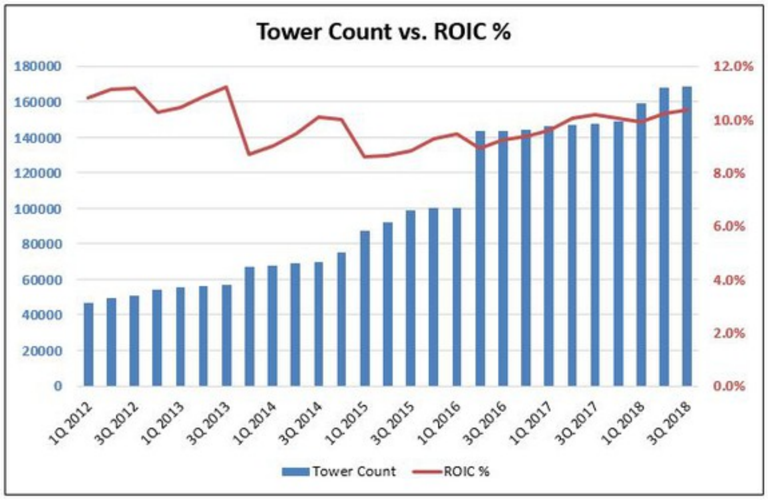
Strong Domestic Growth Continues at American Tower

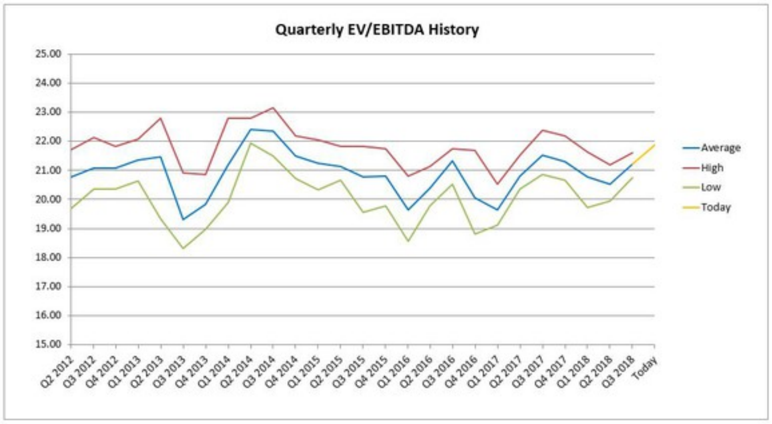
Published Dec 6, 2018 at 2:01PM

Strong U.S. growth continued at **American Tower** (NYSE: AMT) in the third quarter of 2018 as unlimited data plans from wireless carriers continue to gain acceptance and demand for mobile data continues to grow. Thanks to high levels of network investment activity from all four major U.S. carriers, American Tower expects a robust business environment to persist in the U.S. throughout 2018. Since the U.S. business represents 55% of property revenue and 65% of operating profits, this is great to see for American Tower shareholders.

As we expected, international growth should see ongoing weakness in 2018 and into 2019 because of the disruption in the Indian wireless market. However, management has reached an agreement with the Tata Group that will result in a one-time payment of ~$320 million in Q4 2018, offsetting some of the expected churn in India. The U.S. business continues to improve and the international business ex-India is also performing strongly, and American Tower remains on track to continue to increase its revenue and cash flow and expand ROICs across its growing asset base. ROIC in the third quarter of 2018 reached its highest level (10.4%) since 2013, when the company had just 57,000 towers (compared to nearly 170,000 today):



American Tower's stock has been able to easily weather the recent market correction, with the stock actually trading at all time highs as recently as late November. Due to the lease termination agreement with the Tata Group, 2018 guidance was revised sharply higher, leading to a positive reaction from the market. However, I'd caution that this agreement is a one-time benefit, and due to the recent stock price appreciation, American Tower is now trading at valuation levels that are at the high end of its historical range:



What Happened?

CEO Jim Taiclet:

> "In the third quarter, our U.S. property segment delivered strong Organic Tenant Billings Growth of 7.4%, reflecting ongoing investments in 4G technology by our tenants to meet ever-increasing data and video demand. Our International property segment also experienced strong demand for tower space, especially in Latin America. Normalizing for Indian Carrier Consolidation Churn, International Organic Tenant Billings Growth was 8%.
>
> Subsequent to the end of the quarter, we reached a comprehensive agreement with the Tata Group that we believe preserves our ability to achieve our long-term return on investment objectives in India. We expect that this agreement, along with the acquisition of approximately 20,000 Vodafone and Idea towers earlier this year, will position American Tower to benefit from the anticipated recovery in the Indian mobile market."

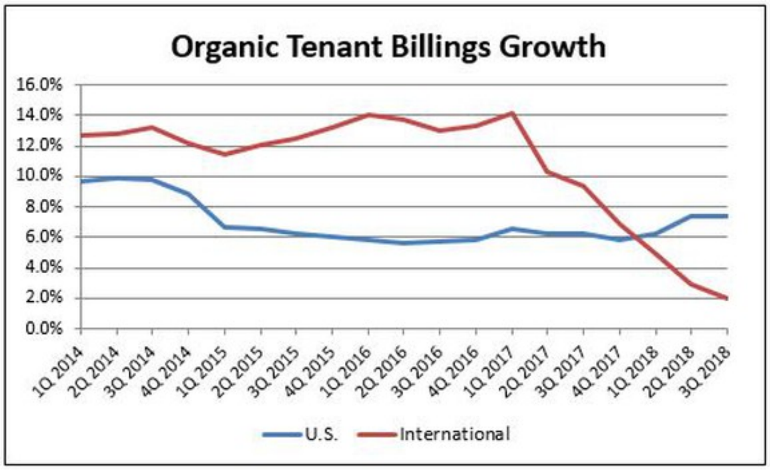
Get More

- Q3 2018 press release
- Q3 2018 supplemental materials
- Q3 2018 earnings presentation
- Q3 2018 10-Q filing

For the third quarter of 2018, organic growth in tenant billings came in at 7.4% in the U.S. and 2% internationally, vs. 6.3% and 9.3% in the same quarter a year ago.

The disruption in the Indian market continued into this quarter (as expected), with -12% organic growth in the company's Asia (i.e. India) division because of an acceleration in consolidation-driven churn. However, management was able to reach an agreement with the Tata Group (one of the carriers that bowed out in India's consolidating wireless industry), terminating the remainder of its leases in exchange for a ~$320 million one-time cash payment to be received in Q4 2018. As a consequence, elevated churn in India is expected to continue for longer than was previously expected (as a consequence of the lease termination agreement and the one-time cash inflow).

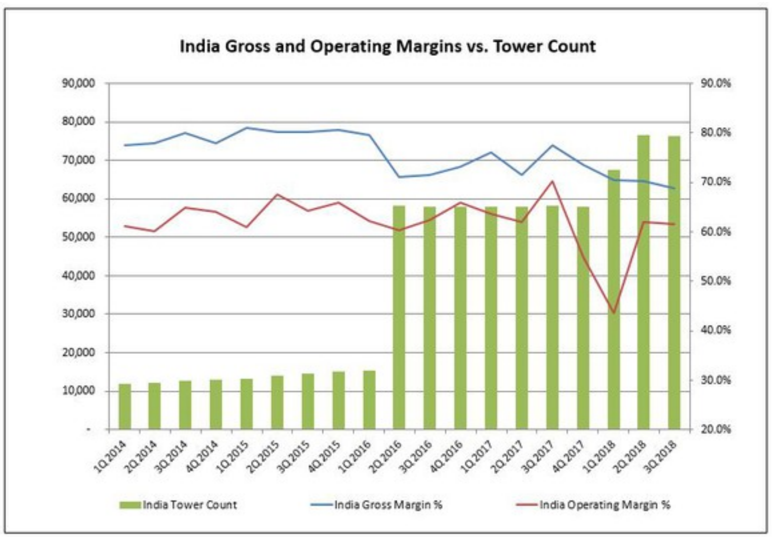
Outside of India, organic growth was more in line with historical growth rates, up 6.7% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda) and 11.4% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Paraguay, and Peru).



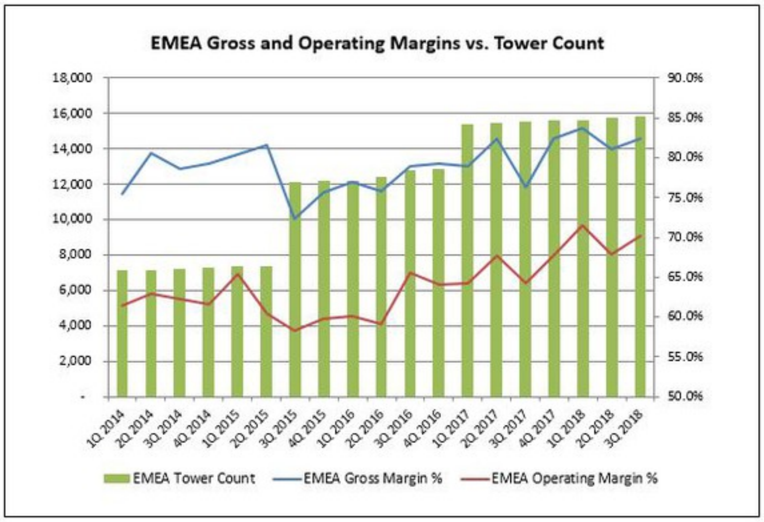
This is the third quarter in a row that U.S. growth outpaced international growth, and given the expected pressure in the Indian market, this result is unsurprising. Once the Indian market stabilizes, international growth should once again eclipse U.S. growth by a few percentage points.

So What?

As we expected, the Indian wireless carrier consolidation has continued to affect growth rates and margins in that market throughout 2018, and that should continue through the rest of the year and into 2019 as a result of the lease termination agreement with the Tata Group. This quarter featured the highest number of cancellations in the Indian market so far, and as a result margins declined slightly:

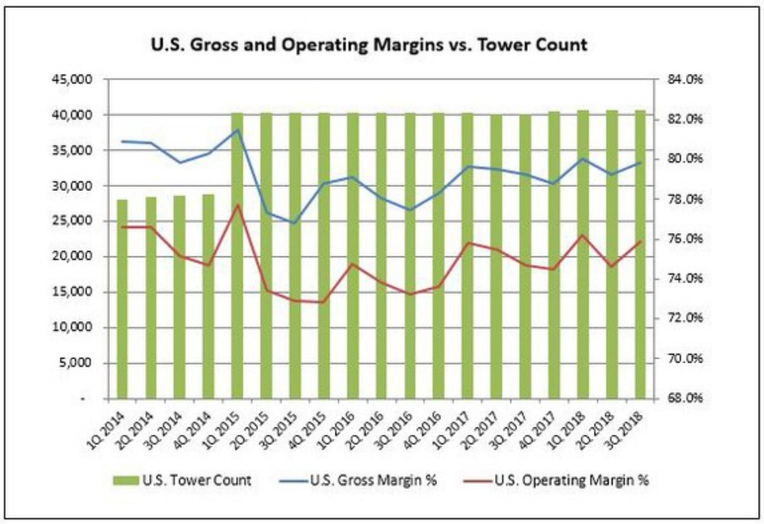


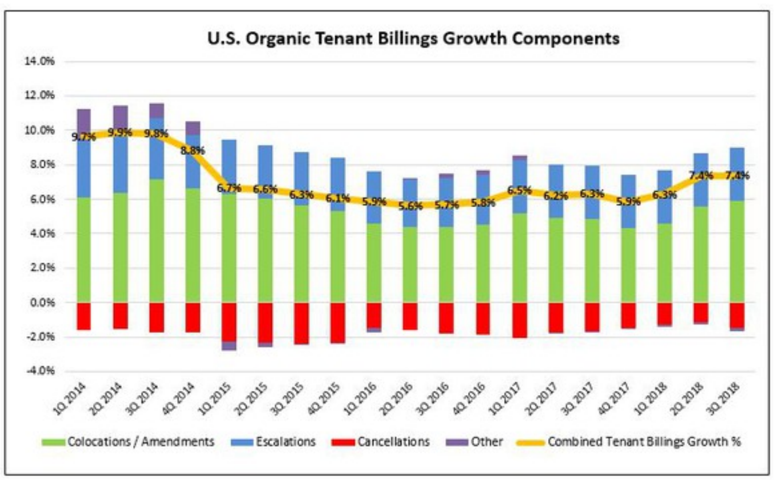
In Europe, the Middle East, and Asia (EMEA) and Latin America, margin trends are positive, and management expects margin expansion over time as the company continues to generate organic growth on its extensive existing portfolio of assets.



As a result, when combining all three regions of American Tower's international business, margins are trending upwards:

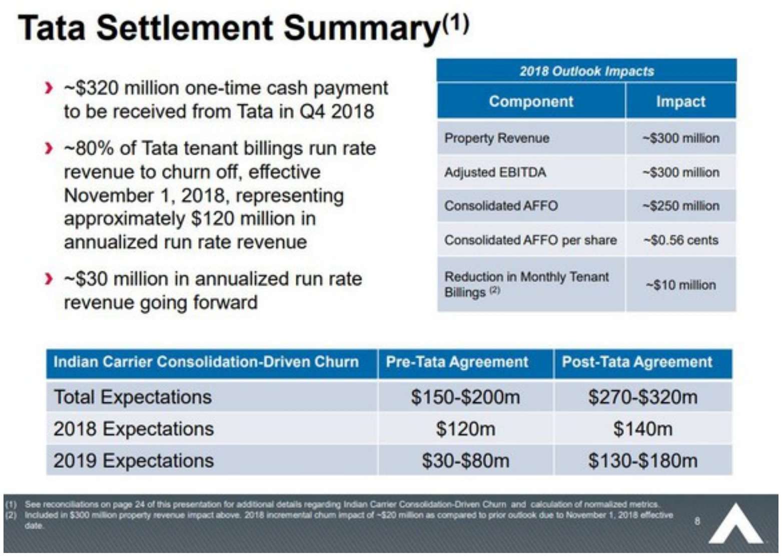
In the U.S., margins are continuing their steady trend upward. TTM gross margins increased year-over-year to 79.5% (from 79.2% a year ago), and TTM operating margins increased year-over-year to 75.3% (from 74.9%). Both the TTM gross and operating margins are at the highest level they've been since the Verizon acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (thanks to the lower tenancy ratio on those new towers). Management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets, and that trend looks set to continue:





Now What?

The third quarter of 2018 represented a continuation of trends that started in the fourth quarter of 2017, as American Tower continued to digest the impact of Indian carrier consolidation, reporting accelerated churn levels in its Asia segment. As a result of the recent lease termination agreement with the Tata Group, churn driven by this consolidation should continue to affect results into 2019 before stabilizing in 2020:



Tata Settlement Summary(1)

- ~$320 million one-time cash payment to be received from Tata in Q4 2018
- ~80% of Tata tenant billings run rate revenue to churn off, effective November 1, 2018, representing approximately $120 million in annualized run rate revenue
- ~$30 million in annualized run rate revenue going forward

2018 Outlook Impacts	
Component	Impact
Property Revenue	~$300 million
Adjusted EBITDA	~$300 million
Consolidated AFFO	~$250 million
Consolidated AFFO per share	~$0.56 cents
Reduction in Monthly Tenant Billings (2)	~$10 million

Indian Carrier Consolidation-Driven Churn	Pre-Tata Agreement	Post-Tata Agreement
Total Expectations	$150-$200m	$270-$320m
2018 Expectations	$120m	$140m
2019 Expectations	$30-$80m	$130-$180m

(1) See reconciliations on page 24 of this presentation for additional details regarding Indian Carrier Consolidation-Driven Churn and calculation of normalized metrics.
(2) Included in $300 million property revenue impact above. 2018 incremental churn impact of ~$20 million as compared to prior outlook due to November 1, 2018 effective date.

8

Aside from the Indian market, the rest of American Tower's business continues to perform well. Growth in the U.S. business is as high as it's been since 2014, and prospects for the rest of 2018 and beyond look strong with all four major U.S. carriers in the process of what management expects to be a multi-year rollout of 5G technology.

Data and Guidance

- Current Price: $162.10
- Fair-value estimate: $152 (from $146)
- Allocation: 4.5%, plus 0.8% in January 2019 / January 2019 $80/$135 bull call spreads
- EV/EBITDA (TTM): 20.35

AMT moves to Buy (from Best Buy Now) on valuation, and its fair value increases to $152. We also have 0.8% in bull call spreads, which expire in January. With American Tower trading above our estimate of fair value, we're unlikely to roll out this leveraged position and would recommend closing the bull call spread before the next ex-dividend date, which is on December 27th. Right now, the midpoint of the bid/ask spread for the January 2019 $80 / $135 bull call spread is $54.90 (with a maximum spread value of $55). If you can close the spread for this amount or higher, that would be a good choice. Make sure to close the spread before the ex-dividend date, otherwise you risk being assigned on the short call and owing the dividend payment, which would detract from the returns on the spread.

News about Motley Fool Pro

Published Dec 6, 2018 at 7:46AM

Dear Fool,

I want to start this difficult note by saying how proud I am to have served members like you for more than a decade.

As many of you may remember, we opened *Motley Fool Pro* during a time of extreme economic uncertainty — calamity, really — and we were unsure whether you'd join along with us. But join us you did.

And despite the fact that we launched *Pro* right in the middle of the Great Recession, over the past 10 years the *Pro* portfolio returns have been far ahead of our own inflation-crushing goal and well ahead of the market indexes, too, helping members reach higher financial peaks.

That's why it's with mixed emotions that I share today's news with you:**After 10 years of running this service, I've accepted an opportunity to launch a private investment vehicle that is inspired by the *Pro* strategy and managed by a sister company.**

I think the timing seems right for a choice like this. With the *Pro* portfolio reaching a major milestone, and with The Motley Fool, LLC, evolving its product offerings, *Pro* is at a crossroads. Meanwhile, for years, many of you have been asking, "Why can't you do this *for* me?"

This does mean the Fool will be closing *Pro* over the next month, as my colleagues and friends strongly believe the service is synonymous with an investing approach that centers on its manager.

Below, I share a little more about how I reached this decision, but first, I want to provide details so you know what to expect for your membership.

First and foremost, we want you to know that we are 100% committed to meeting each and every one of our members on their terms and delivering them solutions and guidance that we believe meets their wants and needs.

So, although *Pro* will be winding down over the next month, please rest assured that for Fools who want to continue to do all their own research and trading with our help, we'll make sure you receive ongoing coverage. For many of you, this is your nest egg that you've been managing based on this guidance, and the Fool could not take that project more seriously.

To that end, in the coming year, spearheaded by *Pro* contributor Billy Kipersztok, you'll continue to receive quarterly updates on all *Pro* holdings, letting you know if any guidance has changed to Hold or Sell, as well as thoughts about how to incorporate new Motley Fool ideas into your portfolio.

Billy, of course, has been a key analyst on *Pro* for five years, and along with the quarterly updates, he will update you on all positions as needed — and we'll send you these email updates even if you decide not to remain an active Motley Fool subscriber.

The team has also put together a 2018 Pro Portfolio Review, including a summary of all of the portfolio's positions as well as what to expect from each investment going forward. You can check out Part 1 of this report right here. Or simply go to **profinalreport.fool.com**. We'll send you Part 2 in the coming days. Remember, the portfolio is invested with the next three to five years in mind, and that has not changed today.

As for adding new investment ideas to your portfolio, our team has worked to set you up with the best choices we have to offer for delivering the Fool's top recommendations to you. For details on the *Pro* loyalty package, members can reach out to our Member Services team at help@fool.com.

It's important that you have choices when it comes to TMF serving your needs, so if you'd like to change what you're getting, our friendly reps will work with you to get you set up well.

Reflecting on a decade together

Ten years of *Pro* have represented 10 years of life — for all of us, momentous moments have transpired in that time.

For me: My wife and I watched our son grow up from 3 years old to 13; we've lost parents and loved ones; we've seen four nieces and nephews born! And we've all seen new companies rise from nothing on the public markets to create fortunes, while our country has gone through triumphs and struggles.

As much as I love *Pro*'s sister service, *Motley Fool Options*, the real-money *Pro* portfolio has been the biggest bell on the Foolish jester cap I've been knitting. And while I'm excited about what's next, this community we share makes it all the more difficult to leave this service that I love to go risk something new.

I'm proud of what we've achieved as a community. The friends I've met along the way, what we've learned together, and that so many of you had amazing courage to stand up and join *Pro*'s endeavor right at the start — despite the market environment — will always resonate with me.

Really, though, whether you joined in 2008 or 2018, I appreciate that you placed your faith in the team and me. And I love that you joined our merry band of Foolish investors looking to grow our portfolios strongly while tamping down risk along the way.

I hope that you are happier, and are better off financially, than you were a few years ago, let alone 10 years. As much as that, I hope you are now more confident than ever as an investor, with more tools in your toolbox to make money in any market.

Where you'll find me next

As I work to launch the new company, J.P. Bennett has joined me, and we're eyeing a launch in early 2019. And you'll be among the first to know about it. After more than 20 years of investing fully in the public eye, and of pre-announcing every trade being made, I'm excited to start a *Pro* philosophy long/short vehicle that will invest in private and in real time.

This new project **will initially be open only to a limited audience — including our eligible loyal *Pro* followers.** And I hope to serve as many interested and qualified *Pro* members as possible, ideally for at least another decade.

To all of you who have made career choices in the past — which I'm guessing is almost all of you — thank you for understanding how this change could come about. Even though I'll miss talking and investing with you here each week in *Motley Fool Pro*, I look forward to the new possibilities and the challenges of this new endeavor. Thank you for everything, Fools.

More to come,

Jeff Fischer

P.S. — I hope you'll understand that, due to the many legal and regulatory restrictions surrounding this new venture, I can't give you any further concrete details about it here in this note.

However, please know that the team and I are working round the clock not only to get this new venture up and running... but also to make sure that you have all of the pertinent information about this new offering as soon as possible.

With that in mind, I'd ask you to please keep a close eye on your inbox in the coming days so that you can stay up-to-date on all the latest developments and need-to-know news.

Johnson and Johnson Demonstrates Resiliency

Published Dec 4, 2018 at 12:59PM

Third-Quarter 2018

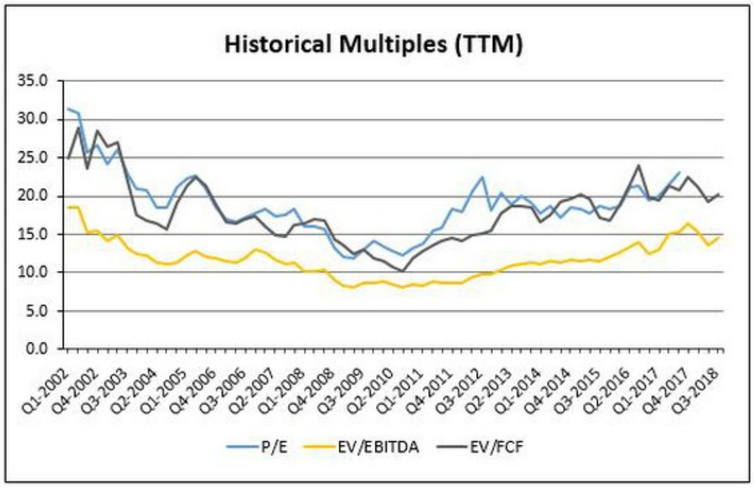
- Press Release
- Earnings Presentation
- Supplementary Sales Data
- Sales of Key Products & Franchises
- 10-Q Filing

Johnson & Johnson (NYSE: JNJ) continued its strong pharmaceutical segment performance in the third quarter of 2018, reporting 8.2% operational growth in pharmaceutical sales. Companywide operational sales growth (i.e., ex-currency and ex-acquisitions) came in at 6.1% for the quarter. On an adjusted non-GAAP basis, J&J posted 7.9% year-over-year earnings-per-share growth for the third quarter. Management increased its operational sales growth guidance for 2018 to 5.75% growth (from 5%) and increased its guidance for adjusted EPS growth to 11.6% (from 11.2%). Since reporting Q3 earnings on October 16, the stock has increased by nearly 11%, with the market assessing the quarter's results favorably.

- **Updated guidance**: Buy (no change)
- **Recommended allocation**: 3.1%, with January 2019 $140 covered calls.

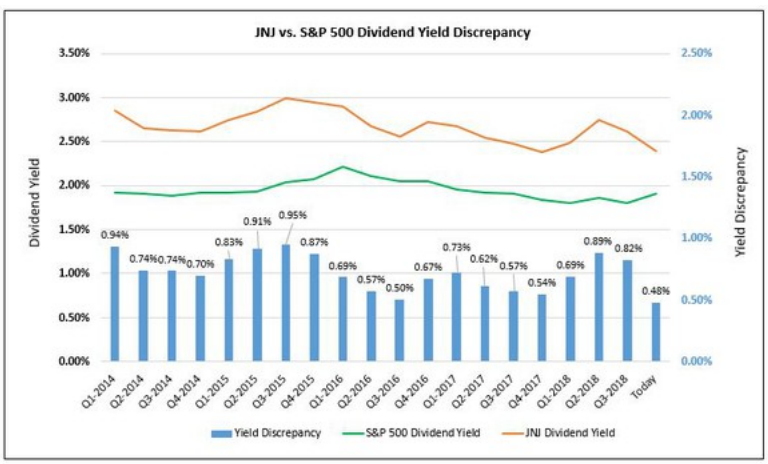
- **Fair-value estimate**: $143 (from $140)
- **Current price:** $148.64

At $148.64 per share, the stock is priced at 16.2 times trailing-12-month (TTM) EBITDA and 22.6 times TTM free cash flow:



Based on management's guidance, J&J is priced at about 18.2 times 2018's expected non-GAAP earnings -- above the S&P 500, which is trading at about 17 times expected 2018 earnings estimates. The stock has fully recovered from its 2018 lows (a 52-week low of $118.62 set on May 29th), setting a new all-time intra-day high today of $148.97. J&J's stock price demonstrated excellent resiliency during the recent market correction; during the period between September 21 and October 29 (when the S&P 500 declined 11.5% peak-to-trough), J&J's stock price declined just 3.7%. This is exactly the type of price stability we expect to see during downturns from a stock we've consistently called one of the safest you are likely to find in the entire investment universe.

