or they're not so efficient and they go to the other — is very powerful, especially over long-term periods of time where you let the compounding work. And actually what we see is if you're looking over very long periods of time that these are retirement accounts and these are dollars you might not spend for 20 or 30 years, the compounding is actually so valuable, you can even beat long-term capital gains rates. You can convert the money into ordinary income — you still finish with more money, because you've got decades' worth of compounding growth instead of annual tax drag. Even capital gains treatment can whittle down over time.

Now for others, this isn't necessarily about the investments and the asset location, but it's sort of a general strategy that I call, "tax bracket arbitrage." So, the standard for tax deferral is pretty straightforward. Paying taxes is not very appealing. If the government has to take it at some point, I'd rather have them take it as far away as possible so I get to keep my tax dollars working for me in the meantime. We variously call that the power of tax deferral, the time value of money, letting my dollars work for me. Got lots of different labels. It's good stuff.

But there's a problem to this when you do too good of a job. If you push enough income down the road, when you ever actually want to spend it, you notice you've got this giant mountain of income that you can't dig through without blasting yourself into the top tax brackets. Which means your optimal strategy is actually a little bit more of a balance. Certainly if you're at higher brackets, you clearly want to defer. If I'm paying at top tax brackets, what's the worst-case scenario? I'll pay in a high bracket now, or I'll push it down the road and pay the same high bracket later. Not really a big deal. I'd rather pay it later.

But if you're having low-income years, it turns out the optimal strategy is not always to just defer, defer, defer. Sometimes the best thing you can actually do, to save on taxes, is to pay them as quickly as possible if you can harvest them at lower rates. And that's the balance that we're seeing starting to emerge now, so I'll give you one example of this where we see it commonly, which is with retirement accounts.

So, we look at someone who's in their sixties. The standard strategy, "Oh, well, I'm in my sixties. My income's probably fairly low. Maybe I'm drawing a little bit of social security. I'm managing my investments tax efficiently. I've got a lot of stuff inside a retirement account, so my tax bracket's hanging out at 15% pretty steadily. It does that all the way through my sixties until I reach that unfortunate date where I turn seventy and a half and the government says, 'I would appreciate it if you would start liquidating your retirement accounts now,'" and we take our first required distribution from an account that we've been compounding with growth for a couple of decades and suddenly our tax bracket blasts through the roof. And unfortunately, because we weren't touching that IRA at any point through our sixties, basically the whole thing is now going to get liquidated at 30%+ tax rates. This is not a good deal.

The better deal is to actually try to smooth it out. So, you know what? If I whittle down that account when I'm in my lower brackets, I whittle it out at 15% and 25% each and every year just enough to fill the 15% or 25% brackets — then by the time I get to seventy and a half, my income doesn't go up. It basically doesn't change, because I've whittled down my IRA just enough that I don't really have this problem in the future anymore. I've smoothed out my tax rate and I get all my IRA dollars at a lifetime average tax rate of 25% instead of a tax rate of 33%. Compounded over a lifetime, it's a very significant difference in wealth.

And of course, with retirement accounts, I can do this especially easily because we have the Roth conversion rules, now, with no income limits that let me do these as conversions, and not only do I just get to whittle the income down, but I turn it in tax-free on the other end, so I never have to deal with it later, as well. And so, we see this getting done with Roth conversions and as I'll touch on a little bit later, we actually see it getting done with capital gains strategies, as well ... where sometimes you harvest the losses and sometimes you actually harvest the gains.

Now, part of what we have to deal with, as well ... It's not just, as I said earlier, about our tax brackets. We have these new rules or I should really say old rules that we brought back for the phase-out of itemized deductions and personal exemptions. So, this is the rules we have through the 1990s and 2000s. In the infinite wording wisdom of Congress, we "phased out the phase-out," because that's not confusing. So, we phased out the phase-out. Then we repealed the phase-out. Then we brought back the phase-out. So, now we've got a phase-out again. Well, welcome to the tax code. I live in this stuff all day.

So, this is really two sets of rules. The first one is commonly called the Pease limitation after Congressman Pease who originally created the rule. The Pease limitation is the one that says as your income elevates above certain thresholds, you start phasing out your itemized deductions, and for every dollar you're over the line, three cents of that is subtracted against your deductions. And you can do that all the way up until you phase out 80% of your itemized deductions.

Of course, the problem with that for people in most states is as you ratchet up your income, you do things like pay taxes to your state — unless you live in Florida or Texas or Nevada or one of the few that doesn't have one — so the more income you have, the more you pay in state taxes. The more you pay in state taxes, the more you have in deductions, which means you never, ever, ever reach this cap. So, for most people, it just goes all the way up. You keep earning more income — you keep phasing out a small slice of your itemized deductions as you go.

And the same thing happens for personal exemptions. This is a separate but similar rule. It says once your income crosses the line, you start phasing out 2% of your personal exemptions for every $2,500 that you're over the line. Now this one kind of starts and stops, so I'm phasing out 2% for every $2,500 which means after 50 units of $2,500 I phased out 50x2 is 100%. So, the personal exemption phase-out actually starts and stops while the Pease limitation basically goes all the way up. The thresholds for this we did change last year. We made them $250,000 for individuals, $300,000 for married couples. It's indexed for inflation, so this year we'll be at $254,000 and $305,000 respectively and it will creep forward every year going forward.

Now, this has to be one of the worst-named labels under the tax code, and I don't say that lightly given our tax code. But we see so much confusion around this label of the phase-out of itemized deductions, and the reason why it's kind of weird the way that it's labeled is it's not actually calculated based on your deductions. It's calculated based on your income. You lose a portion of your deductions for every dollar your income is over the line, which means if you have more deductions, it doesn't matter. When you have more income, you pay more taxes.

Which means when we actually do the math, you start earning more money, you start out phasing out deductions. The deductions were giving you credits at a 33% tax bracket. You kind of wind through the circular math and basically it's just a 1% surtax. You thought you were in the 33% bracket — it's 34%. You thought you were in 35% — it's 36%. You thought you were in 39.6% — it's actually about 40.8%. It hits the top bracket a little bit harder because of the circular math to it.

Now frankly, it would have been a whole lot easier if we just raised the top three brackets 1%, but as you may recall during all the fiscal cliff negotiations in 2012, what we were going to do with just the top tax bracket — whether we were going to go back to 39.6% and what threshold was so incredibly controversial — there was no way to pass a rule saying, "Let's also raise the other top brackets 1%, as well." So, we just did this by doing the exact same thing, but calling it something else. But that's really all it is. It's not a disincentive for itemized deduction strategies. It's just a 1% surtax because it's calculated on your income.

When we go through the personal exemption phase-out, 2% of your personal exemptions times the amount per $2,500 ... you go through a bunch of really messy math and what you basically get to is another 1% surtax ... almost exactly, within a basis point. This one's a little bit different, though, because the personal exemption phase-out is actually a 1% surtax per exemption. We take one exemption for every member. So, this is actually a 1% surtax for an individual, 2% for a married couple, 5% for a family of five.

This starts to get a little bit nasty for a lot of dual-income couples that we see — where by the time we take the whole family into account, you're a little over $300,000 in joint family income, you're at a 33% bracket plus 1% for Pease plus 5% personal exemption phase-outs for the five family member exemptions you're losing. Which means you're actually in the 39% bracket — not all the way up at $450,000-plus of income, but it kicks in at $300,000. More progressive tax system, higher tax rates and higher-income individuals ramping up more quickly. That's the whole theme to it.

So basically what we find is the PEP basically lifts up the 33% and the 35% brackets. When you actually look at the charts, as it turns out, it starts in the middle of the 33% bracket and it ends at the top of the 35%. It's just the way the math lines up — so it just lifts the middle two brackets. Pease lifts all three of the top brackets by 1%.

But again, one of the biggest things to it — and we always encourage clients to think of it this way for the folks that we work with, as well — forget all the terrible labels for it. They're just surtaxes. They're just higher rates at the top brackets. You don't need to avoid charitable giving. It doesn't mean — notwithstanding what the media likes to write — this is not a disincentive to charitable giving. It has no impact on it unless you're one of the rare few that are actually capping at 80% of your reductions. Then when you go through some of the math, it's a little bit of a disincentive. For everybody else, it's actually no disincentive whatsoever for a charitable giving. If you're interested in some of the math of how that works, I'll give you a link up here and we'll make sure you have it in your handouts, as well.

Now, a few other areas to look at. One of the other big changes that came through with the fiscal cliff legislation last year were the new long-term capital gains rates. So, just as with the old system, we went from six ordinary brackets to seven ... we went from two capital gains brackets to three. It used to be 0% at lower income levels and 15% in the middle. Now it's 0%, 15% and 20%.

And they're graduated rates, just like the regular tax system. So, just as with the regular tax system, if I went all the way from zero dollars up to $0.5 million of income in one year, some of it's at 10%, some's at 15%, 25%, 20%, 33%, 35% and only the last little slice is actually at 39.6%. We get the same thing with long-term capital gains. Now, if I had a $0.5 million worth of capital gains in a single year, the first $73,000 or so was taxed at 0%, the next roughly $380,000 is taxed at 15% and then the last little under $50,000 is taxed at 20%. So, similar graduated rate structure.

But it's a very different environment from where we were before, especially when we layer on this new Medicare tax that also kicked in last year. So, the reality is we don't really actually have three capital gains brackets. We have four. We have the 0% bracket for those in the bottom two ordinaries. We have a 15% rate for those who are in the middle brackets but not yet subject to Medicare tax. We have an 18.8% rate — the 15% plus the 3.8% for those who are in the upper-middle brackets and then as it turns out, no one will ever actually pay the 20% capital gains rate.

If you're at a high-enough income to be eligible for the 20% rate ... Eligible-eh. If you have the great privilege to generate so much wealth you can give the government 20% of it on your gains, you will have to be subject to the 3.8% surtax, as well. That's just the way the math works out for it. And so, that's actually how we look at and manage capital gains exposures — four brackets, 0%, 15%, 18.8% and 23.8% and obviously for many of you, you're going to have to add your state liability on top of that, as well.

What happens when we start planning for this? Again, kind of similar to the discussion that we had earlier. This basically becomes a form of bracket arbitrage opportunity where sometimes you want to harvest the losses, which is obviously a very popular strategy already, and sometimes we actually want to harvest the gains. Because we do too good of a job of systemically pushing the capital gains bill down the road, we get the exact same problem that we do with the IRA.

A decade or two of fantastic work deferring your capital gains bill. Congratulations. Now you can't get out from under it without either dying, donating it or paying a giant slice because you pushed yourself in the top bracket by doing such a good job of pushing your capital gains down the road. And the problem is harvesting losses actually makes it worse — because every time I harvest a loss, I have an investment that I bought for $50,000 and fortunately it went the wrong direction. It's down to $40,000 ... so I harvest the loss. I buy something else with the loss sale rule for a while, then I switch back to the original thing. The good news is I get my tax savings on a $10,000 deduction. The bad news is my cost basis is now $40,000, not $50,000. My future capital gains are bigger. So, the more effectively I systematically harvest my losses, the bigger I make this tax burden down the road, not to mention all the gains that I'm deferring on the things that are up.

Now historically, this wasn't a big deal. For decades, we've only had two capital gains brackets. We've moved them a little bit about where they were, but we had one bracket if you happened to be in one of the lower two ordinary brackets, and then we had a second rate ... 15%, 20% before that. You could have had $50,000, $500,000 or $50 million — it was all subject to the same rate, which basically made tax deferral really easy. You just always kicked the ball as far as you could down the road because it couldn't get worse. The top rate was the same top rate and it applied to everybody once you got to $70,000 income.

Well, now it's not our environment anymore. We went from two capital gains brackets to four, so now bracket management ... Unless you're someone who persistently earns $0.5 million or more as a minimum and it's all up from there, you have to be really careful about navigating your capital gains brackets. If you do too good of a job of harvesting losses and pushing it down the road, you're not going to be able to exit from these investments without paying more in taxes in the future. Which means the optimal strategy — yes, if you're a high-income year, you want to harvest the losses — but if you're having a low-income year, you actually want to harvest the gains.

Now, harvesting gains, it turns out, is a lot easier. Harvesting losses is kind of a nuisance — loss sales rules, 30-day something else, switchback, transaction costs, tracking and there are all the other issues. Harvesting gains is easy. Sell it and buy it back. If you can type the trade in three sections, you'll be out for three seconds. Congress did not create a rule that says, "You owe us money, but since you reinvested in your stock, you can keep your tax dollars." You sell it and buy it back, you owe them the money, except it's actually a good deal if you can whittle down your capital gains and make sure you're always paying at 15% so you never get to that point in the future where you push yourself up into 23.8%

If you're one of those folks [00:29:28] manage your income and up that you're all the way down in the bottom two tax brackets, you're harvesting at zero. You bought it for ten, it's up to twenty. You sell it for twenty, you buy it back for twenty. Your cost basis is now twenty. Your tax bill is zero. It's a free step-up in basis every year. You want to take advantage of it. Fill yourself all the way up to $73,800 of income as a married couple, and that's $73,800 after all deductions, so you can sometimes get quite a bit of capital gains in there. Free step-up in basis. Obviously you still have to deal with your state tax exposure, so you may have a little bit at the state level depending on where you live, but it's still a pretty phenomenal deal.

Now, the other thing we find that people sometimes misjudge is just the overall value of deferring capital gains. Capital gains deferral is a really great deal for the long term and a really minuscule, irrelevant deal on the short term. I'll give you an example of what this looks like. Let's say we have an investment. We bought it for $100,000. Had a fantastic run. It's up to $150,000. So we're up 50%.

So, we got a $50,000 gain. If I'm going to assume a 15% capital gains rate, your tax bill is going to be $7,500. Now the reality is if you were ever going to spend this, you are always going to pay this $7,500. I can't really make it vanish. Unless you're going to die with it or donate it, you've got to pay the $7,500 tax bill if you ever want to spend the money.

What you can do is keep $7,500 working for you instead of putting in Uncle Sam's pocket. That's the time value of money. So, if I assume this thing can grow at an 8% rate of return as sort of a long-term average, basically the actual economic value of this tax deferral is growing 8% on my $7,500 tax bill. It's worth about $600 to me. Now, that's not bad. I certainly don't want to shake a stick at $600, but $600 relative to an investment that was worth $150,000 on something that's actually had a run that's up 50%. Six hundred dollars on a $150,000 investment — the actual economic value of pushing this tax bill out for a year is 0.4%. So, like a rough five minutes in the market.

So, think about that the next time you're looking at an investment and it's November, and you're going, "Oh, it would be really nice if I could hold this until the end of the year to get it next year." Or you're within a month or two of your long-term capital gains threshold and you're trying to eke it out to get there. Over short-term periods of time like that, there's remarkably little value in trying to avoid a tax bill and defer it for another year compared to the investment risk of holding something if you otherwise really don't want to hold it. So, we actually give you a chart here. Again, this will be in your handout materials, as well where you can kind of apply it. Not surprisingly, the larger the gain, the more value there is to continue to defer it. The higher your tax rate, the more value there is to continue to defer it, and this does compound over time.

So, decade-long or multi-decade periods of tax deferral by holding a position is hugely, immensely valuable. There's a lot of wealth created there. But over short-term periods of time — like trying to make it to a holding period requirement, or trying to make it to the end of the year to push it in the next calendar year — you can lose the entire value you're trying to create in minutes, so be very careful not to let the tax tail wag the investment dog on that.

So, a few other things to look at. We had a change for qualified dividends, as well. Qualified dividend treatment. So, at one point, the concern was qualified dividend treatment was going to go away, and we were going to go from taxing dividends at long-term capital gains rates at 15% to treating them as ordinary income. Anybody notice late 2012, you got a couple of extra dividend checks you're not used to receiving late in the year?

That was corporations saying, "Hm. I'm not quite sure how this legislation is going to turn out, but if I'm wrong, my dividend income goes from being taxed at 15% to being taxed at 43.4%. Not really interested in gambling on that. Let's push out a bunch of dividends." And so a huge amount of dividend distributions happened in December from all sorts of companies that were afraid of that. Now as it turned out, we didn't lapse qualified dividend treatment. We kept it around. But because it's attached to the capital gains rate, we now have the same four tax-rate structure for dividends — 0%, 15%, 18.8%, 23.8%, state goes on top of it.

Now a practice — at least from what we've seen so far — the higher-dividend tax rates have not really moved investment behavior that much. If I'm going to calculate the after-tax yield of something that yields 4% ... it pays a 4% dividend ... at a 15% rate, my after-tax yield would have been 3.4% at an 18.8% rate because of this new Medicare surtax. My after-tax yield is ever so slightly less than 3.4%, so negligibly different and I'm probably not going to do anything different. So, it's certainly a little bit of a tax drag on our ability to generate after-tax return, but it doesn't really materially change our investment decisions that much. At least, that's what we've seen so far. And there's still a preference for dividends over ordinary income investments, all else being equal.

The one exception we probably do see for that is for any of you that actually happen to own your own business that's structured as a C corporation, so structured the same as any other large, publicly traded corporation. Because at the end of the day, the only requirement for qualified-dividend treatment is it has to be a domestic C corporation, so it has to be a U.S. C corp or a couple of certain foreign ADRs work. And you have to hold it for 60 days — for 90 days for a preferred stock.

So, if it's the family business that you've had for 50 years — you're 49.8 years past the holding-year period requirement and it's a C corporation. But the difference is if I'm having a low-income year, I can't go out there and say, "You know. This is a low income year. This would be a fantastic year for Apple to distribute some of the cash. Like I want the dividend now. My rates are low."

When it's your business, you do control the timing of the income, and so we see a lot of closely held businesses that are being very specific about dribbling out income and profits in the form of dividends exactly enough to fill the bottom brackets, and then they stop before they get to the top ones and then they let the rest of it carry to the next year and they do the same thing over again. So, there are a lot of business strategies around unwinding that.

Now, one of the other big areas that we have to deal with in terms of our tax environment is the infamous alternative minimum tax. So, this has had a huge roller coaster over the past couple of years. We've had no less than half a dozen different pieces of legislation since 2001 that have extended or reinstated a lapse of the AMT rule. So, we patch them. We patch them short term. They lapse. We come back in and say that would be a bad idea, so we extend them again. Then they lapse. Then we extend them again, then they lapse. Sometimes they lapse and we have to go the whole year before we realize that this is bad and we retroactively fix it.

The good news from the American Taxpayer Relief Act and the 2012 fiscal cliff legislation is we finally, permanently fixed the problem. We didn't repeal it. We can't really repeal at this point. AMT repeal is depending on whose numbers you want to use — something on the order of a $2 trillion tax cut for a decade. Not getting through Congress right now. But we did permanently patch it. So, no more temporary lapses and things that keep falling off and coming back again where we never know, from year to year, whether 5 million or 30 million people are going to be subject to the AMT.

We basically fixed everything at the 2011 levels and permanently indexed it for inflation going forward, so we got rid of this whole creeping problem where the AMT system wasn't adjusting for inflation. The individual system was, so we pushed a couple of hundred thousand people over the line every year, which is why in 2001, there were fewer than a million people subject to the AMT, and by 2011, there were 5 million subject to the AMT. If we went off the AMT cliff, it would have been 30 million, so we backed away from that.

But where we basically stand now is if you're one of those people that find yourself subject to the AMT, we didn't get rid of it. You're pretty much going to continue to be subject to the AMT until you have a big change in your income circumstances. If you're one of those people who's not subject to the AMT, you're going to continue to not be subject to the AMT unless you have a significant change in your income or circumstances. So, it kind of took everyone where they are and sort of locked them in place.

Now, what we find, though, for those people who are subject to the AMT, they would sometimes underestimate how much planning opportunity there is. So, AMT is kind of a funny system on its own. How we calculate it is really a mess, because basically we calculate all our regular stuff, then we undo half of it, then we redo part of it, then we calculate a bunch of rates. It's a total nightmare.

But in practice, the AMT is actually a really simple system. It says, add up all your income. Take relatively few deductions. Everybody gets one big giant deduction. We call it the AMT exemption. It basically makes up for all the other things we didn't get. And then there's an almost flat tax on the rest — 26% for the first chunk, 28% for the rest. So, it's basically add up your income, get one big deduction, flat tax the rest.

Now, the caveat for the AMT is that big deduction that everybody gets — that AMT exemption — actually has a phase-out. The AMT exemption, itself, phases out at higher income levels. Now, as we looked at earlier with the Pease limitation — the phase-out of itemized deductions — what phase-outs of deductions do in practice is function as surtaxes on our income. The caveat, though, is the AMT exemption phase-out is much more harsh. The Pease limitation of phased-out itemized deductions — when we go through the math — it's like a 1% surtax. The AMT exemption phase-out is actually about a 7-8% surtax.

And so, if you think of AMT as this relatively flat-tax system where everything is subject to a 26-28% rate, the AMT exemption phase-out creates this bump in the middle. I labeled it up here as the AMT Bump Zone. When your income falls in that range, you're not subject to the 26-28% rates anymore. It jumps up to 35%, which means, not surprisingly, the planning opportunity becomes relatively straightforward. Avoid that. So, if your income is at the lower end of the bump range, you want to spread income out, you want to defer it, you want to stretch it, however best you can, to avoid hitting that bump zone. I illustrated it here in terms of ordinary income. It applies for capital gains, as well. It will bump your capital gains rate from 15% to about 21%.

If your income is high though — and this is the surprise we see for a lot of people — if your income is high ... if you're actually so high that you've gone out of the AMT bump zone so you phase the whole exemption out as down to zero —there's no more [00:39:36] — you end up being subject to a flat tax of 28% that goes rather high up the income scale. Exactly how high up it goes depends on exactly what your deductions are and what state you live in. It can end anywhere from about $600,000 of income up to about a million before you leave the AMT zone.

But while you're in that area, you're subject to a flat rate of 28%. There are actually a bunch of people out there with a $0.5 million of income, and because they have the great blessing to be subject to the AMT, the bad news is it makes them pay more money on the income they're already earned. The good news is at the margin, their rate's actually lower. It's at 28%.

And so, what we actually see for a lot of people is you have a big income year ... Maybe you have a big capital gains distribution. Maybe you got some big bonus from business. Something else happens that pushes your income up already and you've gone through the bump zone — turns out one of the best planning strategies for a lot of individuals is to take your income from $400,000 to $600,000. It's a flat rate of 28%. You're not going to get better than that at high-income levels.

Married couples — it's very similar. The bump zone is just a little bit wider. It's just how the math works out. The AMT exemption is a bit bigger for married couples and so the bump zone starts a little bit later and it goes a little bit longer, but you get the same kinds of planning opportunities.

Now, in general we find in terms of what creates exposure to the Alternative Minimum Tax, there are a couple of things that tend to do this rather consistently. The first one is high state income taxes rates. So, any of you that are living in states that have relatively high rates ... Around this area. D.C. and Maryland are fairly high. Virginia is sort of a mid-tier state. And I give you a list of some of the others up here. States that have 8-10% tax rates — it's really hard to avoid the AMT in those states once your income gets above about $100,000 to $125,000.

High property tax bills are an AMT trigger, as well. Any deduction that you take for state taxes paid to a state or local municipality come back for AMT purposes. So, big state income tax bills do it as well as the local taxes. Big property tax bills do it. Now, depending on where you are, for some people this is just because you pay a big property tax bill. A lot of counties in this area here — the tax rate's only 1%, but our real estate is ridiculously expensive, so your property tax bill is pretty big.

We have clients we work with up in New Hampshire — the good news is their real estate is a whole lot cheaper. The bad news is their property tax rate is 2.5-3%, so a lot of them actually pay more in property taxes than I do. So, whether it's a high property tax rate, or a high property tax bill because of just the expense of the property, anything that generates a big property tax bill ends out being an AMT trigger.

Now, other triggers that we see. Large numbers of dependents end out being a trigger. Because AMT gets rid of your exemptions, every family member for which you claim an exemption is something you lose for AMT purposes. Now ironically, because we now get rid of exemptions for the ordinary income brackets and higher income levels, this primarily hits large families from $100,000-300,000 of income. I was going to say that's the sweet spot. Like, that's the bad sweet spot. About $100,000-300,000 with large families.

And this was actually challenged a couple of years ago. There was a famous court case in the mid-1990s from a farmer in the Midwest who had — I forget exactly — I think it was nine children. He actually took this to tax court and basically said, "Your Honor, the AMT was intended for people taking advantage of these aggressive, esoteric tax structures. It was not meant for middle class farmers like me with lots of children to help tend the farm. I shouldn't have to pay this." And the tax court judge's response is basically, "You're right. This really wasn't intended for you at all, but it is how the laws are written, so pay your bill and take it up with Congress." And twenty years later, we haven't done anything to change it. So, large families at middle-income levels actually become AMT triggers.

And then anything that generates a lot of miscellaneous itemized deductions. That could be investment management fees. That could be variable annuity losses. Anything that goes in that big, broad bucket — miscellaneous itemized deductions subject to 2% of AGI floor — anything in that bucket can become an AMT trigger.

Now the reality for all of these — it doesn't mean you don't claim these deductions. If you don't claim your deductions, you just pay Uncle Sam more money under the regular system ... so, it's not as though you dodge these things and save any money. The point to this, though, is if you have a lot of these deductions, you're likely to be subject to the AMT, which means a) you may not be getting nearly as much tax benefit from them as you thought. In fact, you may not be getting any at all and b) you're planning to be focused more around planning for the AMT bump zone than thinking about all those regular tax brackets, because that's actually the environment that you're in.

And another chart that you'll have for your handout materials that you can use is a way that you kind of quickly gauge when you'll be subject to the AMT. So, how you read this chart. Let's say your income, after you've gone through all of your deductions and everything else for your family, is $200,000. So, we go to the $200,000 line and we read across to the right. So, if you're a married couple filing a joint return, the number is $30,000. What that means is if I go through the list of things that we just showed you — state income taxes, property taxes, personal exemptions, etc. — you add up those things. It adds up to more than $30,048 — you're going to have an AMT problem.

Now, it doesn't take much here. If I'm in California, $200,000 of income, I'm paying almost $20,000 in state income taxes. If I'm a married couple, I have $8,000 worth of personal exemptions. So, I'm at $28,000 out of $30,000 and all I did was live there and be married. You have a child — you're over the line. You own a house — you're over the line. You claim any miscellaneous itemized deductions that add up to anything — you're over the line. This is kind of the point. High state tax rates — that state tax bill alone throws you right over the line. Look at what happens if you're at $300,000 of income. Your state tax bill alone puts you over the line here in Virginia. So, it gets very, very hard to avoid the AMT in those middle zones.

Now, ironically, when your income gets high enough, you're adding at 39.6% in the regular system so much that basically it's almost impossible for million dollar incomes to actually pay this. It hits married couples, primarily, from about $150,000 up to about $500,000 or $600,000 of income. Individuals — it's more like about $125,000 to $400,000 or so. And if you're in those ranges, it's really hard to avoid the AMT, especially if you're living in a state that has even a moderate state tax rate.

So, as we wrap up here, unfortunately, I guess, if there's one thing that you take away from this, it's that there's kind of a lot of different parts in figuring out what your tax rate is now. There's a lot of different layers that you have to take into account. We've got not just our tax brackets but the phase-outs of the itemized deductions and the exemptions. Different rates for capital gains and qualified dividends. You might be subject to the AMT and be dealing with that side. You might have to deal with the AMT exemption phase-out and the bump zone that comes there. We've got these new Medicare taxes layered on top. If you're a retiree, we have other income thresholds for the taxation of your social security benefits and the threshold for your Medicare Part B and Part D premiums to rise, as well. So, there are a lot of different layers that go on top. And this is pretty much the simplest chart I could come up with to summarize it.

This will be in the handout materials, as well. I also make it available on my site, here, so you can download it directly if you want. This is basically every different possible income type and adjustment that applies to you. So, depending on the nature of your income, you may have to add one to five different columns simultaneously to figure out what tax rate you'll actually be exposed to between, "Oh, well, it's AMT and I've got the AMT exemption but it's also investment income and it's capital gain and I've got the Medicare surtax on top of it. Oh, and my phase-out of itemized deductions applies as well, though I'm so high, I don't have to deal with the personal exemption."

And, of course, even figuring out what income it applies to is kind of messy because for some of these, it's based on earned income. For some of it, it's based on adjusted gross income. Some of it's based on taxable income, which is AGI ... after itemized deductions. And some of it's based on AMT income, which has its own peculiar calculation with limited deductions. So, even just figuring which income you're supposed to use for the formulas is kind of horrific.

So, the good news, at least, when we look out a couple of years ... tax reform will make this easier. And the formula for tax reform is pretty standard. When we actually look back through what we now have is about a 100-year track record of income tax in this country — when you look at it from a broad, generational perspective, we actually are amazingly consistent with it. We have a relatively simple system. We spend 20 to 30 years mucking it up. Then we reform it and make it simpler again. Then we spend another 20 to 30 years mucking it up. So, we started in 1913. We had a big change at the end of the Great Depression. We had a big change in 1959. The last big change we had was the Tax Reform Act of 1986, so we went 27 years from 1959 to 1986. We're now 28 years out from the Tax Reform Act of 1986. Anybody feel like we're sort of due for tax reform? Like it's gotten a little crazy? All right.

We're due. I actually thought the odds were decent that we could get it done last year or this year, but once the American Taxpayer Relief Act turned out to be permanent, all the pressure was off and tax reform, I think, basically came off the table. So, it's probably going to be a 2017, next-election kind of thing where we'll see how it boils out, but I do think we'll get there.

Ultimately, tax reform means fewer boxes, fewer lines. If we get any legislation in the next couple of years, unfortunately, it's likely to be the other direction which is more boxes, more lines. We'll call them "loophole closers," but if we get any legislation, unfortunately, that's kind of the tilt of what it looks like.