However, due to that price stability and the recent highs achieved by the stock, J&J's relative valuation compared to the S&P 500 is as unfavorable as it's been since its inclusion in the Pro Portfolio. Because J&J has such a consistent history of dividend payments, one of my favorite ways to monitor the company's relative valuation is to compare its dividend yield to that of the S&P 500. This comparison strips out the confounding effect of interest rates that occurs if you look at J&J's dividend yield in isolation (since dividend-paying stocks tend to fluctuate in price alongside interest rates). When we make this comparison, the yield discrepancy between J&J and the S&P 500 is as narrow as it's been since we started covering the stock:

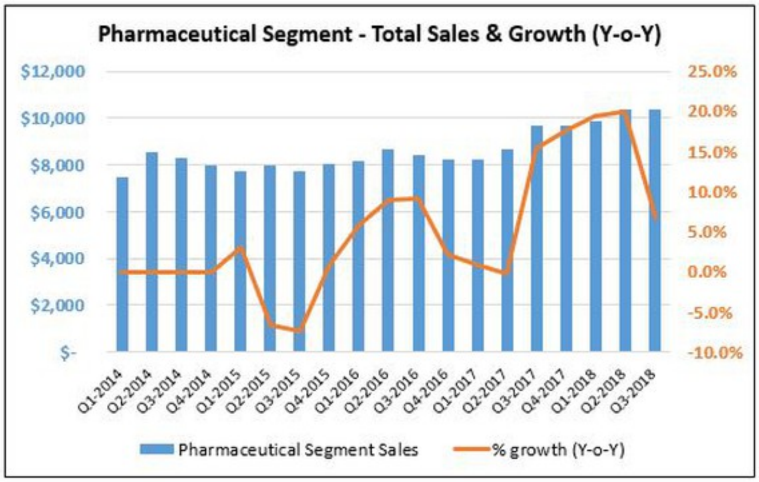


Since 1999, the average yield discrepancy between the S&P 500 and J&J has been 0.61%, and it's currently at 0.48%.

Our fair-value estimate increases to $143, and Johnson & Johnson remains a Buy (with overlaid January 2019 $140 covered calls). Our covered calls are currently in-the-money by 6.2%, and due to the narrowing of the relative valuation between J&J and the S&P 500, we don't plan to roll our calls up and would be content to let our shares go at $140 in January. However, if the stock declines below $140 by January, we'd be happy to hold our shares (and potentially write new covered calls, depending on the stock price and valuation).

Division Performance

J&J's pharmaceutical division finally saw a lapse in acceleration in the third quarter, growing at 6.7% year-over-year compared to 20% last quarter:



The reason for the deceleration of growth is the lapping of the company's 2017 Actelion acquisition, as we're no longer seeing acquisition-related growth. The 6.7% organic growth from the pharmaceutical segment represents strong performance and still leads companywide growth, as the consumer segment grew 2% year-over-year and the medical device segment was flat. On a currency-adjusted operational basis, pharmaceutical growth was 8.2%.

Drugs in the oncology market continued to lead the pace, with Darzalex sales up 57%, Zytiga sales up 43%, and Imbruvica sales up 38%. We expect the pharmaceutical division to continue to be the predominant driver of growth for Johnson & Johnson.

Our Thesis

Johnson & Johnson is is a diversified health-care conglomerate, with more than 260 operating companies organized into three business divisions: consumer, pharmaceutical, and medical devices. At eight out of eight of our *Pro* quality criteria, J&J is a quintessential *Pro*-quality stock. While its large size means we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk from one of the safer stocks you are likely to find in the entire investment universe.

Pro: What to Do Next

Published Dec 4, 2018 at 10:00AM

Introduction

Dear *Pro* member,

For as long as *Pro* has been in existence, we've aimed to own every stock we recommend for at least three years, and ideally longer. And as Jeff and JP leave to pursue their next Foolish opportunity in hopes of continuing to serve investors well, we maintain that three-year outlook on everything *Pro* owns.

It's true that some of our stocks have required at least three years of patience already. But we continue to believe those stocks will eventually produce pleasing returns -- otherwise, we wouldn't still be holding them. As always with investing, act logically and slowly as you go forward. When managing a diverse portfolio that has a long-term outlook, it's rarely in your best interest to rush. Overall, remain calm and optimistic about your investments; they're well-vetted!

Also, please remember that while we all invested together in *Pro*, in the end being part of this service means you made every decision yourself. That means you can and should be confident in your *next* decisions, too. We're here to help you with any choices you might want to make now, or in the coming 12 months as our coverage continues. We've separated our long positions into three "tiers" of conviction. Let's get to it!

Summary by Tier

Tier One: These are the companies we feel most confident about owning over the next three to five years.

- ***New Dec. 10 --*** **Adobe Systems** (NASDAQ: ADBE): A digital-content powerhouse with stellar financials.
- ***New Dec. 10 --*** **American Tower** (NYSE: AMT): Long-term contracts make this business stable.
- ***New Dec. 10 --*** **Broadridge Financial Services** (NYSE: BR): Dominance in shareholder services.
- **CME Group** (NASDAQ: CME): Volatile markets help this business.
- ***New Dec. 10 --*** **Mastercard** (NYSE: MA): Plenty of growth left.
- **Medtronic** (NYSE: MDT): Stability alongside strong earnings growth in a defensive sector.
- **Paycom** (NYSE: PAYC): A long runway will help it keep growing and growing.
- **Verisk** (NASDAQ: VRSK): Pricing power and customers that aren't going anywhere.
- ***New Dec. 10 --*** **Visa** (NYSE: V): We like owning both MasterCard and Visa.

Tier Two: We have great reason to own these companies over the next five years, too, but we think they are at least modestly more risky (either in terms of valuation or business growth) and/or their futures less certain than those of Tier One businesses right now.

- **Amazon** (NASDAQ: AMZN): Its market capitalization means it must keep producing meaningful business growth.
- **Apple** (NASDAQ: AAPL): Smartphone growth is a question, but we believe in the ecosystem and management's ability to keep expanding free cash flow.
- **Facebook** (NASDAQ: FB): Management absolutely must improve. If they do, the stock is cheap. Its properties are still among the most valuable online.
- ***New Dec. 10 --*** **FactSet Research Systems** (NYSE: FDS): Stability and growth despite recent industry headwinds.
- **NVR** (NYSE: NVR): Excellent management should see it through any housing downturn.
- **Oracle** (NYSE: ORCL): We hope to see more cloud success in 2019, but we know there's risk in the growth rates achieved.
- **Skyworks Solutions** (NASDAQ: SWKS): We like it, but its fate still remains closely tied to iPhone sales.
- **Square** (NYSE: SQ): A young powerhouse in the making. We like Square but expect price volatility.

- **Starbucks** (NASDAQ: SBUX): We're watching U.S. same-store sales.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Of China's Internet leaders, we like Tencent best.
- **Zuora** (NYSE: ZUO): This recent software IPO has long-term promise.

Tier Three: Yes, we still like these businesses, too (that's why we still own them), but we have more concerns about them than the others. If you're looking to raise capital, we'd start here. (In Johnson & Johnson's case, we can let covered calls do their work -- or keep the stock if they don't.)

- **Coherent** (NASDAQ: COHR): Low visibility to intermediate-term growth puts this one in our third tier even though the long-term business remains healthy.
- **JD.com** (NASDAQ: JD): Major founder issues gives us major pause right now. This one's a tax-loss candidate.
- ***New Dec. 10 --*** **Johnson & Johnson** (NYSE: JNJ): Our $140 covered calls may sell our shares for us. If not, J&J is Tier Two quality.
- **OpenText** (NASDAQ: OTEX): Consider moving these funds into a stronger, growing software company if you're so inclined. OpenText's reliance on acquisitions is starting to look a bit tired lately.

New Dec. 10 -- **Diagonal Call:** **Home Depot** (NYSE: HD). A well-managed free-cash-flow machine.

Short Call: **Sonos Inc.** (NASDAQ: SONO). Our short thesis is still tracking nicely.

Companies by Name

Adobe Systems

Tier One: These are the companies we feel most confident about owning over the next three to five years.

Adobe is the undisputed king in the creative-software and digital-marketing space, providing industry-standard products and services used by creative professionals to create, deliver, manage, and measure multimedia content and experiences. The company has been executing nearly flawlessly since its then-radical 2013 pivot from legacy product licenses to a cloud-based subscription model.

Adobe has expanded its total revenue from $4 billion to $8.6 billion over the past five years, a 17.1% compound annual growth rate. Over the same time span, subscription revenue as a percent of total revenue has grown from 35% to 88%.

Adobe made two significant acquisitions in 2018: Magento in May for $1.68 billion and Marketo in September for $4.75 billion. The former boosts Adobe's capabilities in digital commerce, and the latter gives it an edge in business-to-business marketing sales lead management. Management has an excellent track record for acquisitions, and these in particular should help fortify Adobe's strong competitive position in its markets.

Adobe's valuation multiples are rich -- it's currently trading at 52 times earnings and 35 times free cash flow -- but strong business momentum should allow the stock to grow into its valuation over time. This is a growing, high-quality business that operates with competitive advantages in two complementary markets, digital content creation and digital advertising, both of which have strong secular tailwinds. And that should lead to a strong chance of North Star-beating returns over the long run.

Amazon.com

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

An integral part of its customers' lives that makes their existences easier in a myriad of ways, Amazon is near or at the top of the list of the most powerful and admirable companies operating today. From its first $25 book sale in 1995, to $220 billion in trailing-12-month revenue as we speak, Amazon has consistently defied skeptics while expanding its product line, warehousing footprint, and delivery capabilities. Today the company achieves strong free cash flow, too -- and, yes, profits.

Lately priced at about $1,500 per share, the stock trades at about 50 times free cash flow and 64 times projected one-year earnings. That gives Amazon relatively little room to disappoint in the short term. So when management announced in its guidance last quarter that fourth-quarter sales might only increase about 15% year-over-year, Wall Street was disappointed. But we continue to think longer-term with Amazon, and we believe it has such a strong position in online retail that its own worst enemy is itself. Amazon needs to keep customers' trust (because there are plenty of competing online sellers) and also thread any regulatory needles carefully.

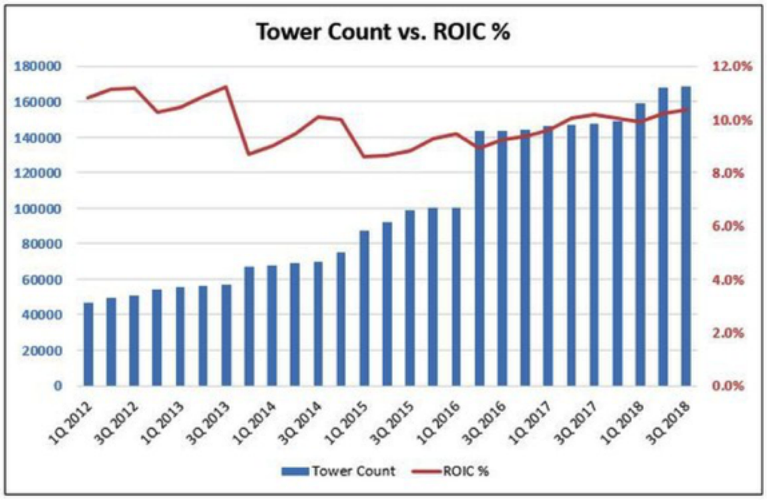
But overall, we believe Amazon will continue to be a winning investment over time and that management will continue to push itself to improve and evolve. That means it's hard to imagine our portfolio *without* a reasonable stake in this business. But be prepared for share-price volatility, perhaps quarterly, as investors start to digest slower growth rates from this giant.

American Tower

Tier One: These are the companies we feel most confident about owning over the next three to five years.

Despite its name, American Tower is actually the most global of the three major U.S.-based tower operators (the other two being Crown Castle and SBA Communications). The company has shown us steady growth, both organically and through significant acquisitions, since its addition to the *Pro* portfolio. It now operates nearly 170,000 towers across 16 countries, compared with 55,000 towers across 11 countries when we first recommended the stock in 2013.

American Tower benefits from excellent economics with high incremental returns on capital, leading to rising return on invested capital (ROIC) over time. In the third quarter of 2018, ROIC reached its highest level (10.4%) since 2013:



American Tower is a well-managed business operating in an industry benefiting from long-term secular tailwinds, and we expect continued strong growth as U.S. and international markets invest more and more in wireless technology.

In addition to our long stock position, we also have 0.8% in bull call spreads, which expire in January. With American Tower trading above our estimate of fair value, we're unlikely to roll out this leveraged position. We would recommend closing the bull call spread before the next ex-dividend date, which is Dec. 27. The in-the-money January 2019 $80/$135 bull call spread has a maximum spread value of $55, so use a limit order and hold out for as close to $55 per spread as you can. Make sure to close the spread before the ex-dividend date; if you don't, you'll risk being assigned on the short call and owing the dividend payment, which would detract from the returns on the spread.

Apple

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

If you think you're having déjà vu when it comes to negative headlines regarding iPhone demand and Apple suppliers, you're not the only one. Over the past few years, in addition to giving thanks and celebrating with loved ones, we've seen the emergence of a new holiday tradition: speculation on whether Apple's best days are behind it. A quick Google search of headlines at this time last year will show you countless articles about weak iPhone X demand and the way iPhone 8 production was slashed in half. Despite those fears, Apple's stock went on to soundly outperform the market -- until this latest round of fear-mongering started.

To be fair, Apple is partially to blame this year; management's decision to stop reporting unit sales has provided plenty of ammunition for those who want to herald the end of the golden age of the iPhone. But we remain optimistic that management will continue to grow its installed base of iPhones in the coming years, and we're also confident that the other business units (including the services division, which expanded by 27% this past quarter to $10 billion) will continue to thrive, making them more than capable of offsetting any future weakness in iPhone unit sales. At just 13 times forward free-cash-flow estimates after the sell-off, the stock appears to have a lot of bad news already baked into the price, providing long-term minded Fools with an attractive entry point. We eye 2019 with a definite plan to keep our shares.

Broadridge Financial Services

Tier One: These are the companies we feel most confident about owning over the next three to five years.

The *Pro* portfolio contains more Broadridge than almost anything else (except Mastercard), which means we have a high level of conviction in this investor communications management and global securities processing giant. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy portfolio anchor.

The stock has been in a slump recently, declining after its most recent earnings release amid market-wide volatility among technology companies. Since reaching an all-time high of $138.24 in mid-September, Broadridge's stock price has declined by more than 28% as of this writing. There were some surface-level factors in the most recent earnings report that likely contributed to the market's current negative sentiment on the stock, but nothing to suggest that our long-term investment thesis is impaired. In fact, this quarter's results support the argument that Broadridge's business continues to strengthen. After the recent sell-off, Broadridge's P/E multiple is as low as it's been since the fiscal second quarter of 2018 (late calendar 2017), when the stock price ranged between $80 and $90 per share. Our fair-value estimate of $117 per share means we think Broadridge is a bargain at current prices, and we're confident in North Star-beating returns from the current share price.

CME Group

Tier One: These are the companies we feel most confident about owning over the next three to five years.

As we hoped when we recommended it at the beginning of this year, CME Group's stock has benefited from interest rate hikes and market volatility. The more volatility in the markets (and commodity markets), the more investors use futures contracts to manage risk, leading to record volume in futures contracts at CME. With some of the strongest operating margins of any company in the S&P 500, CME is a financial powerhouse that's expanding overseas, too.

A leader where liquidity is key and network effects create competitive advantages, CME Group should continue to pay a healthy dividend that nets an annual yield of about 3% to 5% (we'll learn the amount of the latest special annual dividend soon) -- and that's on top of healthy historical share-price appreciation. CME Group will be affected by ups and downs in trading volume, which sometimes wanes during periods of greater stability, but as we've seen over the past 10 years, the business and stock can excel nonetheless. All else being equal, that makes us confident that we want to own the stock over the next several years, and ideally as a permanent fixture in the portfolio if merited.

Coherent

Tier Three: We still like these businesses, too, but we have more concerns about them than the others. If you're looking to raise capital, we'd start here.

Our worst-performing stock this year, Coherent has issues we've long been exploring. China's retaliatory tariffs on U.S. technology companies have hit this business significantly, and some execution issues at Coherent didn't help. As of the Nov. 6 conference call, management expects 2019 revenue to decline by 8% to 12% compared with 2018 results. Earnings per share will decline year-over-year, too.

On the plus side, Coherent remains an industry leader with strong profits and free cash flow (both of which should continue next year), and the stock, lately priced at about $130, trades at only 12 times expected earnings for the year ahead. Even so, Coherent is among our few Tier Three businesses -- ones we would consider selling to raise capital if you need to, or if you want to take the tax loss and invest the funds somewhere you like better.

Coherent still looks well-positioned to continue to serve the lasers that make our increasingly digital lives possible, including as the Internet of Things takes off and smartphones keep selling. Thus, we continue to believe in its long-term potential for pleasing returns. But we also have exposure to these trends through Apple and Skyworks, among others, so trimming here -- in one of our more cyclical businesses -- could make sense if you want to.

Facebook

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

It's difficult to discern to what extent Facebook's woes are its own fault and to what extent they were unavoidable, given its stature as the largest community ever gathered. The spread of hateful content, false news, and even paid advertising could have been curtailed much earlier, it seems, if management had taken the risks seriously enough from the start. Instead, it seems the issue was pushed aside — or at least pushed down the road. Now, management is spending billions to try to repair the problem, but there's no amount of money that can easily fix a damaged reputation.

At the same time, we have to cut management some slack for their youthful inexperience (CEO Mark Zuckerberg is 34), the novelty of their business, and the gravity of the issues pressuring them -- as long as they're acting honestly and in good faith. That's what we need to be confident about, if we're going to remain investors.

Financially, there is little to argue with so far. But the further Facebook slips in the public trust, the greater the risk that people will abandon its properties, in which case advertising dollars will start to face strain. We're not near that point today. Third-quarter revenue was up 33%, to $13.4 billion. Expenses rose by 53%, to $7.9 billion, but Facebook still generated impressive profits. Increased spending will continue through 2019, but Zuckerberg said, "I know we need to make sure our costs and revenue are better matched over time, and that's something I'm focused on as well."

From a financial perspective, that was the key statement in the third-quarter conference call. Spending velocity will ultimately subside — nobody can keep hiring and investing at this torrid pace — and revenue should keep growing until the two metrics are better aligned again. But it feels as though Facebook can't afford many more missteps before droves of people begin to lose trust in it entirely. The company is on thin ice right now, and the stock price reflects that.

Lately $131 and down about 28% year to date, the stock trades at 17.5 times expected earnings for 2018 and 2019 and 15 times expected earnings for 2020 (when net income is expected to expand more strongly again as spending cools). Should the business prove resilient, these prices will be too inexpensive to last. **Alphabet** (NASDAQ: GOOG)(NASDAQ: GOOGL) has averaged a 29.3 P/E ratio over the past 10 years with a much, much lower operating profit margin than Facebook has today -- even as the latter spends egregiously.

Facebook is lately our third-largest holding. We are comfortable enough to maintain our stake, though we definitely expect much better from management than the things we've been reading about (even if not all of the reporting tells both sides). We hope, and believe, that our long-term faith will ultimately be further rewarded, but we need to have renewed trust in management if we're going to stay committed to the stock for many more years to come. That means we must all be watching management now, and we need to be patient -- because of higher expenses, 2019 earnings may not grow much at all. That said, this should set the stage for stronger earnings growth in 2020, with Facebook already being well prepared for that year's presidential election.

FactSet Research Systems

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

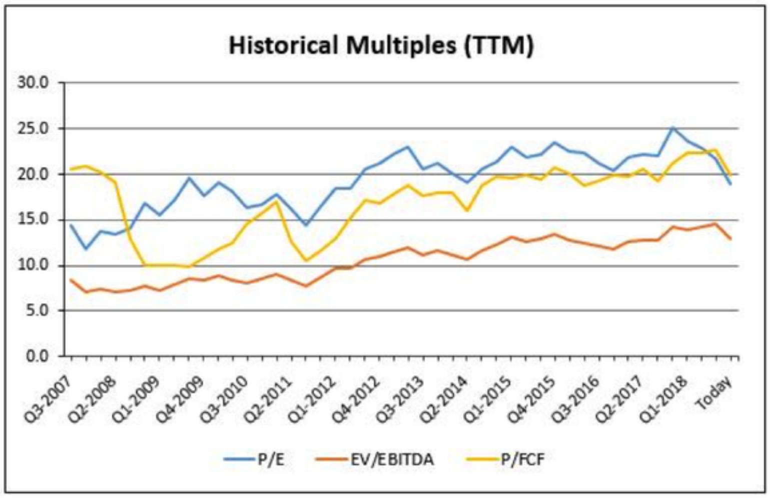
Combining proprietary data and software analytics with data from 220 suppliers, 115 news sources, and 85 exchanges, financial information provider FactSet is a great example of the type of "compounding machine" we seek in *Pro*. This company has reported 37 straight years of revenue growth, and it fits eight out of eight of our *Pro* quality criteria as shared in the original buy report from May 2016.

FactSet's unique data offerings become embedded in its clients' workflows, leading to strong retention rates (95%), significant pricing power (5.7% organic growth in annual subscription value in fiscal 2018), and high free-cash-flow margins (26% in 2018). FactSet's management has also returned an average of 92% of free cash flow to shareholders since 2013. These factors have helped contribute to FactSet's quiet outperformance -- since its inclusion in the *Pro* portfolio, FactSet has generated a 15% compound annual growth rate via capital appreciation and dividends, well above our North Star. With its pricing power and consistent growth, FactSet is a high-quality business that has a good chance of producing healthy long-term returns.

Home Depot

Diagonal Call

Like Broadridge, Home Depot has gotten caught in a downtrend since mid-September, falling from a high of $215.43 to recent prices of about $175 per share -- a decline of nearly 20%. Also as with Broadridge, the falling stock price does not correlate with a weakening business. In the most recent quarterly report for Q3 2018, Home Depot reported 5% year-over-year revenue growth, 5.1% U.S. comps growth, 28% online sales growth, and 36% growth in earnings per share. As a result of the recent downtrend, Home Depot is trading at a P/E multiple of 19, which we haven't seen since 2014:



Home Depot is a well-managed free cash flow machine that has posted consistent sales growth amidst a strong housing market, and as with our other housing-related investment, **NVR**, we believe our original long-term thesis is intact. Our January 2020/February 2019 $110/$185 diagonal call is humming along nicely, with a simple return (so far) of 16% in just more than a year, and with our short call expiring in a couple of months, we'd look to keep this position going by rolling out and/or up (if necessary) or writing a new diagonal call for more income, depending on where the stock price lands by February expiration.

JD.com

Tier Three: We still like these businesses, too, but we have more concerns about them than the others. If you're looking to raise capital, we'd start here.

Ahh, JD. If a bear market for Chinese stocks and concerns about a slowdown in that country's economy weren't enough, JD's management is also dealing with fallout after the U.S. arrest of its CEO, Richard Liu, on allegations of sexual misconduct. Recently, we've seen the company -- and Liu -- trying to assuage fears of "key man" risk, with Liu staying largely quiet during recent earnings calls and announcing a shift in his focus toward new business ventures. However, to date these tactics haven't done much to help.

Also notable was Liu's conspicuous absence from the World Internet Conference this year, and the fact that he wasn't invited to (or declined to attend) a recent symposium with Chinese President Xi Jinping. We could interpret these things as Liu preferring to lay low until his legal issues come to a conclusion, but a skeptic might wonder whether Liu is preparing for an exit and/or whether he has fallen from the good graces of the Chinese government.

Unfortunately, all of this is happening during an investment year for the company as it builds out its logistics business, which has hurt margins and given investors even more reason for doubt. Although our original thesis was never predicated on Liu being the next Jeff Bezos, we'd be lying if we said we weren't concerned about the effects the Liu situation is having on JD.com. At a minimum, it's likely a major disruption for management and a negative hit to employee morale. Outside of a recovery in the Chinese market, we're struggling to find an immediate catalyst for the stock. That makes JD a strong candidate for selling for tax purposes before this year is out; you can then reassess whether it's worth repurchasing shares (once your 30 days are up for wash-sale rules). This thinking puts it among our few Tier Three stocks.

Johnson & Johnson

Tier Three: We still like these businesses, too, but we have more concerns about them than the others. If you're looking to raise capital, we'd start here.

We've slotted this one into Tier Three mainly because we've written January 2019 $140 calls on the stock and are prepared to let our shares go by expiration if necessary. But Johnson & Johnson's business has performed right in line with our expectations ever since we brought it into the portfolio in early 2017. Although the consumer and medical-device divisions have seen sluggish growth, the larger and more important pharmaceutical division (which makes up 51% of companywide sales and 61% of operating profit) has been leading the way. Sales there have expanded by 26% since the end of 2016, with particularly strong performance from the company's oncology drugs. And the stock has held up well during the recent market correction; it's declined much less than the market as a whole and even reached new all-time highs recently.

The J&J position has been a steady performer for us via capital appreciation and dividends, and we've been augmenting the position's return with three separate rounds of covered calls, as well. Our January 2019 $140 calls are currently in-the-money, and given the stock's valuation, we'd be content to let our shares go at $140 in January; that would result in a 22% simple return (11% CAGR) since the position's inception. However, if the stock declines below $140 by January expiration, we'd be happy to hold our shares and potentially write new covered calls, depending on the stock price and valuation.

Mastercard

Tier One: These are the companies we feel most confident about owning over the next three to five years.

The second-largest payments processor in the world (behind fellow *Pro* holding Visa), Mastercard makes money as an intermediary between banks around the world, generating revenue based on the gross dollar volume ("GDV") of activity on the products that carry the Mastercard brand. In 2017, Mastercard products processed $5.24 *trillion* in GDV, demonstrating the size and scale of this global financial giant. (For context, global GDP in 2017 amounted to about $80 trillion.)

And even though Mastercard is one of the largest publicly traded companies in the world by market capitalization, the business is still growing at high rates; in the third quarter of 2018 (on a currency-neutral basis), GDV rose by 13%, net revenue expanded by 17%, and earnings per share were up 36%. Mastercard's strong organic growth is a result of the company's key position as an intermediary in the global economy, robust global economic activity, and continued penetration of electronic payments. Revenue growth looks likely to remain strong, with management expecting "low-teens" revenue growth for the foreseeable future. Mastercard is arguably Pro's most impressive long-term holding – among positions we've held longer than two years, it has the highest position-level CAGR at 28.5% per year since the position's inception in 2011. As Mastercard has proven over time, an asset-light, highly profitable business with healthy growth in organic revenue provides a strong recipe for impressive long-term returns.

Medtronic

Tier One: These are the companies we feel most confident about owning over the next three to five years.

Quietly but surely, Medtronic continues to expand its international sales by more than 10% a year, with a strong focus on China. The U.S. business maintains its dominance, too, placing among the top three in nearly every major area of focus across the medical-devices industry. Last quarter, organic sales were up 7.5% and earnings per share jumped more than 13% year-over-year.

The stock has been a quiet performer for the Pro portfolio, earning North Star-topping returns for the years we've owned it. Medtronic is promising more of the same, suggesting annualized sales growth in the mid-single digits that would lead to earnings-per-share growth of at least 10% annualized.

Health care is both a defensive sector *and* a good holding to have at all times -- assuming you own a business that is steady and growing. Medtronic fills both needs, providing some ballast in a volatile market, yet growing enough to please us. Should Medtronic's international sales begin to falter, we may need to revisit the thesis; we also want to see CEO Omar Ishrak stay in place. Overall, though, we're happy with how Medtronic is positioned, and we continue to foresee North Star-like returns from it. If anything, we could have made it a larger position during past pricing opportunities.

NVR

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

Both revenue and EPS continue to grow at a healthy clip (up 11% and 27%, respectively, this past quarter), but you probably wouldn't have guessed that by looking at NVR's stock. Year-to-date, NVR is down about 30% as fears regarding the effect of rising rates on the housing market have made investors eager to sell homebuilding stocks. Although there could be more near-term pain as the market attempts to make sense of the changing macroeconomic conditions, we still believe our original long-term thesis for NVR is on track.

In the intermediate term, NVR will likely benefit from Amazon's decision to set up a new HQ in NVR's northern Virginia backyard. There are also rumors that Apple is exploring the idea of adding 20,000-employee campus in the same region. And it's worth keeping in mind that weakness in the housing market isn't necessarily a bad thing for long-term investors here -- it affords NVR's management the opportunity to scoop up both lot purchase agreements (essentially option contracts on finished lots, a key part of its business model) *and* its own shares at more advantageous prices. This is a long-term commitment for five years or more.

OpenText

Tier Three: We still like these businesses, too, but we have more concerns about them than the others. If you're looking to raise capital, we'd start here.

We've been clear about our intentions to potentially replace OpenText in the *Pro* port for some time now. The company's sales were up 4% last quarter, and management foresees organic sales growth in the low single digits for the year that just started, with recurring revenue more than 75% of the total. That's not bad, but most of the annual growth remains driven by acquisitions, and as the software environment becomes ever more competitive, we're concerned that the quality of any potential acquisitions may diminish or the cost of this strategy may go up.

Meanwhile, many new software companies are building successful businesses from the ground up, and many may stand a better chance of creating exceptional shareholder value for the next five to 10 years. **ServiceNow** (NYSE: NOW) and **Veeva Systems** (NYSE: VEEV) are two companies that might make good replacements -- with the caveat that those stocks are much more volatile than OpenText's, and we don't necessarily want to add more volatility to the portfolio at the moment. Additionally, OpenText is one of the least expensive software stocks we follow; lately at $32, it trades at only 12.3 times expected earnings this year and 14.3 times trailing free cash flow. So you should feel perfectly content to go on owning it if it suits your portfolio.

Some things to watch for: Acquisitions that seem especially expensive or that don't appear to be working out within the planned time frame; sales growth that stalls or, heaven forbid, turns negative; management citing growing competitive pressures, which they've never done in the past. Although we've known OpenText for more than a decade and could go on owning it for many more years, we've been leaning toward replacing it with something that's growing much more organically. If there are other Fool-recommended software stocks you like more than OpenText, you can consider moving your OpenText funds (a relatively small portion of your *Pro* portfolio) into those stocks instead. (Our own Paycom is one option, as are the businesses mentioned above.) Just keep your tax consequences in mind if you're selling. And if you prefer to go on owning OpenText, we still like the stock for the coming three years, assuming none of the above warning signs or others show up.

Oracle

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

We're hopeful that Oracle will start to get -- and deserve -- much more respect in 2019. It's not as though the business is struggling: In its first quarter of 2019, Oracle's sales were up 2%, but earnings per share jumped 19%, and 91% of the company's revenue is recurring in nature. Plus, Oracle is starting to overcome the drag of transitioning from an all-license software company to cloud sales (for which up-front revenue is smaller, but long-term value to Oracle is higher). The company remained a free-cash-flow monster as it went on building its cloud-server warehouses, and it now competes with the likes of Amazon on cloud hosting (although Bezos and Co. do remain comfortably ahead). More importantly, Oracle is now ready to enjoy a healthy annuity of cloud software revenue from customers.

Plus, recent news that Warren Buffett and his team started a large position in Oracle helped to lift the stock. With time, we believe Oracle's stock could rise as investors slowly realize that its cloud business is substantial, and its license business should be highly regarded, too. Oracle faces competitors on all sides, but we believe it's holding its own. Management expects earnings-per-share growth "in the double digits" (at least 10%) for its 2019, with revenue growth improving by more than 2% in the second half. Recently at about $49, the stock trades at only 14 times expected earnings for the year ahead, and about 15 times trailing free cash flow.

At this price, and with the cash-flow growth rates we anticipate, we believe Oracle should challenge our North Star over the coming three years, as long as everything remains the same or improving with the business. It's in our Tier Two mainly because of the risk that its cloud revenue won't expand by as much as Wall Street hopes, which would keep its value multiple low. And if competitors are taking market share directly from its prospects, we'll eventually see that, and it will hurt. But we're hopeful at the moment. That said, as with OpenText, if you want to replace Oracle with a software company that is growing sales much more strongly, you can consider it.

Paycom

Tier One: These are the companies we feel most confident about owning over the next three to five years.

The cloud-based payroll and human-resources software provider expanded its revenue by 32% last quarter, to $133 million, and earnings per share more than doubled to $0.50, even as Paycom spends to continue to grow. Management expects the current pace of revenue growth to continue, with incredible gross margins of 84% to 85%. Lately at about $121, the stock looks less pricey than you might expect, trading at about 39 times estimated earnings for the year ahead. Beyond that, we like Paycom's long-term potential, as most of its revenue is recurring. And it has a giant market in which to keep taking market share, especially since it's only now starting to proactively target companies with more than 2,000 employees. Management has repeatedly said they believe they're only just beginning to address the market's needs, and we agree. Like Paychex decades before it, we believe that founder-led Paycom may remain a strong, growing stock for years.

Skyworks Solutions

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

One of our favorite semiconductor stocks, Skyworks recently reported its ninth consecutive year of record sales and profits, with fiscal 2018 revenue up 6% to $3.9 billion and earnings per share up 12% to $7.22. Profit margins continue to rise, and its business continues to expand beyond Apple. Customers include Samsung and its flagship phones, **Cisco Systems** (NASDAQ: CSCO), **Microsoft** (NASDAQ: MSFT), **BMW** (NASDAQOTH: BAMXF), **Tesla** (NASDAQ: TSLA), Amazon, and many more. The Internet of Things and the 5G network rollout continue to represent tremendous tailwinds for Skyworks, and the business maintains competitive design and manufacturing advantages that keep others at bay.

But the stock price is back to where it traded several years ago, unnecessarily reminding us that semiconductor stocks can often be a cyclical test of patience. Eventually, however, long-term owners of the best of them are rewarded. We still believe that Skyworks fits the bill, and that the business will be much larger three to five years from now -- as long as Apple remains a major customer. That is easily the largest risk, and it must be watched. We see no signs of Apple looking to move away from Skyworks, but we need to be observant.

Already down largely on fears that Apple iPhone sales are slowing, Skyworks (lately around $70) now trades at 9.8 times expected earnings for the year ahead, the cheapest it has been since a brief stint in 2012. Management expects record revenue and earnings again in 2019, even if growth will be slight that year because of flat phone sales. You should feel comfortable keeping a 2.6% stake in the stock as long as you can also keep a close eye on Apple; you should also ensure your combined exposure to both companies is reasonable. If you need to trim one or the other, we would focus on owning Apple over Skyworks, since Apple is in the position of power in this relationship.

Sonos Inc.

Short call

The post-earnings pop in Sonos' stock price was short-lived; though the market was initially thrilled with management's revenue growth and guidance, after reviewing the results and earnings call, we think our short thesis is still tracking nicely. For starters, much of the "beat" this quarter can be attributed to the company's switching up its strategy and getting more aggressive with its product launch cycle. Previously, the company took an Apple-esque approach to releases, opting to launch only a few products each year.

However, management has now all but acknowledged that increased competition requires a more rapid upgrade cycle and an expanded product line. We think there are a few problems with this, including the fact that this change in approach will continue to exert downward pressure on margins (which is never a good thing when you don't make any money). We're also willing to wager that the company is likely overestimating customers' eagerness to upgrade and/or buy additional Sonos speakers, which could result in both inventory issues down the line and an unforeseen slowdown in sales.

Finally, we think management's newly announced plans to go after market opportunities outside the home are an indirect acknowledgment that the market opportunity inside the home isn't nearly as big as they've represented it, likely because they're losing ground to the competition. With that in mind, we're content to leave our position alone for the time being, watching and waiting for a January expiration that could bring the full profit.

Square

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

One of our best-performing stocks over the past 16 months or so, Square looks like a potential monster in the making. Founder and CEO Jack Dorsey is letting the company find creative solutions for its millions of card-accepting customers, including micro-finance for small businesses, inventory software, and food delivery. Like a mini (very mini) Amazon.com, Square's business is increasingly difficult to nail down, because it includes everything from regulated banking to point-of-sales credit card revenue to software and services. But we like that, because each business relates to the other.

And it's working, because revenue growth rates have been accelerating both sequentially and year-over-year. That's the kind of rare performance that normally makes Wall Street swoon. Adjusted revenue was up 68% year-over-year last quarter (announced Nov. 7), and technically it was Square's first quarter of GAAP profitability. CFO Sarah Friar sees continued momentum in the business, expecting sales growth of about 60% in the current quarter. The longer term points to a much larger market opportunity across all business lines. Such promise comes with a volatile stock, though, and we expect that volatility to remain. We've seen this countless times with young, growing companies, and we know that if the business keeps performing, the end result could be excellent long-term shareholder returns.

Starbucks

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

After languishing for much of the past three years, shares of Starbucks finally started to perk up earlier this month as investors responded positively to the latest quarterly results. Investors also liked management's commentary on China and how the Alibaba partnership will provide "rocket fuel" for their Chinese initiative. Fortunately for investors, although Starbucks the stock may have done a whole lot of nothing the past few years, Starbucks the company remained busy growing on both the top and bottom lines. Combined, these two factors resulted in some significant multiple contraction, with Starbucks' P/E and P/S both falling by almost 50% from peak to trough. This is important because it gives us confidence that the recent surge in the stock price hasn't immediately pushed the stock back into "overvalued" territory. Although the company still has many obstacles to overcome, we believe the odds are in our favor that Starbucks outperforms the North Star over the next three years.

Tencent

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

Like JD, Tencent is also suffering from Chinese stock malaise in addition to business-specific issues. Although many of the headlines surrounding Tencent are currently devoted to the Chinese government's freeze on granting monetization rights for newer games, we tend to view this as a temporary roadblock, not a long-term thesis buster. We believe Tencent is taking the necessary steps to keep itself in the good graces of the government and that many of these moves are designed to simply help the mobile gaming industry catch up to its PC counterpart in terms of regulation. In the interim, despite the hit to the company's financials, this monetization freeze could ultimately end up helping Tencent by essentially starving smaller gaming companies of the oxygen they need to continue developing new games, in addition to making newcomers less likely to enter the space. We were more concerned with the news of management's more siloed approach to using its data (we believe it's more valuable shared across the company). But since we first expressed these concerns, management appears to have take the first necessary steps to address this issue. With many of the company's products still in the early innings in terms of monetization, and new products constantly in development, we still feel confident in our long-term Tencent position.

Verisk

Tier One: These are the companies we feel most confident about owning over the next three to five years.

The market may be well off its highs (at least as of when we're writing this), but you wouldn't know it by glancing at the stock chart of our underfollowed provider of data analytics for the insurance, natural resources, and insurance industries. After a ho-hum couple of years, we like some of the moves the company has made recently, and the market appears to appreciate the changes the new CFO has made to its disclosures. Those changes would normally lead us to expect an expansion in valuation multiples, as the market generally reacts favorably to increased financial transparency (as long as what it reveals is generally positive), but Verisk's valuation is still within a range we would consider to be fair. We still believe this company has years' worth of North Star-topping performance left in it. And that could continue to come with lower-than-average volatility. Like so many of our *Pro* stocks, Verisk has pricing power and recurring revenue in spades.

Visa

Tier One: These are the companies we feel most confident about owning over the next three to five years.

Visa is an even bigger cog in the global financial system than fellow *Pro* holding Mastercard, with a global market share of more than 50%. Like Mastercard, Visa's financial profile is stellar despite its massive size; in fiscal 2018, the company expanded its revenue by 12% and earnings per share by 58%, and it processed more than $8 trillion in total payments volume (up 11%). A newer addition to *Pro* than Mastercard -- we first bought Visa in 2015 -- the company provides additional exposure to the megatrend movement of global financial transactions away from cash and toward electronic payments. The two companies' business models and economics are similar, and holding Visa alongside our Mastercard position represents our strong conviction in the electronic payments space and provides company-level diversification within the industry. Like Mastercard, Visa's giant payment network should continue to be a source of healthy organic revenue growth as electronic money continues to replace cash, supporting earnings growth at least in the mid-teens (and North Star-challenging stock returns) over the next several years.

Zuora

Tier Two: We have great reason to own these companies over the next five years, but we think they are at least modestly more risky and/or their futures less certain than those of Tier One businesses right now.

Zuora is one of the newest additions to our portfolio, and we're optimistic about its long-term potential; we look forward to watching it grow toward profitability over the coming few years. We're comfortable with the small stake to which we just recently added a bit more. Zuora sells software that lets customers more easily recognize revenue and billing in a fluid, modifiable, and recurring fashion. Its software -- and its whole approach -- is much more attuned to today's economy and fluid business models than older offerings. This is helping Zuora sign contracts with many of today's most dynamic young technology companies, as well as with old-school behemoths such as **John Deere** (NYSE: DE) or **GM** (NYSE: GM).

We do need to watch revenue growth rates. Management has suggested Zuora could expand its revenue by about 25% annualized for years to come, so Wall Street now expects that. At the same time, we want to see expenses contained enough that profitability starts to appear on the horizon, even though Software-as-a-Service business models by nature do postpone profitability for a long time as they build the business. Wall Street should remember this with Zuora just as it has with **Salesforce** (NYSE: CRM), from whence Zuora's founder-CEO originally hailed. We like owning a stake in this young business for the long haul.

Conclusion

The last thing we want is for you to be anxious. The *Pro* team has vetted every company in our portfolio time and time again. That doesn't mean the stocks won't go down at times, of course, but we believe in the underlying businesses and the long-term potential.

What's most important over the coming year is that you make sure *your* portfolio is in a place where you remain comfortable and happy with it. We hope to help you stay (or get) there with our continued updates from longtime *Pro* analyst Billy Kipersztok, and we hope this first report is a big step toward helping you decide which few holdings you might want to sell and demonstrating which ones we believe in most strongly (which is most of them!). Our current allocations make sense, and by large they reflect our beliefs (Medtronic and Verisk, for example, could be larger positions, but in general things are aligned). If you so choose, you can sell from the positions lower on our Tiered list and add to some of the stocks in higher Tiers that are still smaller-than-average holdings. But even if you do nothing, we believe Pro's long portfolio should ultimately win nicely as a whole.

It has been our great honor -- the honor of a lifetime -- to serve you in *Motley Fool Pro*. We hope the team's continued coverage over the next 12 months makes it very easy for you to transition in whatever way works best -- and again, we don't expect any big changes are needed in your long *Pro* portfolio today. Finally, we've closed all our shorts and hedges; they were short-term positions, and the market had fallen for us. If you want to hedge the market going forward, you know that we like to set up simple synthetic shorts. The call's strike price should be above the market index, and the put's price should be below it. For the more advanced investor, ratio put spreads remain an option. You can also simply buy puts -- we like to say it's buying insurance. And we've always kept an ample amount of cash for a rainy-day opportunity. We believe that helps add peace of mind to your investing, along with eventual upside through new investments. We averaged less than 75% net long exposure over our lifetime, but returned more than 100% of the S&P 500's return.

We wish you all the best as you continue your Foolish journey, and we hope that you will let The Motley Fool -- if not us! -- continue to serve you well for years to come. Thank you again for making *Pro* possible, including now, in its next evolution.

-- The *Motley Fool Pro* Team

Pro Guidance Changes and Completed Trades: Dec. 3, 2018

Published Dec 3, 2018 at 12:48PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- None.

***Pro* Completed Trades** (see transaction log; trades take a day to appear):

- **Gilead Sciences** (NASDAQ: GILD): Our naked calls expired fully as income over the weekend.
- **Murphy USA** (NYSE: MUSA): We closed our short.
- **SeaWorld Entertainment** (NYSE: SEAS): We closed our short.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

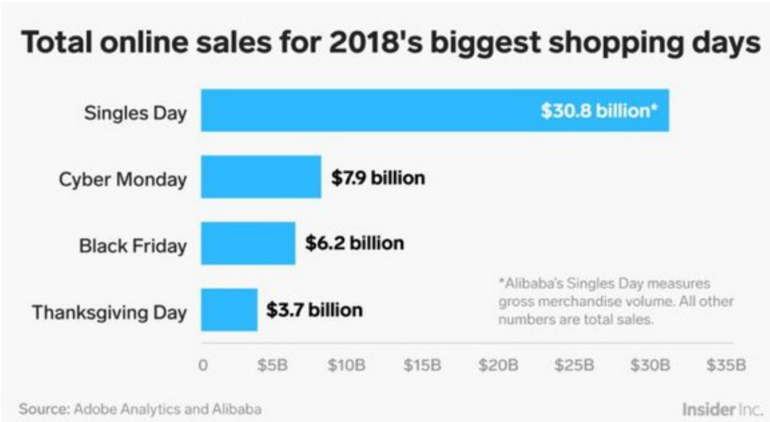
Charts of the Week: E-Commerce in 2018, a Tech Bear Market, and More

Published Dec 3, 2018 at 12:44PM

Dear *Pro* Fools,

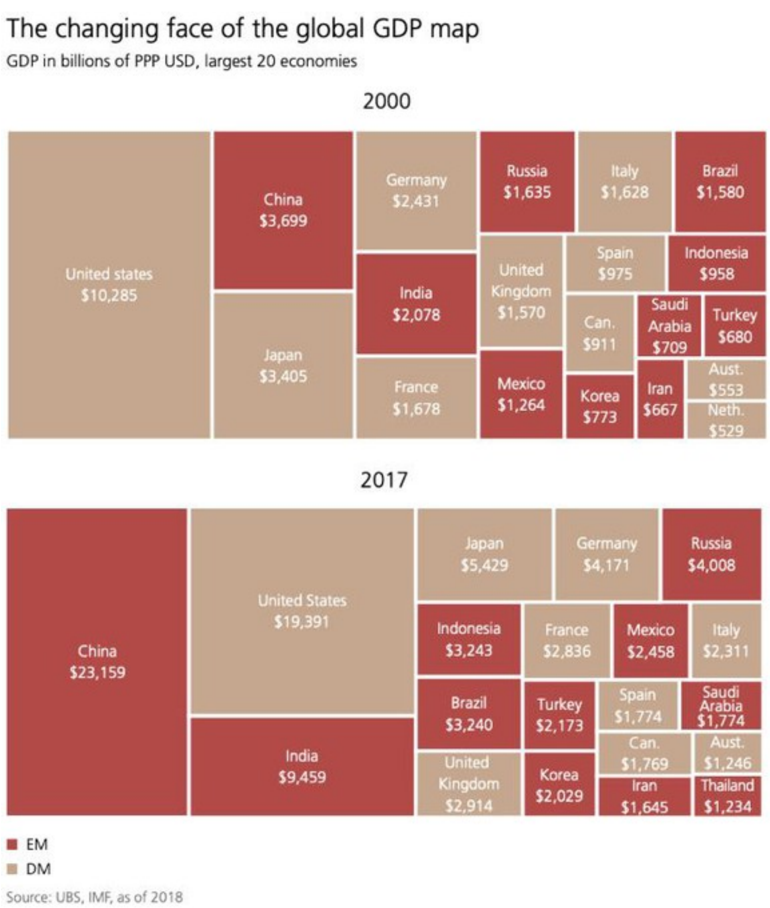
Let's start off our week with another edition of my "Charts of the Week" series. Here are the five most interesting and/or market-relevant charts I've found in the past seven days:

1. E-commerce in 2018



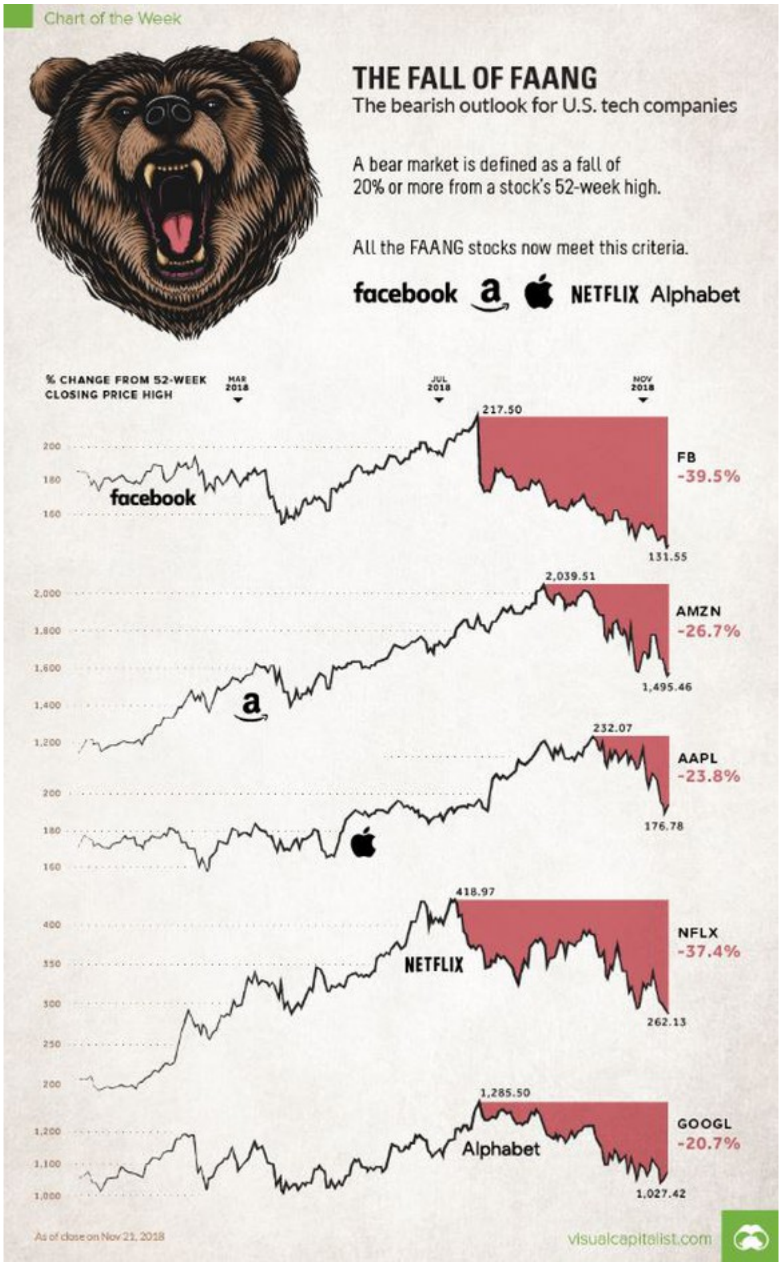
This chart from Skye Gould at BI Graphics shows the total online sales for 2018's biggest global shopping days. If you're not already familiar, [Singles' Day](#) is a holiday with origins in China that has now become the largest offline and online shopping day in the world. And even as online sales rose by 28% on Thanksgiving Day, 24% on Black Friday, and 19% on Cyber Monday, the chart clearly demonstrates the massive scale of China compared with the United States.

2. The Largest 20 Economies in 2000 vs. 2017



Helping to bring home the point from the previous chart, this graphic from [UBS](#) shows the shifting landscape of global GDP. Since 2000, China has overtaken the U.S. in GDP as measured by purchasing power parity, increasing its GDP by more than 500% (a CAGR of 11.4%) since 2000, compared with 89% (a CAGR of 3.8%) for the United States. We can also see the emergence of India over the last two decades; GDP in that nation has increased by more than 450% (a 9.3% CAGR) over the same time span, and it now represents the third-largest economy in the world.

3. The Bear Market in Big-Name Tech Stocks

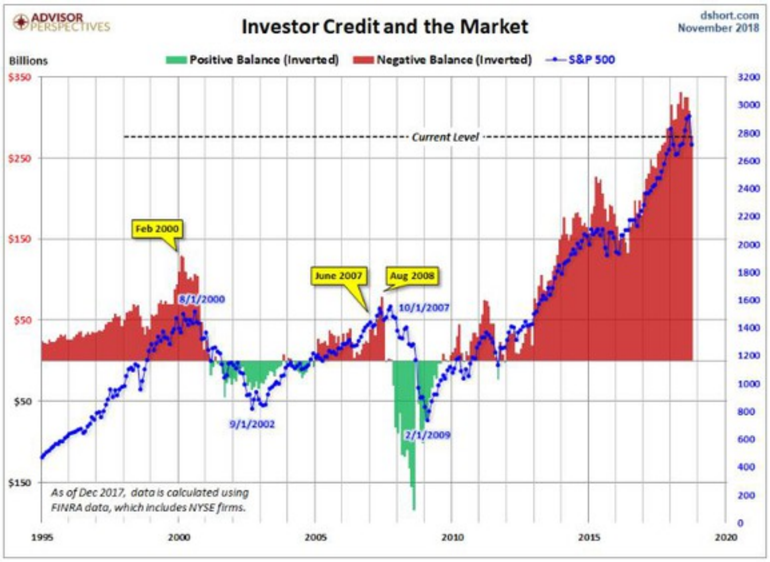


This chart from the Visual Capitalist shows the effect of the recent market correction on the big-name technology stocks. As of market close on Nov. 21, each of the five FAANG stocks was down more than 20% from recent highs, having lost close to $1 trillion in market capitalization from their peaks. The bear market for the FAANG stocks has recovered a bit lately, with each stock trading higher today than the figures from the chart, but the stocks are still well off their summer peaks.

4. The "Powell Effect"

This graph from Eddy Elfenbein's Crossing Wall Street blog shows the effect that the chairman of the Federal Reserve can have on the market. The graph shows the change in value of the S&P 500 index by the minute on Nov. 28, the day Federal Reserve Chairman Jerome Powell spoke at The Economic Club of New York. The spike in the chart at 12 noon coincides exactly with the beginning of the speech, when Powell indicated that interest rates are "just below" neutral. That comment suggests that the pace of interest-rate hikes may slow, which is good for stocks (and hence the spike of the S&P 500, which closed up 2.3% on the day, the market's best day in eight months).