So, I hope that was helpful for you and kind of some food for thought around tax planning ideas, strategies, opportunities and stuff that's out there. I can see the hook over here to the left, but I'll hang around afterwards and during your break, so if you've got any questions, feel free to come up and ask. But thank you very much for your time.

What’s Driving O’Reilly Automotive?

Dear Fellow Fools,

Take a Peek at *Fool One*!

Do you hold cash in your portfolio? Then you absolutely cannot miss this exclusive sneak peek inside the world of our "crown jewel" service — *Motley Fool One* — as analysts Bryan White and Jason Moser talk with nationally syndicated columnist Morgan Housel about his "cash optionality" plan. Find out why Morgan firmly believes it’s one of the single biggest hidden opportunities for savvy investors looking to build long-term wealth.

Read More!

We all love to buy a stock and have it rapidly appreciate in only a year or two. But we have a much larger goal at *Pro*: We want continual compounding from our stocks.

Compounding is the hidden treasure of investing, unfolding slowly but surely with great companies over the years. All of us should want to own a portfolio full of "compounding machines." Rather than short-term home-run stocks that, following a burst, may not compound for years, we want compounding that almost never ends. That means buying businesses that earn high returns on reinvested capital, have ample room to keep growing, and have good drivers at the wheel.

In many cases, it also means buying companies that are ... boring. A boring business is less likely to face constant change in its industry, so it's more able to focus on simply *growing*. Warren Buffett caught this early, and teaches by example, but relatively few of us take heed.

Our pole maker, **Valmont Industries** (NYSE: VMI), went public in 1978. **Apple** (NASDAQ: AAPL) went public in 1980. Since their respective IPOs, Valmont has vastly outperformed the iconic computing company — up 26,100% vs. Apple's 15,000%. How much media attention has Valmont received compared to Apple? As good as zero. What could be more boring than poles?

That was a rhetorical question, but perhaps the answer is an auto-parts retailer. **O'Reilly Automotive** (NASDAQ: ORLY) is up nearly 700% over the last 10 years, to Valmont's 618%. What's driving O'Reilly? The same factors lifting Valmont.

Having learned efficient expansion, management can steadily sell in more places and increase earnings in the process. Like **Starbucks** (NASDAQ: SBUX), O'Reilly can continue to plunk down new stores and see its cash flow rise. Meanwhile, it's an excellent steward for stakeholders. The diluted share count at O'Reilly is about the same today as it was in 2004. (Valmont is another shining example of this: Earnings growth gets passed down to all shareholders.)

In the fourth quarter just announced, O'Reilly's earnings per share were up 23% year over year, and same-store sales 5.4% — that's on top of a 4.2% same-store sales gain a year ago. Keep in mind, that's all *additional* revenue on top of an already strong, recurring sales base. For 2013, O'Reilly's earnings per share were up 27%, marking the fifth year in a row that this number exceeded 25%.

For 2014, management's guidance for same-store sales growth mirrors that of last year, with another 3% to 5% gain projected. And after the company opened 190 new stores last year — more than one every two days — another 200 are expected in 2014. Concurrently, O' Reilly is building massive new distribution centers across core markets, increasing its delivery capabilities and setting up for higher margins.

Looking ahead, management keeps repeating its own words from past years (which we love to hear): "We continue to believe that the best use of our cash flow and the best return to shareholders is to invest in our business by maintaining our existing store base, opening new stores ... and opportunistically consolidating in the industry. To the extent these opportunities do not use our available cash in 2014, we intend to continue to return capital to our shareholders by prudently executing our buyback program."

Answering the first question in the conference call, CEO Greg Henslee added, "Well, really ... we're executing the same business plan that we've always executed."

Ho-hum. How boring. Yet how great, given the results.

That isn't to say O'Reilly rests on its laurels. It seeks continual operational improvement and ever-greater customer loyalty, and it evolves with the industry. Henslee's very next sentence was, "We have adapted to focus on the changing vehicle population in the U.S. ..." In other words, O'Reilly executes a core business model known to work, but adapts it as the landscape changes.

Return on equity has grown from 14% a decade ago to 33% last year, and gross margins from 42% to 51%. That sort of steady improvement over 10 quick years led to a nearly 700% gain for owners of this compounding machine. Right now, there's every reason to believe the business will compound value over the next 10 years, too, and with more certainty and safety than the hottest new stocks of today.

Fool on!

— Jeff (TMFFischer)

Pro Guidance

- **Broadridge Financial Services** (NYSE: BR): Fair value increases to $42. The stock remains a buy at a 3.9% allocation.
- **MasterCard** (NYSE: MA): Fair value increases to $70. The stock remains a buy at a 4.6% allocation.

Pro Catch-Up Trades

Same as last week, Fools!

- **Facebook** (NASDAQ: FB): Following strong earnings, newer members with only a half allocation can increase their allocation to as much as 4.6% (to match us).
- **Tupperware** (NYSE: TUP): If you don't have 2.7% exposure through existing puts (we're short April $90 puts), then sell to open April 2014 $75 puts for at least $2.25 each. Sell one put for every 100 shares you could buy, up to a 2.7% allocation (you could also sell higher-strike puts, but they carry very little time value). If you're not using options, you can buy shares of stock instead.

Pro Coverage & Community

Podcast Transcript

JASON MOSER:

Welcome to EP Weekly. I am your host this week, Jason Moser. Chris Hill is out of the office. I thought maybe it was just because of the snowstorm, but I think he's still up in Philly for whatever reason, so we'll go forward without him. It's going to be a slow week anyways, so not much to talk about today. We've got what? MasterCard news and really the news of the week for us we want to talk about — Morgan Housel's report that just dropped yesterday, if I'm correct...

MORGAN HOUSEL:

Yes...

JASON MOSER:

I'm joined in the studio today with Bryan White and Morgan Housel. Guys, thanks for being here.

MORGAN HOUSEL:

Good to be here.

JASON MOSER:

So, really quickly let's just cover this MasterCard news because, you know, share splits seem to always make a bit more news than they're worth. Stock splits to me are — we know they don't create a whole heck of a lot of value, but they do create a perception out there, at least, that shares maybe are cheaper than they were before, and with MasterCard you're getting ten new shares for one old one. You don't see many 10:1 splits like that — or much more you see reverse splits with big numbers — but not the other way around.

But I think the bigger news of this MasterCard release was the 83% boost in the quarterly dividend along with the new $3.5 billion share repurchase program. Bryan, you know, when I was looking at this news, the two things that stood out to me were the share repurchase program and the dividend because those are the way that MasterCard really returns their capital to shareholders first and foremost. The stock split, not so much. I mean, maybe they open that share base up to a new buyer. Who knows? What's your take on that?

BRYAN WHITE:

Well, I'd say the number one thing would be the buyback. That's probably going to add the most value for shareholders. The dividend — they still don't pay a very high dividend, so you're talking around the 1% range. The dividend's not a big deal. It's nice to see them up that and in the future maybe we can get to a 2% yield and then you can talk about a somewhat significant yield there at 2%.

The interesting thing about the stock split is obviously it's going to open up liquidity in the market. You're going to have a share price around $80. It's going to be more accessible for folks. And we don't care too much about that. We want management focused on the long term. But the good thing is the CEO and the leadership team has shown that they are focused on the long term. They let the stock run to $800 a share — so it's obvious that we're not talking about a company that splits every time they get to $100 a share and brings it back down to $50 or $25 a share.

So, this is a company that obviously there's been plenty of discussion ... and most likely from the institutional side ... asking for a split and things like that, so it's not such a big deal. They've shown that they're focused on the long term. They let the stock run to $800 a share, so it's not as if they're a company that always does stock splits and things like that.

JASON MOSER:

Yes, and again it's worth remembering too, with the share repurchases, that they do bring that share account down. I think that's really what you want to look for in the share repurchase authorizations is it's just an authorization. It gives them the ability to execute those buybacks — but really at the end of the day you want to see those buybacks resulting in the share count coming down ... which for MasterCard it has. Since 2009, it's down about 7%, so that's good. That means that they're not just offsetting a bunch of dilution and inflating earnings per share.

MORGAN HOUSEL:

So many share buybacks are just offsetting share issuances...

JASON MOSER:

Yes, absolutely...

MORGAN HOUSEL:

...and from options from the managers and whatnot...

JASON MOSER:

No question...

MORGAN HOUSEL:

...and it's really almost a trick that some companies can play on their shareholders by announcing, "Look. We're doing this major buyback," and it's really not doing anything to the share...

JASON MOSER:

It's always a headline, too. I think that's one of the first things I learned really quickly was to approach every share buyback headline with skepticism. I mean, the first thing I look at is to see what are they doing with those buybacks? Is that share count coming down...

MORGAN HOUSEL:

You know, really interesting. In 2007, it was the biggest year for share buybacks in history, and among the S&P 500, the actual number of shares outstanding went up that year...

BRYAN WHITE:

That is incredibly interesting...

MORGAN HOUSEL:

It was more buybacks than ever and shares went up — because that was the year, 2007, that companies were paying their CEOs $50 million a year in stock and options, so buybacks were just offsetting that...

JASON MOSER:

Yes, and with all these social media companies (Twitter, Facebook and the like) out here you know you're missing a lot of restricted stock awards ... options being granted to employees and stuff like that. So, tech companies you do see more of that dilution. But, yeah, it's one of those things to always keep an eye on.

MORGAN HOUSEL:

Yes.

JASON MOSER:

Well, we also want to talk this week ... Morgan, you had a report that just came out that really, when I read it last night, I was thrilled, because I share the same perspective. It's titled, "My Cash Strategy for Beating the Market..."

MORGAN HOUSEL:

Right...

JASON MOSER:

"See why Morgan Housel keeps up to 40% of his assets in cash." And I think this is a question that we deal with a lot in members asking, "I have this lump sum in cash. What do I do with it? I want to earn something on it. I don't want to just stick it in a savings account that's going to pay 0.1% or whatever." But you know, I've always felt that having that cash is an opportunity. It serves as what you called "optionality" in the report...

MORGAN HOUSEL:

Yes...

JASON MOSER:

...and so to me, when I read this report it makes a lot of sense. It's how I look at things, and I was really thrilled to read it. What prompted you to write this?

MORGAN HOUSEL:

Well, first I think it's important to point out that just because I keep this high level of cash in my portfolio, I'm not recommending that all of our members go out and do the same. It's really different for everyone. It's dependent on how much money you have, your risk tolerance, your age. So, it's really important to point out that this is not advice for people.

But how I think about cash ... You know, for the past five years, all investors have been looking at the yield that they earn on their cash. It's probably 0% or something close to that. And they say, "Well, look. I'm earning 0% on my cash. We've got 2% inflation. I'm losing money here and that's painful." And I think that's pushed a lot of investors maybe into bonds where maybe there's a lot more risk. Putting more money into stocks than they might be comfortable with.

But I think, as I explain in this report, there's another return you can earn on your cash. It's invisible. It's sort of this theoretical return. But I refer to it as "optionality," which is basically the idea that sometime in the future, stocks are going to crash again. If you have cash on hand to take advantage of those low prices, the value you get from having that cash around can be massive, and that extra value is basically a yield that you are earning on your cash by holding it today that you don't really know of yet. And it's really important.

There's one quote that I had in the report from Warren Buffett and his quote was, "Cash combined with courage in a crisis is priceless." And that's really true. Having cash around hurts when the market is going up. When the market crashes, it's just the most beneficial thing you can ever have around.

And the other point I made in the report, too, is that for your long-term wealth measured over decades, what's really going to hurt your wealth is not necessarily earning a low return on your cash. It's being forced to sell stocks when you don't want to because of unemployment or illness or divorce or whatever it may be. If you're forced to sell stocks when the market is down, that's going to crush your long-term net worth.

JASON MOSER:

Yes, I guess that brought out the economist in me and I'm sure in you, right there ... just the whole idea of being a desperate seller ... whether it's stocks or a house or whatever it may be. You don't want to get caught in a position of being a desperate seller because you really limit your options at that point. Bryan, what stood out to you in this report as far as maintaining cash balances? Is that something you agree with? Is it something you prefer to stay 100% invested or get your money elsewhere where it's even earning some small yield?

BRYAN WHITE:

First, I would say it is an excellent report, Morgan. I enjoyed it thoroughly...

MORGAN HOUSEL:

Thanks.

BRYAN WHITE:

And I agree with what Morgan said to start off. Everything is different, right? I'm young. I tend to skew toward I want, throughout my investing career, to be able to take advantage of the major opportunities. We saw one in '08, '09. I'm young enough where I think I can get one or two or maybe three of those. Those are massive wealth-building opportunities and you cannot really take advantage of them unless you have some cash. So, it's different. If I was in retirement, I'd think much differently. I hope that would not be my focus, because I may not see one of those. It depends where you are in your time frame.

And then Morgan, the quote that you brought up is fabulous. So, if you're at home and you're a member, and you're thinking about this report and it appeals to you ... here's the thing that you have to definitely think about also and prepare for. You have to prepare for the emotional ... the feeling that's going to happen. If stocks drop 20% — if the market drops 20% — are you truly going to be willing to pull into your cash file and go all in or go a significant portion in?

Because it's easy to say, but it's hard to do. The good thing is, for everyone at home, we have a good measuring stick ... '08, '09. How did you feel? What were your emotions like? Were you scared? Were you mad at everything in the world in terms of stocks and market? Did you think it was all rigged against you? Those kinds of things will tell you probably how you're going to feel next time. So, it's not really smart to go after a strategy of 20, 30, 40% cash if you know you're the type of person that is going to become very, very fearful when everybody else is.

MORGAN HOUSEL:

Right. It's much easier said than done...

BRYAN WHITE:

Yes. You need to know your personality if you're going to employ something similar.

JASON MOSER:

I think there's a technical term for having the ability to pull the trigger like that. It's called "intestinal fortitude."

MORGAN HOUSEL:

Right.

JASON MOSER:

Make sure you have the intestinal fortitude to pull the trigger. In one other part of this report, I will encourage members to go through and actually do this exercise. You know, Morgan, you provide a road map...

MORGAN HOUSEL:

Yes...

JASON MOSER:

...and I know this road map would be different for everyone depending on what stage you are in life. Are you protecting your wealth? Are you growing your wealth or whatnot? And maybe it's not even a road map that you adhere to strictly, but it's a first step. It gets it down on paper. It gets your thoughts out there of if the market falls by this much, I would invest this much. And how often may this happen? It really, I think, helps to provide a lot of perspective and I think that no matter what stage you are as an investor, it could be a helpful exercise to do and then to also go through and revisit maybe once a year. I think that having a road map like that is just a wonderful exercise.

MORGAN HOUSEL:

Yes. It's really important to think of these things before they happen — because when a crash comes, you're probably not going to be thinking straight — and if you're just trying to figure it out ... if you're trying to figure out what to do with your cash in October 2008, you're probably not going to be thinking ... It's good to figure this out beforehand. Have it written down on paper. Here's what I would like to do. Here's what I plan to do. You might not follow it to a T when it actually arrives.

BRYAN WHITE:

Well, here's the thing, Morgan. Actually in 2008, if you were heavy in cash, you'd feel like you were the smartest man alive.

MORGAN HOUSEL:

Sure. Absolutely...

BRYAN WHITE:

...and you're probably pretty hesitant to dip into that and go into the stock market because you're laughing at all the fools that are 100% invested and rah rah through 2006, 2007...

MORGAN HOUSEL:

And that cash just saved your rear end. You don't want to get rid of it. It's your best friend.

BRYAN WHITE:

Yes. So, it's tough. You definitely need to think it through.

JASON MOSER:

Cash will save your rear end. Let's leave it there, guys. For Bryan White, Morgan Housel ... guys, thanks for being here...

MORGAN HOUSEL:

Thanks a lot.

JASON MOSER:

...and we'll see you next week.

Don't Let the Rules Keep You From Winning

Published Feb 10, 2014 at 4:00PM

We're moving The Buckle (NYSE: BKE) to Buy First. Here's why.

Dear *Pro* Fools,

Jeff on Starbucks

Interested in an exclusive sneak peek inside the world of *Motley Fool One*? Listen in on the *Fool One* podcast as your very own Jeff Fischer drops by to discuss **Starbucks**' (NASDAQ: SBUX) true growth potential with *Fool One* analyst Bryan White, Sonny Kirtley (TMFTiptree), and award-winning host Chris Hill. Does the 'Bux still have the magic beans required to caffeinate your portfolio? Or has it already gotten too frothy? We've got the skinny!

Listen in!

Billy (TMFTailwind) and I recently spoke with the management team at The Buckle, and the conversation reminded me a bit of playing Go Fish with my 4-year-old nephew, Landon. Landon has determined that playing by the established rules of the game is suboptimal, so if a player is asked for "sevens" and is sent fishing, he demands it be his turn and promptly asks the fisher for their sevens. Because the point of the game is to win, Landon is on the right track, but it's hard to say the game he's playing obeys the rules laid out by the creators of Go Fish.

The rules of jeans-focused specialty retail, as practiced by the most notable industry participants (think **Abercrombie & Fitch** (NYSE: ANF), **American Eagle Outfitters** (NYSE: AEO), and **Aeropostale** (NYSE: ARO)), make for a game that's difficult to win. So, like Landon, The Buckle simply makes up its own rules and plays a fundamentally different game. Buckle investors over the past 10 years have definitely won, notching compound annual returns (including dividends) of 21% per year, outpacing the market by more than 17% per year. So, what is the game The Buckle is playing, and are its rules the right ones for the next 10 years? Let's take a look ...

The Buckle's Rule Book

1. **Focus on service.** Service is what differentiates The Buckle from its peers. In fact, when we asked for the key tell in determining whether a store is being well run, CFO Karen Rhoads said that anyone entering should be quickly greeted by a Buckle teammate showing interest in why you're there and offering a willingness to help consult on fashion. Buckle teammates, unlike the staffers at other mall clothiers, aren't just there to punch buttons at the register and fold shirts; they're denim specialists trained to help find the best style and fit to match your wants and body type. In fact, The Buckle is transforming more into a boutique than a mall retailer — it offers call-ahead fitting appointments and reaches out to frequent customers when new items that fit the look become available. This creates a "personal shopper" experience closer to **Nordstrom** (NYSE: JWN) than Aeropostale. This focus on service is reinforced by incentivizing store managers based on store performance and tracking measures such as call-ahead denim fittings.
2. **Brand choice and exclusive merchandise.** Roughly one-third of The Buckle's sales consist of its in-house brands. The bulk of sales come from name-brand designers The Buckle brings in as demand and popularity warrant. Contrast that with Abercrombie, American Eagle, and Aeropostale, which stock their shelves with proprietary brands only. When those brands lose steam (and they do — teen shoppers are notoriously fickle), sales suffer badly. Offering outside brands allows The Buckle to diversify its product line and fashion risk, but it goes a step further. The Buckle partners with designers to bring in exclusive merchandise, which prevents shoppers from price-shopping on a mobile phone and simply ordering from another merchant online.
3. **Be a trend-follower, not a trendsetter.** The bleeding edge of fashion is bloody for a reason — misread a trend and you end up dramatically discounting your merchandise, swimming in red ink, and potentially alienating your customers. The Buckle is happy to take it slow in its relationship with fashion, focusing on staples that aren't going anywhere (jeans and tees) and experimenting with higher fashion only around the edges. Even then, the company leaves that experimentation up to proven experts; the vice presidents of men's and women's merchandising have more than 50 combined years at the company (starting as store salespeople) and have held their VP posts for decades.
4. **Grow only as it makes sense.** Given the importance of service and well-trained staff, The Buckle can only grow as quickly as it is able to find great store managers. According to management, it is this — and not lease terms or finding attractive locations — that has the greatest impact on new store openings. The Buckle has a management training program, aggressively promotes its rising stars, and offers bonuses to store managers who hire salespeople that ultimately become store managers themselves. The Buckle's growth has been far more modest than its peers — its rule of only opening a store led by a star manager helps reinforce the focus on service and limits the chance of mistakenly opening a low-return store.
5. **The Internet is a tool, not a business.** The Buckle's online strategy is definitely unconventional. It doesn't push its shoppers online, because it's nearly impossible to differentiate itself through its service there. Instead, it uses its website as a tool to enhance in-store selection and to improve inventory management, and as a convenience for loyalists without a nearby store. Management was clear that online is a "complement" to the core brick-and-mortar business. When asked what the retail business model would look like in 20 years, the company said that service will still be paramount.
6. **Stay in touch with stores and customers.** The company's executives spend a "majority" of their time traveling to stores and talking to district and store managers. It made sense, then, when controller Tom Heacock said that one of the most important parts of his job is making sure systems are in place to accurately track key store-level performance indicators and disseminate that information quickly to the executive and merchandise teams to make adjustments as needed. Quick corrections, informed by store-level employees and shoppers, help keep mistakes small.

If We Made the Rules

The Buckle's rule book is internally consistent and reinforcing — and it has achieved dramatic success. Still, I wish the company were studying companies (like Bonobos or Zappos) that have built impressive, service-led, online retail offerings. I also wish the company would double down on building out its loyalty program. The Buckle's brand is not well known, the service it offers in-store isn't apparent when it enters a new market, and it relies almost exclusively on word-of-mouth advertising. Its loyal customers are therefore an incredibly important asset, and it needs to maximize the relationship it has with them. Its existing loyalty program is subpar (it still uses punch cards, for crying out loud!) and would benefit from a study of the system **Starbucks** (NASDAQ: SBUX) has built. But inside the four walls of its brick-and-mortar stores, The Buckle's rule book is solid and difficult for established brands to imitate.

The *Pro* Bottom Line

A read of The Buckle's 10-K or a visit to its website would not reveal that it has written the rules to a different game than the one other mall-based specialty retailers play. The Buckle knows what my nephew Landon knows: Like Go Fish, mall-based specialty retail is a game for suckers. We like that the company plays a different game altogether and that its strategy is misunderstood — it offers us opportunities like this, when its shares are meaningfully undervalued. We're happy with our current allocation, but think shares at this price are worthy of being moved to Buy First.

Onward,

Bryan (TMF42)

Site Update

Pro has eliminated the CAPShot feature from our individual recommendation pages. As we continue to try to optimize our site — and the real estate on each page within it — we found that the CAPShot was not regularly used (and *Pro* hasn't used it for years). The CAPS Community itself is still alive and thriving at caps.fool.com.

Memo Coming Tuesday Next Week

Because of the Presidents' Day holiday, next week's Monday Memo will be a Tuesday Memo, hitting your inbox at 4 p.m. Feb. 18. See you then!

February Live Chat Coming Up!

Our January live chat was so much fun that we're repeating the magic this month. Join us at 2 p.m. Wednesday, Feb. 26, and bring your questions! Click here to set a reminder.

Pro Guidance

- **The Buckle:** The stock moves to Buy First (from Buy) on valuation. We have a 2.4% allocation that we'll continue to consider adding to; we'll issue a new trade alert if we do.
- **Pacer** (NASDAQ: PACR): Thirty days have passed since our trade alert, but we continue to wait for our recommended sell price of $8.95. Unless we issue an updated alert, we'll continue to target that sell price.

Pro Completed Trades

- **Intel** (NASDAQ: INTC): Following our trade alert guidance, we sold to open 36 April 2014 $25 calls for $0.58 each, covering all of our 3,600 shares.

Pro Catch-Up Trades

- **Facebook** (NASDAQ: FB): Following strong earnings, newer members with only a half allocation can increase their allocation to as much as 4.6% (to match us).
- **Tupperware** (NYSE: TUP): If you don't have 2.7% exposure through existing puts (we're short April $90 puts), then sell to open April 2014 $75 puts, lately paying you about $2.75 each, for a 3.7% yield in less than three months. Sell one put for every 100 shares you could buy, up to a 2.7% allocation (you could also sell higher-strike puts, but they carry very little time value). If you're not using options, you can buy shares of stock instead.

Transcript

CHRIS HILL:

Welcome to EP Weekly. I'm Chris Hill, joined in-studio this week by Bryan White, and from *Motley Fool Pro* and *Options*, Jeff Fischer … and the newest member of the team, James Kirtley. You may know him on the boards as Tiptree. Is it Tiptree or TiptreeTwo?

JAMES KIRTLEY:

It was TiptreeTwo. Now I am TMFTiptree.

CHRIS HILL:

That's right, because you're official now.

JEFF FISCHER:

Hooray.

BRYAN WHITE:

Welcome, Sonny. It's great to have you.

CHRIS HILL:

Welcome. We're going to talk Starbucks first and foremost because Bryan, as you and I have talked about before, this is a holding but Jeff, this is also a stock that you watch very closely. It is part of your universe …

JEFF FISCHER:

Yes, we own it in Pro, as well.

CHRIS HILL:

Where are we now with Starbucks, because I'm a longtime shareholder? This is a company that continues to put up great results. In some ways, this is, I suppose, a good problem for a shareholder to have, but I look at it now, and I wonder, "Gosh. Is it now getting to the point where it's too big?" Or not too big, but too big to expect the kind of returns that we've seen over the past decade.

JEFF FISCHER:

Yes. Or is it too big to fail, maybe? No. Anything can fail. So, it's doing extremely well, Chris. And one thing CEO Howard Schultz said in the last conference call is Starbucks may have underestimated the additional store locations they can open in the Americas — so they may actually have more room to expand than they even thought previously before — and that's great news because even today, still 75% of revenue at Starbucks comes from the Americas and it's the highest-quality revenue. By far the biggest earnings store for Starbucks is a new or newish location in the Americas. Now, it's expanding in Asia and overseas, as well, but that's still a minority of the company's profits.

CHRIS HILL:

Bryan, when you think about Howard Schultz and his leadership … I don't want to scare anyone here … but one of the things I think about, every once in a while …

BRYAN WHITE:

Yes …

CHRIS HILL:

… with Howard Schultz is, "Gosh, he's done such an amazing job as CEO. I really hope he's started to think about a succession plan."

BRYAN WHITE:

Well, I think he has and I think we just saw the signs of it now. He's going to step down from the day-to-day operations and focus more on some of their longer-term opportunities. And Starbucks does — I mean, they have a great bench there — so the COO is going to step up. I don't think that there's really any worries about the succession. I think Howard has spent enough time there planting the seeds for all these ways to win that I think they'll remain focused. And the fact that Howard's going to step down from daily operations and focus on the long-term opportunities is a win. I think that's a win.

JEFF FISCHER:

I hope Bryan's right, and I would suspect he is. But it's also accurate or reasonable to be concerned, because the last time Howard …

CHRIS HILL:

I was going to stay — the *last* time …

BRYAN WHITE:

Yeah, the last time …

JEFF FISCHER:

… things went south and he stepped back in and turned things around. But he remembers that, too, of course, so I think Bryan's right. When he steps back a little bit this time, he'll still be involved enough to make sure everything stays on the right track.

CHRIS HILL:

Well, and part of the success of Starbucks — and this makes me think that both you guys are right … that Schultz has learned from that experience — is if you just step back and look at the last 20 years or so and the way he has tried things and failed and learned from those mistakes … And Jeff, I'm thinking primarily of, gosh, back in the nineties where he announced in a conference call, "We're going to be a lifestyle portal and we're going to sell luxury furniture and all that stuff…"

JEFF FISCHER:

I had forgotten about that …

BRYAN WHITE:

Wow …

CHRIS HILL:

And the stock got whacked. But now you think about not only the acquisitions that Starbucks has made over the last 7 to 10 years, but also the new products they have rolled out. Anyone who ever listened to MarketFoolery knows I was leading the charge saying, "This is a horrible idea that won't work." And I'm so happy I was wrong. Even things like the instant coffee VIA — that sort of thing — it's really been … I am hard pressed to come up with any sort of misstep over the last 7 to 10 years.

JEFF FISCHER:

Yes, and now they're tackling food, of course, with La Boulange, which they expect to roll out to 10,000 U.S. stores by the end of this fiscal year. And that's maybe what I'm most excited about for Starbucks in the next couple of years is the company upping its game in food in the U.S. which are, as we just said, already their most profitable stores … but a minority of people go in there and leave with food. A vast majority only buy coffee. You can change that.

CHRIS HILL:

Sonny, you were saying before we started taping here. Some people are saying, "Gosh. What's the next big thing for Starbucks? It's the drive-thrus." But you're saying where you live, in Indiana, it's nothing but drive-thrus.

JAMES KIRTLEY:

That's right. Most of the Starbucks weren't built as Starbucks. They were taken over from failed fast food stores, so they already had the drive-thru built in. And I can tell from my own experience that the drive-thru is probably the greater source of revenue than the …

BRYAN WHITE:

It's a highly profitable model for them. And like Jeff was saying, they're seeing an increased footprint for potential new stores and that's essentially where they're coming from — is the ability to set up these drive-thru locations.

JAMES KIRTLEY:

Yes, the store is never empty, but the drive-thru line is also very long.

CHRIS HILL:

Last thing, Jeff. When you look at the stock — where it's priced right now, hovering just a couple of bucks below an all-time high — does it look richly valued? Fairly valued?

JEFF FISCHER:

Oh, and then there's that.

CHRIS HILL:

Well, you know …

JEFF FISCHER:

Great question, Chris. Shares are lately right around $70. And as you would expect, after a long bull market, it's harder to be excited about them or their valuation at this moment, but I still want to own them. But the shares do trade at 22x expected earnings for September 2015. So, we're waiting about 18 months to get to 22x P/E multiple while earnings are growing, or expected to grow right around 20%.

So, if you had to put a number on it, I'd say shares might be a year ahead of themselves, more or less. But, I wouldn't want to bet against them, and they have so many levers that they are pushing and pulling to grow even more. Basically, they have so many upside opportunities ahead of them in food and new stores overseas, that it's something to own.