5. Investor Credit Balances vs. The S&P 500



This intriguing graph (as of October 2018) from Jill Mislinski at dshort.com overlays investor net margin debt with the S&P 500. Green areas of the graph represent a net positive balance of investor credit (i.e., more cash than debt), and red areas represent a net negative balance of investor credit (i.e., more debt than cash). The blue line represents the S&P 500.

The graph shows how net margin debt is correlated with the movement of the S&P 500, as peaks in investor margin debt tend to coincide with peaks in the market. Additionally, net positive balances of investor credit tend to coincide with market lows. We can see that despite the recent decline of net margin debt associated with the decline of the market in October, we are still nowhere near a net positive balance of investor credit.

The *Pro* Bottom Line

There you have it, Fools -- this week's edition of my top five charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Pro Catch-Up Trades and Expirations: Mastercard, Square, and More

Published Nov 29, 2018 at 12:50PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Broadridge Financial Services** (NYSE: BR): Buy half of our 6.5% stake.
- **Mastercard** (NYSE: MA): Buy half of our 7% stake to start.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy at least half of our 4.7% stake.
- **Facebook** (NASDAQ: FB): Buy half of our 5.7% stake.
- **NVR** (NYSE: NVR): Match our 2.4% stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 2.5% stake.
- **Square** (NYSE: SQ): Buy half of our 5.6% stake.

Shorts:

- **Murphy USA Inc** (NYSE: MUSA): We are closing the short.
- **SeaWorld Entertainment** (NYSE: SEAS): We are closing the short.

Options:

- See below.

Upcoming Expirations:

- **November:**
  - **Gilead Sciences** (NASDAQ: GILD): Our naked calls are set to expire as income tomorrow.

Bear Market Territory

Published Nov 26, 2018 at 1:27PM

Dear *Pro* Fools,

We're officially in bear market territory. The most recent high for the S&P 500 was set on Sept. 21, at a value of 2,940.91. As of Friday's close, the market was down 10.5% from that peak, to 2,632.56. The trough of the current bear market was Oct. 29, when the index reached a low of 2,603.54, down 11.2%.

Over the past two months, I've had friends contact me wondering if they should be pulling out of bullish positions, fearing a market crash. Is it time to panic?

To answer that question, I find it useful to take a look at market history. It reminds me that periods of declining stock prices are normal. I recently read an excellent blog post from Charlie Bilello at Pension Partners that provided great historical context for market corrections. Bilello noted that since March 2009, there have been 23 periods in which the S&P 500 declined more than 5% from peak to trough, which works out to an average frequency of more than two times per year:

S&P 500 Corrections >5% since March 2009 Low

Correction Period	# Days	S&P High	S&P Low	% Decline	VIX Peak
2018: Sep 21 - Oct 29	38	2941	2604	-11.5%	28.8
2018: Jan 26 - Feb 9	14	2873	2533	-11.8%	50.3
2016: Aug 15 - Nov 4	81	2194	2084	-5.0%	22.9
2016: Jun 8 - Jun 27	19	2121	1992	-6.1%	26.7
2015/16: Nov 3 - Feb 11	100	2116	1810	-14.5%	32.1
2015: May 20 - Aug 24	96	2135	1867	-12.5%	53.3
2014/15: Dec 29 - Feb 2	35	2094	1981	-5.4%	23.3
2014: Dec 5 - Dec 16	11	2079	1973	-5.1%	25.2
2014: Sep 19 - Oct 15	26	2019	1821	-9.8%	31.1
2014: Jan 15 - Feb 5	21	1851	1738	-6.1%	21.5
2013: May 22 - Jun 24	33	1687	1560	-7.5%	21.9
2012: Sep 14 - Nov 16	63	1475	1343	-8.9%	19.7
2012: Apr 2 - Jun 4	63	1422	1267	-10.9%	27.7
2011: Oct 27 - Nov 25	29	1293	1159	-10.4%	37.5
2011: May 2 - Oct 4	155	1371	1075	-21.6%	48.0
2011: Feb 18 - Mar 16	26	1344	1249	-7.1%	31.3
2010: Aug 9 - 27	18	1129	1040	-7.9%	28.9
2010: Apr 26 - Jul 1	66	1220	1011	-17.1%	48.2
2010: Jan 19 - Feb 5	17	1150	1045	-9.2%	29.2
2009: Oct 21 - Nov 2	12	1101	1029	-6.5%	31.8
2009: Sep 23 - Oct 2	9	1080	1020	-5.6%	29.6
2009: Jun 11 - Jul 7	26	956	869	-9.1%	32.8
2009: May 8 - 15	7	930	879	-5.5%	34.1
Average	42			-9.3%	32.1
Median	26			-8.4%	30.3

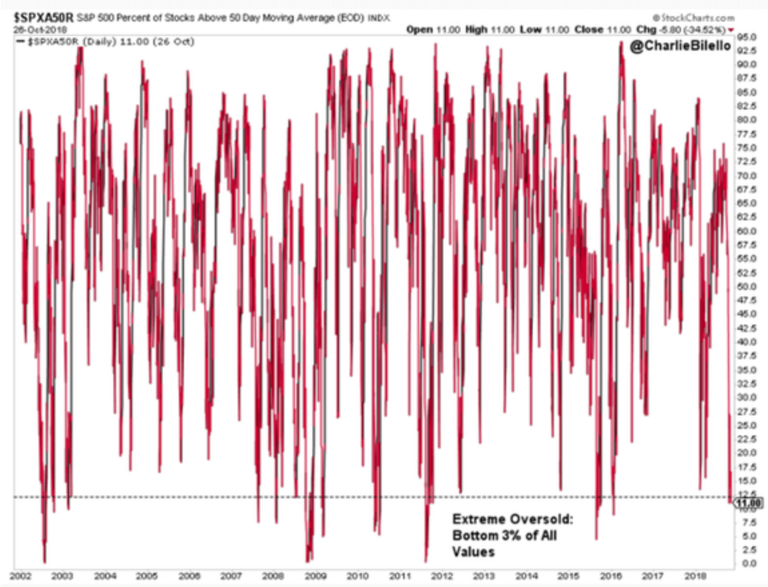
Pension Partners — @CharlieBilello

Source: Charlie Bilello, Pension Partners

We can see from Bilello's table that market corrections don't tend to last very long. Since 2009, the average correction greater than 5% has lasted just 42 days, with a median of 26.

In addition to simple metrics such as length of the correction and percent decline, Bilello also explored a more nuanced metric that he called an "oversold extreme" condition. He quantified this by measuring the percentage of stocks in the S&P 500 at prices above their respective 50-day moving averages. When this percentage reaches a very low level (there are few stocks above their 50-day moving averages), it can be a sign of indiscriminate selling.

As of Oct. 30, the trough of the current correction, Bilello found that only 11% of stocks were above their 50-day moving average. This represented a more oversold condition than 97% of historical readings (with data going back to December 2001):



Source: Charlie Bilello, Pension Partners

After such oversold extremes are reached, Bilello found that stocks tend to rebound quickly, with above-average forward returns in most periods:

@CharlieBilello	S&P 500 Forward Total Returns (Dec 2001 - 2018)							
% Above 50-Day Moving Average	**1-Wk**	**1-Mo**	**3-Mo**	**6-Mo**	**9-Mo**	**1-Year**	**3-Year**	**5-Year**
<12% (Lowest 3% of all values)	0.9%	2.3%	1.9%	9.0%	14.9%	22.7%	56.7%	110.4%
All other values	0.1%	0.7%	2.3%	4.6%	7.1%	9.9%	30.6%	53.9%
Differential	0.7%	1.6%	-0.4%	4.4%	7.7%	12.8%	26.1%	56.6%

@CharlieBilello	S&P 500 % Positive Forward Total Returns (Dec 2001 - 2018)							
% Above 50-Day Moving Average	**1-Wk**	**1-Mo**	**3-Mo**	**6-Mo**	**9-Mo**	**1-Year**	**3-Year**	**5-Year**
<12% (Lowest 3% of all values)	59.5%	69.6%	56.0%	69.6%	84.0%	92.8%	98.4%	100.0%
All other values	57.5%	65.5%	70.4%	76.7%	80.7%	83.5%	81.8%	88.0%
Differential	2.0%	4.1%	-14.4%	-7.1%	3.3%	9.3%	16.6%	12.0%

Source: Charlie Bilello, Pension Partners

The first table above shows that for every period examined except three months, S&P 500 forward returns following an "oversold extreme" have been significantly higher than forward returns after all other market conditions. And the longer the time period, the bigger the differential in performance.

The second table examines the historical likelihood of positive forward returns following an oversold extreme. As with the first table, we see that over shorter time periods, the likelihood of outperformance is more sporadic (three-month and six-month periods were actually less likely to produce positive forward total returns following an oversold extreme). But again, when we look at the longer term, we see a significant difference in likelihood of positive performance for oversold extreme conditions compared to all others. Over the subsequent three- and five-year periods following an oversold extreme, respectively, the S&P 500 produced positive returns 98.4% of the time (with an average of a 56.7% total return) and 100% of the time (with a 110.4% total return).

The *Pro* Bottom Line

All in all, we can conclude that extreme oversold conditions (like the market environment we are in now) tend to result in a higher probability of above-average forward returns than other periods. Does that mean we should expect a stock-market bounce in the near future? Absolutely not. The stock market is a world of probabilities, not certainties. But an oversold market environment, combined with the fact that economic indicators are not yet showing signs of a recession, suggests to me that this market correction is more likely to be a temporary blip with rebounding stock prices than it is to be an enduring market crash. But as usual, I reserve the right to be wrong!

Fool on,

Billy (TMFBillyTheKid)

Gratitude Always Tops Attitude!

Published Nov 21, 2018 at 12:00PM

Dear *Pro* members:

It's a bit of a tradition around here to share our thankfulness with you each year at Thanksgiving (hey, we're not asking for any points for originality!). Some of us are traveling or enjoying time offline today, but we *all* wish you a meaningful, enjoyable holiday tomorrow. And, we want to share some gratitude with you.

Billy Kipersztok

With the Thanksgiving holiday just one day away, soon enough we'll be sitting around a dinner table with our loved ones, enjoying a festive meal and using the holiday as an opportunity to acknowledge what we're grateful for. To me, one of the most important aspects of the Thanksgiving holiday is its emphasis on gratitude. Throughout the rest of the year, it's easy to get caught up in the difficulties of day-to-day life that distract us from how much we have to be thankful for. The Thanksgiving holiday gives us time to reflect and consider how fortunate we are.

Although practicing gratitude on Thanksgiving is great, we should practice gratitude as much as we can, not just because of the holiday. In positive psychology research, people who practice gratitude consistently report many benefits, including:

Physical
• Stronger immune systems
• Less bothered by aches and pains
• Lower blood pressure
• Exercise more and take better care of their health
• Sleep longer and feel more refreshed upon waking

Psychological
• Higher levels of positive emotions
• More alert, alive, and awake
• More joy and pleasure
• More optimism and happiness

Social
• More helpful, generous, and compassionate
• More outgoing
• Feel less lonely and isolated

(Source: Robert Emmons, "Why Gratitude Is Good")

In honor of the benefits of gratitude, I'd like to use this moment to share gratitude for my health, my wonderful family, and the opportunities that I was given as a result of being born in the United States in the late 20th century. I'd also like to use this column to encourage each of you to practice gratitude regularly to receive the multitude of positive benefits it affords! One easy way to practice gratitude is to use a gratitude journal, in which you regularly record the things for which you are grateful (for a description of a gratitude journal and other ways to cultivate gratitude, check out this article). I wish you all a Happy Thanksgiving, and I'll leave you with one more thing I am grateful for: You!

Jeff Fischer

I'm grateful for what Billy just wrote. And I'm grateful to be able to live freely in this country, able to pursue what interests me in hopes of adding to society. I'm grateful to live in a vibrant community filled with others pursuing their passions, and creating for the greater good the culture, food, art, and special events we sometimes take for granted year round in American cities.

I'm grateful for our second-to-none stock market, filled with companies that touch billions of lives, with many of these companies striving to improve our daily experience.

I'm grateful for the weather and the seasons — when the seasons seem out of whack, you quickly realize how integral they are to your own yearly clock and life experience.

I'm grateful for friends and family, both "in real life" and online — and at this point, I think that distinction should fade; online is real life, too. What we've all shared here is as real as what could be shared seated around a dinner table.

I'm grateful for people who are considerate of others. Everyone is dealing with something that's difficult. Kindness makes daily life enjoyable.

I'm grateful for ingenuity. Where would we be on Thanksgiving without the brilliance of electric ovens, heated homes, running water, and — yes — online entertainment. Or board games. Or books and newspapers. Not to mention the medical advancements of the last century.

I'm grateful for the last decade spent in *Pro* and *Options* with members.

We'll never be able to thank you enough for being a Motley Fool member alongside us — that's how we started here, too, as part of the community. We're all one and the same, working together for investing success, and ideally enjoying the ups and downs along the way. Thank you for your long-term approach. That makes The Motley Fool possible. Thank you.

JP Bennett

As the last person to submit his paragraph for today's memo, I had the opportunity to read what both Jeff and Billy had already submitted. I wholeheartedly agree with everything they've already listed (especially all of the amazing Fools we have all over the world. Our community is truly something special!), but I also wanted to add one thing I believe they left off — the Pro and Options team. Having heard countless coworker horror stories from family and friends, it's impossible for me not to feel incredibly blessed to have the opportunity to come into work every day and spend my time with people who aren't just Fools, but also friends.

Have an excellent holiday! And as always, to share any thoughts, please visit the Memo Musings board.

Fool on!

Close Your Shorts on Murphy USA and SeaWorld Entertainment

Published Nov 21, 2018 at 12:00PM

Is this for you? This is for all members who followed our recommendation to short **Murphy USA Inc** (NYSE: MUSA) and **SeaWorld Entertainment Inc** (NYSE: SEAS).

How You Participate

- **Action:** Buy to close, or cover, your short position(s) on both Murphy USA and SeaWorld Entertainment
- **Allocation:** Close all of your short — our initial recommendation was to short 1% each.
- **Recent Prices:**
    - Murphy USA: $77.39

- SeaWorld Entertainment: $25.40
- **Price Guidance:** *Use a **limit order***, and aim to pay less than $78.50 for Murphy USA and $26.50 for SeaWorld.

What We're Thinking

Murphy USA

While our gain on Murphy's is modest compared to our other shorts, we want to close our position for now. The stock sold off on quarterly results that were a bit of a mixed bag (revenue beat estimates slightly but earnings fell short), but the recent sharp decline in oil prices — both the U.S. (West Texas Intermediate) and international (Brent) standards have fallen by almost 25% from their October peaks — should result in some relief at the pump after prices surged to start the year. We do have opinions on the more general financial impacts of this price move on Murphy's business, but even so, we would rather step away from the short today as we dig more into what this could mean for the upcoming quarter in particular.

SeaWorld

The trade alert to sell short this entertainment park leader went out on October 5, and as of this morning the short had gained more than 10% for us, in-line with our goal, in a shorter time than hoped. Quarterly results at SeaWorld along the way showed some promise with a decent splash of continued concerns.

This is the type of situation and business that we would want to keep an eye on for future shorting opportunities. SeaWorld has a high level of debt at high interest rates, is an expensive business to run, and operates in a changing environment. People — we think — are caring more about animal welfare than ever before, and the idea of what is amusing is changing. Witness the recent end of Barnum & Bailey's circus after generations of operations. SeaWorld will likely face long-term headwinds with pockets of trouble as it continues to promote Orca whale shows with its existing whales.

And financially, success is no layup. The company will need to pay down debt even as it spends more to promote traffic and transform its parks. But today, in today's volatile market, we'll take our profit on this short while the chips are down (as it were).

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread on either position:** You should close those positions, too.

Pro Can Help

- **Want to discuss this?** Head on over to the Pro short board.

Plumbing the Highs and Lows

Published Nov 19, 2018 at 4:44PM

Dear *Pro* members:

We've been writing since at least early September that volatility was due to return, and we wrote a few weeks ago that it's likely to stay for some time now, for many reasons. But volatility is not the same as collapse. Though now flat for the year, the S&P 500 is merely at prices it last traded at the end of June, well less than a lifetime ago. The soaring stock market from July to the end of the September is the very same market that now makes it feel like we're falling sharply.

We all want to know whether the next leg will be up or down, but the answer is probably that it'll be both. It'll be choppy. In the midst of this choppiness, we have earnings coverage. We'll update you on all of our companies that demand or would benefit from an update. Today, initial thoughts on **Facebook** (NASDAQ: FB) and **Skyworks Solutions** (NASDAQ: SWKS) are demanded, as both are hitting a new 52-week low.

Faceplant

It's difficult to discern to what degree Facebook's woes are the fault of its own, or what was unavoidable given its stature as the largest community ever gathered. The spread of hateful content, false news, and even paid advertising that checked both of those dreadful boxes could have been curtailed much earlier, it seems, if management had taken the risks seriously enough from the start. Instead, it seems the issue was pushed aside — or at least pushed off, and now the end result is Facebook is spending billions to try to reel the problem in, but there's no amount of money that can easily repair a damaged reputation.

We don't know how accurate a picture the recent reporting on Facebook's woes and practices paints, but we're confident there's enough truth in the stories to concern us — again — about management's choices. At the same time, we have to cut management some slack for its youthful inexperience, the novelty of its business, and of the issues pressuring it. As long as they're acting honestly and in good faith. That's what we need to be confident about if we're going to remain investors.

Financially, there is little to argue with — so far. But the more Facebook dings the public trust, the higher the risk that people use its properties less, and advertising dollars start to face strain. We're not near that point today. Third quarter revenue grew 33% to $13.4 billion. Expenses grew 53% to $7.9 billion, but Facebook still generated impressive profits. Increased spending will continue through 2019, but CEO Mark Zuckerberg, 34, said, "I know we need to make sure our costs and revenue are better matched over time, and that's something I'm focused on as well."

That, from a financial perspective, was the key statement in the third quarter conference call, as far as I'm concerned. Spending velocity will ultimately subside — you can't keep hiring and investing at this torrid pace — and revenue should keep growing until the two metrics are better aligned again. But it feels like Facebook doesn't have many more missteps before droves of people could lose trust in it entirely. The company is on thin ice right now, and the stock price is reflecting that.

Lately $131, and down about 28% year-to-date, the stock trades at 17.5 times expected earnings for 2018 and 2019, and 15 times expected earnings for 2020, when net income is expected to grow more strongly again as spending cools. Should the business prove resilient, these prices will be too inexpensive to last. **Alphabet** (NASDAQ: GOOG) (NASDAQ: GOOGL) has averaged a 29.3 P/E ratio the past ten years, and it (Google) has a much, much lower operating profit margin than Facebook even today as the latter spends egregiously.

Facebook is still our third-largest holding at 5.6%, so we're watching it very closely (and miffed our protective collar expired Friday), and making sure we want to keep owning it, or so much of it. So far, we are comfortable enough to maintain our stake, though we definitely expect much better from management than we've been reading about, even if not all of the reporting tells both sides. For now, it remains a buy.

Skydive

Skyworks has been even more disappointing than Facebook, from a returns perspective, but through no fault of its management.

The company just reported its ninth consecutive year of record sales and profits, with fiscal 2018 revenue up 6% to $3.9 billion, and earnings per share up 12% to $7.22. Profit margins continue to rise, and its business continues to expand beyond **Apple** (NASDAQ: AAPL). Customers include Samsung and its flagship phones, **Cisco Systems** (NASDAQ: CSCO), **Microsoft** (NASDAQ: MSFT), **BMW** (NASDAQOTH: BAMXF), **Tesla** (NASDAQ: TSLA), **Amazon.com** (NASDAQ: AMZN), and many more. Internet of Things and the 5G network rollout continue to represent tremendous tailwinds for Skyworks.

Yet, the stock is back to where it traded several years ago, reminding us of something we didn't need to be reminded: Semiconductor stocks are a cyclical test of patience in many cases. Eventually long-term owners in the best of them are rewarded. I still believe Skyworks fits the bill. Largely on fears that Apple phone sales are slowing, Skyworks (lately $70) now trades at 9.8 times expected earnings for the year ahead, the cheapest it has been since a brief stint in 2012. Management expects record revenue and earnings again in 2019, even if growth will be muted. We have a 2.6% stake.

10 Years of Thanks!

In closing, this Thanksgiving week, we want to thank you! Thank you for putting your trust in us, for being Foolish with us, and being patient with us. The Pro team recorded a short video recently to share some memories from the past ten years, as a way to offer our gratitude. We hope you enjoy.

As always, to share thoughts, please visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer)

Video Bonus: Pro10Year

Transcript

Jeff Fischer: Greeting *Motley Fool Pro* members, and thank you for joining us for this special brief message to you.

First, introductions. I am Advisor Jeff Fischer. To my left is Ellen Bowman.

Ellen Bowman: Hello.

Jeff Fischer: To Ellen's left is JP Bennett. On Skype we have Billy Kipersztok.

So, I am delighted to share that the entire *Pro* team is here. We're here for primarily one reason, and that is to say thank you. Thank you for being a *Pro* member all these years. Whether its been 10 years or one year we appreciate your trust, and we appreciate your Foolishness, and we appreciate how you invest. As you know we're investing for the long-term, but we also have positions that are short-term in nature such as options in shorting and hedging. So, we know you are stepping up and being a little more active than other investors my be. We appreciate that you have been part of *Pro* for however long you've been with us.

To celebrate our 10 year anniversary which is ongoing right now, we just passed 10 years in October, we are going to share a quick word with you each one of us. Maybe a thought or a favorite memory on what our years at *Pro* have meant to us or taught us. So we'll start. JP Bennett, we'll put you in the hot seat first.

JP Bennett: All right. Well, I'd have to say that my favorite memories who've the past four or five years, however long I've been on *Pro*, always centered around member events. I know the boards don't get as much priority as they used to. You know, maybe we'd like to have more events than we're able to. But, being able to communicate and interact with members, especially face-to-face, at member events and the live chats so to speak have always been a great opportunity to kind of remember why it is you're doing what you do. Really kind of keeps you focused on the bigger picture and putting in the effort.

That's a really broad answer so I'll go down a little bit more and say that I'm also a big fan of humor. There was one particular live chat that was the funnies thing I've ever been a part of at the Motley Fool.

Jeff Fischer: Oh-oh.

JP Bennett: If you go back to February of 2017 there was one live chat where you start bleeding from the face.

Ellen Bowman: Somebody just asked more on Instant Message the other day at work, "Where was that live chat where Jeff started bleeding?" It's legendary.

JP Bennett: I will never forget that. I tried so hard to stay composed.

Ellen Bowman: He did.

JP Bennett: I think I let it out a couple times and it sounded like I was a little girl squealing because I was trying so hard. Then after it was over I probably couldn't stop laughing for 10-15 minutes. But-

Billy K.: You did a good job, you kept semi-professional.

JP Bennett: I tried. I tried.

Ellen Bowman: It was a noble effort.

Billy K.: Yeah, it was.

JP Bennett: And the way you rolled with the punches too, that's what sold it for me.

Jeff Fischer: I love that that tied into a member event because I was just back from a member event in Arizona so my face was dried out. I smiled in the first second of the video and there we go.

JP Bennett: So if you haven't seen that, go watch that.

Ellen Bowman: Absolutely.

Jeff Fischer: JP, great answers. Great answers. Ellen Bowman.

Ellen Bowman: Hello. I have been the editor of *Motley Fool Pro* for eight years now. I have a silly one and a serious one. I'll do the serious one first. This is the service that taught me how to be an investor. I've worked on almost everything at the Motley Fool. I've worked on our cryptocurrency service. I've worked on *Stock Advisor,* I've worked on *One*. But I have half of my 401k right now in *Pro*'s long picks. This is the service that taught me how to buy a basket of stocks that all work together and watch them and see what happens to them. Observe when some of them go up and some of them go down. The temperament of the investors to my left and right, and also in the ether on Skype, and the ones that have worked on *Pro* over the years have made me the investor that I am today. So that is the serious one, and I mean it very much.

The silly one is a few years again when Bryan Hinmon was an an investor on this service-

Jeff Fischer: Who is that?

Ellen Bowman: He and I ... Bryan Hinmon. He's dead now, we don't speak of him anymore.

Billy K.: I just saw Bryan last week. He's doing great.

Ellen Bowman: Yeah, no, no. That was dopple ... Yeah, he's not. We don't talk about him anymore. But we used to have this guy on the service who was an analyst and we did a catch-up report for new members who wanted to get caught up to our portfolio. He was writing it and I was editing it. We were going back and forth with it. For some reason we decided that we would see which of us could get the most puns related to the Austin Powers movies into this catch-up report. I think each of us got more than a dozen. I think he ended up winning. I think he had 15. But nobody called us on it. No members, not Jeff, not any ... I don't think you were on the team yet.

JP Bennett: I wasn't on the ... Nope.

Ellen Bowman: Not anyone. We were so proud ... This is one of my crowning achievements as an editor.

JP Bennett: And it has gone unnoticed until now.

Ellen Bowman: Yeah. Exactly. So maybe it wasn't as brilliant as I thought, but I prefer to think that it was. Its massive subtlety as well as its genius. So, this has been a service that has been ... The people who have worked on *Pro* have been the most fun and remain the most fun people that you could work with. And the best teachers that you could have.

Jeff Fischer: That's very sweet Ellen. I love the humor too. We'll have to, in a memo next week, we'll have to share a link to that video and a link to that article.

Ellen Bowman: Yeah. I'll have to dig it up.

Jeff Fischer: Okay. Billy.

Billy K.: Yes. So, for me I have several great memories. I started in *Pro* back in 2013 a as just kind of an analyst in development. Then really jumped in as a full analyst in 2014. One of the things that I noticed almost immediately about *Pro*. I had been, before I started at the Motley Fool I was a subscriber. I had seen *Stock Advisor* and *Rule Breakers*. But once I joined *Pro* in 2013 and 2014 I saw the community and the discussion boards and sort of this interesting vibe them the *Pro* community that was different than all the other services. It just seemed a really tight knit, really together and everybody was all on the same page. Now that I've been with Pro for more than five years I see that, that was not just something that I felt back then but it's something that persists. That's something that I really enjoy about *Pro*.

Specific to memories. Let's see. I have three written down here. One is, so my TMF name which is TMFBillytheKid was actually given to me during a member contest from all of you guys. That was awesome. So what we did was I wrote on the boards, this was like a particularly slow time. Maybe it was during the summer on the discussion boards and I was like, "Hey, let's liven this up. I'll do a contest to see if you guys can name me." So we did a discussion thread and you guys submitted some names and whichever ones got the most recommendations ended making it to a finalist list. Then I did a randomized thing where whichever digit the S&P 500 landed on corresponded to a particular name and then I ended up with TMFBillytheKid. So, my name is thanks to a fun contest with you guys. So that's one of them.

Another memory, which this is also kind of more on the serious side and more on the investing side, is you guys are really great at stimulating discussions about investing. You guys are really smart about our positions. One thing that stands out in particular is **Papa John's** (NASDAQ: PZZA) where one of the investment decisions that we ended up making, which was selling and closing the position I think back in 2017, was because of a discussion that was kicked off by members. I had written a memo or something about Papa John's and then there was a discussion about how maybe you should start to think about it in a different way. Then we had an awesome discussion on the boards and we ended up selling the position mostly due to the discussion with members. So that was awesome.

Then some of the other things that I really enjoy about being a part of *Pro* and interacting with members is just like JP, is going to interact with you guys in person. I've developed some great relationships with people, to many to name. I really appreciate you guys, I really honestly love you guys. It's been a pleasure to work for you guys, and invest along side you and with the awesome team that we have.

So, those are my memories.

Jeff Fischer: Outstanding Billy. I could double down on everything that all three of you said. It's really great. I don't think I need to say anything now.

What I will say will probably just reiterate what was just said. It's meeting members, both online and in person. Just really kind of changes your life and keeps you focused on who you're working for and what you're trying to achieve together. The community that we have has been outstanding and enjoyable. Working with this team and Ellen for so long too. All of you for so long now has been a great honor so far, and a privilege, and a lot of fun as well. Ellen, you touch on the consistent nature of our investing. That's the nature of our team as well. We've been, I think to think, even tempered. Kept a sense of humor. We're as serious as we need to be during darker times too.

Speaking of that, a few memories. I'll throw some dark memories out there. One was 2011 when the credit rating of the United States of America was downgraded and we happened to be short volatility. That was, I'm glad that Ellen was here-

Ellen Bowman: I remember that.

Jeff Fischer: I'm glad that Billy and JP didn't have to live through that. It was Nick, and Bryan, myself. That was horrible.

Ellen Bowman: Yes. That was legitimately horrible. For members and for us and for America.

Jeff Fischer: Yeah. So, shorting volatility overall is a volatile trade when it goes the opposite direction on you. So we learned lessons from that as well. Yet we still kept trying with it, with SVXY, same thing. Worked until it didn't. But in both cases we kept the position small enough to keep our returns where we want them to be and to learn from what happened.

Another fun memory for members who might remember this.

Ellen Bowman: Oh, dear.

Jeff Fischer: Portfolio 2011.

Ellen Bowman: Oh, man, yes.

Jeff Fischer: Remember? So we had the charter portfolio which is what we've had all along these 10 years. Then for one year we opened a real money 2011 portfolio so that new members would have new money going into the same positions that were in the charter portfolio. So, the sole purpose of portfolio 2011 was to mirror the existing portfolio. So it's kind of convoluted.

Ellen Bowman: A little. Very.

JP Bennett: I have no clue what ...

Jeff Fischer: Oh, my gosh.

Ellen Bowman: It was really hard to explain.

Jeff Fischer: It was so much extra work.

Ellen Bowman: Not that he's not a genius, and I'm not a genius, but it was really hard to explain.

Jeff Fischer: So many extra trade alerts. So many extra hoops to jump through. Then 2011 is the portfolio that had its short volatility called out on it by Schwab. So to match it to the charter portfolio it was ... Yeah. So 2011 was a rough year. But I can honestly say the other nine years have overall been great.

Ellen Bowman: Oh, yeah.

JP Bennett: Please don't jinx it, Jeff. Please.

Jeff Fischer: Knock on wood.

Ellen Bowman: Knock on everything.

Jeff Fischer: So many good memories from member events to the holiday photos that Ellen spearheads.

Ellen Bowman: Yes.

Jeff Fischer: To our end of year, or our Thanksgiving columns, which we'll have another one soon where we just share what we're grateful about. But, sharing with you has been the key through it all. Sharing investment ideas, sharing thoughts about life. Sharing our gratitude too.

Ellen Bowman: Mm-hmm (affirmative).

Jeff Fischer: So we just want to take a minute and say, as we celebrate 10 years, thank you everybody for being here. For being a part of *Motley Fool Pro*. Thank you to the three of you too.

Ellen Bowman: Yes, thank you.

JP Bennett: Thank you, Jeff.

Billy K.: Thank you, Jeff.

Ellen Bowman: Thank you Fools. We love this service. Thank you so much for being part of it.

Jeff Fischer: Fool on.

Ellen Bowman: Fool on.

JP Bennett: Fool on.

Pro Guidance Changes and Completed Trades: Nov. 19, 2018

Published Nov 19, 2018 at 4:30PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Broadridge Financial Services** (NYSE: BR): Per our earnings review, our fair-value estimate increases to $117 and the stock moves to Best Buy Now on valuation.

***Pro* Completed Trades** (see transaction log; trades take a day to appear):

- **Facebook** (NASDAQ: FB): As it expired, we closed our protective collar on half our Facebook shares.
- **Flexion** (NASDAQ: FLXN): We closed our short at our desired profit.
- **HNI Corp** (NYSE: HNI): We closed our short at our desired profit.
- **Kellogg** (NYSE: K): We closed our short at our desired profit.
- **Papa John's International** (NASDAQ: PZZA): We closed our short, and our long protective calls on it, at a combined loss.
- **SPDR S&P 500** (NYSEMKT: SPY): We closed our synthetic short for a profit.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Apple, Broadridge, and More

Published Nov 16, 2018 at 1:41PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.8% stake in the stock.
- **Broadridge Financial Services** (NYSE: BR): Buy half of our 6.5% stake.
- **Paycom** (NYSE: PAYC): Buy at least half of our 4.7% stake to start.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy at least half of our 5.1% stake.
- **Facebook** (NASDAQ: FB): Buy half of our 5.7% stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 2.5% stake.
- **Tencent** (NASDAQOTH: TCEHY): Match our 2.1% stake.

Shorts:

- **Kellogg's** (NYSE: K): We are closing the short.
- **Papa John's** (NASDAQ: PZZA): We are closing our short and our protective calls.

Options:

- See below.

Upcoming Expirations:

- **November:**
  - The long puts on our protective collar on **Facebook** (NASDAQ: FB) should be sold to close today (the calls can be left alone to expire).
  - **Gilead Sciences** (NASDAQ: GILD): Our naked calls are set to expire as income on November 30. So far, we need not do anything.
  - **Papa John's:** The protective calls should be sold to close.

Close Your Short on Kellogg

Published Nov 16, 2018 at 1:12PM

Is this for you? This is for all members who followed our recommendation to short **Kellogg** (NYSE: K).

How You Participate

- **Action:** Buy to close, or cover, your short position(s) on Kellogg.
- **Allocation:** Close all of your short — our initial recommendation was to short 1%.
- **Recent Price:** $62.18
- **Price Guidance:** *Use a **limit order*** to close at going prices.

What We're Thinking

In our first short basket alert, we mentioned how we plan to actively manage our collection of shorts. Short positions require a very different mindset than long positions; because shorts are often driven by market sentiment (which can change in an instant), we need to act quickly when necessary.

Our Kellogg short has been a success in its brief history, with the stock down 15% from the price set in the original short alert in late September. Additionally, Kellogg is set to go ex-dividend in a few weeks, with a $0.56 dividend we'd rather not pay. While it's possible that the company could continue to struggle, we're happy to take advantage of a poorly received earnings report and recent market weakness to lock in a comfortable gain on this position in less than two months.

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread:** You should close those positions, too.

- **Want to discuss this?** Ask away on the *Pro* short positions board.

Sell Your Long Puts on Facebook

Published Nov 15, 2018 at 3:33PM

Is this for you? Any *Pro* members who own puts on Facebook that are expiring this week can close those for a profit.

How You Participate

- **Action:** Sell to close your Nov. 16, 2018, puts on **Facebook** (NASDAQ: FB) (or other puts, if you have other November strikes).

- **Allocation:** Sell all that are coming up for expiration.
- **Price Guidance:** Use a **limit order** at the recent price, which of course will change over time. And close by Friday's close.
- **Recent Prices (3:15 pm ET):**
  - Facebook: $144
  - Nov. 16, 2018, $145 puts: $1.70 (splitting the bid/ask).
- **Stock Scorecard Status:** Buy Facebook. Allocation is 5.8%.

What We're Thinking

In September, with shares near $156, we recommended setting up a November $170 call/$145 put protective collar on half of your Facebook position. Today, the stock is priced at about $141.

Your short $170 calls, which paid for your puts, are due to expire as income tomorrow. You can let them be to do just that (assuming the stock price stays below $170, a near certainty). Your $145 puts, on the other hand, have value, so you can sell to close those between now and Friday to capture that profit.

Facebook continues to struggle in the public eye. The latest deep bruise comes from a 6,100-word *New York Times* story out last night that suggests Facebook worked with outside organizations to quiet critics, was slow to respond to election meddling, and obfuscated what was happening, among other charges. We are still -- unhappily -- noodling over these charges and what they may mean for our relationship with Facebook.

Facebook's recent earnings results point to a strong underlying business -- third-quarter revenue was up 33% to $13.7 billion -- besieged by problems that the company should, perhaps, have started spending to correct much earlier. Expenses rose 53% in the quarter, to $7.9 billion, as Facebook spends on employees, security, and hardware. After rising by 50% to 55% this year, Facebook expects expenses to expand by 40% to 50% in 2019.

The end result is that earnings-per-share growth will slow considerably -- to a crawl. At about 20 times earnings, the stock is not expensive, but we'll need to see the promise of a resumption in earnings growth before shares are likely to rise sharply again (though one never knows). On the bright side, CEO Mark Zuckerberg said in the third-quarter conference call that management is aware that expenses must line up well with revenue, and they look forward to getting to that point again.

After selling to close these puts, we'll consider another protective strategy if it seems merited.

Please note: Pro *was not able to set up the collar as recommended, as the stock price declined before we acted; we have a different collar, at lower strike prices, that is out-of-they money and dying. So we didn't benefit on this one. But that's OK.*

Pro Can Help

Close Your Short (and Protective Calls) on Papa John's

Published Nov 14, 2018 at 3:11PM

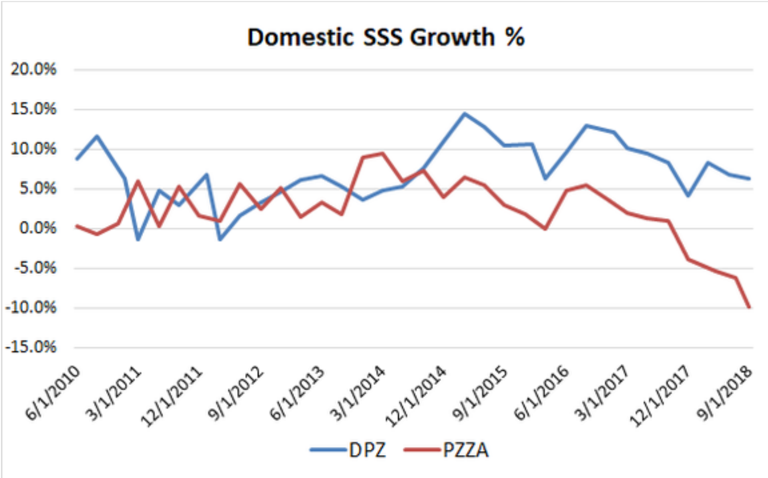
Is this for you? This is for all members who followed our recommendation to short and buy protective calls on **Papa John's** (NASDAQ: PZZA).

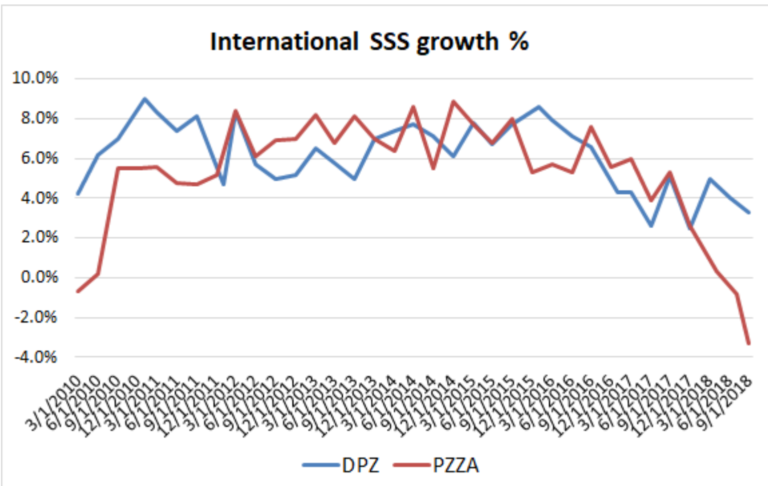
How You Participate

- **Actions:**
  - Buy to close, or cover, your short position on Papa John's.
  - Sell to close your November 2018 $55 protective calls.
- **Allocation:** Close all of your short and sell all of your protective calls.
- **Recent Prices:**
  - PZZA stock: $56.34
  - PZZA November 2018 $55 calls: $1.50/$2.05 (bid/ask)
- **Price Guidance:** *Use a **limit order*** at going prices, aiming to split the current bid/ask. Right now, the trade can be completed for a combined net debit of about $54.57. Our protective calls expire in two days, so aim to get the trade done before then.

What We're Thinking

Shorting is a tough business. Sometimes, even if you're right about the business thesis, the market doesn't care. That's what has happened with our attempted short of Papa John's. Since we initiated our short in late September, the company has continued its financial free-fall, reporting sharply negative comparable sales performance (-9.8% domestic, -3.3% international) in the third quarter of 2018. Papa John's terrible results can be compared to healthy positive results at main rival Domino's (NYSE: DPZ), demonstrating that Papa John's struggles are not an industry-wide problem:





Source: Company filings.

But despite the continued deterioration of the financials, the market seems to care more about the possibility of a buyout than it does about poor business results. Although it's possible that the business will never recover and Papa John's stock is decimated in a few years, it's not worth paying up to see whether that plays out -- especially because it's just as possible that the market remains disconnected from business results for the foreseeable future. With a short like this one, where the market has disconnected its perception of value from what's going on in the business and there is no catalyst in sight to flip that sentiment, it's probably wise to simply take your lumps and move on.

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread:** You should close those positions, too.

Pro Can Help

- **Questions?** Head over to the [*Pro* short positions board].

Close Your Short on HNI Corp.

Published Nov 13, 2018 at 3:45PM

Is this for you? This is for all members who followed our recommendation to short **HNI Corp.** (NYSE: HNI)

How You Participate

- **Action:** Buy to close, or cover, your short position(s) on HNI Corp.
- **Allocation:** Close all of your short — our initial recommendation was to short 1%.
- **Recent Price (this afternoon):** $38.15
- **Price Guidance:** *Use a **limit order***, and aim to pay less than $38.50.

What We're Thinking

One of the downsides to shorting a stock is that while you hold the short position, you're on the hook to pay any dividends the company issues. And because office furniture maker HNI's dividend is non-trivial, we knew from the outset that the company's ex-dividend dates would act as a trigger for us to reassess our position: Is it worth incurring this additional cost to continue shorting the company?

Fast-forward to today and HNI's next payout is right around the corner, with the ex-dividend date scheduled for this Friday, Nov. 16. After mulling over our options for the past week or so, we've decided to take our gain on the stock and close the position for now. The situation is similar to what we saw with International Speedway Corp. -- although our thesis for shorting HNI was long-term in nature, the recent decline has removed a large part of the margin of safety we believed shorting the stock in the $42 to $44 range afforded us. And with the impending dividend payout, we would actually find ourselves in the red if the stock price continued to climb back to the level at which we first shorted shares.

Fools who shorted HNI around the time of our original recommendation should currently have a gain of about 10%, with the stock having fallen more than twice as much as the market since we sent out the original alert -- a more than respectable gain for us in such a short time frame.

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread:** You should close those positions, too.

Pro Can Help

- **Want to discuss this?** Certainly; relax in your comfortable office chair and we'll come to you. Or just click on over to the *Pro* short positions board.

Broadridge Moves to Best Buy Now

Published Nov 12, 2018 at 4:14PM

Fiscal Q1 2019

- Recurring fee revenue growth, year over year: Up 5% to $575 million, or 6.3% trailing-12-month (TTM) growth
- Closed sales growth, year over year: Down 22% to $18 million, or 9.9% TTM growth
- EPS growth, year over year: Up 54% to $0.64, or 32% TTM growth

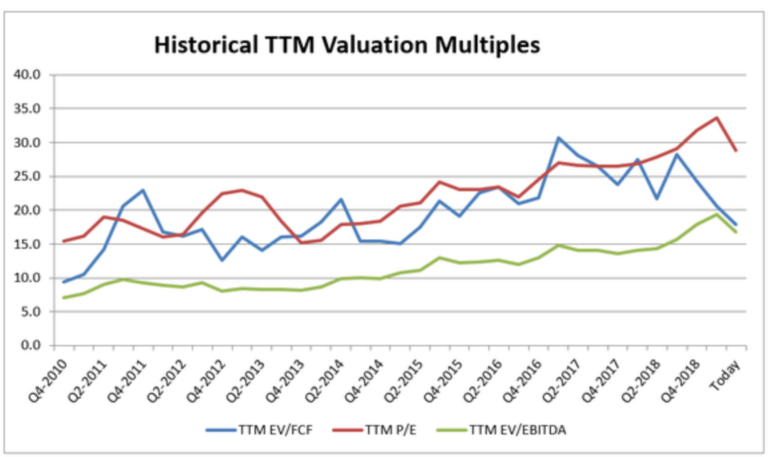
Investor communications guru **Broadridge Financial Services** (NYSE: BR) reported a solid start to fiscal 2019, reporting increased margins, steady revenue growth, and strong earnings growth. However, the market was not happy with the results, sending shares down 11% on the day of the earnings release.

A combination of factors likely contributed to the decline, including a weak quarter of closed sales (which is typical in Q1), an elevated valuation going into the report, and recent market-wide volatility among technology companies. Analysts were also likely displeased with a comment on the conference call about total revenue facing pressure next quarter because of a decline in event-driven revenue (which faces a difficult comparison with atypically huge quarterly results last year).

Despite all of these factors and the sharply lower share price, there is nothing in the earnings report that suggests that our investment thesis is impaired. In fact, this quarter's results support the argument that Broadridge's business continues to strengthen.

- **Updated guidance**: Best Buy Now (from Buy)
- **Recommended allocation**: 6.6%
- **Fair-value estimate:** $117 (from $115)
- **Current price:** $106.50

Based on management's 2019 guidance, at $106.50 per share, the stock is priced at 24 times projected 2019 cash flow and 27 times projected 2019 GAAP earnings per share. Following the recent market volatility and the sell-off after this quarter's earnings report, Broadridge's P/E multiple (my favorite single valuation metric for this company) is as low as it has been since fiscal Q2 2018 (late 2017), when Broadridge's stock price ranged between $80 and $90 per share:



After incorporating Q1 2019 results, **our fair-value estimate increases to $117 per share (from $115)**. The company's valuation multiples have significantly contracted, and Broadridge's stock is a better value than it has been in a long time.

With the current price about 7% below our newly updated fair-value estimate, **Broadridge moves to Best Buy Now (from Buy)** on our scorecard. If you've yet to establish a full allocation, now is a great time.

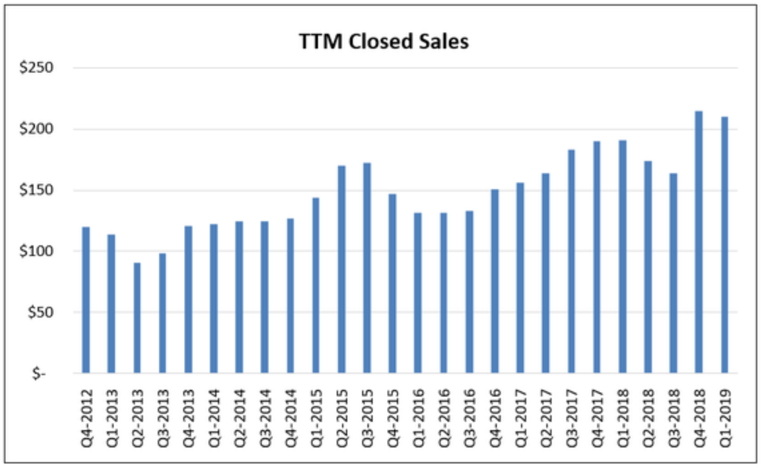
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers offload technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue (augmented by tuck-in acquisitions), slight operating leverage, plenty of free cash flow, and a growing stream of dividends and share repurchases to help achieve North Star-like returns.

The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

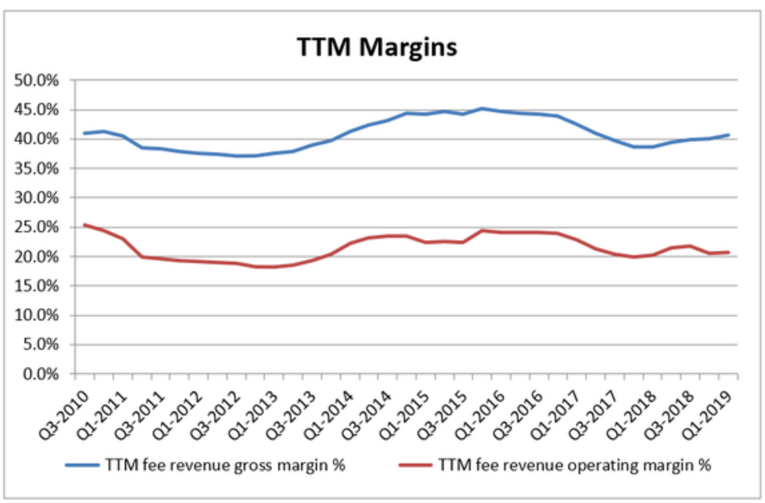
In Q1 2019, Broadridge reported a relatively weak quarter with $18 million in closed sales. This is the lowest figure for closed sales in a quarter since Q1 2016, although the closed metric is very seasonal and Q1 is historically the weakest quarter. When we look at closed sales on a TTM basis to smooth out seasonality, performance is acceptable (if not strong), with $210 million in TTM closed sales, up 10% from the year-ago TTM period:



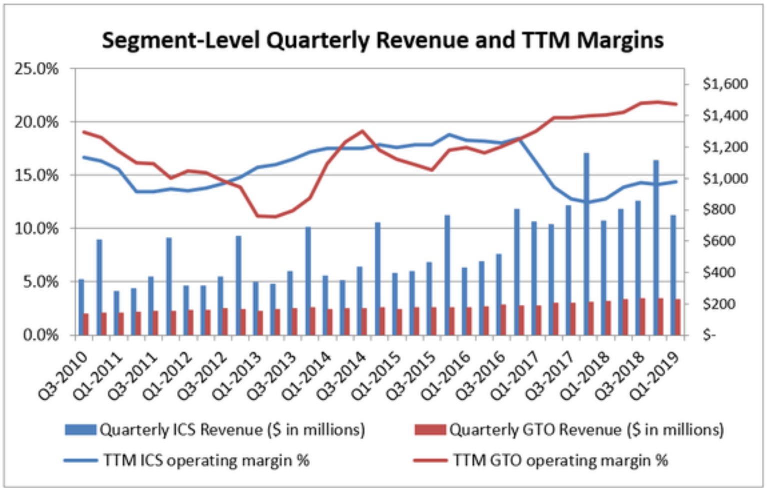
I'm not concerned about the relatively weak closed sales in the quarter given the routine seasonality of this metric and the records set in Q4 2018 (when Broadridge reported $115 million in closed sales). On a TTM basis, closed sales performance is trending upward.

It's only natural that after closing several big deals last quarter, Broadridge saw a slower pace of sales this time. We'll see how the company performs over Q2 and Q3, which historically tend to be stronger than Q1 (but weaker than Q4, which is routinely the strongest quarter of a given fiscal year).

2. Fee-Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, ignoring pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers), we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee-revenue gross margins came in at 40.7% (up from 38.7% a year ago), and TTM fee-revenue operating margins came in at 20.8% (up from from 20.2% a year ago). Although margins can be lumpy on a quarter-to-quarter basis, Broadridge has done an excellent job integrating its 2016 acquisition of NACC and continuing to improve margins on a year-over-year basis:



When looking at Broadridge's separate divisions, we can see that both businesses are improving. While the Investor Communications Solutions (ICS) business has seen significantly lower (though improving) margins because of the NACC acquisition, the Global Technology & Operations (GTO) business, which is acquisition-agnostic, has shown continued strong margin expansion, generating a TTM operating margin of 21.7%:



Despite the continued margin expansion trends for both parts of the business, this quarter was the first of 11 in which GTO's operating margin percentage was not higher than the immediately preceding quarter (21.7% this quarter vs. 21.9% in the one before). However, on a year-over-year basis, margin percentage is still expanding strongly, with this quarter's 21.7% higher than the 20.7% achieved a year ago.

The longer-term margin expansion trends for both divisions of the business are exactly what we want to see as investors, and we expect this to continue over the long run. Broadridge's financial execution since the NACC acquisition is an indication of excellent management, as integrations don't always go so smoothly.

3. Capital Allocation: In the company's most recent Investor Day presentation, we got a detailed update on how management plans to allocate capital between fiscal 2017 and fiscal 2020: targeting a 45% dividend payout ratio and using up to $1.4 billion in incremental debt capacity and expected free cash flow for share repurchases and merger-and-acquisition activity.

After a significant quarter of share buybacks in Q4 2018 ($247 million), management slowed down its share-repurchase activity in Q1 2019, spending just $1 million in the quarter on share buybacks. I appreciate the slower pace, given that the share price was higher than in the prior quarter (the average quarterly share price was $127 in Q1 2019, vs. $113 in Q4 2018) and multiples were elevated.

I'd love to see a resumption of significant activity in share buybacks in the next quarterly report, given that the stock price has decreased significantly and the stock is a much better value this quarter compared with last quarter. If we see higher buyback activity in next quarter's report, that would be another very strong indicator of prudent decision-making by Broadridge management (and I wouldn't be surprised).