BRYAN WHITE:

I'd say Starbucks deserves a premium given the fact that if you look out, you can see a great repeat-purchase model that Starbucks has successfully developed here in the U.S. And when you look at their potential in China and India — just those two markets alone — a repeat-purchase model out there …

JEFF FISCHER:

Of something that's addicting. There's that, too.

BRYAN WHITE:

I think the potential is pretty big out there.

CHRIS HILL:

And I think it was either in the most recent conference call or maybe an interview that he had done right after the latest quarterly earnings — Schultz had that great line about the growth of e-commerce and saying, "Fortunately you can't make a latte on the Internet." So, the possibility for disruption there …

JEFF FISCHER:

Not yet.

CHRIS HILL:

Before we wrap up — Sonny, part of the reason you're in this studio is you're in town for our two-day member event which starts on Thursday … the Fool One event ... and then on Friday MDP/Supernova/Pro. Hundreds of members coming to [00:07:21]. You've been to these events before. I'm curious. What are one or two things that you're particularly looking forward to?

JAMES KIRTLEY:

Every time I've been to one of these things, I meet people that are just extraordinary people. The members that come to these things … Of course, they start with a common interest — investing — and I always have nice conversations about investing with people. But it always segues into talking about life and children and legacies and things like that. It is such an enriching thing to connect with these other people. You see them on the boards, or maybe not. But you get to talk to them, put a face to their user name. A lot of great times. A lot of great memories from the past events. I'm looking forward to this one.

CHRIS HILL:

We will wrap up there. Bryan White. Jeff Fischer. James Kirtley, guest. Thanks for being here. Thanks everyone for listening. We'll see you next week.

Live Video From Our Member Event!

Published Feb 7, 2014 at 5:30PM

Members are descending on Fool HQ to take part in our member event this week — and if you can't make it, we've still got you covered. We'll have live video streaming on this page from **10 a.m. to 11 a.m.** and again from **4:15 p.m. to 5:30 p.m.** on **Friday, Feb. 7**. Details are below, and we'll also record the most popular sessions and make them available after the conference.

Following along? Join the conversation by using **#FoolFest** on Twitter, Facebook, and Instagram — we'll take at least one question from social media during each session!

Friday, Feb. 7

- **10 a.m.:** Welcome from **David Gardner**, co-founder of The Motley Fool
- **10:10 a.m.: Fred Reichheld**, business strategist and author of *The Loyalty Effect*

(break in live stream)

- **4:15 p.m.: National Oilwell Varco CEO** Pete Miller
- **5:15 p.m.:** Motley Fool co-founder **Tom Gardner's closing remarks**

Pro Live Chat, February 2014

Published Feb 5, 2014 at 3:39PM

At 2 p.m. on Wednesday, Feb. 26, the entire *Pro* crew — advisor Jeff Fischer; senior analyst Bryan Hinmon, CFA; research analyst Billy Kipersztok; and editor/publisher Ellen Bowman — answered your questions during a live text chat. Read the transcript below!

Results and More From Apple, Facebook, and OpenText

Published Feb 3, 2014 at 4:00PM

Dear *Pro* member:

Member Event This Week!

The *Pro* team will be joined by members from far and wide at this Friday's Foolish member event in Alexandria, Va.! If you won't be in attendance, don't worry: The *Pro*-specific events — including Jeff's talk on "Portfolio Construction with a *Pro* Blueprint," Bryan's presentation on "Worldly Wonders, Albert Einstein, and *Pro* Core Stocks," Billy's dive into "*Pro* Stock Talk," and our member panel on making the most of *Pro* — will be recorded and broadcast on the *Pro* site after the event. We'll ping you! Whether live or virtual, we hope to see you soon.

Every quarter, we scour our companies' earnings reports. We seek out anything we may have previously missed, and more than that, we look to add to our knowledge and support — or alter — our theses. It's unfair to paint every company with the same brush, but year-end 2013 results are generally looking fair. Early 2014 guidance seems much the same: fair. And in general, stocks appear valued that way, too: fair(ly). Expecting as always the usual big bumps in the road, this still suggests decent long-term upside for the average stock, and even better for those strong companies that surprise Wall Street. We seek to own plenty of the latter.

Here are key takeaways from three of our companies this quarter (and don't miss more earnings reviews at the end of the Memo).

Apple

(NASDAQ: AAPL)

Achieving higher quarterly revenue than any technology company in history, Apple increased its first-quarter sales 6% year-over-year to a record $57.6 billion. Margins appear to be stabilizing, with operating profits at 30%, sending Apple to record net earnings of $14.50 per share. That's growth of 5% after a full year of declining results because of lower margins. Despite supply constraints, iPhone sales were up 7% to 51 million units, and Apple remained the top smartphone supplier in the United States. iPad and Mac sales both exceeded expectations, with sales of the former up 14% to 26 million units, and sales of the latter jumping 19% to 4.1 million units.

But Apple's stock price declined on lackluster guidance for the coming quarter. Wall Street didn't care that several unusual factors are resulting in this soft second-quarter outlook: Channel inventory increases that Apple made one year ago are not being repeated this year; the U.S. dollar is stronger; and there's been a change in the way Apple accounts for revenue from Mac and iOS devices. Now that Apple gives away its core software free of charge, it defers a greater amount of revenue from each computing device sold. Deferred revenue was $11.4 billion at the end of the quarter, and it will take four quarters to recognize even $8.4 billion of it.

No matter. The stock sold lower on a perceived lack of growth prospects — a perception that has some merit. Apple will plug into China Mobile's 750 million subscribers this quarter, and the hope was that guidance would reflect those big numbers. CEO Tim Cook is excited about the China Mobile deal, and though Apple is selling in just 16 China Mobile 4G cities so far, that number is expected to increase to 340 by year-end. But it doesn't appear China Mobile alone can send Apple's results to the next level. More than ever for this giant business, it appears Apple needs a successful new product in a whole new category to fuel growth. Mr. Cook has all but promised exciting new products (possibly plural?) in new categories this year (perhaps wearables?), and we don't expect Apple to disappoint. While we wait, the stock is priced inexpensively and remains a Buy First, with a good risk-to-reward profile.

- Share price: $500
- EV/EBITDA: 7.5
- EV/EBITDA Next 12 Months (NTM): 7.2
- P/E: 12.4
- P/E NTM: 11.6
- P/FCF: 13.4

Facebook

(NASDAQ: FB)

Enjoying record traffic, Facebook saw its fourth-quarter ad revenue surge 76%. Meanwhile, its effective price per ad climbed 92%, starting to fulfill a key point in our original thesis: Ad rates are likely to continue climbing higher as the ads become more effective. Facebook enjoyed estimate-topping 56% non-GAAP operating margins, and increased its earnings per share 80% with strong free cash flow.

In the conference call, management sounded extremely upbeat about Facebook's prospects. This is only the beginning of building a strong mobile-ad business — and "it's working." The key takeaway: User sentiment about ads in mobile *improved* even as ad volume *increased*. The ultimate goal is to have Facebook users appreciate ads as much as hearing from friends and family, because the ads are so relevant to them. Launching ads in Instagram now as well, Facebook is investing in ad quality, believing that will drive more value than quantity ever could. An international rollout of ads is happening incrementally, too, once critical mass has been built in a region and Facebook opens local offices.

CEO Mark Zuckerberg has a three-year plan to build many new ways for the site's users to share experiences with one another, while always improving the platform for advertisers. The five-year plan is to help people network even more effectively — to solve their problems, find solutions to most anything, and make new connections. To this end, Facebook's Graph Search is rolling out on mobile, and Artificial Intelligence is in the works. Over 10 years, the company aims to get much more of the world to the Internet through its Internet.org campaign; a third of the globe is not yet connected.

From a business standpoint, the fact that social advertising is in its infancy is what's most exciting. The massive advertising industry still spends more on old-school paper ads than it does on social sites, and we doubt that will remain true. Despite an aggressive-looking valuation, Facebook remains a Buy, and we're considering topping off our allocation. The business and valuation remind me of **Google** (NASDAQ: GOOG) circa 2005-2007.

- Share price: $62.50
- EV/EBITDA: 39
- EV/EBITDA NTM: 22
- P/E: 104
- P/E NTM: 50
- P/FCF: 54

OpenText

(NASDAQ: OTEX)

Following its acquisition of privately held GXS for $1.2 billion, *Pro*'s favorite enterprise information management software company is poised for leadership in the field of business information exchange. Such communication is mission-critical, allowing trading partners to manage billing, invoices, pricing, cash flow, and more, all on a common platform. Not only does this provide OpenText with strong network effects (and cross-selling opportunities), it increases its recurring revenue, too. Management estimates that recurring revenue is now going to account for 80% to 85% of OpenText's sales. We love that stability, and we believe it commands a higher valuation for the stock, too.

GXS had nearly $500 million in revenue in 2012 (2013 numbers aren't available yet) and $147 million in EBITDA. The acquisition should immediately add to OpenText's earnings, and within 18 months OpenText expects to increase GXS's margins to its own high level. GXS is another in OpenText's history of acquisitions that are complementary to the core business, so odds for success should be better than average.

In the last 20 years, OpenText has made 48 acquisitions for a total of $3.4 billion. Over the next five years, management estimates at least another $3 billion in additional acquisition capacity. The industry is taking root now, so now is the time to keep investing. That OpenText is growing even as it expends some of its focus on acquisitions suggests that its products are in demand. In a sluggish environment for software, its new license revenue was up 7% last quarter.

Although there's risk with any large acquisition, the stock remains a Buy, and we've increased our fair value (see "*Pro* Guidance Changes" below) to account for the new business. This is just a rough estimate, though, until we see results. Meanwhile, Gartner expects OpenText's core industry to increase by 11.4% annualized between 2012 and 2017. Finally, keep in mind that OpenText stock splits 2-for-1 (from $98 to $49) on Feb. 18. Don't spill your coffee on yourself that morning.

- Share price: $98
- EV/EBITDA: 14.6
- EV/EBITDA NTM: 10
- P/E: 39
- P/E NTM: 14
- P/FCF: 18

A Good Fool Asks, "What's Next?"

I'll next review **MasterCard** (NYSE: MA), **TD Ameritrade** (NYSE: AMTD), and other *Pro* stocks reporting soon. But right now, there's even more *Pro* earnings coverage below. Fool on!

— Jeff (TMFFischer)

Pro Coverage

- More earnings coverage! Click for our latest on **Gentex** (NASDAQ: GNTX), **Intel** (NASDAQ: INTC), **Parexel** (NASDAQ: PRXL), **Starbucks** (NASDAQ: SBUX), and **Tupperware** (NYSE: TUP).

Pro Guidance Changes

- **Gentex** (NASDAQ: GNTX): Fair value increases from $29 to $33, and Consider Adding More to $25. We have a 3.7% position.
- **OpenText** (NASDAQ: OTEX): Our fair-value estimate increases from $81 to $88; Consider Adding More increases to $70. We have 3.6%.
- **Parexel** (NASDAQ: PRXL): Fair value increases from $51 to $54. We have 3.3%.
- **Starbucks** (NASDAQ: SBUX): Fair value increases from $71 to $73. We own 2.9% (and we watch for put-writing opportunities).
- **Tupperware** (NYSE: TUP): Fair value decreases from $84 to $82 on lower results. Shares remain a Buy (or you can write puts for 2.8%).
- You can always see all of our current guidance on the Recommendations page. Also see there our exposure — we have 20% cash — and detailed returns.

Completed *Pro* Trades

- **iShares Russell 2000** (NYSEMKT: IWM) ETF: We set up a March 22, 2014, bear call spread, selling 17 $99 calls and buying 17 $117 calls, for a net credit of $12. (We had to lower our strike price one dollar to get our pricing because the market had already declined.)

Write Covered Calls on Intel

Published Feb 3, 2014 at 3:15PM

Is this for you? *Pro* members who own at least 100 shares of **Intel** (NASDAQ: INTC) and are willing to potentially sell higher in exchange for income can participate. If you don't yet own shares, see our Alternative Trades at the end of this report.

How You Participate

- **Trade:** Sell to open April 2014 $25 calls.
- **Allocation:** Sell one call for every 100 shares of Intel you own and are willing to sell. *Pro* is covering our full 4.6% allocation — all 3,600 shares.
- **Price Guidance:** Your call credit will change as Intel stock moves. With 74 days until expiration, aim for at least a 2% yield on the current stock price.
- **Prices:** Stock: $24.10; April 2014 $25 calls (bid/ask): $0.52/$0.53 (for a current 2.2% yield on the share price in two and a half months).
- **Guidance for Stock Purchasers:** Buy (and write covered calls), or write puts (see Alternative Trades at the end of this report)

What We're Thinking

Intel is starting to gain traction selling processors for mobile devices, and PC sales are showing some stability, but management still expects flat results in 2014 as the company continues to invest in itself. To those hoping for modest growth, this recent news is a disappointment, especially because flat sales and earnings in 2014 may only lead to single-digit growth in 2015.

As the resurgence of growth for Intel seemingly slips further into the future, we're looking to earn our desired rate of return on the position by writing options and collecting the 3.7% dividend. With shares trading at less than 6 times EBITDA and 13 times earnings, our valuation risk should be modest as we target North Star-like, 10% annualized returns.

As long as we want to keep our shares, we'll actively manage our covered calls, rolling them if necessary to keep our stock. Were we to lose our shares, though, we could likely turn around and write puts — our alternative trade. Suffice to say, for now we view Intel as a *Pro* income position (again; it started that way in 2008), through both options and (for those not using options) the strong dividend yield. Eventually, though, we hope to see free cash flow and earnings growth again, and we will stop our covered-call income strategy if we anticipate that.

More That Matters

- **Maximum Loss:** The same as stock ownership, minus the call premium received.
- **Maximum Gain:** Currently, we have a net sell price 6% higher than the current stock price; our trade earns 11% annualized if unexercised, and 32% annualized if exercised.
- **Breakeven:** On this trade, today's share price minus the call premium received.
- **Follow-Up:** As shared above, we'll manage the covered calls pre-emptively to keep our shares as long as we want to own them. If we lose the stock, we may write puts.

Alternative Trades

- **Don't own shares yet?** You can use a "buy/write" order to buy at least 100 shares and simultaneously write these calls with us. *Or*, you can sell to open April 2014 $23 puts, lately for a 2.5% yield at $0.58 each. That price will change, but aim for 2% or higher the coming few weeks. Be ready to buy 100 shares per put you sell.
- **Is 100 shares too many?** If 100 shares would be greater than a 5% allocation for you, then don't use options. Just keep your stock position around 4.6%.

Pro Can Help

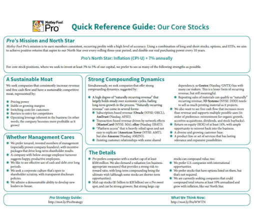
- **Want to learn more?** See our guide to writing covered calls in our sister service.
- **Need an ear?** Post your thoughts or questions on the *Pro* Intel board.

Pro's Watch List: AMERCO

Published Jan 27, 2014 at 4:00PM

Dear *Pro* Member,

A Guide to *Pro*'s Core Stocks



In today's Memo, Billy references several characteristics the *Pro* team looks for in a portfolio candidate. Our printable one-page PDF guide to *Pro*'s core stocks shows you what we're seeking at a glance — view or download it here!

Last week's overall market decline would seem to be a logical topic for this Memo — the S&P dropped more than 2% on Friday alone, and the index posted its worst weekly percentage loss since June 2012. But as Jeff's note on the discussion boards reminded us, it's important to keep perspective; as he put it, "If that mere 2.4% dip [from the S&P's Jan. 15 all-time high] feels heady to you, you may be too exposed to the market (or just not used to falling prices after about 18 months since we've seen a real decline)." So rather than focus on what is actually a pretty minor market change, the *Pro* team thought it would be more fun — and more useful — to show off an example of what we've been working on lately (see the last paragraph in that link).

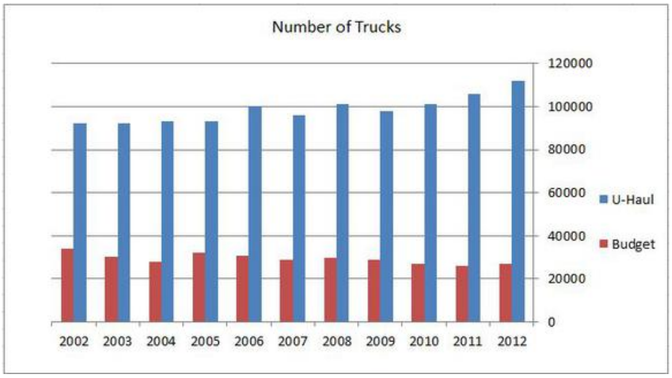
The title of this Memo is somewhat misleading; *Pro* doesn't have an official "Watch List." But Jeff, Bryan, and I each have a set of companies we follow to ensure a steady steam of potential portfolio additions, and we monitor their business performance to ensure we'll be alert if the market presents us with an opportunity we can't refuse. One company that has been on my personal list for awhile is **AMERCO** (NASDAQ: UHAL), the holding company for do-it-yourself moving and storage business U-Haul. Here are a few reasons why I'm intrigued by this company and will be watching its performance over time to see if it's potentially worthy of a spot in the *Pro* portfolio.

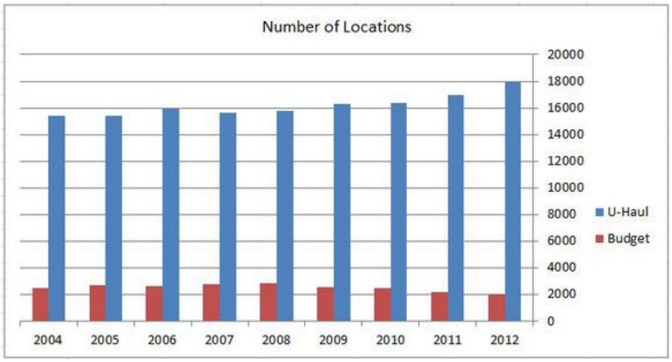
Significant Skin in the Game

Pro values tenured, invested management teams; we want to see leaders with significant financial and reputational stakes in their businesses. AMERCO takes skin in the game to the next level — current chairman/president/CEO Joe Shoen (son of founder Leonard Shoen) runs the business, and Shoen family members litter AMERCO's organizational chart, with most of them having worked with the company for the majority of their adult lives. The Shoen family owns more than 55% of the company's common stock, and executive pay is modest — perhaps even excessively so — for a company with more than $2 billion in annual revenue (total CEO compensation is consistently less than $1 million). What this means is that the vast majority of the Shoen family's wealth is concentrated in AMERCO stock. We can rest assured that the leadership team is running the business with a long-term mind-set that's well aligned with that of common shareholders.

A Strong and Expanding Moat

Another attribute we look for in our investments is a sustainable competitive moat. I believe that AMERCO has a moat in its moving-equipment rental business and is taking steps to reinforce and expand its dominant position there. When you rent out trucks, it's a big advantage to have more vehicles and more drop-off/pick-up locations than your competitors, as U-Haul does. That means that for many routes, U-Haul is the only operator that can ensure an available truck at the start of the trip and an available drop-off location at the end. Take a look at these graphs showing the number of trucks and locations for U-Haul compared with its closest competitor, Budget (owned by parent company **Avis Budget Group** (NASDAQ: CAR)):





Sources: AMERCO and Avis Budget Group

With more than four times as many trucks and nine times as many locations, it's clear U-Haul has a vast and growing lead over its nearest competitors in the size of its rental network. As such, U-Haul should be able to attract customers to a greater degree; this in turn should increase the company's profits, allowing U-Haul to invest in even more trucks and more locations, furthering the virtuous cycle.

Hidden Asset: Self-Storage Real Estate

In addition to its core moving-equipment rental business, AMERCO also operates a self-storage real estate business. AMERCO owns or operates about 40 million square feet of rentable storage space, giving it the third largest self-storage real estate portfolio in the United States (behind REITs **Public Storage** (NYSE: PSA) and **Extra Space Storage** (NYSE: EXR)). Self-storage real estate companies trade at high valuations for a few reasons, including:

- They provide stable, recurring revenue streams with high renewal rates
- The properties require very little maintenance expenditures
- Margins are high, with average EBITDA margins at about 60% for the publicly traded self-storage REITs

Comparing it to its publicly traded peers, I calculate that AMERCO's self-storage portfolio could reasonably be worth up to 35% or more of the value of the entire business. Management is actively developing and growing the real-estate portfolio, and I expect this portion of the business to continue to be a strong contributor to financial results in the future.

The Foolish Bottom Line

AMERCO is a quirky, underfollowed business. This family-run company has an unusually high percentage of insider ownership, a ubiquitous brand, a strong competitive position in its core business, and a valuable real estate portfolio that's perhaps obscured by its holding-company structure. Over the past five years, margins have been expanding, and the company is now generating record revenue and profits. However, the market's been warming up to the story, with the stock price up about 37% over the past six months, well outpacing the S&P 500 over the same span. I'll be keeping an eye on margins to determine whether recent trends are sustainable, and I'll also keep an eye on the stock price to see if Mr. Market is willing to offer us a deal we can box up and store in our portfolio.

Fool on!

— Billy (TMFTailwind)

Pro Catch-Up Trades

- **Tupperware** (NYSE: TUP): If you don't have 3% exposure through existing puts (we're short April $90 puts), then sell to open March 2014 $80 puts, lately paying you about $3.20 each, for a 4% yield in less than two months. Sell one put for every 100 shares you could buy, up to a 3% allocation. If you're not using options, you can buy shares of stock instead. Just realize Tupperware will announce earnings on Wednesday, Jan. 29, before market open. If you'd rather wait until after that event, feel free.

Pro Guidance Changes

- **Starbucks** (NASDAQ: SBUX): Fair value increases to $73 (from $71), and Consider Adding More increases to $59 (from $57). The stock remains a buy at a 3.1% allocation.

Coverage & Community

Set Up a Bear Call Spread on the iShares Russell 2000

Published Jan 27, 2014 at 2:30PM

Is this for you? Any *Pro* member seeking a market hedge can consider this position, which earns its maximum profit on a 10.7% market decline and caps our risk at a 5.4% market increase.

How You Participate

- **Trade:** Use a two-legged order to set up a bear call spread on the **iShares Russell 2000** (NYSEMKT: IWM) ETF. Sell to open March 2014 $100 calls, and buy to open an equal number of March 2014 $118 calls.
- **Allocation:** 10%. Set up one bear call spread for every $112,000 you manage. Pro will set up 17 spreads. Or, simply set up one spread for every $600 you're willing to risk to potentially make $1,200.
- **Price Guidance:** Aim for a net credit of $12 or greater as long as IWM is $112 or higher. If IWM declines before you trade, you'll get a lower credit unless you lower both your strikes by $1 for every $1 IWM has declined (which is fine to do, and what we will do if necessary).
- **Prices:** IWM, $112.10; sell to open March 2014 $100 calls (bid/ask), $12.70/12.85; buy to open March 2014 $118 calls, $0.71/$0.72. Net credit: About $12.05.

What We're Thinking

Currently lacking hedges, the *Pro* portfolio is more than 80% invested. By setting up this 10% hedge, we will lower our portfolio's market exposure to a level closer to 70%. This hedge will assure us a winning position whenever the market is declining, and although a 10% allocation isn't large enough to make a very sizable difference, it will still help. We may add to the hedge later or add different shorts.

The small companies in the iShares Russell 2000 Index are more richly priced than the rest of the market, and should continue to be more volatile, offering our short greater potential downside in a topsy-turvy market.

This bear call spread offers us profits if IWM declines by any amount, but our gain is maximized and capped when IWM declines 10.7% . If the ETF falls below our $100 strike, we'll have our maximum gain at expiration, but we can't earn more. On the flipside, our loss is capped at $118 against our net start price of about $112. This position expires in less than two months because we don't want to "set and forget" a hedge like this for a long period. We will be forced to reassess in March whether we want to continue a similar strategy, adjust it, or let it end.

More That Matters

- **Maximum Loss:** If we set up our spread at a $112 net cost, we risk losing up to $6 per spread ($600 each) if IWM is $118 or higher by expiration. Our loss can't exceed that.
- **Maximum Gain:** We will earn a maximum $12 per spread ($1,200) if IWM declines to $100 or below by expiration. We can't earn more than that.
- **Breakeven:** $112 on IWM; it's your net credit added to your $100 strike price.
- **Follow-Up:** We can close our spread at any time. By March 20, we will need to decide if we want to start a new one or not.

Alternative Trades: Please see this post on the IWM board.

Pro Can Help

Pro Position Updates

Published Jan 21, 2014 at 4:00PM

Dear fellow Fools,

The New Year is off to a fast start — I feel like we barely had time to review 2013 before we had to get ready for a busy expiration Friday (and NFL Conference Championship Sunday). But time marches on, and so do we, methodically reviewing our holdings, evaluating our exposure, and positioning our portfolio with respect to our North Star. We handle all the commotion by remaining focused, striving to make dispassionate analyses about business strategy and competitive landscape, and maintaining a balanced risk-and-reward profile. Here is the thinking behind our three latest position updates.

Medtronic Moves to Buy (Today)

Long gone are the days when **Medtronic** (NYSE: MDT) was a high-growth company being rewarded by the market with a heart-zapping EV-to-EBITDA multiple of 16 to 18. In fact, during my early days covering Medtronic for *Pro*, I spent some time pounding the table and insisting that the market was chronically undervaluing the company's solid business (albeit in the face of some uncertainty), though it had admittedly grown a bit fat and lazy. Medtronic's stock price has recovered nicely since then, and a few weeks ago, we decided to move shares to Hold for a chance to review the long-term impact of several factors: increasing regulatory risk, lower reimbursement rates, slowing growth, and the company's ability to succeed with a new sales model in emerging markets. Here's what I found:

- The current regulatory and reimbursement landscape is the new normal for medical technology companies. CEO Omar Ishrak's clear strength in driving execution (expense control, more focused innovation, smaller acquisitions, etc.) should help fight the margin pressure being impressed upon all medical device makers. Furthermore, Medtronic's geographic footprint, scale, and low-cost manufacturing advantages translate well into the new operating environment and will likely bring it continued (if slightly lower) economic profits for decades.
- In key product lines, Medtronic operates in an oligopoly that has historically behaved very well (few price wars). Without as much growth in these markets, price may play a bigger role, but the competing devices are distinct enough that comparison shopping is still tough. Differentiation is supported by the switching costs that come from surgeon and physician training. These factors support the notion that key legacy product lines will continue to be cash cows that fund higher growth product development.
- The next few years should be a great time for new products. Even assuming declines in a few important, mature product lines, the combination of new product launches and demographic-driven demand suggest that Medtronic can achieve modest revenue growth over the next five years.
- The company truly distances itself from the crowd with its emerging-markets game plan. Medtronic has made emerging-markets growth a strategic priority and has attacked it aggressively (with investments in R&D and physical infrastructure), on several fronts (high-end and low-end products, academic partnerships) and via several models (acquisitions, joint ventures, organic growth). This wide-ranging approach is tied together by a new sales model acknowledging the fact that success in emerging markets requires more than a narrow focus on patient outcomes. Instead, Medtronic has reframed its sales pitch to focus on customer economics and training and feedback in addition to patient outcomes. Historically, measuring customer economics was an afterthought, but saving money is a universal concern that's critical to today's market, and Medtronic's early adoption of this new paradigm and its ability to drive cost savings via scale and dedicated R&D put it ahead of rivals.

We're moving shares to Buy with a $63 fair-value estimate and a $47 Consider Adding More price. Shares are modestly undervalued and poised to exceed North Star-like returns over the coming years. New members without a position should feel comfortable matching our 3% allocation. All that said, the industry is maturing and achieving growth is difficult; Medtronic's competitive advantages will help it succeed in the new environment, but increased global competition and more cost-sensitive buyers will drive down returns over time. This is a position we'll look to convert into an income play (likely via covered calls) if the share price extends too far beyond our estimate of fair value.

Facebook Moves to Buy (Jan. 15)

Our recommendation to sell about half of our **Facebook** (NASDAQ: FB) calls was largely an allocation decision. What wasn't mentioned in the headline (but was noted in the text) was the fate of other half of the calls — specifically, letting them turn into a 3.5% to 4% position in the social networking giant. As we noted in the alert, Facebook shares are a Buy with a fair-value estimate of $58 and a Consider Adding More price of $37. Price-conscious *Pro* members will note that this means we see Facebook shares as fairly valued at the moment. Here are a few things to consider if that makes you uneasy:

- Shares are being rewarded with about the same valuation multiples as they were near the May 2012 offering price — that is, the market is pricing the company's future about as richly as it was then. Impressively, Facebook shares are up about 47% since its IPO pop, meaning that the company has not only lived up to those rich expectations, but increased its intrinsic value far beyond what those early investors expected. We think this can largely be attributed to the company's impressive success in mobile advertising. More generally, we think this highlights the company's potential to dramatically increase its intrinsic value in a short period of time, and that's why we're happy to make the fairly valued shares a Buy.
- As Jeff wrote in the alert, advertising is a very large pie, and the migration of ad dollars from traditional sources to online and mobile media is a shift we contemplate over years, not quarters. While we understand the adoption rates and uniqueness of **Google**'s (NASDAQ: GOOG) ad business were and are truly special, we're emboldened by its historical reality and believe it offers a ballpark estimate of what Facebook could achieve.

Have Patience in Selling Pacer (Jan. 10)

Pacer's pending takeover by **XPO Logistics** (NYSE: XPO) is expected to close during the second quarter. Although we think the deal has a high probability of going through without a hitch, we don't feel the need to wait around; we advise selling your shares at $8.95 or better. Shares have been stubbornly pinned below that price, but we expect the price to converge to $9 as time passes. Stay patient and wait for your price. We plan on staying patient, too.