Broadridge made no acquisitions in Q1 2019, but we expect management to continue to be active with M&A throughout 2019 when opportunities arise.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring organic revenue growth (augmented by tuck-in acquisitions) to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Pro Catch-Up Trades and Expirations: Amazon, Broadridge, and More

Published Nov 9, 2018 at 11:51AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.8% stake in the stock.
- **Paycom** (NYSE: PAYC): Buy at least half of our 4.7% stake to start.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% of our 5% stake to start.
- **Broadridge Financial Services** (NYSE: BR): Buy half of our 6.45% stake to start.

Shorts:

- N/A

Options:

- N/A

Upcoming Expirations:

- **November:** We have a collar on **Facebook** (NASDAQ: FB), naked calls on **Gilead Sciences** (NASDAQ: GILD), and long calls on Papa John's expiring during various weeks this month. We plan to close the Facebook collar (anytime), let the naked calls on Gilead expire as income (they're on track), and close the Papa John's calls at some point (currently for a profit), as we manage that short.

Pro Guidance Changes and Completed Trades: Nov. 5, 2018

Published Nov 5, 2018 at 3:10PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Flexion Therapeutics** (NASDAQ: FLXN): We moved the position to Cover or Close (from Short), recommending that we take our 20%-plus gain before earnings on Nov. 7 -- because you never know, and because we've exceeded our initial goal on the short.
- **SPDR S&P 500** (NYSEMKT: SPY): We moved our synthetic short to Close, wanting to take our profits on this market hedge after the worst October for stocks since the Great Recession.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Flexion:** We covered all of our 1,920 short shares at $14.69, booking a 21% gain on the short.
- **SPDR S&P 500:** We closed all of our long Dec 2018 $171 puts and short January 2019 $285 calls (combined, our synthetic short) for a credit of $2.71, booking a profit on the syn short as we consider new hedges.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

10 Years of Pro's Long Stock Strategies

Published Nov 5, 2018 at 3:04PM

Dear *Pro* Fools,

If you've read what I've written over the years in *Pro*, you probably know that I love data. Processing data into useful intelligence via charts, graphs, tables, and other visualizations is one of my favorite ways to communicate information. Just last month, I wrote a Memo based on charts and tables using *Pro*'s historical performance data.

To keep the data theme going, as part of our extended celebration of *Pro*'s 10-year anniversary, I decided to take a look at an important data set that, to date, had never been analyzed: *Pro*'s strategy-level performance. The data set is huge -- it essentially requires accounting for every single single transaction *Pro* has ever made, and it took me more than a month to finish collecting and analyzing it.

Pro has used many different strategies in our 10 years, including long and short stock positions, option-only positions, ETFs, hedges, and commodities; see our strategy guide for more. But for the purpose of this Memo, we're going to include just the positions involving long stocks, which narrows down the data to a more manageable level.

Our long positions are the most important of all our strategies in *Pro*, and they're responsible for essentially all of our long-term returns. An analysis of *Pro*'s strategy-level performance that looks at long stock positions (as opposed to all other types of strategies) provides the most informational value.

I'll start by presenting the data in raw, tabular form, and I'll follow with a discussion and analysis. The tables below show every active and inactive strategy involving long stock since *Pro*'s inception. They are organized by compound annualized growth rate (CAGR), from highest to lowest.

The Data

Active Positions

Date Initiated	Position	Company	Holding Period (Years)	CAGR
7/12/2017	SQ	Square	1.32	125.0%
11/30/2016	PAYC	Paycom Software	1.93	75.0%
9/18/2012	FB	Facebook	6.13	51.6%
1/26/2017	AMZN	Amazon	1.78	47.9%
9/8/2011	MA	Mastercard	7.16	29.1%
4/28/2015	V	Visa	3.53	22.3%
2/14/2012	AAPL	Apple	6.73	20.2%
2/22/2018	CME (2)	CME Group	0.70	19.4%
8/31/2011	OTEX	OpenText	7.19	18.5%
8/22/2012	SBUX	Starbucks	6.21	18.2%

12/10/2010	WFC	Wells Fargo	5.90	2.9%
2/24/2010	INTC (2)	Intel	4.44	2.4%
11/4/2010	LLL	L-3 Communications	1.22	-3.4%
10/15/2013	TUP (2)	Tupperware	2.20	-12.2%
3/12/2012	INVN	InvenSense	0.78	-52.9%

Discussion and Analysis

Pro has initiated a total of 69 strategies involving long stocks, of which 24 are still active and 45 have been completed.

	#	Average Holding Period (Years)	Average CAGR	Total Appreciation ($)	Average Time Since Initiation (Years)
Active	24	3.8	17.0%	$1,497,280	3.8
Inactive	45	2.6	17.6%	$991,971	7.6
Total	69	3.0	17.4%	$2,489,252	6.3

As you would expect, our active strategies have a significantly longer holding period (3.8 years) compared with our inactive strategies (2.6 years). Interestingly, however, the average CAGR of our inactive strategies (17.6%) exceeds that of our active positions (17%).

However, despite the smaller number of active strategies and the lower CAGR they display, our active strategies have added significantly more to *Pro*'s total capital appreciation. This is because of the longer holding periods (allowing more time for the investments to appreciate) and the fact that the active strategies are more recent (it's been an average of 3.8 years since we initiated each active strategy, compared with 7.6 years for the inactive ones). Because our portfolio has appreciated in value over time, a 3% position initiated today has a much higher impact on our total capital appreciation than a 3% position initiated 10 years ago.

Also interesting: Long stock strategies have accounted for *greater than 100%* of *Pro*'s total portfolio appreciation. These positions have added $2,489,252 to our portfolio's total capital, and as of today the *Pro* portfolio has appreciated by $2,440,175 since inception. This means that in aggregate, our option-only positions, ETF strategies, shorts, and hedges have had essentially a net zero effect on our portfolio. (But keep in mind that the returns of the long stock strategies included in this report include the impact of option strategies overlaid on top of the stocks.) This provides confirmation that the long stock portion of the *Pro* portfolio is by far the most important slice of our strategic approach, and it is where we add the most value.

Compound Annual Growth Rate (CAGR)

The positions with the highest CAGR are a good proxy for our most successful strategies. Looking a bit deeper at the CAGR for *Pro*'s long stock positions, the active position with the highest CAGR is Square, with 125% (!) over 1.3 years, followed by Paycom at 75% over 1.9 years. We've done well adding fast-growing young software companies to our portfolio over the past two years. Looking only at positions with a holding period greater than three years (which is a more appropriate analysis period for our long-term investment horizon), the position with the highest CAGR is Facebook at 52%, followed by Mastercard, Visa, Apple, and OpenText.

Active Positions by CAGR, Holding Period > 3 years				
Date Initiated	Position	Company	Holding Period (Years)	CAGR
9/18/2012	FB	Facebook	6.13	51.6%
9/8/2011	MA	Mastercard	7.16	29.1%
4/28/2015	V	Visa	3.53	22.3%
2/14/2012	AAPL	Apple	6.73	20.2%
8/31/2011	OTEX	OpenText	7.19	18.5%

The inactive positions with the highest CAGR are those with short holding periods, including our second position on Autodesk (106% CAGR over 0.5 years) and TradeStation (71% CAGR over 0.7 years). Of inactive positions with holding periods greater than 1.5 years (because our closed positions tend to have shorter holding periods), here are the top five:

Inactive Positions by CAGR, Holding Period > 1.5 Years				
Date Initiated	Position	Company	Holding Period (Years)	CAGR
12/9/2016	VRSN	Verisign	1.52	37.4%
10/16/2009	EBIX	Ebix	2.32	34.7%
1/23/2009	ADSK (1)	Autodesk	1.99	32.3%
1/8/2009	CCJ	Cameco	1.95	32.1%
7/1/2010	BRS	Bristow Group	2.19	29.0%

Holding Periods

When looking at holding periods for *Pro*'s long stock positions, our longest-tenured active position is Medtronic, which we've held for 9.3 years -- that's almost as old as *Pro*! Oracle is second, followed by Broadridge, OpenText, and Mastercard:

Active Positions, Longest Tenured				
Date Initiated	Position	Company	Holding Period (Years)	CAGR
7/1/2009	MDT	Medtronic	9.35	12.2%
9/17/2009	ORCL	Oracle	9.14	8.4%
4/27/2010	BR	Broadridge Financial Solutions	8.53	16.8%
8/31/2011	OTEX	OpenText	7.19	18.5%
9/8/2011	MA	Mastercard	7.16	29.1%

Our longest-tenured inactive position was AmTrust Financial Services at 8.2 years, followed by Papa John's, Wells Fargo, GrafTech International, and Gentex:

Inactive Positions, Longest Tenured				
Date Initiated	Position	Company	Holding Period (Years)	CAGR
4/3/2009	AFSI	AmTrust Financial Services	8.18	17.4%
7/8/2010	PZZA	Papa John's	6.79	18.6%
12/10/2010	WFC	Wells Fargo	5.90	2.9%
12/16/2008	GTI	GrafTech International	5.37	9.0%
5/29/2012	GNTX	Gentex	5.32	21.5%

Capital Appreciation

The tables below show which active and inactive long stock positions have contributed the most to *Pro*'s total capital appreciation. Capital appreciation is important to distinguish from CAGR because it more appropriately accounts for allocation and the duration of the position's inclusion in the portfolio. The active stock with the highest impact on our portfolio's value is Facebook at $209,310, followed by Mastercard, Broadridge, Square, and Apple.

Active Positions by Total Appreciation			
Date Initiated	Position	Company	Total Appreciation ($)
9/18/2012	FB	Facebook	$209,310.28
9/8/2011	MA	Mastercard	$204,037.25
4/27/2010	BR	Broadridge Financial Solutions	$142,956.43
7/12/2017	SQ	Square	$139,845.99
2/14/2012	AAPL	Apple	$130,029.58

The top five inactive positions by capital appreciation are:

Inactive Positions by Total Appreciation				
Date Initiated		Position	Company	Total Appreciation
7/8/2010	3042.00	PZZA	Papa John's	$127,075.80
4/3/2009	3503.00	AFSI	AmTrust Financial Services	$109,667.17
4/15/2013	2030.00	ORLY	O'Reilly Automotive	$59,863.18
10/23/2008	3665.00	KCI	Kinetic Concepts	$54,878.85
5/29/2012	2351.00	GNTX	Gentex	$52,803.93

Strategy Frequency

Another interesting variable to consider is the frequency of strategy initiation. Over our 10 years managing *Pro*, we've initiated a new strategy involving long stock once every two months or so (53 days, to be exact). However, our frequency has shifted a bit over time -- before 2013, we initiated a new long stock strategy once every 32 days. Since 2013, that number has shifted to once every 89 days. Given that we started off in 2008 with a 100% cash portfolio that needed to be allocated, it makes sense that our first five years were more active than the past five. Still, a new long stock strategy once every three months since 2013 is quite a pace for a portfolio with an average holding period of three years.

Accuracy

A critical consideration for the *Pro* portfolio is accuracy. It is the No. 1 principle in the "How We Invest" section of our guidebook. Our aim, in our own words, is to be correct "the vast majority of the time." Have we performed up to our standards? In analyzing our long stock strategies, we can see that only eight of our 69 strategies (five active, three inactive) have produced negative returns. That's an accuracy rate of 88%, which I'd say qualifies as the vast majority.

The *Pro* Bottom Line

All in all, analyzing the strategy-level performance of *Pro*'s historical long stock positions has provided some interesting and useful insights. We have determined the active (Facebook) and inactive (Papa John's) positions with the most impact, found our average holding periods for active (3.8 years) and inactive (2.6 years) positions, noted our positions with the highest CAGRs, and observed the frequency (every 53 days) and accuracy (88%) of our long stock strategies. Historical context is incredibly useful in assessing our performance and in improving our investing process.

While there is a lot of data presented in this report, there is still plenty left to analyze when it comes to our long stocks. Other useful parameters to look at would be sectors and industries. We could also slice up this data from this Memo in a more granular way by looking at each individual year to see how our approach or performance varied over time.

I hope this Memo provides you with a more complete view of *Pro*'s history and how we got to the portfolio positioning we have today, and I hope the insights generated from the data are useful.

Fool on!

Pro Catch-Up Trades and Expirations: Amazon, Sonos, and More

Published Nov 1, 2018 at 2:54PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.8% stake in the stock.
- **MasterCard** (NYSE: MA): Buy at least half of our 6.9% stake.
- **Paycom** (NYSE: PAYC): Buy at least half of our 4.7% stake.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy at least half of our 4.7% stake.
- **Broadridge Financial Services** (NYSE: BR): Buy 3% of our 7% stake to start.
- **Coherent** (NASDAQ: COHR): Match our 1.2% stake.
- **Medtronic** (NYSE: MDT): Match our 2.6% stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 3.1% stake.
- **Tencent** (NASDAQOTH: TCEHY): Match our 2% stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our recently increased 1.8% stake.

Shorts:

- **Flexion** (NASDAQ: FLXN): Close your short, per today's alert.
- **Kellogg** (NYSE: K): Sell short 1%.
- **Papa John's International** (NASDAQ: PZZA): Sell short 1%.

Options:

- **Papa John's International**: Buy to open November 2018 $55 calls to cap risk on your short, buying one call for every 100 shares you're short.
- **SPDR S&P 500** (NYSEMKT: SPY): Close your synthetic short, per today's alert.
- **Sonos** (NASDAQ: SONO): Sell naked January 2019 $15 calls, lately paying you $0.80 each.

Upcoming Expirations:

- **November:** We have a collar on **Facebook** (NASDAQ: FB), naked calls on **Gilead Sciences** (NASDAQ: GILD), and long calls on Papa John's expiring during various weeks this month. We plan to close the Facebook collar soon, let the naked calls on Gilead expire if possible, and close the Papa John's calls at some point, as we manage that short.

Close Your Synthetic Short on SPY

Published Nov 1, 2018 at 12:30PM

Is this for you? This is for members who have a short on this index and who want to book the profit.

How You Follow Along

- **Trade:** Ideally, use a two-legged order to close your synthetic short on the **SPDR S&P 500** (NYSEMKT: SPY) ETF:
  - Sell to close your December 2018 $271 puts.
  - Buy to close your January 2019 $285 calls.
- **Allocation:** We're closing our **entire** position, which is 17 contracts of each option.

- If you prefer to keep half of your hedge -- so 7.5% of the original 15% allocation -- you could. Just realize that we're closing this position entirely, and looking to potentially set up another hedge or more shorts.
- **Prices (10:30 a.m. ET) and Guidance:**
  - SPY: $271.90
  - Sell to close $271 puts: $7/$7.02
  - Buy to close $285 calls: $2.90/$2.94
  - Combined credit (use limit orders that split the bid/ask): About $4.19
- **Later Guidance:** If SPY moves much in price before you act, you should still close these options on the argument that we're closing the hedge to book a profit, period.

What We're Thinking

Living up to its scary reputation, October was the worst month for stocks since 2008, with the Nasdaq falling 9.2% and the S&P 500 down nearly 7%. (The decline actually started in September, so the total is larger still.)

Even so, declines of this magnitude are natural, typically happening up to three times per year. And when they do, we generally want to book our profits on any market hedges, because the decline is unlikely to become more severe or to last. A hedge in a declining market is ultimately only helpful if you take your profit at some point.

Our synthetic short on the S&P 500 ETF has a short $285 call that expires in January 2019 and a long $271 put that expires next month, on Dec. 21.

Lately, the ETF is near $272. That means *all* of the value in our long $271 puts is time value, and it's currently on track to decay by a few percentage points per day until our expiration in just 50 days (many fewer market days). And that decay will increase in velocity over time, and if SPY rises.

If we don't act and SPY doesn't move an inch, the $7 per share in time value in these puts will be gone next month, while selling the puts today is akin to closing a SPY short at $265 -- about 2.5% lower. We'll take that.

Meanwhile, our January 2019 $285 calls on SPY are only 4.8% out of the money -- a distance that the S&P 500 could travel in a day or two if it chose. So we're going to buy to close these short calls, too, to take this side of our short off the table, removing its risk. We've captured more than 60% of what these calls paid us, and we grew that capital by investing it in the $271 puts. Thus, rather than getting fancy and hoping SPY doesn't rise for the next few months, we'll close these, too.

Closing the synthetic short frees us, in a sense, to consider new hedges, which we want to do just as much as we want to book this gain. However, hedging is much more expensive now than when we originally set this up in March, when the markets were more complacent, so we may need to get creative in constructing another index hedge.

We're ready to close this one anyway, because if we never take gains in our hedges, they aren't really serving their ultimate purpose: helping our returns and giving us more cash to invest during and after downturns.

Alternative Trades

- **IRA-Friendly:** Our alternative trade was a January $245/$255 bear put spread that you could have set up in March for about $2.65 per spread. Now, with SPY still well above those strike prices, the spread is worth about $1.45. We suggest closing the spread as a way to keep your loss at less than half of your hedge cost, rather than potentially losing all of it come January. That said, if you'd rather keep this hedge, you of course may do so.
- **Direct Short:** If you shorted SPY directly, you can buy to close or cover that short, if you want to follow us in this decision.

Close Your Short on Flexion

Published Nov 1, 2018 at 12:30PM

Is this for you? This recommendation is for all *Pro* Fools who shorted **Flexion Therapeutics** (NASDAQ: FLXN) with us.

How You Follow Along

- **Action:** Buy to close, or cover, all of your short shares of Flexion. That's a 0.8% allocation for *Pro*, or 1,920 shares.
- **Recent Price:** $14.50
- **Guidance:** Use a **limit order** to close at the going price.
- **Alternative Trade:** If you set up a synthetic short using options, close those two options, too.

What We're Thinking

As of this morning, we were sitting on a 25% gain in our short of this small biopharmaceutical company, a return earned in about six weeks (the stock fell 10% this past week alone). This put about $7,000 in unrealized profit in our portfolio despite the position's small (1%) size. True to the, well, short-term nature of many shorts, we're going to close this position now to ensure our profit.

With Flexion's market value hovering at about $550 million and the stock price remaining volatile, we could easily see much of this profit disappear if we become too complacent. We could also the stock price decline much further -- we don't have high hopes for earnings next week, or for the company's sole drug in general -- but with a short sale, we'll often take one in the hand as opposed to two in the bush. That's partly because it costs money to short -- each day, you're paying a small fee -- and partly because your potential rewards on a short shrink as the stock price falls, so we have less to gain by waiting around at this point. (Plus, we can always short it again if desired!)

The short has exceeded our near-term hopes for a return, and we'll book our gain. Please note that it's important to use a limit order to cover your shares, so we don't all push the stock much higher. Use a limit order to close your options, too, if you used options to short it. Congrats to those who took the risk of shorting and were rewarded.

More Market Volatility Seems Certain

Published Oct 29, 2018 at 5:22PM

Dear *Pro* members:

Having just returned from a Motley Fool member event with more than 300 Fools in Denver, I can share that Fools are handling the market's renewed volatility with calm and resilience. Most of us have seen declines before, including some far worse than this against backdrops that were much more unnerving and heartbreaking (including 9/11 and the Great Recession, when millions lost their homes and jobs).

Today's market volatility seems to be brought on more by spectral apparitions and imagined ghouls than by actual current events. I don't mean to discount the real risks; concerns about slowing economic growth, sharply lower international stock markets, trade wars, and rising interest rates are all worthy of a role in the haunted house of investing. But currently, these look like temporary scares, unlikely to do more than jump out at us for a moment and then slip back again as we pass by. The economy is still growing at a strong clip. International stock markets are historically volatile. Trade war resolution will be good for all parties. And interest rates will be higher sooner than we think, so much so that talk will turn to eliminating increases or even a rate drop.

The pendulum swings in both directions. Right now, we're still on the downswing. As of now, the Nasdaq is down more than 13% from its Aug. 29 closing high, and the S&P 500 is down about 11% from its Sept. 20 counterpart; both have dipped into negative territory for 2018. We don't like to anchor on the high points, but this is the best way to convey how far we've fallen, and why you may feel a bit shellacked. A 13% decline in the Nasdaq means many tech-heavy portfolios are down 20% or more. Even the big tech stocks have been hit hard. But declines of this magnitude are historically common.

On Sept. 17, I wrote that it was time to restart our short basket. We sought to add as many as five new shorts per week in the following month or so, and while we fell short of that as many stocks fell before we got to them, we did recommend nine short positions (including two naked calls) and a protective collar on **Facebook** (NASDAQ: FB). With that collar plus our in-the-money covered calls on **Square** (NYSE: SQ), we had half of two of our largest positions hedged alongside the new shorts. We've also been maintaining a large short on the **SPDR S&P 500** (NYSEMKT: SPY) that is now well in-the-money.

But we're still keen on adding to our shorts -- assuming we can find stories of woe at prices where we still want to short. We're also considering adding to our index hedge, which would be quick and easy. The S&P 500 isn't crazily priced (at all) at about 15 times expected earnings, and we expect this market decline will ultimately be an opportunity (every decline in history ultimately was). But for all we know, this particular decline could only be halfway through (or less). We could set up another hedge to help cushion against further declines while still providing us some breathing room if -- or, I should say, *when* -- the market bounces.

We'll see Facebook's earnings tomorrow night, and soon after that, we'll be able to share guidance on our November protective collar on Facebook, which should be rewarding you well now.

We're also watching our shorts closely, of course; we currently enjoy a 22% gain on **Flexion** (NASDAQ: FLXN), a 13% gain on **SeaWorld** (NYSE: SEAS), and an 11% gain on **HNI** (NYSE: HNI). I'm not eager to remove short positions unless we're comfortable with our overall exposure, or if a stock has fallen enough that we no longer want to short it. Having some winners in a down market makes it easier to stay the course and reinvest some money in cheaper stocks. We'd hoped to have more shorts by now, but as mentioned last month, we'll continue adding to our evolving book of short positions. Our "bear pen" of potential shorts, as we've taken to calling it, is expanding.

Again, one never knows, but volatility seems likely to continue in this environment. That said, we also know that we need to short prudently, using Foolish skills equal to those we employ when buying strong businesses. Otherwise, the short positions will prove too costly when stock prices do rise, and that's what we want to avoid. So far we've been able to manage this, despite a 10-year bull market that technically continues today.

We'll be in touch again soon. To share thoughts, please visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Oct. 29, 2018

Published Oct 29, 2018 at 2:50PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Zuora** (NYSE: ZUO): We're increasing our allocation, recommending an additional 0.5% buy, to bring us to 1.7%.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Facebook** (NASDAQ: FB): Because the stock had dropped before we set up our trade, we had to adjust our strike prices. We sold seven November 2018 $155 calls and bought seven November 2018 $135 puts for a net credit of $0.05, covering half of our shares before tomorrow night's earnings.
- **Gilead Sciences** (NASDAQ: GILD): We sold to open four Nov. 30, 2018, $78 calls, only being paid $0.69 each (as the price had changed). We set up 1% in look-through short exposure.
- **Sonos** (NASDAQ: SONO): We sold to open 23 $15 calls expiring in January 2019, being paid $0.70 each and setting up 1% in look-through short exposure.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Buy More Zuora

Published Oct 25, 2018 at 2:32PM

Is this for you? This is for all *Pro* members who want to invest in this company alongside us.

How You Participate

- **Action:** Invest another 0.5% of your portfolio in **Zuora** (NYSE: ZUO). For *Pro*, that's about another $17,500 worth, or approximately 900 shares.

- **Recent Price Range:** $17.87-$19.15
- **Scorecard Status:** Buy
- **Price Guidance:** Please, **use a limit order.** It's a smaller company, so set a limit near the current price when you make your investment; lately, aim to buy below $19.50.
- **Alternative Trade**: Seeking a potentially lower buy price? Sell to open puts that appeal to you; for example, you can sell to open one December 2018 $17.50 put for every $1,750 in stock you want to buy lower.

What We're Thinking

The business story at Zuora has not changed since our first recommendation to buy shares in mid-July. However, the stock is demonstrating all the puppy-like volatility that befits a recent IPO; it's down by about 25% since that first buy. Of course, Zuora isn't alone in having a lower share price. Most stocks have declined in recent weeks, and younger, smaller companies have typically fallen by more than average. However, historically, smaller companies' stocks have a tendency to eventually bounce back more robustly, as well.

Expecting volatility in these new shares, we began the position in July with just a 1.5% stake, which is now worth 1.2% of the portfolio. Today, we're recommending investing another 0.5% of our assets in Zuora stock, bringing our total initial investment to a more meaningful 2%, and our current stake's value to 1.7%. For future planning, this is likely the size at which we'll leave the position for a some time to come; we're unlikely to invest more until we see more business reasons to do so.

Meanwhile, we expect the stock to remain volatile, of course, partly because $2-billion-market-value Zuora isn't expected to earn GAAP profits for several more years (though that's not uncommon with young Software-as-a-Service businesses), and the stock trades at about 8.7 times next year's estimated revenue of $229 million. Zuora also must continue to invest to reach more customers, and perhaps the easiest customers to convert were the ones who arrived to the fold earliest. But the market for is solutions is large and growing, and Zuora maintains a leadership position against less focused competitors despite its small size.

We also have a relatively young (49-year-old) founder/CEO, Tien Tzuo, who is invested in and passionate about the business and its mission. (In fact, we recently interviewed him, for when you have 30 minutes.) So, as we wrote in July, we're taking a stake for the long term in hopes that Zuora will become a much larger company as the subscription economy grows. We often like to promote buying more of our winners, sometimes recommending that above investing further into current laggards. But in this case, we're following our original thinking by purchasing a bit more of the stock during volatility. Shares could always go lower, naturally, but we're comfortable adding more at today's price given our time frame and the potential.

ZUORA IN 30 SECONDS

WHAT IT DOES

Zuora sells software that helps any company become a subscription-based business by making it easier to track revenue and billing dynamically.

WHY BUY IT

- Zuora is led by a founder who is passionate about expanding what he calls the "subscription economy." Zuora's customers range from Ford to Box, from industrial to energy, as business models evolve to subscription revenue and require software to match it.

- Zuora's business model lets it expand as its customers do. Annual fees to get Zuora's software are complemented by variable fees that go up as a client's volume usage rises; this resulted in a 112% net dollar retention rate last quarter. And Zuora's subscription retention rate with its approximately 450 largest customers is nearly perfect.

- With an intense focus on making recurring-revenue, subscription-based business models work for its clients, Zuora is likely to be an expert at making its own subscription business excel.

Pro Catch-Up Trades and Expirations: Paycom, Sonos, and More

Published Oct 25, 2018 at 2:11PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.9% stake in the stock.
- **Paycom** (NYSE: PAYC): Buy at least half of our 4.8% stake.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy at least half of our 5.1% stake.
- **Broadridge Financial Services** (NYSE: BR): Buy 3% of our 7.1% stake to start.
- **Coherent** (NASDAQ: COHR): Match our 1.1% stake.
- **Medtronic** (NYSE: MDT): Match our 2.7% stake.
- **OpenText** (NASDAQ: OTEX): Match our 2.7% stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our 1.2% stake.