The *Pro* Bottom Line

Early into this earnings season, market reactions to announcements have been large. Stay tuned to our Monday Memos, the discussion boards, and the What We Think Now page to get our up-to-date thoughts in real time.

Onward,

Bryan (TMF42)

Pro Guidance Changes

- **Facebook** (NASDAQ: FB) and **Medtronic** (NYSE: MDT) are both Buys. See above.
- We've raised **Wells Fargo**'s (NYSE: WFC) fair-value estimate to $53.50 and its Consider Adding More price to $41. Shares remain a Buy.
- We adjusted **The Buckle**'s (NYSE: BKE) fair-value estimate ($54.80) and Consider Adding More price ($38.35) to reflect payment of the special dividend. Shares remain a Buy.

Pro Completed Trades

- **3D Systems** (NYSE: DDD): Our January 2014 puts expired as income. We lack any exposure now.
- **American Tower** (NYSE: AMT): Our January 2014 puts expired as income. We seek new ones to write.
- **Facebook** (NASDAQ: FB): We sold to close 12 of our January 2014 $20 calls at $37.17 (bought for $6.80). We let 14 calls turn into shares at a net $26.80. At current prices, this gives the portfolio about a 4% stake in the stock.
- **ProShares UltraShort Real Estate** (NYSEMKT: SRS): Yes, we miss trades sometimes, too! In the hustle last week, we didn't click "send" to sell to close our January $25 puts. They turned into 600 additional short shares this morning, which we bought to close at $20.23. The outcome is the same. We maintain just a 0.7% short in SRS for those who can follow along per last week's Memo. Our January $25 calls expired as income.

Sell to Close About Half of Your Facebook Calls

Published Jan 15, 2014 at 5:58PM

Is this for you? This alert is directed to *Pro* members who own January 2014 calls on **Facebook** (NASDAQ: FB) — but *all* members should follow this alert's guidance to establish exposure to the stock.

How You Participate

Summary: Members who own January 2014 calls should "sell to close" about half of them, and keep the rest open to turn into roughly a 4% allocation of stock this weekend. Members who don't have any exposure should buy a 2% stake in shares, and we'll see about adding another 2% after Jan. 29 earnings.

Trades:

- **Old timers:** Sell ("sell to close") about half of your January 2014 $20 calls, leaving enough calls open to turn into a 3.8% to 4.1% position in stock.
- **Newcomers:** If just starting a position, buy 2% in shares. After Jan. 29 earnings, we'll see if you should add 2% more.
- **Allocation details:** *Pro* owns 26 calls, which left alone would turn into 2,600 shares at a recent $58, for a value of $150,800, or 7.5% of our $2 million portfolio. We're going to sell 12 or 13 contracts (depending on where shares trade at the time), leaving 14 to 13 calls open. Fourteen would turn into 1,400 shares worth $81,200, or 4.1% of the portfolio.
- **Price Guidance:** Sell to close your calls using a limit order at the current price (lately around $38). Aim to get intrinsic value. So, if FB shares are $58, your $20 calls should sell for $38. Be sure to close by Friday, unless you want more shares.
- **Prices:** Stock, $58; January $20 calls (bid/ask): $37.90/$38.10

What We're Thinking

Stock Info

- **Fair-Value Estimate:** $58
- **Consider Adding More:** $37
- **Scorecard Status:** Buy

In September 2012, we bought $20 call options on Facebook. The social-media giant's stock traded near $20 at the time. Since then, the calls have appreciated 450%, while shares have risen to nearly $58. The $17,700 we invested has grown to nearly $100,000 as expiration approaches this weekend. If we allowed all of our twenty-six $20 calls to turn into Facebook stock, the company would become a 7.5% position — by far the largest in our portfolio.

Instead, we're going to sell about half of our calls, and let the rest get exercised into shares. In the process, we'll be removing *all* of the capital we initially invested, plus some profits; meaning, existing profits from our calls will more than finance our new Facebook shares. Depending on how pricing plays out, we'll have a 3.8% to 4.1% stake in Facebook stock come Monday, with a net start price of $26.81.

Why keep this investment going longer?

As long as Facebook is able to maintain or expand site traffic and increase ad revenue, we should see steep revenue gains in the coming years. We expect Facebook to increase its earnings per share approximately 40% in 2014, and the stock trades at less than 50 times our estimated non-GAAP earnings. Shares trade at a fairly reasonable 50 times trailing free cash flow , but free cash flow will be sporadic the coming years. Overall, the company isn't cheap.

However, most of Facebook's value multiples *are* lower than **Google**'s (NASDAQ: GOOG) multiples were in 2005 and 2006, when the search giant was similarly sized (and fetched 125 times free cash flow). And just like Google's online ad revenue in 2005, mobile and social ad revenue is a tiny slice of the world's advertising pie — even though usage of social sites, led by Facebook, continues to increase. Like Google, Facebook could realistically see ad revenue expand from less than $7 billion during the last 12 months, to several times that figure in the years ahead. Google's ad revenue is likely to hit $50 billion in 2013, even though it has less traffic (and *less engaged* traffic) than Facebook.

But in most ways Facebook is no Google yet, and risks do abound. Will site traffic increase? Can management continue to navigate the fast-changing mobile landscape? Will ads on the site continue to (reportedly) please customers? Will teens who leave the site return? And on and on. Facebook remains one of *Pro*'s riskiest positions, but at the same time, it is *the most trafficked website in the world* (though it still lacks 6 billion of the world's people — that's opportunity). If Facebook maintains its lofty mantel, increases its nascent ad revenue, and drives free cash flow higher, long-term investors should be amply rewarded.

Alternative Trades

- **Different allocation?** Unless you followed our guidance precisely in September 2012, check to see how many calls you own, and let as many get exercised as you're comfortable owning shares in Facebook. For some of you, letting *all* of your calls get exercised may only lead to a few-percent allocation to the stock, so you might want to do that. (In that case, do nothing, and your calls will turn to stock by Monday.) Other members may already own shares in a greater than 4% allocation, so they may want sell to close *all* calls. We're recommending a stock allocation of 2% (for newcomers) to about 4%.
- **Own 2015 calls?** Let those alone for now.
- **Want to roll your calls?** If you want to just keep owning calls, you can roll 2014 options to January 2016 $25 or $30 calls. Sell to close your existing ones, and buy to open new ones. Just realize that selling to close is a taxable event (while accepting shares through exercise is not).
- **Want to target a lower new buy price?** Newcomers can consider "selling to open" most any puts, one put for every 100 shares you would buy. Just realize that earnings are around the corner, on Jan. 29, so expect volatility.

Sell to Close Your Puts on ProShares UltraShort Real Estate

Published Jan 14, 2014 at 11:45AM

Is this for you? Only investors who own January 2014 $25 (or other) puts on **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF need partake in this alert.

How You Participate

- **Trade:** Sell ("sell to close") all the January 2014 $25 puts on SRS you own.
- **Price guidance:** Use a limit order to obtain as close to intrinsic value as possible — lately, that's about $4.20. But close by Friday's end.
- **Prices (1/14/13):** ETF, $20.84; options, bid/ask: $4.10/$4.30.

What We're Thinking

In *Pro's* original recommendation to set up a synthetic short on SRS, we targeted a debit price of only about $1. We ended up having to pay $2.51 to set this up, so today we walk away with a 67% profit when we sell around $4.20. Why not do it again? Because long-term options no longer exist on SRS, and short-term ones aren't worth trying. So we plan to let our short January 2014 $25 calls expire this weekend, and we'll sell to close our $25 puts before the market closes Friday.

Alternative Trades

- SRS no longer has long-term options, so there are no option alternatives to speak of. We still have a 0.7% direct short in SRS that members can match if their broker has shares available for shorting for less than 7% in annual fees. (Most decidedly do not.) It is not a vital or core position for us, but you can see this week's Monday Memo for other alternatives to matching our remaining 0.7% short in SRS if you wish.
- If you followed the original alternative to buy January 2014 $35 puts on SRS, you should sell to close those now, too, booking your gain.

Pro Can Help

Update: Pro’s Option Expirations and Shorts

Published Jan 13, 2014 at 1:43PM

Dear *Pro* member:

Today's Memo will provide an overview of all of our January options and current shorts — but before we dive in, this is an opportune time to touch on the importance of portfolio management. People you meet at a party, or relatives at a holiday dinner, typically want to talk about *a* stock or two, but rarely want to talk about portfolio management. That's not right. You can own any stock you want if you have a portfolio that's built to grow over the years. But you probably shouldn't own *any* stocks if you don't have something resembling a portfolio.

Keep that in mind as you consider our individual positions below. *Pro* is a portfolio service focused on diverse core investments. By having a core portfolio much like *Pro*'s, we believe you can add — or subtract — any other position you like, in small amounts, and still do well. So, you could ignore our shorts and options if you like. But for those enjoying these tools along with us, it's time to update you regarding our pending January expirations, and get members who joined in November up to speed on shorts.

January Option Expirations

Of our four expiring options in *Pro*, let's deal with the easiest ones first.

- **3D Systems** (NYSE: DDD): Our puts are expiring as income; we'll watch the company for potential opportunities.
- **American Tower** (NYSE: AMT): Our puts are set to expire as full income again. We're looking for new puts to write to potentially add more shares to our existing 2.5% stake in the stock (which remains a Buy First).
- **Facebook** (NASDAQ: FB): Our $20 calls have gained about 450% since our purchase in September 2012, turning less than $18,000 into nearly $100,000, about 5% of the portfolio. Our 26 contracts represent 2,600 shares of stock that would be worth about 7.5% of our assets if we let them all be exercised. That would be a bit much at today's valuation. We're going to issue a trade alert this week to advise closing some of our calls, booking their profit, and leaving the rest of our calls alone to turn into shares of stock this weekend. (If you bought 1.2% in stock instead of calls initially, your position should be small enough to let alone.) The trade alert will guide new members into the position, too.
- **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF: Our *synthetic option* short is expiring (our direct short of SRS, of course, is not). Our short $25 calls are expiring as income (we won't touch them), and this week we'll issue a trade alert to "sell to close" our $25 puts. This ETF no longer has long-term options, so we cannot start a new option position.

That's it for *Pro*'s options this week. We have two income positions expiring with no action needed, and we have puts on SRS to sell to close, and about half our calls on Facebook to sell to close as well. We'll let our remaining Facebook calls turn into shares. Watch your inbox for specifics in these alerts!

Pro Short Positions

Our current short positions are small, and in two of three cases, they're not really shorts at all. That's because those two are shorts of *inverse* (or already short) leveraged ETFs. Since we're shorting a short, our position works as a long. Our third short is of a trust that owns euro. New members can short all three alongside us today if they're ready and if their broker has shares available (or, in two cases, if you want to use options).

1) Guggenheim CurrencyShares Euro Trust (NYSEMKT: FXE) (formerly ProShares): We have a 3% short position that will grow in value if the dollar gains against the European currency. Fed tapering is slowly sending U.S. interest rates higher, which may help the dollar strengthen. And Europe's currency block woes remain unresolved, with Greece, Spain, and other members struggling mightily.

- **Newcomers to shorting FXE:** Members not yet short can directly sell short ("sell short" or "sell to open") FXE in an amount up to 3% of your portfolio's value. Shorting is our preferred trade here because it allows you to more easily get into or out of the position. But if your broker does not have shares available to short, you can set up a 2015 or 2016 synthetic short (assuming 100 shares at $135, for a total of $13,500, is a reasonable allocation for your portfolio). Sell to open January 2015 or 2016 $135 calls, and buy to open an equal number of $135 puts. The expiration year you use is your choice, since we don't know how long we'll be in the short. Neither year has a distinct advantage.

- **Past alternative trades on FXE:** If you set up a 2014 synthetic short, you can roll it to 2015 or 2016 (or close it and start a new one). If you set up a 2014 bearish spread (at various strikes), it is likely expiring without value. A new one is not recommended.

2) Direxion Daily Financial Bear 3X Shares (NYSEMKT: FAZ): We have a 0.8% short on this inverse ETF that is itself short the financial giants of America. We believe financial stocks remain inexpensive, so — along with owning many such stocks — we're investing against this leveraged *bearish* ETF. Twice we've increased our short to 1.5% and have seen it pleasantly shrink to its current level of 0.8%. We may add to it again later.

- **Newcomers to shorting FAZ:** If your broker has shares available to short, newcomers can short up to 1% today to roughly match us.If you can't short directly, then set up a synthetic short using January 2016 options. Sell to open January 2016 $20 calls, and buy to open an equal number of January 2016 $20 puts. You'll be charged a premium compared to shorting at the current share price, but that's in lieu of annual shorting fees.Each pair of contracts represents a $2,000 short. Keep in mind that you could *add* another 1% to your **Wells Fargo** (NYSE: WFC) or **AIG** (NYSE: AIG) stake instead, as an alternative trade.

3) ProShares Ultrashort Real Estate ETF (NYSEMKT: SRS): Alongside our SRS options that are being closed and expiring, we have a 0.7% direct short on SRS that we're letting ride awhile longer. We still believe in the thesis that U.S. real estate is recovering, but this inverse ETF has become very small, with only $50 million in assets. Options are no longer viable to use on it, and shorting the ETF is logistically difficult. We'll keep our position (and may add to it if we can), but it may not be sensible for many newcomers (see below).

- **Newcomers to shorting SRS:** Most brokers don't have shares available for shorting, and those that do charge a high fee. Our own Interactive Brokers charges 6% of the short's value annually to short SRS. If your broker has shares available and charges less than 7%, you can sell short up to 1% in shares to roughly match us. Otherwise, pass on shorting this. Either way, at this point the alternative trade of *investing* up to 1.5% in the **iShares Dow Jones Real Estate** (NYSEMKT: IYR) ETF looks at least as attractive, if not more so. You can buy those shares instead, or add another 1.5% to your stake in **American Tower** (NYSE: AMT) if you prefer.

In Summary

Pro doesn't have much short exposure to speak of today, but that's been a good thing, and we're continuing to work on building our short positions in struggling companies. We believe in our small shorts of FXE, FAZ, and SRS as much as we ever did, so you can start positions (or alternative positions) in all three if you lack them.

Newer members who have bought all of our Buy First and Buy stocks are about 68% invested with us, and will be around 70% long after shorting our two inverse ETFs (excluding the 3% FXE short). That's a comfortable exposure number from which to continue to build, while already being positioned to profit nicely. It all comes back to your portfolio, and being positioned well for the coming year and beyond.

So, to repeat: We'll have a Facebook trade this week, and a closing trade on our SRS $25 puts, too.

Ask any questions on the Catch-Up Trades board. And Fool on!

— Jeff (TMFFischer)

Pro Completed Trades

- **Parexel** (NASDAQ: PRXL): *Pro* bought 1,300 shares (3%) at $46.15. Remember that our guidance was to pay no more than $44.25 the week of Dec. 23, and after that, to pay less than our fair-value estimate, which is $51.

Pro Guidance Changes

- **Pacer International** (NASDAQ: PACR): The stock moves to Sell (from Hold) on an acquisition offer that equates to $9 per share. We'll be selling all of our shares (2.2% of the portfolio) at about $8.95 or higher for a nearly 65% gain in about two years.

Most Active Conversations

Sell Pacer International

Published Jan 10, 2014 at 11:00AM

Is this for you? This alert is for *Pro* members who own shares of **Pacer International** (NASDAQ: PACR).

How You Participate

- **Action**: Sell Pacer International
- **Allocation**: We recommend selling all shares. For *Pro*, that is 4,900 shares and 2.2% of our portfolio.
- **Scorecard Status**: Sell
- **Recent Price**: $8.92
- **Price Guidance**: Sell your shares for more than $8.95. Be patient — this deal is expected to close in the second quarter, so you have time.
- **Fair Value Estimate**: $7.75

What We're Thinking

Earlier this week, **XPO Logistics** (NYSE: XPO) announced an agreement to acquire Pacer for $335 million. The deal offers Pacer owners $9 per share, consisting of $6 in cash and $3 worth of XPO stock. Between now and the end of June, when this deal is expected to close, a few things could happen:

1. The deal could go through as planned. We'd get $6 per share in cash and hold a tiny position in the combined company represented by XPO stock sometime in June.
2. The deal could fall apart for any variety of reasons (usually this happens because of meaningful changes in business fundamentals or financing troubles). Our Pacer shares would fall in price, probably considerably.
3. The announcement could attract other suitors with (likely higher) counteroffers. Alternatively, Pacer shareholders could reject the offer and demand a higher price, which could extend this process but result in additional upside.

We believe the most likely scenario is the first. Both Pacer and XPO seem more valuable combined than apart, which means the $9 price tag XPO is willing to pay is likely higher than Pacer would receive from a more traditional intermodal company looking to get bigger. The business combination makes strategic sense, and the fact that Pacer management has agreed to stay on is a strong sign that it liked the deal too. However, we don't think the newly combined company, a small-cap provider of third-party logistics with a business strategy focused on serial acquisitions, has a place in the *Pro* portfolio. We think we can redeploy the cash proceeds better than XPO and its acquisition-centric business.

And we'd prefer to sell early, because we believe this deal is a great opportunity to sell a company we've felt handcuffed by. Pacer has been on Hold for some time because any actionable guidance from us was likely to seriously affect its market price as *Pro* members attempted to follow along. This week's news will likely usher in a trainload of merger arbitrage investors looking for Pacer shares to buy for their books, providing us with a rare opportunity in the form of plenty of demand to sop up the shares *Pro* members are selling.

Perhaps most importantly, we believe this is a fair deal for Pacer shareholders. Given our $7.75 estimate of fair value — which we most recently revised *lower*, down from $9 — the offer price represents a 22% premium to the average closing price over the last three months. We are happy to turn what seemed like a tenuous paper gain into a more certain realized gain. After just more than two years, *Pro*'s rocky ride on Pacer's tracks should result in a gain approaching 65%.

2013 in Review, and Lessons Learned

Published Jan 6, 2014 at 4:00PM

Dear *Pro* Member:

Get Ready for Wednesday's Live Chat!

Got questions? We want to hear them! At 2 p.m. this Wednesday, Jan. 8, the entire *Pro* crew will be answering your questions during a live text chat. We're here for everything you need, from how best to use this service to what to do if you can't follow our options recommendations exactly. Click here to set a reminder!

Last year was one of the best for the stock market in the last four decades, so we're grateful that *Pro* performed even better, gaining 35.1% compared to the S&P 500's total return of 32.4%. We performed especially well given our hedges and generally more defensive stance.

It was a year that made our North Star's 8.7% return look tame, so it's fortunate that we didn't choose to safely lock in many gains early in 2013. When the market suffers negative periods, the North Star will still be positive, so we can't rest on our laurels any particular year.

Winners and Laggards

We saw strength throughout the *Pro* portfolio, but we enjoyed especially large one-year gains of greater than 60% in **MasterCard** (NYSE: MA), **Broadridge Financial Services** (NYSE: BR), **OpenText** (NASDAQ: OTEX), **Gentex** (NASDAQ: GNTX), **Papa John's** (NASDAQ: PZZA), and our January 2013 short of **Direxion Daily 3x Financial Bear** (NYSE: FAZ). Even better, **Facebook** (NASDAQ: FB) shares nearly doubled, sending our calls up more than 400%. For newer members, new opportunities in these last two names should come along.

The **WisdomTree Emerging Markets SmallCap Dividend** (NYSE: DGS) fund continued to be a notable laggard in the portfolio, as was **StoneMor Partners** (NYSE: STON), which spent much of the year as a Sell while we hoped for a $27 sell price. As for the well-run DGS, we believe emerging markets will have their day in the sun, so we're writing puts to potentially add to our shares.

What We Did

Some key decisions (good and not so good) from last year included:

- **January:** Short FAZ, close your **Sony** (NYSE: SNE) short, and write covered puts to close your **SPDR S&P 500** (NYSEMKT: SPY) short
- **March:** Buy more **Apple** (NASDAQ: AAPL) at $431, and buy more **GrafTech** (NYSE: GTI) at $7
- **April:** Buy **O'Reilly Automotive** (NASDAQ: ORLY), and write covered calls on **CME Group** (NASDAQ: CME)
- **May:** Buy **American Tower** (NYSE: AMT), and short more FAZ
- **July:** Buy **TD Ameritrade** (NYSE: AMTD)
- **August:** Buy more **AIG** (NYSE: AIG)
- **October:** Close your covered calls on **OpenText** (NASDAQ: OTEX)
- **November:** Buy **Valmont Industries** (NYSE: VMI), and close the new short calls on SPY
- **December:** Buy **Parexel** (NASDAQ: PRXL)
- And, among other recommendations, we issued 17 option-writing and option-rolling trades targeting income throughout the year.

Many of our best decisions were ones you never saw: sells we didn't make, shorts we passed on, covered calls we didn't write. But we still made plenty of mistakes, and we can take some great lessons from 2013.

Use Covered Calls Sparingly

Specifically, to sell a stock or for income-only positions

We all know this: Only write covered calls on stocks you're ready to sell, or on positions you set up *specifically* for income ("buy/write" trades). I don't regret selling **CME Group** (NASDAQ: CME) or **Rockwood Holdings** (NYSE: ROC) through covered calls. We were ready, and selling led to buys we like better today in **TD Ameritrade** (NYSE: AMTD) and **Valmont Industries** (NYSE: VMI).

But writing covered calls on **3D Systems** (NYSE: DDD) all but forced us to sell our shares at far less than the current share price. That stock looks expensive, so we might have sold long before today anyway, but we didn't even have the choice. We know better than to write covered calls on growth stories. This was a mistake inspired in part by 3D's past volatility and juicy call premiums. Unlike the previous few times that it surged, this time 3D Systems stock did *not* give back its ground — instead, it doubled again and then some, without us. Don't expect to see *Pro* write covered calls on sharply growing companies such as 3D Systems or, for that matter, on outstanding businesses such as MasterCard in future.

What to expect from Pro*:* Only "buy/write" income trades, diagonal calls, or covered calls to strategically sell a stake in a lower-growth business — not covered calls on our most promising positions.

Concerned? Buy Puts and Keep Your Upside

Buying puts can also minimize your shorting risk

Writing covered calls is not very defensive. It may pay you a 3% to 6% premium, but that income will pale if a stock falls sharply. If you're concerned about downside, you might *buy* puts instead, and keep your upside on what you own. This may also apply to index hedges. In October, we set up a synthetic short on SPY that ultimately cost us about $10,000 in losses after our written calls ran against us. Buying the puts alone would have cost us less than $3,000 — a much smaller loss. We didn't need to write calls to pay for our puts, but we did, and we paid a bigger price in the end. Sometimes, simply buying puts is the best route for protection with limited capital at risk.

What to expect from Pro*:* More put buying to hedge and protect, with a focus on risking little capital when the puts expire unused, and no additional pain from the position if prices keep rising.

Writing Puts Can Be a Poor Substitute for Stock Ownership

If the business is a great one, you'll likely want to own shares as well

It's tempting to write puts to target a lower buy price on a stock, but if you're seeking to buy an outstanding business, we usually suggest that you buy some shares initially, too. Writing puts on any of our big winners last year paid relatively little compared to owning the stock. This may be a "bull market problem," but it's still something to keep in mind. It follows that using options to make *any* transaction can sometimes backfire. We started writing covered puts to close our SPY short at $146 in January of last year, and didn't get to cover our 1,000 shares through covered puts until the price was $164 in June. That's 12% higher.

What to expect from Pro*:* We've been good about buying stocks we want to own rather than just writing puts. Expect that guidance to continue. On other trades, we'll continue to weigh carefully whether getting options involved makes sense, or if we just want to execute the trades directly.

Short-Term Returns Vs. Avoiding 'Style Drift'

What's more important?

This is more of a question than a lesson. For several months early in 2013, I contemplated setting up a small "Elon Musk basket" in the *Pro* portfolio, buying shares of **Tesla Motors** (NASDAQ: TSLA) and **SolarCity** (NASDAQ: SCTY). Tesla shares were between $34 and $40, and SolarCity traded in the teens. Both went on to become among the best performers on Wall Street last year. Even a small 1% stake would have grown to at least 3% in each. Today, for better or worse, we would have sizable stakes in two companies that don't fit into our fundamentals-based, North Star-seeking approach.

So the question is, will we be better off by sticking to our knitting over the long haul, or should we "drift" into more speculative positions from time to time? We have faced this question before. In my heart, I believe we will be better served by following our disciplined approach. We may forego extra short-term results, but over the long haul, our steady discipline should reward us as much, or more, than would the insertion of more speculation into our process.

There *is* a place in *Pro* for reasoned speculation — that's exactly what our **Facebook** (NASDAQ: FB) calls were — but there needs to be an underlying valuation we can estimate. Buying stock or call options on Tesla or SolarCity this early would have been speculating. That's great if it's what your approach calls for, but our goal of absolute returns demands our own kind of steady discipline. The good news is that most companies *can* be valued — even young, exciting companies — so we're sure to have more wins like Facebook. And if cash flow at Tesla or SolarCity starts to lend itself to valuation estimates, it won't be too late to profit on either.

What to expect from Pro*:* More focus on earning oversized gains like we enjoyed on Facebook (including using call options on new positions) when fundamentals-based opportunities present themselves — but little outright speculation. We're seeking put-buying opportunities, too, on stocks we believe may fall.

You Can Excel Even With Reduced Risk

... and beat most fund managers to boot

Finally, there's a lesson in the fact that we didn't swing for the fences — we didn't use margin, or make gross speculations — but we still did better than a record-strong stock market. In fact, we defensively held cash of around 20%, and our net exposure to the market averaged 69.6%. Yet we earned 108% of the S&P 500's return. That's an extremely pleasing risk-to-reward result . And it handily tops the vast majority of professional money managers and hedge funds, once again showing us that Fools like us can manage our own money.

2013	*Pro* Net (or True) Long Exposure
January	70%
February	66%
March	70%
April	71%
May	59%
June	66%
July	70%
August	72%
September	69%
October	70%
November	74%
December	78%
Average	69.6%

Throughout 2013, we stuck close to our 70% desired exposure level, adjusting as hedges and new buys or sells demanded. This, I believed, was the right exposure for us to perform well in a strong market given what we owned, and should have helped buffer us in a downturn, too. In 2014, we may lower our net exposure as stock valuations go up.

What to expect from Pro*:* Continued focus on our exposure, both as a rule in the portfolio and in our content for members.

It's a Wrap

2013 was a great year for investors in the U.S. market. But not all did well, of course, and most investors in mutual funds earned less than the S&P 500. A big congratulations to you for being a Fool, and for winning by managing your own money! We're looking forward to investing with you, and learning more for you, in 2014.

Comments? Please visit the Memo Musings discussion board.

Fool on!

— Jeff (TMFFischer)

Pro Trades Completed

- None last week. Our new 3% buy in **Parexel** (Nasdaq: PRXL) is still pending.

Pro Catch-Up Trades

- **AmTrust Financial Services** (Nasdaq: AFSI): Shares remain a "buy," up to a 5.8% allocation. If you're just buying now, start with a 2% to 3% allocation and add to it over time. Or, sell to open put options to start. The February $32.50 or $30 puts pay well — just be ready for more volatility.
- **Tupperware** (NYSE: TUP): Sell to open April $90 puts for $3 or more, for up to 3% in shares.

Pro Coverage & Community

- **Pacer** (Nasdaq: PACR) is being acquired for the equivalent of $9 per share, a 65% gain for Pro.
- **Oracle** (NYSE: ORCL) reported promising earnings. Our fair value will likely increase soon.
- Member nevercontent shares his experimental put report.
- Fools share best practices for being efficient (and enjoying the day)!

Our Favorite Memos From 2013

Published Dec 30, 2013 at 4:00PM

Dear fellow Fool,

January Live Chat Coming Up!

At 2 p.m. on Wednesday, Jan. 8, the entire *Pro* crew will be answering your questions during a live text chat. We're here for everything you need, from how best to use this service to what to do if you can't follow our options recommendations exactly. It wouldn't be the same without you; set a reminder by clicking here, and we'll see you soon!

It was a good year for *Pro*'s Monday Memos. We try to provide value with these communications each week, and you can of course browse our past Memos at any time to find tidbits. It may be thanks to the recency effect, but some of my favorite Memos from the past 51 weeks are new, including our recent interviews with **AmTrust Financial** (NASDAQ: AFSI) and **Valmont Industries** (NYSE: VMI). I also think our *Pro* one-pager Memo on stocks we like is a good first step for several *Pro* one-pagers that will follow. And we enjoyed RockyTopBob's Memo welcoming new members so much that we ran it twice in 2013!

Here are a few of the many other Memos I enjoyed this year:

- Bryan Hinmon's "A Fresh Start... Every Day" is a great reminder to think fresh at all times as you manage your money. And Bryan's column on "Why We Manage Volatility" covers a topic that should be relevant to all investors, because while volatility can be an opportunity, it can also be a giant step backward if you don't prepare for it or you react to it poorly. Finally, "How to Use Your Jackhammer" features Bryan talking about valuation in his own Foolish and helpful way.
- Nick Crow has since departed the *Pro* team, but his "No Crying Over Income" in March offered a prescient look at income strategies during a year when, unknown to all of us, the market was going to soar. I also found Nick's "Six Ways to Fail at Being a *Pro* Fool" an excellent way to present key lessons to members.
- Billy Kipersztok, our newest addition to the team, was thinking ahead when he wrote "The Furor, the Frenzy, the Earnings." Billy shared what he was watching for from a few companies about to report earnings — showing his desire to help members invest better and be prepared. Billy's debut Memo, "3 Things I've Learned from *Motley Fool Pro*," is another great example of what we have in Billy: a member-centric investor here to help you succeed. (You can see why Bryan and Nick brought Billy to the *Pro* team.)