Shorts:

- **Kellogg** (NYSE: K): Sell short 1%.
- **Murphy USA** (NYSE: MUSA) Sell short 1%.
- **Papa John's International** (NASDAQ: PZZA): Sell short 1%.

Options:

- **Gilead Sciences** (NASDAQ: GILD): The company announces earnings tonight. If you haven't written naked calls yet, you can sell to open Nov. 30, 2018, $78 calls for about $0.67 each (less than the $1.10 we originally targeted, unfortunately). Or, wait until after earnings to see what the situation is then.
- **Papa John's International**: Buy to open November 2018 $55 calls to cap risk on the short, buying one call for every 100 shares you're short. Lately they cost $1.75 each.
- **Sonos** (NASDAQ: SONO): Sell naked January 2019 $15 calls, lately paying you $0.65 each. Or, set a limit order at $0.70 (our original desired price) and see if you get that price if the stock rises a bit more.

Upcoming Expirations:

- N/A

Sell Naked Calls on Gilead Sciences and Sonos Inc.

Published Oct 22, 2018 at 4:08PM

Is this for you? These recommendations are only for *Pro* members who are comfortable with the idea of managing a changing basket of short stocks -- and, in the case of today's recommendations, selling naked calls. You need a margin account to participate, or you need to cap your risk by purchasing a higher-priced call at the same time.

How You Follow Along: Gilead Sciences

- **Trade:** Sell ("sell to open") Nov. 30, 2018, $78 calls on **Gilead Sciences** (NASDAQ: GILD)
- **Allocation**: A look-through allocation of 1%. Each contract represents shorting $7,800 ($78 x 100 shares) worth of Gilead shares at $78, so *Pro* will be selling four to five contracts:
  - Current portfolio value: $3,500,000
  - 1% of that is $35,000, which translates into 4.5 contracts ($35,000/$7,800)
- **Price Guidance:** It is critical that you use a limit order. Lately, aim to be paid $1.10 per contract. As prices change, aim to be paid at least 1% per month on the strike price to expiration; with 39 days to go, that's currently $1.01 as a minimum, no lower.
- **Recent Prices**:
  - Stock: $72.72
  - Nov. 30, 2018, $78 calls (bid/ask): $1.07/$1.12
    - Alternative trade: Simultaneously buy to open Nov. 30, 2018, $82 calls (the same number of short calls you write) if you want to cap the risk of your short call.

How You Follow Along: Sonos Inc.

- **Trade:** Sell ("sell to open") January 2019 $15 calls on **Sonos Inc** (NASDAQ: SONO)
- **Allocation**: A look-through allocation of 1%. Each contract represents shorting $1,500 ($15 x 100 shares) shares of Sonos at $15, so *Pro* will be selling 23 contracts.
  - Current portfolio value: $3,500,000
  - One percent of that is $35,000, which translates into 23.3 contracts ($35,000/$1,500)
- **Price Guidance:** It is critical that you **use a limit order** and accept no less than $0.70. If prices fall below $0.70 we will provide updated guidance later in the week.
- **Recent Prices**:
  - Stock: $12.39
  - Jan. 18, 2019, $15 calls (bid/ask): $0.70/$0.80
- **Note**: Unlike with Gilead, we're not offering an alternative trade to set up a bear call spread. This is because Sonos' far out of the money options are still too expensive, in our opinion. But your mileage may vary.

What We're Thinking

Gilead Sciences

A former laggard in the *Pro* portfolio, Gilead is due to report earnings Oct. 25 after market close, providing its call options with a healthy premium heading into that report. We believe Gilead's stock will likely remain below our strike price by Nov. 30 expiration, partly because Hepatitis C drug sales should continue to be lower year-over-year, dragging on annual comparisons. Although Gilead may finally be in a place to expand its total year-over-year revenue in 2019, even that prospect is not certain, as most everything needs to go right: HIV drug sales must keep growing; Hepatitis C drug pricing must hold up for new contracts (the largest risk, in our opinion), and products in the pipeline need to keep advancing for the stock to do well.

Our options only go to Nov. 30, however, so next year's results are mostly beside the point for us. We expect more of the same from Gilead when it announces earnings on the 25th: stable guidance, and optimism for growth in 2019 and beyond. But after a stronger-than-expected second quarter, the stock gave back its gains, and it now continues to linger in a lower price range once more. Investors know any growth on the horizon is likely to be tepid, and Hep C drug sales could still decline further.

Sonos Inc.

Stop me if you've heard this story before: A consumer-goods company in a rapidly growing market goes public under the guise that its first-mover advantage and strong brand will result in excess profits for the foreseeable future, despite rapidly increasing competition. No, we're not talking about Fitbit or GoPro, although we believe these companies provide a road map for what's likely in store for wireless home speaker leader and recent IPO Sonos.

The reason for our skepticism is perhaps best illustrated by two statistics that at first glance sound quite positive:

- In 2018, a study found that Sonos had 84% share in the wireless audio category among industry professionals.
- A Morgan Stanley analyst recently estimated that more than 70% of U.S. households will own a smart speaker with voice commerce capabilities by 2022.

The issue as we see it is that the later category (smart/connected speakers) is likely to replace the former (wireless), and that market leadership in the former doesn't automatically translate into leadership in the later. In fact, the same analyst estimated that Amazon and Google will control 62% and 33%, respectively, of the smart speaker market by the end of this year.

And from our vantage point, this isn't even a clear fight. For Sonos, speakers are everything, but for the big tech companies they're simply a part of a much larger strategy -- their business model doesn't solely depend on selling hardware for a profit, so they're incentivized to offer better products at the same price as Sonos (or similar products cheaper) as a way to win business. A recent teardown of comparable Sonos and Amazon speakers found that the Amazon version likely cost more to manufacture despite being sold to consumers for 25% less.

Add in the fact that Amazon, Google, Apple, etc., are likely to have much stronger preexisting relationships with smart-speaker purchasers, and we anticipate Sonos' market share will dwindle in the coming years. To make the short case even more compelling, there is also the fact that Sonos uses Amazon's Alexa for its smart speakers -- Amazon could, of course, disable this feature with little notice. And finally, Sonos has been unable to generate meaningful profits despite its dominance in the wireless speaker market over the past few years.

Ideally we'd be able to short this company directly, but the current cost to borrow is prohibitively high. By selling the January $15 calls, we are able to generate a healthy yield with a sizable amount of protection, given that these calls are currently 21% out of the money.

The Foolish Bottom Line

Selling naked calls is not a strategy we use often, but as long as you size your positions conservatively, the strategy in some ways presents lower risk than shorting a stock outright (because you're effectively shorting at a higher price). However, your potential rewards are small, being limited to the premium the call options pay you. We write naked calls to short either when shorting is too expensive and difficult, as with Sonos, or when we only want to potentially short something at a higher price, as with Gilead. Writing naked calls with little time to expiration also helps us to reassess regularly, which is always important with shorts.

Pro Can Help

Please bring any questions to the *Pro* Shortsboard!

Pro Guidance Changes and Completed Trades: Oct. 22, 2018

Published Oct 22, 2018 at 4:04PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- N/A

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Facebook** (NASDAQ: FB): We are still trying to set up our November 2018 protective collar on half our shares, setting up seven contracts of each. At current prices, we are looking to sell to open $165 calls (we have to go lower than the $170 in the alert), and buy to open $145 puts, for zero net cost at worst. We'll tell you if and when this fills. The stock has fallen since our alert, so the situation is less favorable to us right now, but it can still serve our purpose.
- **Papa John's** (NASDAQ: PZZA): We bought seven November 2018 $55 protective calls, covering our entire short. We paid $1.75 each using a limit order.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Johnson & Johnson, Papa John's, and More

Published Oct 18, 2018 at 2:49PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.9% stake in the stock.
- **CME Group** (NASDAQ: CME): Match our 2.6% stake.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Services** (NYSE: BR): Buy 3% of our 7.1% stake to start.
- **Coherent** (NASDAQ: COHR): Match our 1.2% stake.
- **Medtronic** (NYSE: MDT): Match our 2.8% stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our 1.3% stake.

Shorts:

- **Flexion** (NASDAQ: FLXN): Sell short 1%.
- **Murphy USA** (NYSE: MUSA) Sell short 1%.
- **Papa John's International** (NASDAQ: PZZA): Sell short 1%.
- **SeaWorld** (NYSE: SEAS): Sell short 1%.

Options:

- **Johnson & Johnson** (NYSE: JNJ): Roll your October 2018 $135 calls to January 2019 $140 calls. Aim for a credit (lately it's a $0.30 credit), and roll by Friday's close to avoid losing your shares.
- **Papa John's International**: Buy to open November 2018 $55 calls to cap risk on the short, buying one call for every 100 shares you're short. Lately they cost $2.45 each.

Upcoming Expirations (October):

- **Johnson & Johnson**: Our October 2018 $135 short calls are in the money as we hit expiration tomorrow; roll per the alert.

Roll Your Covered Calls on Johnson & Johnson

Published Oct 16, 2018 at 2:49PM

Is this for you? This is for all *Pro* members who wrote October 2018 $135 covered calls on **Johnson & Johnson** (NYSE: JNJ) as per our alert in July. Those who *don't* own the stock can buy at least 100 shares to write these covered calls (so long as you are OK with capping upside in exchange for near-term income). Those who own less than 100 shares as a full allocation can continue to hold them.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all October 2018 $135 written calls.
  - "Sell to open" the same number of January 2019 $140 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all seven of our calls.
- **Recent Prices**:
  - Stock: $136.40
  - Buy to close October 2018 $135 calls (bid/ask): $2.04/$2.10
  - Sell to open January 2019 $140 calls (bid/ask): $2.89/$3
  - Net credit to roll: Approximately $0.88 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls, and aiming to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $0.88 net credit for this roll, although that number will change as prices change. Realize that with expiration on Friday, you should roll these calls before then or your owned shares may be called away.

What We're Thinking

Johnson & Johnson reported earnings today, and the market is pleased with results, with the stock up nearly 2% as of this writing (on a day when the market as a whole is up strongly). In J&J's third quarter of 2018, companywide revenue increased 3.6%, once again led by the pharmaceutical division (with 6.7% year-over-year revenue growth), and adjusted earnings per share rose by 7.9% year over year. JNJ's earnings continue to align with our expectations for the business: that the pharmaceutical division will be the largest growth driver for J&J and should offset the slow to no growth in the consumer and medical-device divisions. We'll have a more detailed update on J&J's quarter once the company releases its 10-Q filing (usually within two weeks from the earnings date).

We're now in a position to roll our calls up and out for a credit, aiming for more income and upside from this position as we roll out to January 2019. If our shares are called in January, we'll be selling at a net price of $140.88, slightly above our fair-value estimate and accounting for a 22% total return (11% annualized) since the position's inception.

Buy Protective Calls for Your Papa John's Short

Published Oct 12, 2018 at 10:40AM

Is this for you? This trade is for members who have an active direct short position on shares of **Papa John's** (NASDAQ: PZZA) -- and who want to pay a bit to cap the risk on it.

How You Participate

- **Action:** Buy protective calls on Papa John's.
- **Trade:** Buy ("buy to open") Nov. 16, 2018, $55 calls.
- **Allocation:** Buy one protective call for every 100 shares you are short, protecting your entire short position. *Pro* is currently short 700 shares, so we will be buying seven calls. If you shorted less than 100 shares or are short an odd lot of shares (i.e., not in multiples of 100), see the Alternative Trades section below.
- **Price Guidance: It is critical that you use a limit order**, initially aiming to split the current bid/ask spread (lately $1.85 or so, but that will change). Prices will fluctuate as the stock moves, with the trade getting more expensive to set up if shares rise, and less expensive if the stock declines. **If prices change a lot**, it's a judgement call on your part depending on how much you want to spend; you should also consider using different strike prices, rolling up or down a strike accordingly to target a better entry price. We may use a different strike price, if necessary, by the time we make our trade.
- **Recent Prices:** Stock, $52.30; Nov. 16, 2018, $55 calls (bid/ask), $1.65/$2.00. Splitting the bid/ask, try a limit of about $1.80 to $1.85. Don't overpay.

What We're Thinking

Since we initiated our short of Papa John's just a few weeks ago, shares are up 12% because of several news items:

- On Sept. 26, shares popped 8.5% on rumors that founder John Schnatter was reaching out to private equities to discuss a buyout of the company.
- On Oct. 1, activist investor Legion Partners Asset Management LLC disclosed a 5.5% stake in Papa John's.
- On Oct. 9, the stock closed the day up 9% on rumors that activist hedge fund Trian Fund Management was considering making an offer for the company.

Shorting is tough -- even if your assessment of the business is right, sometimes factors outside your control can cause the stock price to work against you. We knew a potential buyout was one of the biggest risks to this Papa John's short, and in fact we were already on track to recommend buying protective calls, but the rumors -- and the market -- beat us to the punch.

Now, we're faced with the decision of whether to take our loss and close the short altogether, or pay to cap our risk with protective calls at these higher prices. Although of course it's not ideal that the stock is up so strongly quickly after initiating our position, we are still confident that business results are likely to be poor, and with Papa John's set to announce third quarter 2018 earnings in the last week of October or first week in November, we think it's possible shares could trade significantly lower if business results disappoint and takeout rumors fall through or even just dissipate for some weeks.

That likelihood of a continued deterioration in business fundamentals is enough for us to feel comfortable paying 0.04% of our portfolio's value to cap our risk at a net $56.85 per share (9% higher than the current price and 22% higher than the price in the original short alert). If the share price continues to rise, we're capped at a 22% loss on a 1% position (a 0.22% ding to the port) since the recommendation, and if it declines, we retain exposure to all the potential downside of the stock.

Alternative Trades

- **Are you short less than 100 shares?** Consider closing your short now, or setting up a cover-stop loss order at $55 to $57 or so (your choice).
- **Using options to short?** If you set up a synthetic short, you can cap your risk by purchasing these same calls we're buying. If you only bought puts, your risk is already capped -- no need to take action.
- **Short an odd lot of shares?** You have two choices:
  - Either buy back your odd number of short shares until you are short a multiple of 100 shares, then buy one call for each 100 shares you are short, or ...
  - Short more shares to increase your odd lot of shares to a multiple of 100 shares, then buy one call for each 100 shares you are short.

Pro Catch-Up Trades and Expirations: Shorts and More

Published Oct 11, 2018 at 4:03PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.8% stake in the stock.
- **Broadridge** (NYSE: BR): Buy half of our 7.2% stake to start.
- **American Tower** (NYSE: AMT): Match our 3.6% stake.
- **CME Group** (NASDAQ: CME): Match our 2.6% stake.

Continue building your portfolio with our Buys, including:

- **Coherent** (NASDAQ: COHR): Match our 1.2% stake.
- **Medtronic** (NYSE: MDT): Match our 2.7% stake.
- **OpenText** (NASDAQ: OTEX): Match our 2.8% stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our 1.2% stake.

Shorts:

- **Flexion** (NASDAQ: FLXN): Sell short 1%.
- **Murphy USA** (NYSE: MUSA) Sell short 1%.
- **Papa John's International** (NASDAQ: PZZA): Sell short 1%.
- **SeaWorld** (NYSE: SEAS): Sell short 1%.

Options:

- N/A

Upcoming Expirations (October):

- **Johnson & Johnson** (NYSE: JNJ): Our October 2018 $135 short calls are in the money with about one week until expiry; we'll have guidance on rolling, or letting the stock go, before expiration.

Jeff Interviews Zuora's CEO! Plus, Quick Thoughts on the Market

Published Oct 10, 2018 at 4:42PM

Hear Tien Tzuo, co-founder and CEO of **Zuora** (NYSE: ZUO), answer your questions and explain his company as he talks with *Pro* advisor Jeff Fischer.

Plus, get Jeff's thoughts on today's sharp market decline -- and on the market's recent behavior in general -- in this discussion-board post.

Transcript

Jeff Fischer: Greetings, Motley Fool members, I am Jeff Fischer, advisor of Motley Fool Pro. I'm delighted to be joined today by the founder and CEO of Zuora, Mr Tien Tzuo. Hello team.

Tien Tzuo: Hey Jeff. Thanks for having me on the show.

Jeff Fischer: Thank you. We appreciate it quite a bit and congratulations on your company coming public just this last April.

Tien Tzuo: Thanks, it's a big year. It's been good. Appreciate the Congrats.

Jeff Fischer: You seem perfectly positioned for what we're going to talk about today. Your business model itself is working to empower the subscription economy, a term that you've coined, a phrase that you've coined. We're going to talk about how that sets your company up for the future as the economy does indeed transition into what's becoming more of a service oriented sort of economy.

But, serving Motley Fool investors here in this recording, we also have a lot of just strict business related questions. Let's jump in right with the first one that we like to go to, which is, Tien, Warren Buffett has said as you know, that the number one factor behind his best investments across his whole 72 year investment career is pricing power. How do you view pricing power at your company?

Tien Tzuo: Well, with all due Respect to Warren Buffett, I think the world has actually changed. This is the central thesis of our company. We see that the 120 years has been really characterized by a product based economy. The primary goal of businesses was to come up with a hit product and to sell as many units of that product as possible. To give you more cars, more pens, more laptops. It could be more movie tickets, it could be more seats on an airplane. Whatever it happens to be.

The whole premise of businesses was to say, if I can sell as many units as I can, I can take my fixed costs, spread it over those units, lower my marginal cost, and that's the basis of competition. In that world, pricing power makes a lot of sense because if you have pricing power, then you can have the biggest spread between your marginal revenue and your marginal cost.

We don't live in that world today. In Apple, every quarter that passes you can see they obsess less about how many iPhone 10s do I sell? They instead say, "I have a billion and a half Apple IDs, and I've got all sorts of ways of monetizing those Apple IDs." That's how Facebook thinks, that's how Apple thinks, that's how Amazon thinks, that's how Google thinks, that's how Salesforce thinks. That's how Uber thinks.

In this world, it's not just about pricing power. I would say it's about the strength of your relationship power. Netflix has a 130 million people around the world that view Netflix as TV. This is what they go to when they want entertainment. Yeah they can sign up for Hulu, they can sign up for an HBO, but they're loyal, they're committed to Netflix and the power of the recurring revenue that Netflix has today is what sets up Netflix's competitive advantage.

It's not that price is not important, but the underlying thing now when you're not selling a product but you're building a relationship with customers, is the power of those relationships.

Jeff Fischer: Those are great points. It makes me think of Amazon Web Services where in a sense they're employing the opposite of pricing power. They want to lower their price on a steady basis because they can provide better service at lower cost and by sharing some of that with the customers, they keep their customers longer, make them happier and the customers use the product more.

Just as you touched on, it's becoming in some regards a usage based economy more than a product based economy, at least in the spaces we're talking about. In that case, pricing power could actually be thrown out the window in some regard. Your company, as with so many software as a service companies focuses on a dollar based retention rate. You target 108% to 112% dollar base.

What that means for investors listening who may not know is every year you're looking to make more revenue on your average customer than in the past year. That's due both to customers using more of your products, or just more usage growth because there is a fee attached to that as well.

Back in relation to pricing power just to talk about that for another minute, is there something to the idea that annual contract, dollar based retention rates can be a replacement for the old school way of thinking about pricing and instead, you're just trying to serve your customers more and better even if it's at a lower price point per product but if you're adding more products, of course you're going to grow with your customer?

Tien Tzuo: Well, your Amazon example is a fantastic example because Amazon realizes that the more you use AWS, the more you're going to grow with AWS. There's certainly lots of company that started off and their AWS bills was just tens of dollars a month or hundreds of dollars a month and as their organizations have grown, they're now giving Amazon millions of dollars a year or tens of millions of dollars a year.

I think Netflix gives Amazon a couple billion dollars a year if I remember right, to stream all their videos. You can see that Amazon and Jeff Bezos talks about, it's all about the customer. This isn't just platitudes that don't mean anything, there are actually fundamental businesses built on the customer. People like to contrast on the retail side, Amazon versus Walmart and think that Amazon is an Ecommerce store and Walmart is bricks and mortar store and that's not really the case.

You can see it's a lot more complicated now. Walmart has the Ecommerce, Amazon has physical stores, but Amazon takes everything you do back to your Amazon ID. You walk into Whole Foods today, they want you to use the app to actually scan the purchase. You walk into an Amazon Bookstore and if you swipe your credit card and walk away from the bookstore, they encourage you to go back online and log that transaction to get your Amazon ID because they want to have that one-on-one relationship with you and they want to have a total view of who you are.

Then what they say is, they want you to use that Amazon ID in more and more parts of your lives. Whether it's entertainment, whether it's shopping, whether it's groceries, whether it's reading a book versus Walmart is just saying, look, I want to sell you more stuff. Come into my store and buy some stuff. Focus on the stuff and not focused on the relationship. You talk about pricing power, it's a lot more complicated.

It's not about how do you extract every single dollar from the customer on that single transaction, it's about viewing the customer as a longterm relationship and knowing that if you are able to deepen that relationship, be a more relevant part of their lives either as a consumer or a business, you will find ways of monetizing that relationship.

Jeff Fischer: Great points made it across the board. It has been fascinating to see how quickly Amazon is changing your experience inside the Whole Foods to broaden it and make it deeper, so great example. Tien, of the nearly 500 companies that have annual contract values with Zuora of above $100,000 a year, can you talk about one company or maybe even one whole industry that we would not expect to see as one of your customers using your subscription based revenue software and subscription based billing software? What's a company or industry using your software that would likely surprise us?

Tien Tzuo: You know, for years and years we would paint a picture that the world's moving towards a subscription economy. We would get a lot of pushback that says, well, maybe this is just a software thing or maybe this is just [inaudible 00:07:57] thing. I think as consumers now our lives are so dominated by services. We're buying less and less stuff that we could kind of feel that the world truly is moving towards the subscription economy.

But, the examples that we love to give that really expands people's imaginations are around these physical products because it really shows that this is not a digital trend, but everything can be this way. And so, we talk about Caterpillar, we talk about Komatsu, we talked about Schneider Electric. We talk about Ford, we talk about General Motors.

In the last earnings call, we talked about this company based in Wauwatosa, Wisconsin, have Briggs & Stratton. You might not realize it, but they are the world's largest manufacturer of lawnmowers. And of course, everybody immediately thinks, "Well, how do I subscribe to a lawn mower? Does that mean [inaudible 00:08:52] a month?"

Instead of buying this thing, it's not exactly like that. It's the fact that over the last five years, virtually every manufacturing company has invested to make their products smart, collecting data and sending it over the internet. If you buy a washing machine today, it's probably Wifi enabled. If you buy a car today, it's got 3G in it. If you buy a Briggs & Stratton lawnmower today, it's internet enabled and it's collecting all this data.

They're saying, "Well, what can we do with these things now?" They launched a product with us. It's a product targeting commercial turf companies. These are organizations and they tend to be fragmented and they tend to be small that send teams out to HOAs and commercial buildings and take care of the landscaping using Briggs & Stratton equipment. But, now they're able to build a workforce management system that helps these organizations increase productivity, rdrive more efficiency, drive more use out of their products, figure out where their people are, schedule these projects in a more efficient way.

You can see that once physical products are smart and connected to the internet, this whole digital revolution that we've seen take place in software and media is really going to reach all fabrics of our lives and everything that we do.

Jeff Fischer: Last conference call was fun by the way. InfoHub for Commercial Turf is the product that is ... Does Zuora create customized products for customers frequently? Is that part of your longterm strategy? I imagine there's a lot of work that goes into that and then maintaining that.

Tien Tzuo: Yeah. We understood the power of the subscription based business model based on the previous companies that we worked at, which were software as a service companies. I worked at Salesforce, the biggest [inaudible 00:10:38] software as a service company. And so, it was a mental leap to say, because we were heads down saying, look, we're totally bought in obviously given what we do, that subscription business models will take over the software industry. This is what we see taking place now with Adobe, with Microsoft, with all the software products that we use today.

The leap was to say, is this a universal phenomenon? That was the leap of faith that we really took that said the subscription business model is going to permeate all the industries over time. We also knew that it was really, really hard to run these businesses and the existing software products that companies used to run their business, these so-called ERP systems from SAP and Oracle really don't work.

Our thing was, can we build a universal billing module, a subscription management system that's anchored around billing, revenue recognition and subscriber management, but do it in a way that services all industries, all business models, all around the world? We've invested a ton in making our product customizable.

That's why as you see subscription business models go from software to media, to manufacturing, and we've seen some utilities companies really start to transform themselves. But as it goes from industry to industry and industry, that our product set can actually go into those industries because it's a highly customizable system.

Jeff Fischer: Do you have any examples and perhaps you don't, of a case where it's very difficult or even impossible for a company to transition? I realize that may be partly due to they just don't have enough will to do it yet, but any concrete examples where it's a lot more struggle than a company thought?

Tien Tzuo: Well, we have a lot of conversations [inaudible 00:12:23] also talked about this book that we put out that allows us to reach companies that are trying to understand, what is a subscription based business model about? What is it and how do I do it?

Jeff Fischer: Subscribed is the book. On Amazon, anyone can come pick it up. It's a great book. Congratulations on the book as well. I know how much work goes into writing a book.

Tien Tzuo: Yeah, and we're getting CEOs of Fortune 500 companies reaching out that says, "Look, I read the book. I gave it to my staff. Help us under the transformation." I'll just simplify it down. This model is about starting with the customer. It's about reinventing the customer, or rethinking the customer as a subscriber to your services.

When you look at it that way, any company can really be a subscription business because all companies of customers. But the trick is, how do you transcend thinking about your business model as selling those customers units of your product and think of it as a service that they can offer?

We were talking to a hotel company, and in the classic hotel business model is selling a product. In this case, it happens to be a room, a room night if you will. The way you sell it is, you put it onto as many channels as you can. You put it on bookings.com, you put it to Expedia, you give it to travel agents to sell. And they're saying, okay, what if we transcend that way of thinking?

We have two types of customers. We have travelers on the consumer side and we have local businesses that are around our hotels on the commercial side. And then we have a set of capabilities. We have obviously real estate, we have concierge services, we have food and beverage services. Why can't we unlock these things and when a traveler is coming into a city where we have a hotel, but they're not staying at our hotel, maybe they're staying at a friend's house, maybe they're staying in an Airbnb, they should be able to tap into the concierge service in the same way that they stay at the hotel.

Let's hold onto the traveler in all parts of their lives if you will, in that sphere of travel and become more of a travel brand, versus just selling room nights. It's a whole different way of thinking. Any company can do this. It is a journey and our goal is really to inspire them with stories to help them transition to this new business model.