And now for some favorites from the rest of the team!

From Bryan Hinmon:

- 5 Things Every Investor Should Know: This January 2013 Memo from Jeff gives a simple, useful look at the five things it's most important to know about *yourself* when investing.
- Why We Manage Volatility: Yes, Jeff mentioned this one above, but I'll pat myself on the back a bit by repeating it. As noted in this Memo, *Pro*'s efforts to lessen portfolio volatility — through shorts, hedges, and a constant focus on our North Star — are a down payment on better decision-making, a goal we are always pursuing for you.
- Are You Optimizing Your Life? Well, *are* you?! In all seriousness, this Memo from Jeff is a great (and characteristic) look at what it takes to excel, not just in investing but in all areas of life. One point in particular is especially relevant in this season of resolutions: "We can't have everything, and we'll never be perfect. We're aiming to do the best that's sustainably possible in every area of life."

From Billy Kipersztok:

- For an introduction to the history of *Pro*, check out the best of *Pro*'s early years; Nick highlights some of the team's best Memos all the way back to 2008.
- Knowing when to sell is one of the most difficult challenges many investors face. Jeff's Memo on why most stocks we sell will do well dovetails nicely with Nick's (final) Memo on when not to sell.
- Bryan's deep dive on Buckle and his discussion of industry structure showcase how we think about analyzing our companies — focusing on key, value-driving business metrics overlaid with an understanding of competitive positioning.

Looking ahead, we'll work to continue to deliver extra value to your inbox every Monday in 2014. With new investment guides on the way, one-pager guides, more Catch-Up Trades, updated guidance, and much more, the Monday Memo remains a touchstone of the service. We welcome your thoughts on what you love and what could be improved — drop us a line on the Memo Musings discussion board. Happy New Year, Fools!

Best,

— Jeff (TMFFischer)

- Member KBecks offers holiday wishes.

Pro Looks Ahead to 2014

Published Dec 23, 2013 at 4:00PM

Dear fellow Fools:

The *Pro* team and I hope you're ready for a wonderful holiday week. We're wrapping up the year with the portfolio at a record high, but the better news is that we own a few dozen outstanding businesses at good prices -- and we believe many *more* new highs are in store the coming years. Today, let's take a fun look ahead.

The Market in 2014

As the Federal Reserve starts to decrease its monthly asset purchases in January, we should expect interest rates to eventually creep higher, benefiting *Pro* holdings including **TD Ameritrade** (NYSE: AMTD) and ticking bond prices lower. Drifting bond prices could drive more investors to stocks, especially if the economy continues to strengthen. Businesses are more likely to borrow and spend funds as the economy improves, investing for future growth. Many companies had been waiting (for some weird reason) to see what the Fed did before addressing new opportunities. We're not short-term prognosticators, but factors like these could help the stock market the coming few years.

A more important factor is valuation. At 1,818 on Friday, the S&P 500 traded at 16.6 times expected normalized earnings for 2013, and 15.3 times expected 2014 earnings. This is smack in the middle of historical averages, suggesting the average stock is neither cheap nor dear. The bigger risk here seems to be the 2014 earnings estimate itself, which calls for 9.2% year-over-year growth. That follows just 4.9% expected growth in 2013. Can earnings really accelerate that much next year? The answer to that question is surely one key to the market's performance in 2014.

Pro in 2014

We will continue to recommend owning strong companies that we believe *will* grow value in a rewarding fashion for competitive, qualitative, and fundamental reasons. If the broader stock market is a headwind next year, giving us choppy prices, we'll have a chance to ramp up our options strategies for extra returns. Generally speaking, aside from pursuing North Star-type returns, we have several service objectives for the new year, including:

- Continuing our goal of offering you at least 12 income trades per year
- As opportunities arise, building out short positions in companies we doubt
- Hedging for market volatility of 7% or greater
- Strengthening our personal relationships with our companies, and reporting to you all we learn
- Hosting regular live chats, so you have more chances to ask your questions in "real time." Our first live chat of the new year is at 2 p.m. ET Jan. 8 -- save the date!
- Sharing more of our research on the competitors of our companies, and companies we choose *not* to buy
- Continuing to concentrate the portfolio in companies we believe will be long-term "compounding machines" of your capital
- Making our trade alerts more useful and pleasurable to read, and (with options) more actionable over longer periods of time
- Offering more "catch-up" trades
- Offering more unique, *Pro*-type positions. You'll know them when you see them!

Monday Memo Topics

Coming soon, our weekly Memos will discuss:

- Lessons learned, good and bad, in 2013
- "What We Believe" -- our yearly column, as we look forward
- Hedging
- Shorting
- Portfolio construction: market exposure for upside with less risk

Giving Right Now

It's fun to look forward, but right now it's time to relax, enjoy the holiday with family and friends, and appreciate all that you have -- and to consider giving something back if you're able. The Fool's charity of choice this year is Pencils of Promise, an organization that builds schools in areas where children historically lack education. Pencils of Promise gets the local community involved -- and invested in -- the process, and then monitors the school's progress, helping ensure success. Read about Pencils of Promise to see why it has the Fool's support, and we hope yours, too.

Thank You!

Members old and new alike, we hope you enjoyed this year as much as we did! The big reason we enjoyed it? You. The *Pro* community is amazing. Thank you for being a part of our lives, and for being a *Pro* member. The world is vast, but we all share a home at the Fool.

Have a wonderful holiday! And to share your good tidings, visit the Social Banter board. Fool on!

-- Jeff (TMFFischer)

Pro Completed Trades

- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): We profitably closed and rolled our four Dec. 2013 $46 puts to March 2014 $46 puts, for a net credit of $1.05 each. Shares remain a Buy with a 1.7% allocation, and we're writing puts for about another 1% more.

Community & Coverage

- *Pro* spoke with **AmTrust Financial Services** (NASDAQ: AFSI) for a second time last week, and Jeff's confidence in the long-term business remains unshaken, even as *Pro* works to learn more. To see all of the recent posts on AmTrust that members valued most, click here.
- **Oracle** (NYSE: ORCL) reported strong quarterly results, looks well-positioned, and remains a Buy First. Get our take.
- With **MasterCard** (NYSE: MA) as the subject matter, Jeff explains why our fair-value estimates can be so conservative -- hint: it's all about the value multiple the market is willing to pay for a stock.
- **American Tower** (NYSE: AMT) gets some love from *Barron's*.
- Member nevercontent shares his experimental put-writing idea list.

Buy Parexel International

Published Dec 23, 2013 at 1:30PM

Is this for you? *Pro* is allocating 3% to **Parexel International** (NASDAQ: PRXL), so if you're following our portfolio closely, you should do the same.

How You Participate

- **Action**: Buy Parexel International
- **Allocation**: 3%
- **Scorecard Status**: Buy First
- **Recent Price**: $43.50
- **Price Guidance:** This stock trades with moderate volume, so **use a limit order and this week pay no more than $44.25**. If you're not starting a position now, then over time, aim to do so below the fair-value estimate.
- **Fair-Value Estimate**: $51
- **Consider Adding More**: $36
- **Options**: We may use them later, but they aren't necessary.

The Business

Parexel is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 90% of the top 200 selling drugs.

What We're Thinking

Parexel has many of the markings of a *Pro* core stock:

- *A strengthening competitive advantage*. Parexel's size and global reach give it a cost advantage over the smaller competitors in its fragmented industry. Its intangible assets, including its good reputation and its relationships with clients and regulators (built over time and from thousands of trials with successful outcomes), provide an advantage in winning new business.
- *Contracted and reliable revenue streams from trusted partners*. An industry shift from transactional, project-based relationships to integrated partnerships improves revenue reliability.
- *A founder-CEO*. He's run the business for more than 30 years and owns more than 1% of the shares outstanding.
- *Improving financials*. We think natural operating leverage as Parexel's technology segment grows larger and more efficient asset utilization as its partnerships mature will boost margins and eventually yield returns on capital around 20%.

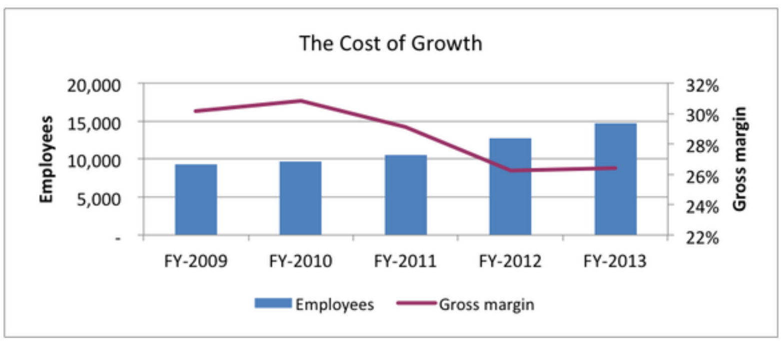
From today's price, we believe the company's strong business performance will drive its stock to out-earn our North Star over the next decade. If our forecasts of the company's core business and industry tailwinds prove too optimistic, we could still see a nice return from the company's rapidly growing technology division, Perceptive Informatics -- whether that's in the form of a possible spinoff, or just the market's acknowledgement of Perceptive's hidden value.

What We're Watching

Hoops. Lots and lots of hoops. Moving a new drug from discovery through clinical trials to commercialization involves jumping through a lot of hoops. For pharmaceutical and biotechnology companies, the stakes are huge -- on the order of 10 years and $1 billion per new drug. And because the patent clock starts ticking in the early stages, every extra second a drug spends in development is an extra second it can't turn sales into fat, patent-protected profits. This is why biopharmas are increasingly turning to CROs, which specialize in navigating the clinical trials process more quickly and efficiently than the drug companies are able to do on their own.

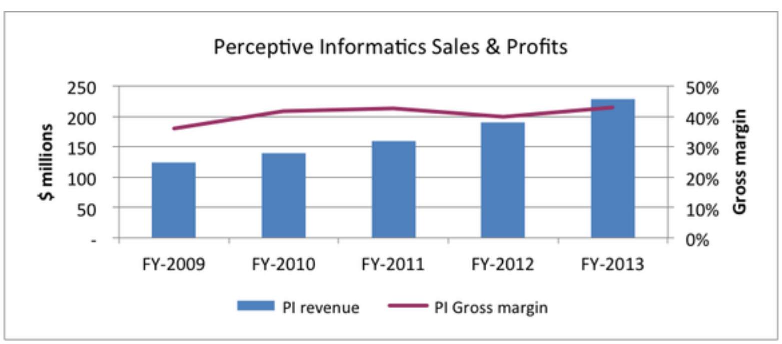
From 2004 to 2013, the number of development dollars outsourced to CROs (outsourcing penetration) has increased by almost 50%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work -- and those massive staffing needs -- can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex, making large, proven CROs with expertise and global capabilities more of a value-adding *partner* than a transactional customer.

Parexel fits that mold, and it has been a leader in signing multi-year partnerships with major biopharma companies including **Eli Lilly** (NYSE: LLY), **Merck** (NYSE: MRK), and **Pfizer** (NYSE: PFE). These partnerships represent more predictable business, a chance to cross-sell services, and tighter integration with ongoing processes that we believe will strengthen the partnership bond over time. To adjust to these new contracts and the massive business that comes with them, Parexel has had to scramble to hire thousands of researchers, use contract employees as a stopgap, and build out relationship monitoring and management teams. All of this has cost money and hurt margins.



Source: Company filings

However, we believe the future financial picture will look vastly different than it has over the past few years: Contracts should mature and bring increasing workloads; hiring needs should slow and new hires become more productive; people and resources should be better utilized across projects; and workflow visibility (knowledge of upcoming tasks over the long term) will aid in efficient planning. Additionally, Parexel's technology segment, Perceptive Informatics, is a leader in several e-clinical applications that turn archaic trial-related processes digital, and should become increasingly profitable as it grows. Its underlying market is expected to increase by at least 10% per year , and if the segment's MyTrials solution becomes the industry standard platform for accessing e-clinical apps, growth should handily eclipse that.



Source: Company filings

The fact that other large CROs -- Parexel's mortal enemies! -- are customers who rely heavily on Perceptive products leads us to believe that the company is well-positioned to compete in the market. As this segment grows, we expect its margin profile to resemble that of other niche software providers with a service bent. Aside from the advantage Parexel enjoys from having technology closer to -- and better integrated with -- its clinical research services division, the potential size and profitability of this under-the-radar segment gives us confidence that gross margins should eventually and sustainably eclipse former highs.

To track the company's progress against our thesis, we'll be watching these things:

- *Health of existing partnerships, renewals, and success in winning new ones*. Success of existing partnerships should bring higher outsourcing penetration and encourage new biopharmas to make the business-model shift. New partnership agreements should lower customer concentration and modestly eliminate risk. Furthermore, a partnership mentality levels the bargaining power and improves the CRO's long-term profitability.
- *Business trends*. We think backlog and gross margin trends are the ones to watch. Backlog will be lumpy, but we expect it to increase over time. The conversion of backlog into revenue is captured in the "book to bill" ratio, which also exhibits some noise -- and has provided us with this buying opportunity. We expect gross margin improvement in the company's core clinical research segment and in its technology segment.

How It Fits Into *Pro*

Pro's only direct exposure to health care is longtime holding **Medtronic** (NYSE: MDT), which is currently on Hold and considered fairly valued. With increasing regulation and changing industry landscapes, we've been focused on researching companies likely to benefit from the Affordable Care Act and adoption of health care abroad. With Parexel's core stock characteristics and its focus on saving industry participants time, money, and headaches in wading through the complexities of clinical trials, we think we've found just that. In addition, we feel we have an adequate margin of safety at today's prices and that Perceptive Informatics offers another possibility to unlock value in the future. We prefer to start most new holding allocations around 3%, which is what we are doing here.

Alternative Trades

If you prefer a lower potential buy price, you can write March 2014 $40 puts for an attractive annualized return.

Roll Your Puts on DGS

Published Dec 19, 2013 at 2:00PM

Is this for you? *Pro* members who wrote December 2013 $46 puts on the **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) ETF with us should consider this rolling trade for more credits. Those lacking 3% exposure to DGS should also consider writing the new March 2014 $46 puts with us.

How You Participate

- **Trade:** Use a rolling order to "buy to close" your December 2013 $46 puts, and "sell to open" an equal number of March 2014 $46 puts.

- **Allocation:** We're looking to increase our 1.8% existing stock exposure to DGS to about 3% total, so write puts for a potential 1.2% or so more. *Pro* is rolling all four of its existing December puts (which equates to about 1% more at current prices).
- **Price Guidance Now:** Aim to roll for a credit of approximately $1.25. Pay as little time value as possible to buy to close your December puts, which expire Friday. For example, if DGS is $45.30, aim to pay only about $0.75 to close the December puts ($0.05 in time value). Lately, you can collect about $2 to write the March puts, for $1.25 in net credit.
    - **Friday:** We need to roll by the close of market Friday to avoid buying shares this weekend, so use a limit order, but accept the best credit available.
- **Prices (Dec. 19):** DGS, $45.30; December 2013 $46 put options (bid/ask), $0.65/$0.85; March 2014 $46 put options, $1.80/$2.15

What We're Thinking

Little has changed since we wrote these December puts in September, except that the Federal Reserve finally announced its intention to begin tapering its asset buying in January. Emerging markets have largely been treading water since September, leaving DGS about where it started. However, you might recall that the ETF's price did increase soon after our trade alert, making us accept a lower credit than we originally hoped for writing the December puts. Today, we can add to our credit, lowering our potential buy price further, by rolling those puts to March.

Pro was paid $1.24 to write the December 2013 puts. We should collect $1.25 or so, net, this go-around, leading to about $2.50 in total credits to date, and a potential $43.50 start price on new shares if we get them. Today's credit amounts to 2.7% in extra yield on our strike price in three months. So, rolling now is simply a way to be a bit more defensive and target a lower buy price on any new shares. We don't know how much the Fed's tapering will increase the value of the dollar, affecting debt obligations in emerging-market economies, so rolling for another credit feels Foolish as we wait and watch.

How It Fits Into *Pro*

Although most *Pro* companies sport healthy international sales, our portfolio has modest direct exposure to emerging-market companies. This has been a *good* thing since 2009, because U.S. stocks have easily outrun emerging-market stocks. But as we shared with you in September, emerging-market stocks are much cheaper than U.S. equities now, so we're looking to increase our 1.8% DGS exposure to a full position of at least around 3% with today's trade, and possibly more over time. If we don't get new shares anytime soon, we'll keep targeting income.

More That Matters

- **Maximum Loss:** After this roll, our risk is the same as share ownership starting at about $43.50.
- **Maximum Gain:** Unless the stock stays at less than $46 and we get to buy new shares, the most we can gain on this trade is the put premium, or about a 2.7% incremental yield in three months (more than 10% annualized). By rolling, we may miss additional upside if the stock price recovers before March.
- **Follow-Up:** We'll buy shares if the stock remains below our strike price at expiration, or we'll roll again if we want to be more defensive. If our puts are on track to expire unused, we'll look to write new puts for more income.

Alternative Trades

- **If you don't own any shares:** DGS is a Buy. Match our current 1.8% allocation with a direct purchase. Then write these puts for about 1.2% more.
- **If you can't write puts:** Simply buy shares — 1.8% now, and up to 3% on a dip closer to $43.50.
- **If commissions are high on one contract:** If commissions to roll one contract would eat up much of your credit, simply do nothing and accept new shares this weekend. That's fine!

Pro Can Help

- Visit our DGS discussion board if you have questions or comments!

Pro Talks With Valmont Industries

Published Dec 16, 2013 at 4:00PM

Fellow Fools,

Early in *Pro*'s still-new relationship with **Valmont Industries** (NYSE: VMI), which manufactures irrigation systems and steel poles, Bryan got on the horn with the company at its balmy Nebraska headquarters. Valmont's head of investor relations, Jeff Laudin, was happy to speak with The Motley Fool, so we set up a one-hour phone conference.

Live-Stream Our Holiday Party!

We're celebrating an amazing 2013 with a small group of local Fools, and we want to make sure you don't miss a minute of the action!

Starting at 6 p.m. ET, tune in here to watch speeches from David and Tom Gardner, CIO Andy Cross, and more of your favorite Foolish analysts and advisors. Plus, we'll be sharing off-the-cuff conversations happening between your fellow members and Fools from HQ. Join us!

Bryan and I selected the smallest conference room in Fool HQ (see how considerate we are?) and enjoyed a lengthy chat with Mr. Laudin. He seemed thoughtful, very knowledgeable, modest, and long-term-oriented — reflecting the approach of his company. Mr. Laudin has been in his position since 1998, sporting tenure like so many Valmont employees. What follows are our edited notes from our conversation with *Pro*'s newest investment, on our scorecard since November.

The Business

- The company's two primary businesses are infrastructure development and irrigation for agriculture.

- This is a time of economic austerity, and management has seen challenges, but the company's products are eventual "necessities" -- as record results even now attest.
- The public needs safe roadways (some states raise the gas tax to pay for them), and infrastructure buildout is politically attractive.
- Valmont's "Valley" irrigation systems use an estimated 30% to 50% less water than flood irrigation, and they maintain better soil quality while improving crop yields.
- Valmont operates globally in long-term growth industries, even though they're cyclical. "Economies can't grow without investing in infrastructure."
- Austerity "is *not* a long-term concern" at the company.
- Management embraces the fact that it operates in cyclical industries, and seeks to control the things it *can* control. For decades, this has served it well. "We take pride in managing cyclicality well."

Company Culture

- Founded in the 1940s, Valmont strives to maintain a "family feel," reflecting the founder's vision.
- Integrity is paramount, and "doing the right thing" is highly valued.
- Passion is necessary. Employees should be passionate that highway safety saves lives, irrigation feeds the world, and electricity powers it.
- Because Valmont is a results-oriented business, employees are held accountable.
- Employees are given autonomy to excel. At the same time, investment in management is integral. Valmont has found through its own Gallup study that "employees don't leave a company — they leave their manager." To keep turnover low, Valmont cultivates its managers. Countless managers and employees have lifelong careers at Valmont, and that makes the company stronger.

Results

- We liked hearing that management doesn't set specific targets for results, because targets can create bad behavior and short-term thinking. Instead, Valmont's goal is "*continual improvement*" on every metric that matters.
- Margins have increased strongly over time, and in response to our questioning, Mr. Laudin said he believes "there is more operating leverage in the business." The company seeks to increase operating income as a percentage of sales in a steady, continued manner, but (again) doesn't set targets.
- Valmont also focuses on a proprietary measure it calls Total Value Impact. TVI = net operating profit after tax, divided by invested capital. Everyone at the company uses this measure, and it drives bonuses and promotions.
- The current management team took over in 1993. Since then, the stock has returned about 17% annualized, putting it in rare company indeed. Shares have outperformed the likes of **Starbucks** (NASDAQ: SBUX) and **Whole Foods** (NASDAQ: WFM) over the past 10 years, too.

Acquisitions

Like many of our companies, Valmont enjoys strong extra growth through acquisitions, and plans to continue the strategy.

- When acquiring, Valmont seeks to: add to its existing business platform; bring more products to market; gain more expertise to offer customers; enter new geographies; make certain it can achieve a high return on invested capital; make sure the culture fits.
- Valmont is not interested in entering markets entirely different from those in which it has expertise. "You have to know who you are. We are a manufacturing company. We want to stay true to that ..."
- As with **AmTrust Financial** (NASDAQ: AFSI), many acquisition targets are pointed out by division managers and employees in the field ("feet on the ground are able to bubble up ideas").
- Many acquisition candidates are small, fragmented, and privately held.
- Management knows that "seventy percent of acquisitions don't work, so we don't do them unless [the price is right and] we know we can add value."

Share Dilution and the Dividend

- Over the decades, Valmont has not taken any notable action to dilute the value of investors' shares (it had 23.2 million diluted shares out in 1989, and has 26.9 million out today). This is, according to Mr. Laudin, "a fortunate result of how we operate."
- The dividend payout ratio is currently only 8.6% of net income, and has been as high as 20% in the past. But this only means net income has grown more quickly than the dividend. The company aims for "steady dividend increases," rather than a stated payout ratio or dividend yield.
- Management is averse to having more than 40% debt compared to its average invested capital. If the company takes on extra debt for a large acquisition, they'll want to pay it back quickly.

Our conversation with Valmont was another step toward growing our conviction that we're invested in a well-run, long-term business — a company we hope to be proud to own for years, and nicely rewarded for it. If you have questions about Valmont, please visit our Valmont discussion board. Valmont remains a Buy First stock in *Pro* with a 3% starting allocation. You can revisit its original recommendation, which is always available on our Alerts page.

Fool on!

— Jeff and Bryan

Pro Dec. 21 Expirations

- **The Buckle** (NYSE: BKE): Our $45 puts are set to expire as income this week. We'll opportunistically look to write new ones at attractive prices.
- **WisdomTree Emerging Markets SmallCap Dividends** (NYSEMKT: DGS): Our $46 puts are near-the-money, but will expire as income this week unless the stock declines to less than $46 by Friday. We're ready to accept new shares, but we may roll our position with a trade alert on Friday if the premiums are attractive and the stock is flirting with $46. We weren't paid much to write these puts and may want to collect more premiums by rolling forward another month.

Pro Catch-Up Trades

- **Tupperware** (NYSE: TUP): Follow our month-long price guidance in the alert to get your put-writing trade completed.

Pro Completed Trades

- **Tupperware**: We sold to open seven April 2014 $90 puts on Tupperware today for $4 each, per our trade alert guidance last week. This exposes us to a potential 3% stake at a net $86 if Tupperware is below $90 by expiration.

Coverage & Community

- A decline in **AmTrust Financial** (NASDAQ: AFSI) stock has Jeff sharing additional perspective, while Bryan summarized the situation as of last week. Today at 5 p.m., AmTrust is hosting a conference call that *Pro* will attend — we'll update you shortly after.
- Member "nevercontent" shares his put-writing ideas.
- **The Buckle** (NYSE: BKE) announces a special dividend.
- Pro member Lon shares a sad story of surprise margin loans, a warning to be Foolish about your finances.
- ADrumlinDaisy's daughter buys her first stock!

Write Puts on Tupperware

Published Dec 11, 2013 at 3:00PM

Is this for you? *Pro* members who lack 3% exposure to **Tupperware** (NYSE: TUP), either through existing stock ownership or written puts, should consider this new recommendation or its alternatives.

How You Participate

- **Trade:** Sell to open April 2014 $90 puts
- **Allocation:** 3.1% — write one put for every $270,000 you manage. *Pro* will write seven contracts.
- **Price Guidance Now:** Use a limit order of $4 or higher to start (for a 4.4% yield in 4.26 months).
    - **Later:** If $4 doesn't fill by Dec. 18, then accept no less than $3.60 until Dec. 24 (4% in about 4 months).
    - **Still later:** From Dec. 26 to Jan. 11, accept no less than $3 (3.3% in just over 3 months).
- **Prices (Dec. 11): Stock:** $93.85; **Options:** $3.80 bid / $4.20 ask

What We're Thinking

After losing our Tupperware shares through covered calls, and having our latest written puts expire as income, we want to reinitiate exposure to the company. We estimate the shares' fair value at around $85, and if Tupperware executes its plans well, by next April its estimated fair value will be $87.50. These puts could allow us to pick up approximately a 3% position below that price.

How It Fits Into *Pro*

Key factors make Tupperware unique in the *Pro* portfolio:

- The company's direct selling method, with 2.8 million salespeople, sets it apart from our other retailers and negates the need for expensive retail space.
- Tupperware's low-cost, culture-specific kitchen tools and storage give it strong opportunities in emerging markets (about two-thirds of its sales) — even those where income is limited.
- Tupperware can benefit from a weak job market that sends more quality candidates for employment its way.
- The company adds some lower-tech flavor to balance out the spicy side of our high-tech portfolio.

Several other traits make Tupperware a desirable investment, including management's focus on growing in immense urban markets (such as major cities in Brazil, China, Malaysia, and India) and goals of increasing the dividend with net income growth and using excess cash flow to lower the share count.

Annual sales growth may only register in the single digits, but long-term earnings per share may sustain 10% or greater annualized growth. Coupled with the dividend (lately 2.6%), we expect North Star-type returns — with lower-than-average long-term risk — if we get to buy shares at our desired start price.

More That Matters

Maximum Loss: Our risk is the same as share ownership starting around $86.

Maximum Gain: Unless the stock declines and we get to buy shares by expiration, the most we can gain is the put premium. At $4, that's a 4.4% yield in 128 days, or about 13% annualized.

Follow-Up: We'll buy shares if the stock is below our strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire unused, we may write new puts for more income.

Alternative Trades

If you own stock already: Keep holding a 3% or so position.

If you can't write puts: The shares remain a Buy, though we're aiming for a lower start price. If you're not writing puts, you can start to average into shares in 1% increments, or wait to see if we get shares in April and then buy with us.

If you're more defensive: To target a still-lower buy price, consider selling to open April 2014 $85 puts. They're well out-of-the money, so you'll have to accept what they pay you. Also consider writing July 2014 $80, $85, or $90 puts. They don't yield as much per day or annualized, but offer higher absolute payments that result in lower potential start prices.

Pro Visits AmTrust Financial

Published Dec 9, 2013 at 4:00PM

Dear Fools,

Last week, Bryan and I boarded Amtrak at D.C.'s Union Station and "rode the rails" up to New York City. During our three-mile walk from Penn Station to the headquarters of **AmTrust Financial Services** (NASDAQ: AFSI), we stopped to grab lunch at a divey-but-excellent Greek restaurant (the owner scolded me when I asked if I could order a *decaf* Greek coffee; she said, "You'll have regular, and it'll be strong"). After lunch, we stopped by the Fool's New York office (where we were delighted to see fellow Fools including Tom Gardner) before heading to our appointment.

AmTrust HQ is situated in a giant building on Maiden Lane, not far from the new Freedom Tower (an impressive sight) and Wall Street itself. Plaques on the many glass doors outside read, "This building is a holding of AmTrust Realty," and we later heard how the building was bought under duress for a song – as was AmTrust's other headquarters in Ohio. The man at the front desk pointed us past holiday decorations to the elevator for the top floor – 48 or 49 – and Bryan and I headed up.

Before long, we were in a large glass-walled conference room with a view that seemed to stretch to Canada ("We can see Jim Gillies's house!"). There, we were joined by AmTrust CEO Barry Zyskind, CFO Ron Pipoly Jr., and Senior Vice President of Investor Relations and Corporate Development Elizabeth Malone, CFA. With a tray of bottled water between us, we made our introductions and began to pepper our hosts with questions, including the ones you – *Pro* members – asked. As we progressed, we got the sense that management was forthright, honest, open to tough questions, and generous with their thoughts and time. In an effort to share as much as possible from our meeting, here's where our narrative ends and the news begins.

From AmTrust to Us

Pro's largest holding, AmTrust is a specialty insurer with a focus on workers' comp policies at small businesses. The company also insures extended warranties on consumer products, among other things and has a growing fee-income business in related fields. I (Jeff) have followed AmTrust since its 2006 IPO. Sporting an industry-leading combined ratio (a measure of its profitability) and outstanding growth, AmTrust clearly has competitive advantages. But what are they? Are they sustainable? We asked and listened.

The Business

- As a young company in an old industry, AmTrust has built its entire business around new technology. All of its software is developed in-house, with 150 programmers working in Cleveland referred to as "the middle of the company." The CTO attends all the risk meetings and has a say on acquisitions, and the tech team has to know the insurance industry.
- This technology means that AmTrust's costs of processing are much lower than those of most competitors or companies it acquires, so it can generate strong new cash just by moving acquisitions onto AmTrust software.
- With real-time technology, management is able to measure the business in an extremely granular fashion and keep tight tabs on losses.
- As one member of management put it, "We take risk very seriously. We spend 2.5 days per month going through every line of business and review[ing] our performance – these are our 'loss reserve meetings,' or business reviews. These meetings are intense and we get everyone on the phone together." Seeking ways to continually improve, AmTrust knows of no other company that reviews losses this often.
- CEO Zyskind started to build AmTrust when he was in his late 20s. At the time, the company was tiny and every risk (or policy) mattered. So Zyskind and his small team studied every claim and every policyholder. They knew the insureds and the claims, and were reactive to every need. That level of care, concern, tracking and paranoia has become embedded in the culture of AmTrust.
- Technology allows AmTrust to play better defense – to monitor its business from every angle to protect against growing losses. And it gives offensive advantages as well by lowering costs, improving long-term profit ratios, and identifying areas of opportunity (or improvement).
- AmTrust sees itself as a franchisor: It provides vital back-end services -- technology, central office responsibilities, cost-effective reinsurance, and an A-rated balance sheet -- to the policy writer. Then it lets its divisions (including companies it acquires) run their businesses, assuming each business line is fundamentally sound from a loss perspective.
- The CEO's favorite part of the business is "playing offense" – finding creative ways to grow the business in low-risk ways. (You could see the excitement in his face as he talked about "knowing when you've found a great deal and you're going to make money.")

Dividends

Recently, AmTrust issued a special 10% stock dividend -- twice. *Pro* members wanted to know why. We asked management that question and added one of our own: "Where is the quarterly dividend headed?"

- The Karfunkle family, which controls more than 50% of AmTrust shares along with Zyskind, likes dividends. The company doesn't have a specific dividend-yield target, but will likely increase the dividend as income and book value increase – so, steady increases are the general goal.
- As for the special 10% stock dividend: This has been issued when AmTrust has high confidence that earnings will rise by more than that amount. So management views the 10% stock dividend as a "very clear signal to the market," a "bullish message," that near-term earnings should increase by at least 10%. Institutional investors have sought more liquidity in the shares, and the stock dividend serves that purpose by increasing the share float. As a still-small company, AmTrust would like to continue this practice, but Canadian shareholders loathe the taxes it triggers, so AmTrust is rethinking the strategy.

Acquisitions

AmTrust has added considerable value through acquisitions. The company plans to continue down this path. Management spoke about their approach and strategies for several minutes:

- First and foremost, AmTrust makes sure the underlying business it's acquiring is fundamentally sound from a loss perspective. "Then we ask ourselves if we have the system capabilities to improve the operations and fix the problems. We care about maintaining a 15% or greater return on equity, so we tend to look at areas that are in trouble for one reason or another," but that can be fixed quickly.
- The company prefers to string together small deals that don't look like much individually, but together are very meaningful. It recently closed several small deals ($30 million here, $40 million there) that add up to a quarter-billion dollars in new premium. But the individual deals were small enough to fly under competitors' radar. AmTrust doesn't like bidding against anyone else, so it goes where nobody else is.
- In its acquisitions, AmTrust targets niche businesses that it can lead, seeking minimal acquisition and integration risk. It does extreme due diligence on why a particular target got in trouble in the first place, and management makes sure the target can be moved to AmTrust's tech-centered platform.
- Getting the right people involved in the underwriting and adjudicating process is key to an acquisition from the very beginning; from there, AmTrust communicates the direction it wants the business to go. Fixing a misstep can take a long time, so AmTrust tries not to veer off course in the first place, preferring to take advantage of *others'* mistakes.
- Everyone is excited about fee-based businesses at the moment, so their pricing isn't attractive. Thus, as CEO Zyskind put it, "We're focusing on organically growing our fee businesses, and finding more merger and acquisition activity in traditional [insurance] policy businesses as competitors flee some markets," sending those prices lower. When fee-based businesses are cheaper, AmTrust will look to acquire there. These things cycle.
- Often, it's agents in the field who first flag a potential acquisition after noticing opportunities where someone has stumbled. To be clear, AmTrust is not interested in buying bad books to clean up, because those often leave little premium standing. It wants to buy businesses that offer healthy renewals; otherwise, it's not building on the past.

Fair Maiden?

In 2007, AmTrust played a key role in forming a reinsurer that agreed to reinsure 40% of certain AmTrust premiums. The company is called **Maiden Holdings** (NASDAQ: MHLD), and Zyskind remains the non-executive chairman of its board. This company's stock has done well, too, though not as well as AmTrust's. But since the beginning, the relationship has come under media scrutiny from time to time. I've been familiar with Maiden since its founding, and I remain comfortable with it. In fact, Maiden offers meaningful advantages to AmTrust, as management shared:

- CEO Zyskind said, "Nowadays people look at Maiden as a related party, but most don't understand where it came from. Maiden came about in 2007 as a way to optimize AmTrust's capital structure. In 2007, every possible source of capital would have been seriously dilutive – we wanted to avoid this. Maiden offered a long-term, risk-sharing partnership, with a solid balance sheet to backstop AmTrust's underwriting – something that ratings agencies loved. AmTrust helped Maiden develop its platform." (I'll note that it has indeed done this – Maiden no longer only does business with AmTrust.) "AmTrust has definitely benefited from the relationship; with an A-rated reinsurer behind it, AmTrust was able to grow through the financial crisis."

- Put another way: Maiden is an advantage to AmTrust because it's like having access to another balance sheet without the risk. And, again, it's a long-term relationship, so there's no chasing short-term results.
- Reinsurance is a commodity business, so a long-term partner that cares about risk and not just price is a company AmTrust can trust and work with on similar books of business.
- The partnership is sealed through June 2016. AmTrust has provided predictable, low-risk premium to Maiden, so the relationship is expected to continue.
- As Zyskind put it, "We go to bed with our balance sheet, and we wake up with our balance sheet." Not romantic, but definitely what you want to hear from an insurance company you own. And Maiden in effect allows AmTrust a better balance sheet with less risk.

Future and Tidbits

The company expects acquisitions to continue. AmTrust should grow its insurance and fee-income businesses organically, and make acquisitions in either business line when prices are low (right now, insurance has the best potential there).

- CEO Zyskind said, "We think the fee businesses themselves [that AmTrust now runs] might be worth $800 million to $1.2 billion." (AmTrust's total market value is $3 billion today.) "The businesses are very niche-y and very sticky." Margin expansion should be the name of the game. The main reinvestment there is the cost of acquisitions to buy out competitors and complementary businesses.
- Although the CEO is only 41, AmTrust has built up "great bench strength" and remains risk-averse, conservative, and entrepreneurial. "And we are young," Zyskind smiled.
- The greatest testament to the company's conservative nature lies in how it sailed through the financial crisis, allowing it to acquire falling companies cheaply.
- The CEO has never sold shares and doesn't expect to anytime soon. He's in for the long haul.
- Employees are often granted shares as part of their annual bonus, but if you sell shares, you may get a visit from the CEO himself – asking you why you sold.
- All the meeting rooms have glass walls, so the CEO can see and walk into any meeting. Hey, it's an open environment!

We left with the impression that AmTrust is well and tightly run. It's the CEO's baby, and although employees may have reason to fear him when they make mistakes, they also respect him. The CFO was no-nonsense (and took an hour out of his day for us despite travel and conference plans), and the senior vice president was candid ("We're not allowed to sell our shares!" she said, only half teasing).

After saying our goodbyes, Bryan and I rode the elevator down and walked along Broadway as night fell. We shared a greater understanding of AmTrust, and more confidence to remain long-term owners in a dynamic young business that we rate a "Buy." That said, we will never let our critical guard down. We *are* allowed to sell our shares if we decide to -- but we hope to own them for years and years.

[Stocks 2014: 12 Stocks to Outsmart the Market Today]

Black Friday and Beyond

Published Dec 2, 2013 at 4:00PM

We Keep on Top of Our Companies! Today, Jeff and Bryan are visiting **AmTrust Financial Services** (NASDAQ: AFSI) at the company's New York City headquarters, meeting with the CEO and CFO of *Pro*'s largest holding. Thank you to members for your questions! Jeff and Bryan will report back with a summary as soon as it's ready.

Dear Fools,

Here in the U.S., Thanksgiving weekend is a time to spend with family, friends, and others you cherish, and to reflect and be thankful for what you have. We hope you were able to enjoy the holiday.

The weekend also represents one of the most important periods of the year for retail-related businesses. Since 2005, Black Friday (the Friday after Thanksgiving) has ranked as the busiest shopping day of the year in the United States. And given that we're all investors here, there's plenty of data from this busy shopping period that has implications for us. Here are a few takeaways from the preliminary data for this year.

1. Online commerce continues to grow.

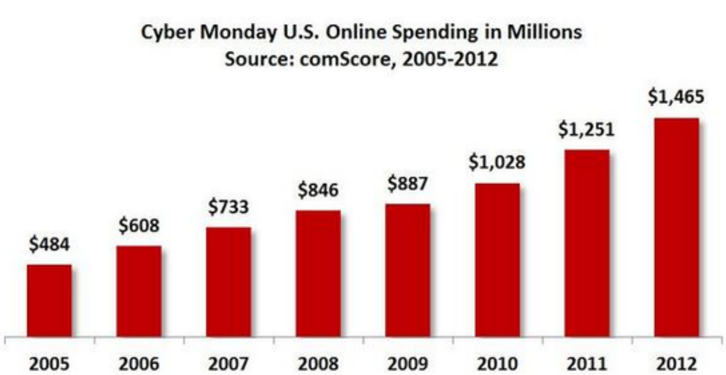
According to **comScore** (NASDAQ: SCOR), this holiday season has already broken records for e-commerce. Black Friday 2013 (Nov. 29) was the heaviest online spending day of all time, with a record $1.2 billion in desktop/laptop online sales, a 15% increase over last year's $1.04 billion. Additionally, a record 66 million Americans used their computers to score some deals, a 16% increase over last year.

2. Mobile devices are changing the landscape.

Not only are desktop and laptop sales increasing, but mobile sales are increasing even faster. **IBM** (NYSE: IBM) reported that mobile traffic grew to almost 40% of all online traffic, an increase of 34% over Black Friday 2012. Mobile sales also increased to almost 22% of total online sales, up 43% year over year. There was some interesting data regarding purchase activity on smartphones and tablets: Alhough smartphone users were more likely to browse (25% of all online traffic vs. 14% for tablets), tablet users were more likely to buy (driving 14% of all online sales vs. 7% for smartphones). Also interestingly, **Apple** (NASDAQ: AAPL) device users are more likely to shop online and buy online, with iOS traffic (iPhones, iPods, and iPads) reaching 28% of all online traffic vs. 11% for **Google**'s (NASDAQ: GOOG) Android. Mobile Apple devices made up 18% of all online sales, compared with just 3.5% for Android.

3. Cyber Monday is going to be big.

By all accounts, today (Cyber Monday, the first day most of us return to work after Thanksgiving) should be the heaviest online spending day in history, breaking Friday's record. Although today's books are obviously not yet closed, Cyber Monday has been the top online spending day of the year for the past three years, and a quick look at historical data makes it easy to see why comScore expects Cyber Monday sales to approach $2 billion:



The Foolish Bottom Line

There's a pretty obvious theme in the shopping data from this past holiday weekend: Online commerce and mobile commerce are becoming increasingly important to the retail industry. The *Pro* portfolio has a few positions that are affected by these trends, including **The Buckle** (NYSE: BKE), Apple, and **MasterCard** (NYSE: MA). This data reinforces the need for retailers to improve their online channels (something we've seen The Buckle do) and is good news for MasterCard, as online sales have to be processed through payment networks like the one it owns.

Thoughts on Black Friday or Cyber Monday? Did you shop online this year? Chat with us over leftovers on the Memo Musings board.

Fool on!

Billy

Pro Catch-Up Trades

- **American Tower** (NYSE: AMT): Write ("sell to open") January 2014 $74.65 puts for at least $1.10 if and when the stock dips. We're looking to potentially double our stake in the stock to about 5%.

Community & Coverage

- We hope you all had a wonderful holiday!
- New *Pro* members are introducing themselves on the Meet & Greet board, and getting started on (unsurprisingly) the Getting Started board. Ask your questions!
- Jeff summarizes the highlights of **OpenText's** (NASDAQ: OTEX) planned $1.16 billion acquisition of GXS Group, which will make OpenText the leading B2B integration services provider.
- Member Dom (dsciola) asks if **TD Ameritrade** (NYSE: AMTD) benefits from high-speed trading.

Write Puts on American Tower

Published Nov 26, 2013 at 10:30AM

11 a.m. Editor's Note: Fools, pricing on this recommendation changed quickly, and it has been updated below as of 10:50 a.m. Please use this updated guidance to place your trade!

Greetings, New *Pro* Members! In this recommendation, we are writing ("selling to open") put options to potentially buy more shares of AMT at a lower price, and generating income in the process. You need put-writing permission to complete this trade, and you should be able to buy $7,465 worth of the stock (and still have that be a reasonable allocation) for every put you write (remember, each option represents 100 shares of the stock). If you're new to options and aren't ready to make the trade, don't worry. There is always another opportunity. Brush up with the Fool's Guide to Writing Puts. Finally, AMT remains a Buy First stock, so you should have already allocated 2.4% to it. This option trade is to potentially double our position. If you have questions, please visit the AMT board linked at the end after reading this report. Enjoy!

- **What We're Doing**: Writing puts for income or to potentially add about 2.7% to our stock position (which would bring our total allocation to just more than 5%).
- **What We're Thinking**: We want to keep this strategy going — we're writing puts for a fourth time to earn income and lower our effective buy price on a potential second helping of shares.
- **What We're Expecting**: Recent earnings results confirm that company fundamentals remain strong and will drive long-term performance, but other factors continue to cloud the near-term outlook.

Guidance Essentials

- **Action:** Write (“sell to open”) January 2014 $74.65 puts on **American Tower** (NYSE: AMT).
- **Allocation:** About 2.7% more, enough to potentially bring our stake to about 5%. For Pro, that means writing seven contracts. Each new contract represents a $7,465 potential obligation.
- **Recent Price:** $77.83
- **Option Price** (bid/ask): January 2014 $74.65 puts: $1.15/$1.25
- **Price Guidance:** Use a limit order, aiming for $1.20 to start. As prices change, ideally accept no less than $1.10, for a 1.5% yield in about two months.
- **Alternative Trades:**
  - If you don't yet have an allocation to American Tower, we recommend you buy a 2.4% allocation to match Pro (in 100-share lots, if you can) and then write the January 2014 $74.65 puts for about $1.10 or higher, representing about another 2.7% worth of shares. The stock is a Buy First.
  - If you'd like to be more conservative than Pro, consider writing the January 2014 $72.50 puts, which yield less but give you more breathing room if the stock price declines.
  - If you aren’t using options at all, consider doubling your allocation to the stock now or if it dips to $74.65 or lower and we get “put” new shares.

What's New?

Our November $72.50 puts on American Tower expired this month as income, so we're going back to the well (or shall we say back to the tower?) for another put write. The stock is a Buy First, so we've been looking to add to our position with a written put strategy that's been active since July. Numerous short-term concerns (a July short "report," sector-correlation concerns, the looming taper decision from the Fed) leave us continuing to believe we'll be able to add to our position at a lower price.

There's been a flurry of activity from the tower sector in recent months, with American Tower making two sizable acquisitions and competitor **Crown Castle** (NYSE: CCI) hyping its own deal with **AT&T** (NYSE: T). Tower operators are taking advantage of low interest rates and financing costs to add to their tower collections (a prudent strategy in our view).

Additionally, the recent activity in the industry provides evidence that carriers increasingly favor leasing towers over owning them. There are two reasons for that: Tower operators can do it cheaper thanks to their scale and ability to "co-locate" tenants, and it frees up capital for carriers to invest elsewhere (say, in network capacity and coverage upgrades). And as carriers invest in their networks, who benefits? You got it — the tower operators, including our very own American Tower. The company reported earnings Oct. 30, and the results confirmed that our thesis is on track — the business is executing its strategy just as we expect, with climbing returns on capital and continued healthy demand both domestically and abroad. While AMT the stock has been volatile, American Tower the business continues to execute. In the meanwhile, we're happy to write puts and get paid to wait for our buy price on a second helping of shares.

Return Math

- **Maximum return:** We make 1.5% in 52 days (about 11% annualized) on this put write if shares of AMT remain higher than $74.65. If that's the case at expiration in January, including our three prior put writes, we will have earned put premiums of about $4,010, or about 7.8% of the capital we're putting at risk and 8.7% of our initial investment in AMT shares.
- **Breakeven:** We begin to lose money on this ongoing put strategy when shares fall below $68.15, or about 12.4% lower than where they are today. Considering just this iteration of the strategy, we'd begin to lose money if AMT fell to less than $73.55. Meanwhile, we own shares of stock already, too.
- **Maximum risk:** We're on the hook to buy shares if the stock price falls to less than $74.65 by expiration. If that's the case, we'll consider accepting shares or rolling to keep the strategy going.

Next Step: Please post any questions on the American Tower discussion board.

Write Puts on American Tower

Published Nov 26, 2013 at 12:00AM

11 a.m. Editor's Note: Fools, pricing on this recommendation changed quickly, and it has been updated below as of 10:50 a.m. Please use this updated guidance to place your trade!

Greetings, New *Pro* Members! In this recommendation, we are writing ("selling to open") put options to potentially buy more shares of AMT at a lower price, and generating income in the process. You need put-writing permission to complete this trade, and you should be able to buy $7,465 worth of the stock (and still have that be a reasonable allocation) for every put you write (remember, each option represents 100 shares of the stock). If you're new to options and aren't ready to make the trade, don't worry. There is always another opportunity. Brush up with the Fool's Guide to Writing Puts. Finally, AMT remains a Buy First stock, so you should have already allocated 2.4% to it. This option trade is to potentially double our position. If you have questions, please visit the AMT board linked at the end after reading this report. Enjoy!

- **What We're Doing**: Writing puts for income or to potentially add about 2.7% to our stock position (which would bring our total allocation to just more than 5%).
- **What We're Thinking**: We want to keep this strategy going — we're writing puts for a fourth time to earn income and lower our effective buy price on a potential second helping of shares.
- **What We're Expecting**: Recent earnings results confirm that company fundamentals remain strong and will drive long-term performance, but other factors continue to cloud the near-term outlook.

Guidance Essentials

- **Action:** Write ("sell to open") January 2014 $74.65 puts on **American Tower** (NYSE: AMT).
- **Allocation:** About 2.7% more, enough to potentially bring our stake to about 5%. For Pro, that means writing seven contracts. Each new contract represents a $7,465 potential obligation.
- **Recent Price:** $77.83
- **Option Price** (bid/ask): January 2014 $74.65 puts: $1.15/$1.25
- **Price Guidance:** Use a limit order, aiming for $1.20 to start. As prices change, ideally accept no less than $1.10, for a 1.5% yield in about two months.
- **Alternative Trades:**
  - If you don't yet have an allocation to American Tower, we recommend you buy a 2.4% allocation to match Pro (in 100-share lots, if you can) and then write the January 2014 $74.65 puts for about $1.10 or higher, representing about another 2.7% worth of shares. The stock is a Buy First.
  - If you'd like to be more conservative than Pro, consider writing the January 2014 $72.50 puts, which yield less but give you more breathing room if the stock price declines.
  - If you aren't using options at all, consider doubling your allocation to the stock now or if it dips to $74.65 or lower and we get "put" new shares.

What's New?

Our November $72.50 puts on American Tower expired this month as income, so we're going back to the well (or shall we say back to the tower?) for another put write. The stock is a Buy First, so we've been looking to add to our position with a written put strategy that's been active since July. Numerous short-term concerns (a July short "report," sector-correlation concerns, the looming taper decision from the Fed) leave us continuing to believe we'll be able to add to our position at a lower price.

There's been a flurry of activity from the tower sector in recent months, with American Tower making two sizable acquisitions and competitor **Crown Castle** (NYSE: CCI) hyping its own deal with **AT&T** (NYSE: T). Tower operators are taking advantage of low interest rates and financing costs to add to their tower collections (a prudent strategy in our view).

Additionally, the recent activity in the industry provides evidence that carriers increasingly favor leasing towers over owning them. There are two reasons for that: Tower operators can do it cheaper thanks to their scale and ability to "co-locate" tenants, and it frees up capital for carriers to invest elsewhere (say, in network capacity and coverage upgrades). And as carriers invest in their networks, who benefits? You got it — the tower operators, including our very own American Tower. The company reported earnings Oct. 30, and the results confirmed that our thesis is on track — the business is executing its strategy just as we expect, with climbing returns on capital and continued healthy demand both domestically and abroad. While AMT the stock has been volatile, American Tower the business continues to execute. In the meanwhile, we're happy to write puts and get paid to wait for our buy price on a second helping of shares.

Return Math

- **Maximum return:** We make 1.5% in 52 days (about 11% annualized) on this put write if shares of AMT remain higher than $74.65. If that's the case at expiration in January, including our three prior put writes, we will have earned put premiums of about $4,010, or about 7.8% of the capital we're putting at risk and 8.7% of our initial investment in AMT shares.
- **Breakeven:** We begin to lose money on this ongoing put strategy when shares fall below $68.15, or about 12.4% lower than where they are today. Finding Bits of Pro in New York

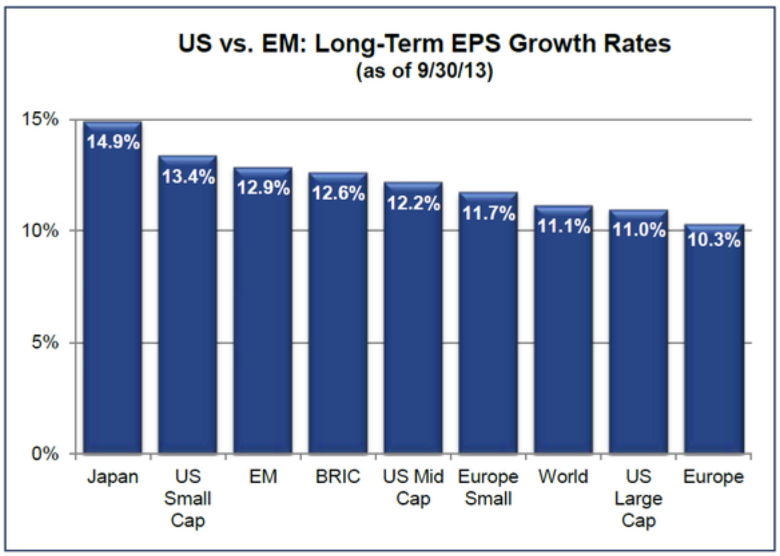
Published Nov 25, 2013 at 4:00PM

Dear Fool,

Once or twice a year, The Motley Fool releases me from my cage onto some unsuspecting city, and I have the privilege of hobnobbing and rubbing elbows with folks who wear much nicer suits than I do. Last week, that took the form of the CFA Equity Research & Valuation Conference in New York City, where I spent two days submerged in several interesting issues regarding stocks and investment management. As far as I know, the entire conference isn't designed around me, but there were plenty of *Pro*-centric takeaways from this year's event. Here are the most interesting ...

Are Emerging Markets a Trap?

Market maven Richard Bernstein, known for studying market cycles to inform his investing decisions, spoke about emerging markets — specifically, how investors seem to be ignoring a few issues those markets face. His argument (part of which you can read here) has a few pillars. First, he posits that focusing on the demographics of emerging markets is silly, because what matters is whether those populations can become wealthier and spend their newfound riches. It's not a certainty that they can, especially given that the only regions currently suffering from harmful rates of inflation are emerging markets — so even while per-capita incomes are rising, purchasing power isn't. Bernstein drove this point home by asking, "How are these people supposed to buy toasters when they increasingly can't even afford the bread?" Furthermore, if wealth accumulation in these markets were considerable, we'd see it reflected in superior earnings growth of businesses located there. Bernstein used the chart below to show that relative earnings growth is actually quite modest.



Source: Richard Bernstein Advisors LLC, Factset.

Finally, Bernstein showed that investors' expectations for emerging-market performance are still too high: Companies in these markets miss earnings almost twice as often as U.S. companies, yet cash is still pouring into emerging-market mutual funds.

My take: Currently, *Pro* has a 1.8% allocation to the **WisdomTree Emerging Market Small Cap Dividend Fund** (NYSEMKT: DGS), and we've written puts to purchase another 1%. If Bernstein is right, we are (at best) in the middle of a cycle during which this ETF will underperform. I don't disagree with the inflation data Bernstein presents, or with inflation's impact on consumer spending in emerging markets, but I do take issue with his conclusion that the result is uninspiring earnings growth. The chart he cites (above) shows expected earnings growth of 12.9%, which in absolute terms is pretty good, and it's the third-highest among the groups he tracks (behind only Japan and U.S. small caps). I'd bet the difference between those groups' EPS growth and that of emerging markets is probably within the standard error of the data. (Standard error is the fudge factor introduced by making an estimate based on a sampling of companies, instead of using every single one.)

He also fails to take into consideration the price investors pay for that earnings growth — a factor *Pro* dealt with by selecting the DGS ETF, which features small-cap dividend payers with modest valuation. The fund's average price-to-earnings ratio is 12.9, and its price-to-cash-flow ratio is 7.9. We think these factors increase our odds when investing in underfollowed, relatively stable, established companies with access to these markets. Overall, I'm happy with *Pro*'s approach to investing in emerging markets.

Medtronic: Great Business, Real Headwinds

Scott Black manages Delphi, a value-oriented investing firm headquartered in Boston. His talk focused on Delphi's approach, which shares many commonalities with what many of us have learned from Warren Buffett: Buy great businesses at sensible prices. A quick scan of the regulatory filing showing Delphi's holdings reveals that *Pro* holding **Medtronic** (NYSE: MDT) fits this mold; the company has been in the Delphi portfolio since mid-2010. (Delphi also owns **Oracle** (NYSE: ORCL) and **The Buckle** (NYSE: BKE).)

Speaking of Medtronic, the folks at Morningstar apparently think it's a great business, too — they award it their highest economic moat rating of "wide." However, when Damien Conover (who leads the health-care team at Morningstar) spoke about economic moats in the health-care sector and the effects of the Affordable Care Act, he did note that the act's 2.3% medical device tax is punitive for Medtronic. He also pointed out that competition in the company's core product lines is increasing, and that regulatory and reimbursement pressures continue to mount.

My take: Currently, *Pro* has a 3% position in Medtronic. We recently moved the company to Hold, citing that very regulatory and reimbursement pressure, as well as a changing risk profile given the increasing importance of an unproven sales model in international markets. Conover's confirmation of the increasingly difficult operating environment is telling, and it supports my suspicion that there are probably better places for *Pro's* dollars within the health-care sector. The quality of Medtronic's business and its current pipeline are solid enough that we won't be forced into taking action just yet, but I do have my eye on a few health-care businesses that are benefiting from tailwinds rather than fighting a headwind. I'm not sure if Scott Black stuck around for Conover's presentation, but he too should consider the fact that Medtronic may struggle to grow earnings at above-average rates given its changing industry dynamic.

The Foolish Bottom Line

Fool HQ is located in Alexandria, Va., and that geographic distance from the hustle and bustle of Wall Street is part of what allows us to think clearly and independently. But it's also refreshing and informative to venture into the chaos from time to time to talk stocks with some of the industry's best and brightest. Beyond the *Pro*-specific nuggets I highlighted above, the conference offered plenty more useful insights – you can check out my notes here, here, and here. Seeking out divergent opinions helps us make better portfolio decisions, so if you have a unique insight or strong opinion on the investment thesis for one of our holdings, we invite you to share it on the company's discussion board. Our investing brains are bigger combined than apart, and thankfully, our boards are less crowded and more collegial than the streets of New York City.

Onward,

Bryan (TMF42)

Portfolio Check-In Event

Published Nov 25, 2013 at 2:00PM

During our Portfolio Check-In Event on Nov. 25, advisor Jeff Fischer and senior analyst Bryan Hinmon, CFA, were on video to discuss the Building Your *Pro* Portfolio reports, share their insights on the *Pro* investing and portfolio management philosophies, and offer guidance. Meanwhile, the rest of the *Pro* team took member questions via a live text chat.

An archived version of the video and a transcript are below, along with a transcript of the live chat.

JEFF FISCHER:

Hello, Fools. Welcome to *Motley Fool PRO's* live portfolio check-in event. I'm Jeff Fischer joined by Senior Analyst Bryan Hinmon. Joining all of us in the text portion of today's chat is Analyst Billy Kipersztok. We think we're going to have Jim Gillies checking in from *Motley Fool Options* and Jim Mueller helping us on the chat, as well. And Ellen Bowman, who oversees everything that we do in PRO and Options.

We are delighted you are here with us. Thank you for being a *Motley Fool PRO* member — and to new members — welcome to the service. We're glad you're here. Today we're going to have a fun hour to talk about PRO a little bit, our philosophy, tease a trade that we have coming out later this week and answer your questions … as many of them as we can.

If you see on your page — I'm going to take a minute or two here to slow down. Make sure your video feed is working. You'll see on your page you'll have a video feed — and that's us right now live — and you'll have a text portion which is also live and there you can type in your questions. Billy or Jim or Jim or Ellen will answer your questions … as many as they can … and Bryan and I will be looking at your questions as well and answering them throughout the course of this hour.

It's going to be a fun, full hour and our goal, of course, is to get you a little more comfortable with PRO, with how we invest … and for those of you who need a little help … some help getting started. And remember. It's just one step at a time here. And another thing we always tell members as they join is we're not here to make a little money. We're not here to make a little money one week and a little money the next month. We're here to make a lot of money over a meaningful amount of time. And so as you invest with us, extend your horizons. Look out at least a couple of years, because real wealth is made or grown by having an appropriate time frame ahead of you and that makes it a lot more fun, too. Bryan, you were going to say something and I was going to give you a chance…

BRYAN HINMON:

I was just going to say — we'll talk about it a lot later on. But you've set up and framed this whole discussion saying that our members — what we want them to do is extend their time horizon. You want to consider your entire investing life — and one of the things that really defines *Motley Fool PRO* is our North Star and our mission which we've set out. And we distinctly considered time frame when we were hashing that out and figuring out how we wanted to really build the service around that. I won't spoil it all here, but time frame is so important to what we do that we try to embody that with North Star and our mission.

JEFF FISCHER:

That is certainly true, Bryan and it's a great jumping-off point. Before we get to your questions, we'll talk a little about our philosophy. Bryan, why don't we start with the North Star. I'll ask you to define the North Star for everybody, but I'll start by saying we have a constant rolling three-year goal. We want to always make money every rolling three years. That's our absolute returns goal, which means PRO is not about relative investing. We're not trying to do better than the market index, which could easily be down over three years. We're trying to make money no matter what the market does.

Realistically we think over every rolling three years — we need to make money at least every rolling three years — whatever the market does. So, even if the market is down, our goal is to make money. Now over time, of course, our return goal is quite, quite generous…

BRYAN HINMON:

It's way more aggressive than just make money every rolling three years…

JEFF FISCHER:

So, let's talk about that. That's our North Star, Bryan. Can you define it and let's talk about it.

BRYAN HINMON:

Yeah, I'm happy to. PRO's mission, as you just pointed out, is consistent recurring profits with a high level of accuracy. Well, that's really pretty abstract and so the North Star was really our effort to quantify that. You pointed out inflation matters because I don't know about everybody out there, but I plan on living for another 90 or 100 years…

JEFF FISCHER:

Bryan is healthy enough that he will. He's the healthiest guy I know, so you're in good hands…

BRYAN HINMON:

I'm going to try my darndest — that's for sure. So with a 90 or 100-year investing horizon — I'm being a little facetious here, but…

JEFF FISCHER:

I mean, your children will have that sort of horizon, at least, and your grandchildren…

BRYAN HINMON:

Exactly. And so, that's the mind-set that I have here. Well, over 90 or 100 years, or 30 or 40 years, or even 20 years for that matter … inflation can eat away at your purchasing power, and so we need to be cognizant of that and acknowledge it and so that's what we've done with the North Star which, as I said, quantifies our mission.

All the North Star is — it's a very simple concept — it's inflation plus 7%. We've already explained why we care about inflation. Why 7%. Well, as it turns out, the rule of 72 essentially says that if you earn 7% a year, essentially your money doubles every 10 years. And so what we've said is, "That seems reasonable." It's an aggressive return number to throw out there…

JEFF FISCHER:

Yes…

BRYAN HINMON:

…but over time, if we achieve such results, we will probably be able to live the lifestyle that we want to live. We'll probably achieve the goals that we've set out for ourselves under a variety of scenarios. While we don't know all of our members' goals — we don't know their horizons — we don't know their personal situations … we have set up North Star (inflation plus 7%) to double the real purchasing power of our portfolio and our members' portfolios every decade. And if we do that, we're probably going to be serving our members really well.

JEFF FISCHER:

That's right, Bryan. Inflation as we define it, just to go a little deeper into the weeds, is CPI-U or Consumer Price Index All Urban, so it includes pretty much everything. Right now, inflation's running around 3%. The last I looked, it's maybe a little above 3% a year. So when you add 7% — which is our absolute return bogey every year on average — 7% to current inflation, we're looking at 10% plus per year is what we aspire to make. That's our North Star. And obviously, no one can say, "Oh, we'll make 10% a year no matter what, every year." But over time, over a rolling three years, we hope to make 10% annualized. Over 10 years, we hope to make 10% plus annualized, so it's over longer periods we hope to make that.

BRYAN HINMON:

And I think that we should provide a little bit of context here. We're not playing T-ball here. We haven't just put the ball on the T. Or it's not even slow-pitch softball where we have a larger ball and it's coming in really slowly for us to take a big, old swing at. As we've defined it, the North Star, as a return, is really pretty heady. From 1970 to 2012, the North Star has actually increased at a compound annual growth rate of 11.3%...

JEFF FISCHER:

Uh-huh…

BRYAN HINMON:

…just far and away above what the S&P returned over that same time of 9.9%. And so, that return differential is huge over that 42-year time horizon…

JEFF FISCHER:

It truly is. And so, if we're going to stay close to our North Star — remember, it's an aspirational goal — if we're going to stay close to it, odds are we need to do better than the S&P 500, as well … but, that's just incidentally…

BRYAN HINMON:

Right…

JEFF FISCHER:

…I think the key strength or one key strength of North Star is that it makes us look away from the market. If the market's rising really, really sharply … say it gets ahead of itself valuation-wise … we should not feel pressured to pursue it…

BRYAN HINMON:

Right…

JEFF FISCHER:

…because you go down that path, and you're going to fall with it when it falls. We need to stay on a steadier course which are steady returns, year in, year out. So, when the market looks more risky, we're more likely to hedge it … to set up shorts, things like that … because we want to make money in the next year or two if we can.

BRYAN HINMON:

Jeff, I love the point you made there about how North Star allows us to focus on what we think matters and not get caught up in the current market environment. When I'm explaining to people what I do and about PRO and about the North Star, the way that I explain the North Star is that it's almost like built into some glasses that we wear. And then the North Star provides the lenses through which we look at our portfolio and make our portfolio decisions…

JEFF FISCHER:

Mm-hmm…

BRYAN HINMON:

And so, when we're having our internal conversations and we're debating a stock and we're debating an allocation move or something like that, we always put on those North Star glasses and frame the discussion around, "Well, is this going to help our portfolio track the North Star or is it going to detract from that?" And we believe as long as we are making our portfolio decisions through those lenses — more often than not, we're going to come out pretty close to making the right choice.

JEFF FISCHER:

I like that Bryan, and we need to trademark that before Google grabs it. Patents it. That's certainly how we look at everything. When you look at fair value on the site for a company, what we're looking at, even more than fair value is yes, it plays in … but can that stock, from today's price exceed or match the North Star in the next three-year period?

That's our main bogey for any stock that we rate a "Buy," and we need to believe every day that that buy is a worthy buy for the portfolio and for every member who's just joining the service now should they buy that stock today. And if it's rated, "Buy," then we think they should because we believe it's going to at least match our North Star to come in three years.

Let's talk about a few essentials here that veteran members know very well, but new members may not. That is, in general, we are a full portfolio service and so portfolio management is part of what you're getting here. Whether you mirror the PRO portfolio exactly, (which many members do), or if you pick and choose from it, (which many other members do, as well, just choosing your favorites), you should know that we aspire to have about 20 to 24 core positions and right now we're at exactly 20…

BRYAN HINMON:

Mm-hmm…

JEFF FISCHER:

…and therefore, on average, each position starts at around 3% and can go all the way up to 5% to start and then we'll manage the allocation on an ongoing basis, whether we want to make it larger or smaller over time. We're a fairly focused portfolio and we believe that's going to result in stronger returns over time, because we know our positions extremely well. We can adjust them as we need to. When opportunities do come along, we're ready to act. We have the confidence to act because we have the knowledge of our companies and their competitors and the valuation and all those factors that matter so much. We also, then, add into these 20, 24 core positions. When we feel it appropriate, we hedge and we'll short. And, of course, we use options.

Now, things to keep in mind. Our core positions — we're always thinking in terms of rolling three years. Shorts, hedges and options are, of course, shorter-term vehicles so those we think of in terms of months to a year or two. And you combine all these things and that's how we manage the portfolio.

But, just one point before we move forward. Quite a few members do not use shorts or some don't even use options, and that's okay. You can just use PRO's core positions and that can be your long-term stock portfolio or part of it. But if you want to use shorts and options — and we encourage you to — we will get you started in those, new members. We'll get you started in those in real time with reports that come out in the near future. So, first we wanted to get you focused on building your core portfolio and then we'll move into shorts and options … options, first, actually. We plan to have an options trade this week that anyone who is ready to make some income can jump onboard with us tomorrow…

BRYAN HINMON:

Sure…

JEFF FISCHER:

…when that goes out.

BRYAN HINMON:

Well, before we move forward, I want to apologize. Jeff and I — this is new for us. We're not used to dancing in front of the camera. We don't have our trusty MC here so we forgot one bit of housekeeping — just to remind everyone that this event is, of course, going to be recorded and logged on the PRO website. So, if you need to refer back to it, this and the chat portion will be available for you.

But enough with that nonsense that we're not good at. Jeff, let's dive a little bit deeper into something that you said. You know, 20 to 24 core positions. What the heck do you mean by core position — and I'm going to tee you up here by saying that … When was this? September 30th you wrote a memo called, "PRO One-Pager - Stocks We Like," and in it, you sort of answered this question…

JEFF FISCHER:

Mm-hmm…

BRYAN HINMON:

So, run through with me how you think about a core position. What traits in the companies do you like to see?

JEFF FISCHER:

The key things we look for in a long-term company we want to own, Bryan, as you know are strong returns … mainly returns on equity, returns on invested capital, healthy margins which tie into a sustainable competitive advantage. And that's probably where we actually start most of the time. What advantage does this company have that allows it to generate profits on an ongoing basis and how is that sustainable — because without a sustainable advantage, today's profits are going to dissipate.

And then we look for management who knows how to reinvest the proceeds of the business to grow the business still further. And if the company also has recurring revenue or annuity-like revenue (like a software provider does on a subscription basis) so much the better. It just makes it all the easier for that company to be a compounding machine which is a term we took from Chuck Akre.

We're going to favor a business that looks like it can compound its growth, year by year, over the long term. That sort of really outstanding business — like MasterCard, which is a "Buy" or Amtrust Financial, a "Buy" in our portfolio — that sort of great business is the type that we want to own and we hope to own for years and years to come and really grow wealth with those businesses.

BRYAN HINMON:

Yes. You don't even have it up on your screen here — I'm peeking — and you walked through that really smoothly. It's because over your years of looking at businesses, these sort of common traits have bubbled to the top and are common themes among the companies that you have personally invested in and had the most success with. And now I'm proud to say they populate the ranks of our largest holdings in our portfolio, in general.

It brings up a good point, a reminder to me that I should write a memo on compounding. As investors, we always talk about how compounding is sort of a wonder of the world and is truly remarkable. But what I don't think enough investors pay attention to is how compounding gets better and better the longer you let it work…

JEFF FISCHER:

That's certainly right, Bryan, and it's difficult to even get your head around it … how the numbers actually work and how a business can grow so much more after it's already grown.

BRYAN HINMON:

Yes. So, note to self. That memo is coming…

JEFF FISCHER:

All right. Compounding memo from Bryan is on the way.

BRYAN HINMON:

That's coming. And it also reiterates the fact that selling is a really hard decision and so…

JEFF FISCHER:

Yeah. At what point do you cut off that so-called compounding machine if you've really bought into one?

BRYAN HINMON:

Exactly. And so, the easy way out is to say "don't sell." Well, of course, that's a mistake in many instances. But the better the work we do in identifying the compounding machines on the buy side, on the front end of the transaction … the less we have to worry about when to sell. Even if they get a little bit overpriced — a little bit beyond our estimate of fair value in the near term — as long as the compounding dynamics are still there over a long-enough time frame, we know that that is going to contribute even still an outsized proportion of our portfolio's gains.

These great companies — we don't worry about slight over-valuation or extended valuations or these sorts of things. We would rather own compounding machines that are a little bit expensive over average businesses almost any day of the week.

JEFF FISCHER:

That's exactly right, Bryan. The other thing to keep in mind, too, is if we do see prices escalate to a point where we think it's going to be a couple of flat years in the market, we can set up all kinds of positions to make money in a flat environment … options positions or hedges or shorts … and meanwhile let our core stocks be … so that we don't have a turnover, we don't have a taxable event and we make money other ways and let this compounding continue afterwards.

It's remarkable how a business can grow value. I made a post today on the PRO Philosophy board about most of the families I know who have made real wealth — well, all of the families I know who have made real wealth, and it's a few dozen — have done so by owning some stocks and keeping them … not by trading in and out. Not by trying to guess where the market's going. It's more owning good companies for years, for decades, really.

And Coca-Cola, you would think… In the 1920s people were saying Coca-Cola's growth is done. Why buy that stock now? Of course, it's gone on to make billions for people since then literally, and in just the past seven years I think it's about doubled again … like all new value creation. And this is a company that's not in PRO right now, but it's a great example of a well-known name that still hopes to grow their beverage volumes 60% between now and 2020.

BRYAN HINMON:

Sure. And you know, that brings to the forefront that when people were doing their analyses in the 1920s of Coke at that moment, they could only see so far out. They couldn't see the next shoe to drop was international expansion and that Coke was going to replicate its advantages all across the world as the world grew. And then, okay, well, that started to slow down a little bit and investors got worried. What is the next shoe to drop? Well, Coke just continued adding categories. Water. Healthy beverages. You name it — they just kept adding to the portfolio.

That highlights the fact that even though I think you're a pretty smart guy, I know you can't see 40 or 50 years into the future with any sort of certainty. The best we can do is choose businesses that have those sustainable competitive advantages intact now to buy them the time and resources to invest for the future. And as long as we are partnering our money with great managers and great business thinkers — we're stacking the odds in our favor of finding those companies that are going to be able to compound for decades instead of years.

JEFF FISCHER:

That's right, Bryan, and well said. So, Bryan, I'm going to run through the high-elevation look at PRO quickly just to recap … for new members especially … and then let's get to some questions. If you see some questions in the live chat that you'd like us to answer, we certainly will.

BRYAN HINMON:

Sure.

JEFF FISCHER:

So, Fools, to recap. PRO is The Motley Fool's only long, short and options real money portfolio and you joined because you want to make money on an ongoing basis. You want to do better in poor markets when the market is finally flat — and it will be — or when it goes down. And you want to make really good money over the long term and that's what PRO is set up to do — make money, smooth out the rough times in the market. Make money during flat markets. We have strategies that will make money in flat markets. That will make money in falling markets. And then, of course, we have these 20 to 24 positions that we believe will compound the rest of our assets over the longer term.

PRO has returned, just to review, more than 13% annualized in the five years we've been in operation — not that we compare to the market — but that's better than the market which is a good thing, because that means we're also doing better than our North Star right now and that will be our ongoing goal from here forward.

A few housekeeping notes — to new members especially. *Motley Fool Options* is the sister service to PRO. PRO is the full portfolio service that you signed on for. Options you get free with your PRO membership for the life of your PRO membership. We think that's a great combination with our team and Jim Gillies, as well, in Options. The two services do go well, together.

You can use the ideas in *Motley Fool Options* to complement your *Motley Fool PRO* portfolio and Options also has great educational content in Options U and an amazing options community which is a whole other set of members who are in *Motley Fool Options* that you can converse with, learn from and help, as well.

BRYAN HINMON:

Jeff, I've got a couple of questions for you, if you're ready.

JEFF FISCHER:

I am ready. I am ready.

BRYAN HINMON:

All right.

JEFF FISCHER:

And we're going to try to fly through these. We have a lot of questions coming in, which is great to see. Let's see how we can help.

BRYAN HINMON:

Sure. There seem to be a lot of questions. Even though you said, "Hang tight on shorting," everyone seems a little worried about a frothy market.

JEFF FISCHER:

Is it 2009?

BRYAN HINMON:

I'll get to that joke in a minute. They want to know how to get started with shorting. I think there's a general answer that you can give and then sort of a PRO-portfolio-specific answer you can give. And if you think that might feed into a nice conversation about PRO's exposure and how the portfolio is exposed right now.

JEFF FISCHER:

That's exactly where I would go, Bryan.

BRYAN HINMON:

Well, fire off, then.

JEFF FISCHER:

Let's talk about it. Let's talk about it together. PRO is exposed. We're about 75% net long to the market. We have more than 20% cash, that means, and that's a pretty good hedge right now for our current desires and purposes. We are looking at building our so-called short book or building our short positions into the portfolio and those will do two things. They'll raise cash for us because you get cash when you short (not that we plan to use that cash because it does hold the short open … but it also hedges our long positions and lets us keep, as we just talked about, our core holdings for the long haul).

New members — I joked about 2009 because in early 2009 and even March, 2009, members were clamoring for shorts and we were not shorting anything as the market fell. And throughout 2009, one critique was, "Where are your shorts? You don't have shorts?" And then 2010. We have not shorted much since then, thankfully, and we still don't see valuations that demand a lot of shorting.

In fact, that there's a lot of concern out there is maybe a good sign — not that we care about terms like this — but that stocks may climb a wall of worry. Really, we just focus on valuation and we will short companies that we think are failing and overvalued … and we'll hedge when we think our market exposure is too great … but right now it's 70%, 75% and so we'll get there and we're working on it.

But if you buy all of our longs, you're less than 70% long because we have a few stocks on hold which means if you're following PRO, you're more than 30% cash. And when you have that much of a buffer or that little exposure, we don't think you need to add shorts right away. You want to have upside potential. Bryan, what do you want to add?

BRYAN HINMON:

I can't add much on top of that, Jeff other than to say that we realize that part of the allure of PRO is that it is billed as a long-short portfolio…

JEFF FISCHER:

Mm-hmm…

BRYAN HINMON:

…that uses options. The way we view it is at least a "go anywhere" portfolio — more than putting titles on it — and so I think of the portfolio, at least in my head, as we have our core longs and then we have our positioning, our exposure. That clumps together the short book and the cash position.

That's how I would encourage members to view it, as well. Just to say, "Hey. Right now we're 75% invested in our core holdings and 25% out of the market right now … or ultimately, when we find the opportunities, short the market." But the starting point is that we're only 75% invested, so even if we're worried about a frothy market, we have 25% out of the market and our stock selection has been sufficiently good that our returns have been great this year…

JEFF FISCHER:

Yes. Since inception, that's a good point. We've had some shorts and hedges in cash since inception and our returns, really including all those so-called drags on the portfolio, have been great … so our returns on risk are great.

BRYAN HINMON:

Yes. So that 25% that is basically the two buckets here — the 25% that's other stuff — over time, as the opportunities present themselves, we'll figure out the right allocation for that 25% … be it 25% in shorts or be it 12% in shorts and 12% in cash or whatever. The bottom line is that we hear you about the frothy market. We're not overly concerned. It doesn't keep us up at night — but we do have 20% to 25% dry powder right now that is removed from the market and obviously would be removed if the market were to do something treacherous.

Keep in mind that the exposure, which you can find on our recommendations page and Jeff is responsible for updating that whenever there are major changes … at least once a month…

JEFF FISCHER:

Yes…

BRYAN HINMON:

…but honestly you do it …

JEFF FISCHER:

…every couple of weeks or whatever. It was updated Friday.

BRYAN HINMON:

It seems like you've been doing it almost every week or every other week lately.

JEFF FISCHER:

Bryan, let's talk about the macro just for a minute. As we outlined at the beginning with our companies, we care how our companies are valued and what we think they'll return for you the coming three years. That's how we think. That's a reasonable way to think.

But we also keep an eye on the macro — namely in relation to our potential hedging and shorting positions. And the macro right now — I like that everyone's quite concerned. And yet you have the S&P 500 at an average valuation. It's not, at all, like far extended. It's not yet to a valuation where most bull markets do end. People cite the returns since 2009, which I find absurd. Why cite it from the bottom…

BRYAN HINMON:

Right…

JEFF FISCHER:

…of 2009? Since 2007, the market's up a paltry 15% to 20%, the S&P. So, it's really gone nowhere for six years, almost. You have pretty weak GDP growth around the world this year, which is a good thing. You have pretty weak earnings growth in the S&P, this year. Nearly flat, which I consider a good thing. I hear people saying, "It's stalled out. It's stalling." Well, it's not an airplane. The fact that growth was so light this year makes it more likely that there will be growth next year. It makes the comparisons next year better.

Meanwhile, GDP was really weak this year and could tick up higher next year … at least that's how current models look. Now, you have the Fed changing hands, which means they're very unlikely to rock the boat. Now, Bernanke does not want to rock it right before he leaves and Yellen does not want to…

BRYAN HINMON:

Not on her watch…

JEFF FISCHER:

Not on her watch. She's going to very, very slowly change any policies that are in place. I think when they do start to taper, it's going to be so gradual, and people are already so on edge about it, that it could very well turn out to be a positive for stocks when everyone sees, "Oh, the world's not ending. Instead of buying $85 billion in bonds this month, they're buying $80 billion, and look. The market didn't implode." And they're going to take it down so slowly and keep rates as low as they can for as long as they can. But I think tapering could end up — not that we're investing with this in mind — but could end up being a non-event or even a plus for stocks.

Finally, Treasuries have already gone up. They've already recouped. They've already gone up back to rates that people were … They've already taken into account tapering, to a large extent. So, the market has already adjusted. The 10 year, I think, was down to one point something, 1.7%. Now it's back almost to 3% just on the hint of tapering to come. So, that adjustment's been made and it's back near an average of where you would expect it to be.

Long and short is we're not macro-minded all the time, but we keep it in mind at all times, if that makes sense. We look at the valuations of our companies foremost and then we'll put hedges and shorts in place as we see fit month by month, quarter by quarter. Remember, we can be market-neutral in a day if we want to be. We could just hedge out all of our exposure if we wanted to be.

BRYAN HINMON:

Yeah, Jeff. It's funny. There's always some sort of activity going on in the bigger picture — in the economy that worries people. There's almost always some bigger picture, geopolitical risk that's out there. And now is the time of year when you start hearing the Wall Street wizards making their year-ahead stock return predictions. They're going to come fast and furious pretty shortly here.

I was reading in the *Wall Street Journal* over the weekend — over the last past 14 years a firm called Birinyi Associates put together consensus year-ahead estimates — basically, the average prediction, year-ahead prediction for stocks of all the major Wall Street firms.

Well, over the past 14 years, exactly 0 years did they predict that returns would be negative. So, a biased group. Keep that. But also, in 4 of the 14 years, we had negative returns, so they were in the wrong direction … not just wrong in terms of they guessed 9% and the market went up 11% that year. They had the totally wrong direction. All I'm saying is that it's very difficult to make the linkage between what's going on in the economy and how that's going to play into stock market performance.

JEFF FISCHER:

That's true…

BRYAN HINMON:

So, to a large degree, we don't try. We pay attention to the extent that we think it is going to cause dislocations or cause structural changes to our businesses or at least very prolonged impacts on our businesses. Otherwise, what we really care about is how our businesses are doing. And that's not how the stock prices of our businesses are doing — but how the businesses themselves are performing. Again, it's a different mind-set.

JEFF FISCHER:

That's so true, Bryan, and it reminds me of what we have always told veteran members since 2008: One key to successful investing is to remain flexible. It's very unlikely that you'll ever see us 100% long and that's it — everything pointed in one direction — because when things do go against you, (and they will … it's inevitable for short periods or even a year), you would have nowhere to go.

We like to remain flexible, so that if we do have a dislocation, as Bryan talked about, that's an opportunity. It becomes an opportunity right away. And if you have cash on the side or if you have hedges in place, as a majority of the time we do, we take advantage of that dislocation and make it work for us and that does a lot for peace of mind during market declines, as well.

It's funny how over history — and I don't want to keep thinking of very long stretches of time — but over history, the market has only ever gone up. We're sitting here and it's at an all-time high, which it has done almost every decade and many, many times over that decade as far back as you care to look. But despite that and despite the chart that is up, up, up … so many people, ourselves included, think about those short, down periods. And you can get into a blind spot if you worry too much about them.

So, we do exactly what Bryan said. We make sure our businesses our strong, reasonably priced, have a competitive advantage and then as we see fit, we'll hedge and short and we'll short failing businesses which is fun to do when that works out. Earlier this year we were short Sony and we made money on Sony while the market was going up, so that was fun.

BRYAN HINMON:

Jeff, I have a member question for you.

JEFF FISCHER:

Let's get to questions. More questions, great.

BRYAN HINMON:

Yes. Frank asks, "Should I add some ETFs for diversification?" I guess the question is how do you think about diversification in the PRO portfolio and then we'll answer Frank's question specifically.

JEFF FISCHER:

Great question. A lot of studies have shown if you own a dozen different companies in different industries, you are diversified. Now for a lot of us, that may feel like it's not enough diversification. A lot of people aren't comfortable unless they have 20 or 30 stocks or more. Well, PRO is diversified. We believe it's well diversified. You can certainly further diversify if you wish. The key is that you're comfortable by adding some ETFs very easily.

But the thing to keep in mind with an index ETF is that it will move with the market and with a specific ETF — such as a commodity ETF or a Brazil ETF — you're making a very specific investment, very specific bet in that one niche. So, ETFs don't always add diversification is what I'm saying. It depends on the ETF.

BRYAN HINMON:

Yes. And I would remind Frank that you should consider your entire asset allocation. I have no idea what the right asset allocation for Frank is, but for someone … let's say someone my age … maybe something appropriate is 75% stocks and 25% bonds. We'll just keep it easy with the two asset classes there.

We think PRO is appropriate for that larger stock bucket because we are putting money into the market and even though we're managing the portfolio in a way that is different from just riding the market's vicissitudes, we're putting capital at risk in the market and so we think it fits into that larger stocks bucket. Frank, should you add ETFs to complement that? Sure, especially if it's filling out your broad asset allocation plan.

JEFF FISCHER:

Good answer, Bryan. And I'm going to run through four of the questions I've seen on the text chat commonly and they're common questions on the community boards, as well. One is, "Can you mix PRO with other Fool services?" And our answer is yes. We've seen many members do it successfully. They add favorites from other services to PRO or vice versa and build their own Foolish portfolio that way. They're all Foolish recommendations, so you can mix them. Just be sure to try to stick to our allocation guidance on your PRO selections and if you have any questions about your diversification, because you're only choosing some PRO stocks, let us know on the boards.

And finally, do keep in mind we build the portfolio very specifically because it is a portfolio service. We want and expect the portfolio over time to work together as a whole, so that's one of our core missions and what we work towards every day. So, if you're breaking the portfolio apart, you'll have different results, but many members do add other stocks to the portfolio from other Fool services.

The other one. Do I buy everything, all your buys a person buys right now, or can I average in? You can certainly average in. If you're all cash right now, we would say buy most of them. Get up to 50% exposure and go from there. If you're already largely invested, then average into PRO stocks as you're able and you can buy them in halves if you want to go gradually rather than buying the whole allocation at once.

IRAs. That's another common question. Most PRO strategies work in an IRA. Most of our Options strategies do, as well. Shorting does not work in an IRA, so if you want to make shorting a key part of your strategy, or a part, you'll need to open a brokerage that's friendly to shorting and any discount broker will do. Members use everyone from TD Ameritrade to Interactive Brokers to E-Trade. And Interactive Brokers has great short availability on some of the more unique tickers we like to short or ETFs we like to short. A reminder on shorts and hedges. We'll get you up to speed with live trade alerts in the coming weeks on those. Those are four common questions. I hope that helps.

BRYAN HINMON:

So, Jeff. You spoke a little bit about income. There's a question on here about if you're looking for reliable income, what can PRO do in that regard and then do you have any other suggestions for George?

JEFF FISCHER:

Great question. PRO has a mission of issuing to members at least 12 income trades a year or, obviously, at least one a month. And we're on track for that — maybe beyond it this year. A lot of what we do for regular income is writing options and our preferred strategy is writing put options. When you sell a put option Bryan, as you know, you are getting paid income up front and you're obligating yourself to buy shares of a stock if it declines below your strike price by expiration. If it doesn't, you keep the income and you can write another put, and that's how it becomes steady income.

If it does decline below your strike by expiration, you can take shares … and you should be happy to do so … or you could roll your put options to another month and go for income again. Either way, if you do take the shares, you keep what the options paid you, again, so it lowers your cost basis. So, regular income. Is it reasonable to invest, George is asking, $1 million into the portfolio and expect a fairly regular income from the portfolio?

The long-term answer is yes. Again, we promise to deliver 12 income trades a year. The market, though, has been obviously more geared towards owning stocks the past several years, so we haven't written as many income positions as we otherwise would. There will come a time when the market is flat for a long time and we'll be writing a lot more income positions. So, over time, it should smooth out and income, no matter what, will be a steady, ongoing part of PRO.

BRYAN HINMON:

I have another comment or two for George — the first being that I don't know the number off the top of my head, but numerous PRO companies do pay dividends…

JEFF FISCHER:

Mm-hmm…

BRYAN HINMON:

…in fact The Buckle even pays almost regularly a special dividend, as well.

JEFF FISCHER:

The yield on the portfolio — the whole thing, last I looked was around — I don't want to get it wrong, but it was up there. It was close to the S&P…

BRYAN HINMON:

It was close to the S&P's yield. It's about what it was the last time I looked, as well…

JEFF FISCHER:

And that's with a lot of cash on the side.

BRYAN HINMON:

Yes. Another thing that George can consider is creating his own dividend — selling off positions every time he chooses to rebalance. Maybe that's quarterly. You can sell down positions to get them back in line and create a synthetic dividend in that regard.

And then I think now's a good time to peel back the curtain a little bit and tip our hand and talk about two income trades that we're currently considering. I don't think there's anything wrong with that, is there?

JEFF FISCHER:

Hm-mmm…

BRYAN HINMON:

So, the first one is Medtronic, which is a company that I cover for PRO and put on hold recently. Basically, I've been starting to ask myself and converse with the team. Does Medtronic, from here, help us achieve our goals? I think there's serious head winds at the company. The company's trading a little bit beyond what I think it's worth right now, which, again, isn't a huge deal because it's a very good company, a very good business…

JEFF FISCHER:

Mm-hmm…

BRYAN HINMON:

…but it does call into question, given the head winds the company's facing, that I wonder if it can help us achieve the portfolio returns that we're going after. So, one of the ideas that's on the table is to convert Medtronic into an income position and maybe use it as an aggressive covered call candidate. Ideally, then, we'd be able to take what is a fairly valued stock … but a company that we know well. We feel very comfortable in the downside … and turn it into an income generator. And that's not something that we have done all that often in PRO. Tupperware — we've done it with Tupperware over time and Plum Creek Timber back in the day…

JEFF FISCHER:

Yes, we like to write covered strangles…

BRYAN HINMON:

Yes…

JEFF FISCHER:

…which is a combination of writing covered calls and writing puts.

BRYAN HINMON:

So, Medtronic is currently being wrung through our wringer as potentially becoming an income play. Who knows where it will turn out in that debate? We're still very much having that conversation. But that's an idea of something we're considering.

JEFF FISCHER:

That's right. And there's another trade that we plan to go out tomorrow, Tuesday morning, early Tuesday morning Eastern Time, probably in the first couple of hours of trading. Assuming everything goes right — assuming the numbers line up — that trade will go out tomorrow.

That's an income trade. That is writing put options on a stock where you're paid income, day one, and you're committing to buying that stock. We'd be happy to buy it if it declines below our strike price by the expiration. And this one is pretty short-term. These options expire in January, so it's about a two-month income put-writing trade that you'll have tomorrow in your Inbox, and then if you have any questions about it, you can ask the company board there at the bottom of the trade alert which goes out tomorrow.

BRYAN HINMON:

Yes. So, that one is probably coming.

JEFF FISCHER:

Yes, very likely.

BRYAN HINMON:

Another idea — I won't give the name here — but another idea that we've been actively debating for some time is we just had the final batch of 2016 LEAPS become available. Our team has been actively scouring those options for diagonal call candidates…

JEFF FISCHER:

Yes, that's exciting, too…

BRYAN HINMON:

…and strangely, we haven't done that, really, in PRO.

JEFF FISCHER:

We haven't done that in PRO at all.

BRYAN HINMON:

I think Jim Gillies might have a monopoly on it in *Motley Fool Options*. But it's an income strategy that we're both fond of and it's one that we have been giving a lot of consideration to on a couple of names in PRO.

JEFF FISCHER:

And I do think after these five years of rising stocks, you're starting to get to a price which … it still looks reasonable … but where we're going to want to overlay more income strategies into the PRO portfolio to get our returns that much higher because we can't just rely on rising earnings and rising share prices.

One thing to keep in mind about fair value which I see questions about in the chat is that fair value is a fair price for a buyer or a seller today. A lot of people equate fair value with the sell price — but fair value is a good price. It's a price from which you can expect to earn your desired return which, for us, as you may know now, we look to earn at least 10% annualized from any stock we buy.

So, if we say a company … its fair value is $55 … we expect from that $55 to earn 10% a year … which means that fair value will go up 10% a year. So, a year from now, when we update it, we'll say, "Oh, now its fair value is $60." So, two things. Fair value is good for a buyer — or a seller if someone wants to get out — but it's not, default, a sell price. And a fair value will go up every year, typically by 10% or more, if the business does well.

BRYAN HINMON:

Yes. That's a great point. We comment on that a lot. And ideally what we find is the companies that we buy are so good that they compound their intrinsic value at a rate greater than what we expected. And then basically all that means is we have a certain level of business performance embedded in our valuation models, and to the extent with which the company can improve its operations … grow sales, improve margins, reduce costs beyond what we have forecasted … they're able to grow that intrinsic value far beyond 10% or whatever our chosen discount rate is. Again, that just plays into the importance of finding those core stocks that exhibit those great business characteristics.

JEFF FISCHER:

Good point, Bryan. Here's a comment from Sarah. She just asked, "The market is kind of too hot and not sustainable. I want to protect my portfolio. Will buying the S&P index put option do the job? How do you figure out which option to buy?"

It's a very good question, Sarah. And we talked about the market earlier. If you heard that, this will be archived and you can go back to it, as well. We think the market is reasonably priced. We like that there's a lot of concern out there. That said — it's about exposure. If you feel your portfolio is too exposed to the market, you can hedge some or much of it by buying put options on the S&P 500 or shorting the S&P 500 directly.

If you are buying put options on the S&P 500 as a hedge or on anything to protect it, what put you choose depends on how long you want your insurance to last and how much money you want to risk for that insurance. For those who don't know, a put option, as a tool, we'll certainly use. We have in the past and we will again. When you buy a put option, it's like buying insurance, because a put option goes up in value when the underlying asset falls.

So, if you buy a put option on the S&P 500 … when the S&P 500 falls, that put option will go up in value for you. You can then cash it in when you want and you've made money while the index fell. It's very important to know that "buying" a put option is the opposite of "selling" the put option. We sell to open options to make income on them, but you'll learn that as we go forward with you together. So, I would ask Sarah how long do you want to protect your portfolio against a fall in the S&P 500. How much of your portfolio do you want to protect? That would lead to your answer of which put options do you buy on the S&P 500.

But we would advise that you protect your portfolio only when you have good reasons to do so — not just because you feel the market's unsustainable. A lot of people have felt that the past three years and a lot of insurance money has been for naught.

BRYAN HINMON:

So, Jeff. I'm going to ask a question by C.R. Parr here. Dig into your brain a little bit. C.R. Parr asks, "Are you still writing options for Coke, Tupperware, Buckle and Disney?"

JEFF FISCHER:

Great. So, Coca-Cola and Disney are two live trade recommendations in *Motley Fool Options*, our sister service. We have recommended buying calls on both Coca-Cola and on Disney — so go to the Options service to see that advice. You can just go to the *Motley Fool Options* and put in the tickers and you'll get the trade alerts. Those are also trades you can make in the Friday Options Weekly Column.

Tupperware and Buckle are two PRO positions. We are writing puts on Buckle. They come due in December and we'll probably be writing new ones if an opportunity exists. And Tupperware, yes. We are looking at writing new puts and perhaps very soon. That should be a trade alert in your Inbox as soon as it's ready. So, just watch that. Bryan, let's see…

BRYAN HINMON:

Uh, oh. I see your wheels spinning round…

JEFF FISCHER:

We had a question about DGS — Wisdom Tree Emerging Markets ETF — and then we'll have to wrap up with some closing thoughts. We only have eight minutes left. A new member asks, "This is your one international exposure investment…" that they see — direct international exposure — emerging markets he means. Is there a reason for that? And what is our thought about international investing and how PRO accesses that?

BRYAN HINMON:

Well, excellent foresight. There is a blurb in today's Monday Memo which is going to come out shortly about DGS, so be sure to read it. It's written very well.

JEFF FISCHER:

It is. You did a good job, Bryan.

BRYAN HINMON:

More seriously. More seriously. You know, what's surprising or may be surprising to people is … I'm going to get the number wrong, but I'm not off by an order of magnitude here … something like 60% of revenue from S&P 500 companies now comes from outside of the United States. So, the whole notion, I believe, of international investing is a little passé, at this point, because the bulk of companies of any size … they're international companies already. Their operations are incredibly diversified.

It almost means nothing, now, where a company is domiciled. What's far more important is where it's manufacturing its products and where it's selling its products. And so, when we think about diversification and we think about the risks we're taking on, we don't think about where a company is headquartered or in terms of trying to achieve some sort of allocation abroad or trying to achieve some allocation to the U.S. We think about it in terms of where the company is actually doing business.

JEFF FISCHER:

Right…

BRYAN HINMON:

So, true. Wisdom Tree Emerging Markets small cap dividend fund is our only — by name — international investment. We have companies that do the preponderance of their business abroad. Graftek — the preponderance. Tupperware is something like 80%. Intel. So, most of our companies, honestly, are multinational companies that somewhere between 40% and 60% of their revenues come from abroad. It's honestly the rare company that is U.S. centric — a company like The Buckle who only has retail locations in the United States.

JEFF FISCHER:

Right. Even Papa John's Pizza, which is actually called Papa John's International, has all kinds of room to grow overseas. So, that is how we think about it. We look at each company and where they're selling and the PRO portfolio is diversified around the world by that measure.

And I think, Bryan, it also brings up … I just read today an article about how the market is valued to GNP — the Gross National Product here in this country — the market looks a little expensive compared to that … but that needs to take into account now that more than 60% of earnings come from around the world, so you have to look at world GDP or whatever the term would be. You have to look at the whole worldwide productivity…

BRYAN HINMON:

Absolutely. Our companies benefit from growth around the world.

JEFF FISCHER:

And we love to own U.S.-based companies for a few reasons, when they are international, because we know their market. We know them better. We know how the SEC treats them. We know their disclosure rules. Historically, U.S. companies the past many decades have actually outperformed emerging markets and international companies. And a study many people have heard of by now is that developed markets outperform emerging markets because they get a higher value multiple because there's more certainty there. So, we love owning developed companies that are expanding greatly, like Starbucks, in emerging markets. It's the best of both worlds.

That said, we like DGS, too. It's rated a "Buy" right now. It's a high-yield, small-cap diversified ETF in emerging markets around the world. It's rated "Buy" and we're writing put options on it to potentially buy more, so it's paying us income, as well. So, check that out and get onboard with that purchase.

BRYAN HINMON:

And one of the commonly-cited reasons that people put some assets in international markets is that historically the correlation with U.S. markets has tended to be lower. Stepping back really quick — what we're talking about here is if the U.S. markets are zigging — to add a little buffer to your portfolio. You can find things that move in a slightly different zig and zag direction, and it will dampen the volatility of your portfolio. So, people have turned to international investing as a way to, maybe as the U.S. market is declining, find an investment that will go in the opposite direction.

Unfortunately what we've seen over the past decade is those correlations have gotten much, much, much closer and so the benefit of investing abroad, at the expense of investing in the United States, has really been whittled away. We like that idea though, of finding a diversifier for the portfolio, and so one of the ways we found that you can still do that, where the correlation differential has really held up, is by going into small caps in emerging markets. So, that's part of the reason that we chose to go that route.

JEFF FISCHER:

So, be sure to check out DGS. Again, if you go to the PRO site or you're already there, enter DGS in the right-hand corner ticker box and you'll get the original alert … but you'll also get it … and we have to wrap up now … you'll get it in the portfolio-building report. It's summarized right there for you.

So, members. Thank you for joining PRO. It's an exciting time in the service. You're joining at a great time, new members, and I think veterans are here at a great time because the past five years of work have really led to the core positions that we own right now and we see great things in those companies.

Now we're starting to look to build out our short portfolio, which we haven't seen a need to have much need for, for the last five years — but we're going to want to add more shorts and that's going to be a big focus in 2014, assuming we see the need for it. Meanwhile, we love what we own. We look forward to adding more to the positions that we own and really making money over time with these stocks that are, I think, 1 in 10,000 … each one of these are. They're really high-quality companies.

So, remember to go to your PRO guidebook on the PRO site. That has everything you need to get started including your portfolio-building reports. Then take your time building your portfolio with us. Ask your questions. Move into positions gradually as you're ready. There's no rush. Watch for options and shorting educational content and then trades alongside that in the coming weeks.

And then we're here to help you on the discussion boards. One good board that we'll always go to is the Getting Starting and Help board. We'll be there to help new members, especially. And we're looking forward to a great 2014 with you and more returns beyond that time. Bryan, thank you. Do you have any closing thoughts?

BRYAN HINMON:

Jeff, I can't add too much on top of that, so I'll just use this opportunity to say thank you to our great team who answered questions on the live chat. Say thank you to our existing members who have been wonderfully welcoming on the boards to new members. And say thank you to new members and old members alike for putting your trust in the PRO Team. All I can say is we'll work hard for you. We'll keep on keeping on.

JEFF FISCHER:

Exactly right. Well said, Bryan. Thank you again, everybody. Thank you for taking this first step with PRO, new members, and we look forward to the next step and the one after that. Fool on! Have a great Thanksgiving holiday.

Portfolio Building Report

Published Nov 20, 2013 at 12:00PM

AmTrust Financial Services (NASDAQ: AFSI) | **Apple** (NASDAQ: AAPL) | **Broadridge Financial Solutions** (NYSE: BR)

Oracle (NYSE: ORCL) | **Papa John's International** (NASDAQ: PZZA) | **Starbucks** (NASDAQ: SBUX) | **Wells Fargo** (NYSE: WFC)
WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS) | **The *Pro* Bottom Line**

Download this report as a PDF

Dear *Pro* Member,

The way we manage *Pro* is pretty simple: We own a portfolio of investments that we expect to earn healthy positive returns over every rolling three-year period, so we can double our real purchasing power (that's after inflation) every 10 years. We own strong stocks and promising ETFs; we hedge to protect gains; we "sell short" to profit on falling prices; and we use options strategically and for income. Whether you use all of our strategies or just own *Pro* stocks, our mission is to earn you strong returns over our time frame. That's likely the prime reason you're here. Not all of our investment decisions will be right, and we won't always come close to our constantly positive North Star goal, but with a firmly plotted course, a stellar crew of analysts, and our wonderful community, we expect to stay firmly on track and enjoy the journey together — and to come out far ahead.

In our Most Recent Buys report last week, we highlighted our latest portfolio additions. Although those holdings may be our newest, shiniest toys, their true value is only apparent as a part of our larger portfolio puzzle. To complete that puzzle and execute our mission, we present to you this Portfolio Building Report, which summarizes our remaining Buy First and Buy positions.

Here are a few things to consider along the way:

- **Don't anchor on fair value.** We expect every investment we rate Buy First or Buy to play a role in helping us achieve the return goal stated in our mission. Yes, that's true even if the current stock price is a touch higher than our estimate of fair value! For one thing, our fair-value estimate is an imprecise figure, and for another, a "fair value" is really a range of values, one that doesn't take into consideration the holding's part in the portfolio puzzle.
- **Where to look first.** The reason we distinguish between Buy First and Buy is simple: We want to draw attention to our most compelling return opportunities at the moment for those members with limited capital available, or for those who don't follow the Pro portfolio step-for-step. Our decisions, however, are made in the context of all of the pieces of the portfolio puzzle, working in concert toward our mission.

- **What about Tupperware?** In October, we recommended writing puts on **Tupperware Brands** (NYSE: TUP). Those puts expired in November; some members may own shares (around 3%) as a result of that position or of our Alternative Trade recommendation. Although Pro has no official position in Tupperware right now, we will likely have an official follow-up recommendation soon. New members should hang tight and wait for the Trade Alert.
- **Say hello.** If you haven't already, please introduce yourself on our Meet & Greet discussion board. More than anything else, it's Pro's community that differentiates us from every other investing service in the world. Stop by, say hi, and carpool with the other intrepid members on this journey with us.

Onward,
— Bryan Hinmon, CFA, senior analyst

Buy: AmTrust Financial Services

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 6.9%

What It Does

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** (NASDAQ: AFSI) handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries.

AmTrust focuses on insurance niches (primarily workers' compensation and product warranties) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates and predictable cash flows allow it to focus on writing new policies, look for struggling insurers to acquire, and hunt for obscure investment opportunities.

How It's Working

AmTrust's strategy — being a disciplined underwriter of low-hazard, small policies in well-defined niches; using technology to keep its expenses low; and opportunistically acquiring policies other insurers struggle to find profitable — has resulted in impressive growth. Gross written premiums have risen from about $1.1 billion to about $3 billion over the past five years, and this increase, combined with a laser-like focus on low expenses, has resulted in consistent growth in earnings, dividends, and book value.

What We Expect

More Resources

- *Pro*'s recommendation history
- Talk about AmTrust on our discussion board

The insurance market works in cycles, and recent signs indicate an upswing on the horizon, which means pricing and profit should improve across the board. AmTrust should thrive in a strengthening market: It can charge as much as its competitors and make more in profits thanks to its lower expense structure, or it can undercut the competition on price in a bid to take market share. If the economy continues to improve, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

AmTrust has consistently traded higher than our estimate of fair value, but we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding, and we're happy to let this winner run, expecting to increase our fair-value estimate over time.

Buy First: Apple

The leader in mobile computing products is cheaper than it's been in years.

Suggested Allocation: 3.5%

What It Does

Led by its iPhone and iPad, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the Apple operating system, which centers on its iTunes and App Store marketplaces. Apps turn a piece of hardware into a personalized, go-anywhere computer that becomes ingrained into the user's daily life.

The company's uniquely integrated hardware and software have made for a great consumer experience that provides disincentives to switch to a competitor. Apple will have to fight harder to win new customers as competitors close the quality gap, but we maintain that it remains one of the best companies in the world, with the best products in its class, and it has one of the least expensive stocks among large caps.

How It's Working

Apple refreshed all of its product lines over the past 12 months, with the iPhone 5S achieving record debut sales and brand-new iPad models reportedly selling like hotcakes (literally, they're so thin). The iPad may set new sales records, too, this holiday quarter. This year's product refreshes show that Apple has not lost its touch and is not chasing the lower-priced market, instead aiming to protect profit margins. We like this choice. We also like that Apple is taking time to debut a new product category, which it hints it may do in 2014. Whether it's a TV, watch, or something else, Apple needs to get the product right and should take its time. It remains the most cash-rich company on earth, and generates tens of billions of new free cash flow every year.

More Resources

- *Pro*'s original recommendation (2/14/12)
- Talk about Apple on our discussion board

What We Expect

In the longer term, we expect more great innovations from Apple, including whole new product categories. Meanwhile, we believe customer loyalty will drive healthy recurring sales, and new customers, new market expansion, and product refreshes will fertilize stability and growth. The stock is too inexpensive for such a high-quality company at the very heart of the mobile computing revolution.

Buy: Broadridge Financial Solutions

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.0%

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in 2013, its platforms processed 85% of all shares in the U.S. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller segment, securities processing solutions, accounts for 27% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

How It's Working

Both earnings and free cash flow are modestly depressed because mutual funds have been scrimping on investor communications recently and investor skepticism around the global economic recovery has led to low trading volume. Still, in fiscal 2013 Broadridge grew sales 6%, grew earnings 11%, raised its dividend by 17%, and continued to position its business for strong sales and margin performance for years to come. And Broadridge continues to serve its customers masterfully; its 99% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

More Resources

- *Pro*'s original recommendation (4/27/10)
- Talk about Broadridge on our discussion board

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. We expect modest sales growth to translate to earnings growth around 10%. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: The Buckle

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 3.0%

What It Does

The Buckle (NYSE: BKE) sells jeans, other apparel, and accessories at 452 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service.

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by specialty retailer **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests. The store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company reported modest same-store sales growth of 2.1% last year and has notched another 2.2% gain through two quarters so far this year. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. Management's stellar performance has earned getting the benefit of the doubt:

Metric	2002	2012	Annual Growth
Stores	304	436	3.7%
Sales per Store	$1,339	$2,387	6.0%
FCF per Store	$57	$406	21.6%
Sales per Square Foot	$274	$475	6.0%
Inventory Turnover	4.7x	6.0x	3.0%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

What We Expect

More Resources

- [*Pro*'s original recommendation] (6/20/12)
- [Talk about The Buckle on our discussion board]

With 452 stores at the end of fiscal second-quarter 2013, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. Recent expansion into footwear, accessories, and children's offerings should provide enough fuel to keep same-store sales healthy, while the company's commitment to customer service entices repeat visits.

The Buckle also has a history of paying special dividends with its excess cash; it's done so for six of the past seven years. Just last December, *Pro* members holding the stock received a $4.50-per-share payout from the company in addition to the regular $0.20 dividend. Naturally, we encouraged all members to celebrate by buying themselves and their loved ones a few new pairs of jeans. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has been approaching North Star-level returns.

We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle.

Buy: Gentex

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.5%

What It Does

In 1982, a small company in Zeeland, Mich., called **Gentex** (NASDAQ: GNTX) made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

How It's Working

In 2000, the company sold 6.8 million units; in 2012, it sold 23.8 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option). Gentex has turned these market dynamics into wonderful financial performance. Revenue has risen by nearly 20% per year since 1987, and over the past decade, the company's net margins have bounced around the mid-teens. Those numbers are shockingly good for an auto-parts supplier, showing that its fancy mirrors are showing up in more and more new cars.

What We Expect

More Resources

- [*Pro*'s original recommendation] (5/29/12)
- [Talk about Gentex on our discussion board]

Currently, fewer than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy: Intel

Rumors of the PC's death have been greatly exaggerated.

Suggested Allocation: 4.6%

What It Does

Intel's (NASDAQ: INTC) goal is to be "the preeminent computing solutions company that powers the worldwide digital economy." Whether it's a high-speed server for a data center, a new Ultrabook with a touchscreen and detachable tablet, a new smartphone, a tablet, a car, or just about anything else: Now more than ever, Intel has the computing technology to drive it.

Admittedly, the company was late to the smartphone and tablet markets, but there's a silver lining: As these devices eat into PC sales, investors' fear about Intel's tardiness brings us the value opportunity we see in the stock. And because smartphones and tablets have very short life cycles, Intel can catch up quickly by steadily inserting its technology into new product designs.

How It's Doing

Intel asserts that the tablet is broadening the PC market, not shrinking it, and we agree. Tablets are wonderful for what they are, but it seems likely that the PCs of tomorrow will have the best qualities of both a tablet and a PC. If not, people will continue to need tablets for some uses, and PCs for others (which is fine with us, too!). Intel's new Atom chips are making their way into an increasing number of new tablets and smartphones – and Intel's chips continue to power the vast majority of all PCs, in whatever form they take. High-powered servers are also selling in record numbers as the cloud is built.

More Resources

- *Pro*'s recommendation history
- Talk about Intel on our discussion board

Intel is investing for greater growth in computing devices, period, whatever shape they take. Wall Street is leery of the company's expensive capital investment plans, designed to maintain its leading-edge manufacturing abilities, but we view this spending as a strong indicator for the company's future. Intel's confidence in the future of microprocessors seems well-placed in our increasingly digital age; as the number of devices connecting to the Web grows exponentially, so does the need for more computing power.

What We Expect

Historically, buying true blue chips (Coca-Cola, Johnson & Johnson, IBM …) when they're out of favor has been an excellent investment strategy. We believe Intel will fit that bill, too. Eventually, we believe Wall Street will realize Intel is here to stay -- and is indeed at the heart of a worldwide computing revolution. When that happens, investors will start to price the stock at a valuation that at least matches,if not exceeds, the market average. In the meantime, we can buy it at a good discount and enjoy a 3.7% yield, too.

Buy: MasterCard

Plastic is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.8%

What It Does

MasterCard (NYSE: MA) is among the most attractive businesses in the world. Here's why: The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a very large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ... it's cash. While MasterCard's stock price has risen since we recommended buying in September 2011, our thesis remains intact: Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives.

How It's Doing

More Resources

- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard on our discussion board

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — domestically and especially in developing nations. In the first nine months of 2013, MasterCard processed $2.1 trillion in purchase volume, $1.4 trillion of which came from outside the United States. Growth in its U.S. business was 7%, strongly outpacing our economy (as measured by GDP). And worldwide growth, excluding the U.S., clocked in at a tremendous 15.4% in local currencies. Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard.

What We Expect

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner. CEO Ajay Banga and team are doing a tremendous job moving the company forward, so much so that results have outpaced our expectations every quarter since we bought shares. We expect MasterCard will continue to surprise the world with its strong growth for years to come.

Buy: OpenText

This company's information management software keeps the digital lives of businesses in order.

Suggested Allocation: 3.1%

What It Does

OpenText (NASDAQ: OTEX) sells software that lets companies organize and manage their growing reams of electronic content. Its products help companies, governments, universities, and others operate more efficiently and effectively, meet compliance requirements, and communicate with colleagues, customers, and partners.

OpenText is the leading independent provider of solutions in the enterprise content management (ECM) market and a leader in the broader enterprise information management (EIM) industry. Its top competitor, **IBM** (NYSE: IBM), may be larger, but OpenText enjoys longstanding sales relationships with **Microsoft** (NASDAQ: MSFT), **Oracle** (NYSE: ORCL), and **SAP** (NYSE: SAP).

With its newly planned acquisition of privately held GXS Group for $1.1 billion, OpenText is also positioned to become the largest provider of business-to-business transactions in the world, ahead of IBM. This should lead to strong recurring, high margin, transactional revenue, and more customers to whom to cross-sell.

How It's Doing

More Resources

- *Pro*'s original recommendation (8/31/11)
- Talk about OpenText on our discussion board

OpenText has increased sales and cash from operations by more than 14% annualized over the past three years, and seeks to continue to grow by at least 10% annualized as its industry expands. Trading at 14.5 times free cash flow, the business is attractively priced to increase shareholder value by at least its annualized cash-flow growth rate.

What We Expect

Electronic content management industries served by OpenText should increase top-line demand by at least 10% annualized over the next several years, and OpenText should take market share, too. OpenText has a long history of steady growth through acquisition, and enjoys diversified software sales to multiple industries. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, exciting acquisitions in the works, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Buy First: Oracle

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.4%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell** (NASDAQ: DELL), and **Microsoft** (NASDAQ: MSFT) — Oracle's stock price has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

By combining its software expertise (both in the traditional sense and in the cloud) with its young hardware business, Oracle is poised to experience another period of growth. The business is incredibly sticky — companies don't trust their data to just anyone, and it can be tricky and even risky to make a switch. So to add to its revenue base, Oracle mainly needs to cross-sell new products to existing clients, while continuing to rope in new clients with its great breadth of modular software solutions.

How It's Doing

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability on which Oracle can grow.

Where is it looking to grow? Oracle is targeting new cloud software sales, software as a service (SaaS), and groundbreaking data hardware sales — and we're pleased with its progress to date and the prospects of all three.

More Resources

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle on our discussion board

In the fiscal year 2013 that ended May 31, Oracle's new software sales topped a record $10 billion, up 6% in constant currency. Non-GAAP earnings per share rose 11% to $2.68, non-GAAP operating margin hit an all-time high of 47%, and free cash flow hit a record $13.6 billion.

What We Expect

Wall Street loves growth, but it especially loves growth that comes with higher margins. Oracle trades at 11.4 times free cash flow, well below the S&P 500's average in the mid-teens. With management expecting more operating leverage ahead and growth in hardware sales, the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years. We expect the company's hardware and modular software combinations to continue to create a clear value proposition, driving new sales. We also expect Oracle's transition into more SaaS and cloud sales to go smoothly. With 390,000 customers, including all 100 of the Fortune 100, Oracle is the company we admire most and want to own in the enterprise software market.

Buy: Papa John's International

Deliver a slice of the profit pie right to your doorstep.

Suggested Allocation: 3.7%

What It Does

Papa John's International (NASDAQ: PZZA) operates and franchises more than 4,000 pick-up and carry-out pizza joints in more than 35 countries. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tagline. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract the best franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

How It's Working

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For nine consecutive years, the company has recorded positive or even North American comparable-store sales growth. Recently, international comps have been in the 7% range, offering lip-smacking evidence that Papa John's flavors travel well. It has opened more than 230 restaurants in both of the past two years, a pace which should continue. And because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it is taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management recently initiated a dividend and has consistently bought back stock over the years.

- [Pro's most recent update (10/18/13)]
- [Talk about Papa John's International on our discussion board]

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. We think the brand can easily support 6,600 worldwide locations by 2023. The company should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and new markets maturing, we believe 2% same-store growth is sustainable over this period. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: Starbucks

You only think you go for the coffee — Howard Schultz & Co. are serving up an experience.

Suggested Allocation: 3.4%

What It Does

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We think we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 19,700 stores in 60-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

How It's Working

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, Teavana tea bars, La Boulange bakeries) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

Recent results have been robust. Starbucks continues to add stores at a rapid clip, and its same-store sales have been growing by an astounding 7% per year. Earnings and cash-flow performance have increased even faster, and all of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings.

What We Expect

More Resources

- [*Pro*'s original recommendation](#) (8/22/12)
- [Talk about Starbucks on our discussion board](#)

Given its very recognizable brand, artfully crafted business, and fanatically loyal customers, we expect Starbucks' diversified growth to continue. We believe the world's coffee and tea drinkers will happily support 30,000 or so stores across the company's various brands, and that products bearing the aspirational Starbucks brand will expand the company's real estate on grocery-store shelves.

The company's scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is a pioneer in social marketing, and is perhaps better positioned than any other brand to reach out to its customers, nurture their relationship with the company, offer deals, and customize experiences.

Starbucks is riding high since CEO Howard Schultz's return to power in 2008, and it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. We're not worried that shares trade higher than our fair-value estimate; we think Schultz & Co. have many tricks up their sleeves that will allow Starbucks to grow into and beyond its current valuation, and we want to be along for the caffeinated ride.

Buy: Wells Fargo (WFC)

At heart, banks are simple businesses, and Wells Fargo is the best of the breed.

Suggested Allocation: 2.7%

What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 9,000 branches and 12,000 ATMs. It's the fourth-largest bank in America, it's consistently No. 1 in customer satisfaction for American large banks, and it's the leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Doing

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for the most recent quarter (Q3 2013) were very attractive, at 1.5% and 14% respectively — great results given that the bank is using less leverage than before the financial crisis. Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to record earnings. Deposit growth has been tremendous, and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is impressive and is continuing to improve. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with upcoming capital regulation requirements well ahead of schedule.

What We Expect

More Resources

- [*Pro*'s original recommendation](#) (12/10/10)
- [Talk about Wells Fargo on our discussion board](#)

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In the current low-interest-rate environment, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy firms up and loan demand resumes picks up, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

Shares are trading at less than fair value, and they yield a growing 2.8% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 2.7% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund

Diversification with some of the best small companies you've never heard of.

Suggested Allocation: 1.9%

What It Does