Jeff Fischer: That makes so much sense. Especially when you remember the fact that as people, we want relationships. We all crave connections and relationships that are ongoing and that become more powerful over time because of that bond. Speaking of longterm, the Motley Fool is 25 years old now. We like to buy companies, buy the stock and keep it and keep it. We recommended Starbucks and Amazon in the 90s, Netflix early this millennium and those are still active recommendations. That's how we view this relationship as well.

You have said, and we love hearing this that your number one goal is to position your company for sustained long term growth and you have a ambitious growth targets. Which financial measures are most important to you today? And then, if you can look ahead five years, what might be most important to you financially five years from now?

Tien Tzuo: Well, you pointed to some amazingly successful companies. What I would say is, the common pattern is that they really identified a longterm trend. Retailing [inaudible 00:15:59] from bricks and mortars to Ecommerce is going to be more customer centric. That's not a five, 10 year trend, that's a 30, 40, 50 year trend.

Entertainment is going to be streamed given high bandwidth, and so we're betting on a business model shift of the subscription economy and it's going to take place over again, not five years, but over a multi-decade standpoint. That's definitely something that we watch quite a bit of.

We have this thing called the subscription economy index where we monitor the growth of subscription businesses. We're seeing that they're growing in any quarter, five to nine times the growth rate of standard businesses, the SMP 500 if you will. We're always trying to get a sense of how fast is the subscription economy growing? We need to make sure that we are the leader in how to talk about it, we're positioned as the leader.

Then fundamentally, is the business model there to create sustained growth over a long period of time? Above and beyond the standard metrics that we obviously report on, this is why we've highlighted ... Look at our number of logos if you will. To make sure that that's continuing to grow.

We do sell to a lot of startups where there's a VC portfolio effect if you will. If you look at all the companies are going public this year, whether it's Pluralsight, whether it's Zoom, whether it's SurveyMonkey, these are all our customers, but we got them when they were young. And, for every box or every SurveyMonkey, there's probably five, six or seven companies that don't quite make it. It's the nature of the venture capital market. So, we draw 100 K line really to exclude that effect so you can get a better year over year compare of the growth of our new customers.

Then the net dollar retention is really to say these companies are continuing to put more transactions through our system and their subscription businesses are successful. This gives us the engine of growth that as an external investor, you can track and measure for us on a quarter by quarter basis.

Jeff Fischer: Perfect. Research and development to speak of some numbers, for years now Zuora has spent about 21% to 22% of revenue on R&D. Is that a goal or has that just happened to fall out that way?

Tien Tzuo: Well, this is a very big product to build. One thing that I would suggest is, we actually do a lot of work about understanding the income statement for the subscription based business models. We actually, if you look at the book, there's a whole chapter on how to recast income statement, to break out recurring revenue in non-recurring revenue. Understand that the fundamental margin structures of a subscription business and understanding that sales and marketing in this model often as a cap X because you're acquiring future revenue, not just today's revenues.

And so, the 21% or 22% is a great number. We also counsel people to look at that as a percent of our subscription revenue versus our total revenue. You can look at it both ways. You can see we're continuing to invest in the product because this is a big production to build. SAP and Oracle's ERP systems weren't built overnight. I think we have a multi-year lead in terms of our ability because we started early to focus on the product, but we definitely don't want to rest on our laurels because there's more capabilities that we want to build into our system that I know our customers are asking for.

Jeff Fischer: That leads me gently to a question about new products, which I don't like to ask so frequently when you have young and vibrant products right now that are growing rapidly and you have all sorts of avenues to grow them and as we just talked about, a very large longterm market to address. How do you think about new products in that case? In general, do you have a roadmap to expand beyond current offerings or are you waiting to see the industry mature a bit more and listen to your customers and hear where they want you to go?

Tien Tzuo: Well, we're more unique. Certainly not completely but for a company of our size, we already have a multi-product strategy. Don't look at us as a one trick pony if you will that's trying to cycle as much as possible. We have essentially two flagship products and they're both related to business models, dynamic business models in the subscription economy.

The first product is billing and the second product is RevPro, which is a product focused on the complexities of revenue recognition in this new model. Then we also have what we call a family of add-on products. These are connectors to tax engines, payment gateways. There's a collections module that we sell to folks that have more complex collections requirements in the subscription economy.

These are add-on products that we typically go back to our customer base and say, "Hey, you didn't have this need before but as your business model is getting more sophisticated, as you're doing more things with billing, more things with revenue recognition, you might have these additional needs as well."

In June, in our annual subscriber conference, we really announced progression and a roadmap across all these things. On the billing side, we're really, really excited about the new orders module that actually formalizes an order concept and allows us to be more of a hub for all sorts of transactions for these businesses. Not just subscriptions transactions, but traditional you one time transactions as well.

We also announced the Collect Product as the newest member of our add-on family. Those products are doing really, really well. It's only been a few months and hopefully we'll have more things to talk about in those products in the future, but we are not stopping. We are continuing to advance in our product, we're listening to our customers and we're committed really to building the broadest and deepest suite of products and help companies build, manage and transform into subscription businesses.

Jeff Fischer: So you have your heads down, you're going after large, evolving and exciting market. Are there any competitors that might keep you up at night? Have you seen anything that any competitors have done lately that you would point to as, "Okay, we need to address that and move in this direction," or is that not the case?

Tien Tzuo: Our belief is that Oracle and SAP's ERP systems were good for the old world, the product economy, but they're not appropriate for this new world. So the question is always, how can we help our companies understand the differences between these two things and why one is necessary for success in the future? But obviously then the question is, how will Oracle and SAP evolve?

We believe that those two companies are buckling under their infrastructure. They're having a hard time innovating. They're acquiring pieces of technologies to keep their revenue growth going, so I would say those are two big companies that we'll continue to keep our eye on, but we feel really good about where we are in position to what those two companies are doing.

Jeff Fischer: Tien, can you name a few of your favorite subscription based businesses?

Tien Tzuo: Well, we see so much. I probably have an occupational hazard of having too many descriptions. I've got [inaudible 00:23:24] subscriptions, I've got Hulu, and HBO, and Netflix, and Amazon. One of the things that we're seeing is really interesting is you used to; if you had $20, $30 to spend on health, you used to give it to the local gym. But, now you've got this proliferation of choices.

You can give it to ClassPass, you can give it to Peloton, Weight Watchers are rebranding themselves as a health brand. So, I'm looking at, gosh, is there a way to direct that spend into something that I should pay for services that are tied to the Apple Watch, but I would take a look at the health and wellness space because I think you're going to see major transformations there in the next 12 months.

Jeff Fischer: That's exciting, that's so necessary. Subscription based businesses I'm in the same boat, I keep joining more and more, but happily so because done correctly they end up saving you money. And as you said, you form a relationship. We have a 13 year old son and we go to movies all the time. I'm this close to joining AMC's subscription based service where you can see up to three movies a week for $19.95 a month, save a lot of money if you see just three movies in a month.

We have just a few minutes left. Again, congratulations on your IPO this spring. If I can get a little personal, I'd love to hear what has changed since the company came public. And we can stick to the positive side, what do you like about being a public company and heading up a public company? Then let's talk for a few minutes about the company culture.

Tien Tzuo: Well, I think we did a good job of saying ... We have a big vision internally. We call it The World Subscribed. All thousand plus of our employees, we call them ZEOs, we call ourselves ZEOs are really focused on one mission and only one mission, which is to help companies one at a time be successful in the subscription economy. That focus is a longterm focus. We talked about hey in this next leg of our journey we will likely flip from going private to public.

It's part of the process. It gives us the capital we need, it gives us the reach we need so it's something that we've been pretty deliberate about over not just the last six months, but really over the last two or three years to build a business model that a public investor would value versus a private venture type of investor.

But, that's just an investor transition. Our vision doesn't change, our mission doesn't change. We certainly celebrated this big milestone that so many employees here have worked hard for, but the day after it was really back to work. I would say that the interesting thing for us then is being public does give us a broader platform to tell our story. To tell the story of the subscription economy and how we're helping these companies really transform. So, even being on your show as an example is something that we enjoy doing and being public is further opportunities to do so.

Jeff Fischer: Thank you Tien. Can you name, you did name just minutes ago a few companies that also recently went public that I'm assuming you respect. Are there a few others? I know DocuSign is a customer of yours and a company we follow as well.

Tien Tzuo: Yeah, we love our customers and we certainly have a block of software as a service companies that are all hitting the public markets today that we grew up with in many ways and hats off to their success. Whether it's [inaudible 00:27:08], DocuSign or Pivotal Software, we're some of the ones that hopefully will be going public later this year.

Jeff Fischer: We love that you call all of your employees, you're all called ZEOs. Here at the Fool as you may know, we've called ourselves fools for the past 25 years. It makes life a lot easier when you can, "I'm a fool. I'm doing my best, but I'm a fool." It's fun. Are there any other cultural innovations at Zuora that you want to point to today that you think make your company a unique and special place to work at?

Tien Tzuo: Yeah. Well, the ZEO is something that really came out folks. We all have so many choices today; movies we can watch, places we can go and obviously companies that we can work at. So ultimately, we're all looking for a company that allows us to be who you are and be the best that we can be.

The mindset that we want to bring into this thing is, we are all ZEOs. Maybe there's one CEO, but there's over 1,00 ZEOs and each of us have a leadership role, each of us are empowered to do what we believe is the right thing. And then, we also have a culture that allows all 1,000 ZEOs to come together and do good work together. The spirit of collaboration is a really, really important part of what we do.

One thing that we said is, we went through a process like many other companies of saying, what are our corporate values and should we write them down? We took a nontraditional approach. We said look, we have a good sense of what our corporate values are, but instead of writing them down, four words, five words which we found inflexible and it didn't really allow the next generation of ZEOs to really participate in shaping that because it's already set in stone, we said we're going to tell our values through a set of stories.

We have a set of stories that we go back to. We're always adding new stories to the mix. It allows every ZEO coming in to engage at an emotional and mental level as to what it means to be a ZEO. And so, we have a nontraditional approach where if you say, "Well, what are our values?" We'll say, "Hey, our value is simple, we're all ZEOs." We'll let every employee and every ZEO really unpack what that means for them and to participate in a broader discussion of how to shape what that means for us as we continue to evolve and grow as a company.

Jeff Fischer: That's fantastic and that's very Foolish with a capital F, something we definitely celebrate. Tien Tzuo, founder and CEO of Zuora. Ticker is ZUO as you fools listening already know. Thank you. Also, author of Subscribed: Why the Subscription Model Will Be Your Company's Future - and What to Do About It. It's a great read fools for anyone who's an investor looking at how the investing landscape is changing today. Tien, we're delighted to begin our relationship as shareholders with your company and we wish you all the best.

Tien Tzuo: Great, thanks for having me on the show. It was a great time.

Pro Guidance Changes and Completed Trades: Oct. 8, 2018

Published Oct 8, 2018 at 4:10PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Facebook** (NASDAQ: FB): The stock remains a Buy with a 6.2% allocation, but today we announced that we'll set up a protective collar on half of our shares.

Pro Completed Trades (see transaction log; trades take a day to appear):

We completed our six recent short sales, shorting a 1% allocation in each of the following:

- **Flexion** (NASDAQ: FLXN) at $18.50
- **Kellogg** (NYSE: K) at $70.25
- **HNI Corp.** (NYSE: HNI) at $42.12
- **Murphy USA** (NYSE: MUSA) at $80.63
- **Papa John's International** (NASDAQ: PZZA) at $50.43
- **Sea World** (NYSE: SEAS) at $28.68

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Set Up a Protective Collar on Half of Your Facebook Position

Published Oct 8, 2018 at 3:05PM

Is this for you? Any *Pro* members who have long exposure to this stock, and who want to protect against downside, should consider this recommendation.

How You Participate

- **Action:** Set up a protective collar on **Facebook** (NASDAQ: FB).
- **Trade:** Simultaneously ...
  - **Sell to open** Nov. 16, 2018, $170 calls.
  - **Buy to open** Nov. 16, 2018, $145 puts.
- **Allocation:** Set up one protective collar (one of each option) for every 100 shares you want to protect. *Pro* will collar 700 of our 1,400 shares, setting up seven collars. This protects 50% of our position, leaving a 3.1% allocation uncovered.
- **Price Guidance:** Use a **limit order** and initially aim to set this up for **credit**. Prices will fluctuate as the stock moves, with the trade getting less expensive to execute if shares rise, and more expensive if the stock declines. Initially, aim for no cost or a credit. **If prices change a lot**, it's a judgement call on your part depending on how much you want to spend; you should also consider using different strike prices, rolling one side or both sides up or down a strike accordingly to target no cost or a credit. We will use different strikes, if necessary, by the time we make our trade.
- **Recent Prices (2:50 pm ET):**
  - Sell to open Nov. 16, 2018, $170 calls (splitting bid/ask): $3.45
  - Buy to open Nov. 16, 2018, $145 puts: $3.05
  - Net credit to set up the collar: **$0.40**
  - Stock: $157.87
- **Scorecard Status:** Buy. Allocation is 6.2%. We are putting a collar on half.

What We're Thinking

Facebook is spending to safeguard its content in a battle that will certainly evolve and continue long into the future. Where people mass online, multitudes of outside parties will seek leverage, often through hidden and evolving means. Facebook may find itself pushing forward its high spending long into the future, and Wall Street wouldn't like that. In the immediate, usage among U.S. visitors -- its most lucrative per capita -- slipped last quarter, and the obvious risk is that this trend continues. For these reasons and others -- including Facebook's inexcusably casual attitude toward protecting user data in the past -- we want to hedge at least half of our shares going into the next earnings report in late October.

Why This Strategy?

A protective collar costs little to nothing to set up, yet it protects you from big downside. Plus, it gives the stock you cover with calls some upside before reaching the strike price of your short calls. In this case, including a credit, we have about 8% upside in the shares we're covering, and we have downside protection on these shares starting about 8% below the current share price. If the stock is trading between our strike prices by expiration next month, the options expire unused. On a large decline in the stock, we could sell to close our puts for a profit, or -- if we wanted -- let our stock get sold at $145. On what we know currently, we wouldn't let that happen, but the story could always change. Finally, if the stock price is above the strike price of our $170 calls, we could sell half our position at that price, or close or roll the calls. Overall, our main goal is to protect half our position from especially nasty downside surprises during an especially uncertain time for Facebook's business.

Alternative Trades

- **Own fewer than 100 shares and want protection?** You shouldn't sell a call option if you own fewer than 100 shares (because the call represents 100 shares), but if your Facebook stake is still a large enough part of your portfolio that you want to protect it, you can buy a put option and have more protection than you need. The Nov. 16, 2018, $145 put is lately about $3.45, so it's $345 for one put, and the stock needs to fall 8% just to hit your strike. But it's insurance for disaster. You can buy this insurance if the cost is worth it to you. We still plan to be in Facebook for the long haul.
- **Own 100 shares?** You could collar all of it, if you're comfortable doing so. Or just plan to ride out volatility.
- **Just own Facebook calls or a synthetic long?** You can effectively collar a portion of those positions, too, if you wish.
- **Not using options?** Make sure you're comfortable with the size of your Facebook position. The stock remains a Buy, though, and we don't plan to sell any shares unless the Facebook story changes. This hedge is a "just in case." If the story does change, we'll of course issue a trade alert with new guidance.

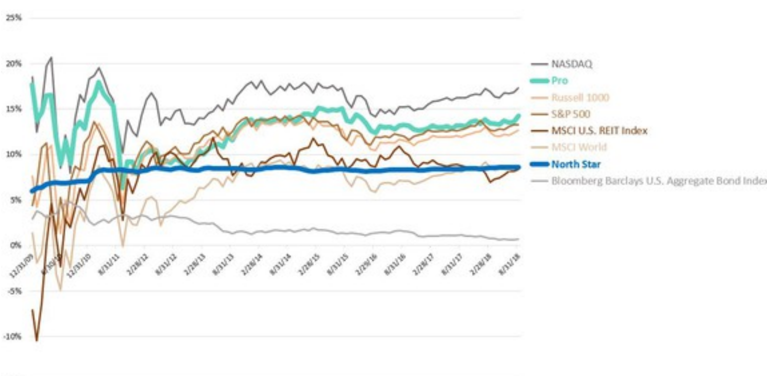
10 Years of Pro Performance

Published Oct 8, 2018 at 1:26PM

Dear *Pro* Fools,

Pro is now 10 years old! Almost 10 years ago to the day, on Oct. 6, 2008, *Pro* was seeded with a $1 million real-money cash investment. That $1 million has appreciated to more than $3.5 million as of today. That works out to a 13.5% annualized return over 10 years, significantly exceeding our guiding North Star (which is up 8.5% annualized). It's been a wonderful journey, and there are many other adjectives we could use to describe the past 10 years of *Pro*: exciting, educational, interesting, difficult, calm, agonizing, and consistent are some that come to mind. I've been a part of the *Pro* journey since 2014, and it's been an absolute privilege to work with the talented investors and support staff that have been a part of *Pro*, and to invest alongside you, our members.

In honor of *Pro's* 10 year-anniversary, I've updated the performance graph from the [North Star section of *Pro*'s Guidebook] (which is a very important section if you haven't read it!), using the most recent data available (as of Sept. 30):



([Click here or on image for larger version.])

To properly interpret this graph, keep in mind that the returns shown here are annualized, not cumulative. While annualized returns allow for easier comparison of data over time, they have some flaws. Over short time periods, annualized returns can appear volatile, while over long periods the data becomes more smooth (which is why the shorter time periods on the left side of the graph look more variable and the longer time periods on the right side look more stable). Additionally, annualized returns over periods of less than one year are not very useful, so I started the data series a little more than a year after *Pro's* inception. I've also included various market indices for comparison, which I hope will provide context for *Pro*'s performance relative to other asset categories.

Additionally, here is a tabular form of the same data, showing return comparisons over different time periods (also as of Sept. 30):

	1 year	2 years	3 years	5 years	Since Inception
Annualized Total Return					
Pro Portfolio	22.9%	17.7%	15.2%	15.5%	14.0%
North Star	9.6%	9.5%	9.2%	8.6%	8.6%
NASDAQ	23.9%	23.1%	20.3%	16.4%	15.8%
Russell 1000	17.1%	17.5%	16.4%	13.0%	12.6%
S&P 500	17.9%	18.3%	17.3%	13.9%	13.1%
MSCI U.S. REIT Index	2.4%	0.8%	6.3%	7.8%	8.0%
MSCI World	9.2%	12.5%	11.3%	7.2%	7.4%
Bloomberg Barclays U.S. Aggregate Bond Index	-3.7%	-3.1%	-1.2%	-0.3%	0.6%

Finally, here is the annualized volatility (i.e., the standard deviation) of the monthly returns for the same data categories:

	1 year	2 years	3 years	5 years	Since Inception
Volatility (Standard Deviation)					
Pro Portfolio	11.1%	8.5%	9.4%	9.4%	11.1%
North Star	0.7%	0.7%	0.8%	1.0%	1.3%
NASDAQ	10.5%	8.6%	11.9%	11.7%	15.5%
Russell 1000	8.5%	7.2%	9.4%	9.5%	13.7%
S&P 500	8.7%	7.3%	9.3%	9.5%	13.5%
MSCI World	8.2%	6.6%	9.4%	9.7%	14.5%
MSCI U.S. REIT Index	12.3%	10.8%	12.5%	13.4%	23.5%
Bloomberg Barclays U.S. Aggregate Bond Index	2.0%	2.6%	2.7%	2.9%	3.5%

What Does This Say About Our Portfolio?

We can see that since inception, *Pro* has outperformed every major index except the NASDAQ, which has appreciated by a robust 15.8% annualized over the past 10 years. Given *Pro*'s relatively lower levels of volatility compared with the major indices since inception (see the last column of the volatility table), this is an impressive feat, and it is a testament to our conservative, volatility-conscious investment approach.

Additionally, we can see that *Pro's* returns correlate much more closely with market indices than with our North Star. This is an important consideration: While we aim to achieve North Star-like returns over long periods of time, we do *not* expect to follow the return trajectory of our North Star over short periods. Our North Star is an abstract concept, not an real, investable asset. In fact, it's much more stable than any asset that will allow for the magnitude of returns we are looking for, and that's because it includes a constant 7% annual appreciation factor. As *Pro* investors, we must understand that to achieve the type of returns we seek (7%-plus), we must be willing to accept short-term volatility.

To illustrate that point, you can see from the volatility table above that the only included asset category that comes anywhere close to matching the stability of the North Star is bonds. However, in exchange for that stability, the annualized returns are far lower than what is achievable from the more volatile equity category. And while we accept that volatility is inevitable, we still work very hard to reduce the *Pro* portfolio's volatility using shorts, hedges, and our sizable cash balance. The table shows that the *Pro* portfolio scores the lowest among all the included categories (except for bonds) in terms of the volatility of our monthly returns since inception.

However, we can also see that over the past year, we've taken on more risk. *Pro*'s one-year annualized volatility is higher than every index except the REIT index. This is likely because of some significant fluctuations in some major holdings this year, including our former largest holding, Facebook, which has ranged from $150 to $220 per share this year, and our SVXY position, which imploded early this year. In exchange for that risk, we've been rewarded with higher returns during this period of rising stock prices. Since the last time we updated this analysis in late 2016, the *Pro* team has widened the gap between our portfolio's performance and the North Star. So far, taking on more risk has been beneficial to our returns, but that may not continue, so we need to be mindful of our risk exposure and volatility in the future.

The *Pro* Bottom Line

All in all, over the past 10 years, *Pro* has done well to outperform our North Star and most other stock categories while still achieving lower volatility with our returns. We aim to continue to achieve our goals as we move forward, keeping our volatility, expected returns, and allocations in mind.

Sell Short HNI Corp, Murphy USA, and SeaWorld

Published Oct 5, 2018 at 1:25PM

Is this for you? These recommendations are for *Pro* members who are comfortable with the idea of managing a changing basket of short stocks as part of an ongoing long/short portfolio strategy, and who have margin accounts with shorting availability on these stocks. (You could also employ options, although that's not ideal for what we're aiming for.) You don't need to short if you don't wish. The purpose of having a large book of shorts is to raise extra capital that you can ultimately invest in long positions, as well as to perform better in market declines.

How You Follow Along: HNI Corp

- **Trade:** Sell short 1% in **HNI Corp** (NYSE: HNI).
- **Shares Available** (IB): 2.1 million at an 1.1% annual fee
- **Dividend Yield:** 2.7%
- **Market Cap**: $1.86 billion
- **Recent Price**: $42.56
- **Alternative Trade**: January 2019 $40 synthetic short
  - Sell to open January 2019 $40 calls; buy to open an equal number of January 2019 $40 puts; set up one synthetic short for every $4,200 in exposure you want.
  - Price: Unless the stock price moves, aim for a credit of about $2 to set this up.

How You Follow Along: Murphy USA

- **Trade:** Sell short 1% in **Murphy USA** (NYSE: MUSA).
- **Shares Available** (Interactive Brokers): 1.4 million at a 0.25% annual fee
- **Dividend Yield:** 0%.
- **Market Cap:** $2.67 billion
- **Recent Price**: $81.33
- **Alternative Trade**: January 2019 $80 synthetic short
  - Sell to open January 2019 $80 calls; buy to open an equal number of January 2019 $80 puts; set up one synthetic short for every $8,000 in exposure you want.
  - Price: Until the price moves, aim for a net credit of about $1 or higher (setting up a short at about $81 net).

How You Follow Along: SeaWorld Parks & Entertainment

- **Trade:** Sell short 1% in **SeaWorld Parks & Entertainment** (NYSE: SEAS).
- **Shares Available** (IB): 1.4 million shares at a 1% annual fee
- **Dividend Yield:** 0%
- **Market Cap:** $2.54 billion
- **Recent Price:** $29.13
- **Alternative Trade**: January 2019 $28 synthetic short
    - Sell to open January 2019 $28 calls; buy to open an equal number of January 2019 $28 puts; set up one synthetic short for every $2,800 in exposure you want.
    - Price: Unless the stock price moves, aim for a small credit to set this up.

All prices will change as the shares move, but the stocks will continue to be recommended as short positions in *Pro* until we share otherwise.

What We're Thinking

As ever, the *Pro* portfolio is managed as a whole. Our goal is to earn desirable *overall* returns and to double our real purchasing power every 10 years, ideally while facing lower-than-average downside risk. It's unrealistic to expect every position to make money, and that's especially true with shorts and hedges. Our shorts will be actively managed; if we don't like how one is moving, or we make a desired 7% to 10% return, we could close any short a mere 14 days after starting it. But in most cases, each short will last an average of a few months, and new shorts will be cycled in from a growing list of candidates we keep behind the scenes. This week's additions follow.

HNI Corp

We believe the ideal short candidate is one that offers us an asymmetrical risk/reward trade-off, one that is likely to *at worst* keep up with the market as the market rises, but will underperform the market by a noticeable margin when the next bear market hits. And we believe we've found this type of short in HNI. As one of the largest domestic providers of office furniture, which makes up 75% or so of its sales, HNI's business is closely tied to the economic cycle. However, given the structural headwinds that we believe the domestic office-furniture market is currently facing, we believe HNI could struggle going forward even if the current bull market continues.

Domestic consumption may have finally returned to pre-Great Recession levels, but the increase in telecommuting, the rapid rise of open-office workspaces, and changing preferences toward a simpler, Apple-esque minimalist aesthetic all suggest to us that recent lukewarm industry sales are likely to persist. Plus, we're supposedly in a booming economy right now, with ultra-low unemployment.

In recent years, sales of both occupied space and furniture have noticeably lagged growth in the number of white-collar employees. And despite management's spending close to $300 million on acquisitions since the start of 2007, HNI's revenue is still 17% below its 2006 peak. To make matters worse, domestic production continues to steadily lose share to imports, and one of the company's biggest inputs, steel, has risen sharply in price so far this year, meaning the recent slide in margins and return on invested capital will likely continue. As a final kicker, the remainder of HNI's sales are tied to the housing market, providing a hedge against our two housing stocks.

Murphy USA

With almost 1,500 stores, Murphy USA is currently one of the 50 largest gas-station convenience-store chains in the United States. The company's value proposition largely centers around being extremely competitive on pricing -- you can think of it as the Walmart of gas stations. In fact, for 20 years Walmart had a partnership with Murphy to develop and operate gas stations outside Walmart stores. This has worked well in the past, but we believe that Murphy's best days are currently in the rearview mirror.

For starters, the company is fighting not one but two secular headwinds. Gasoline retail sales per capita have been decelerating for decades, and we see no catalyst to lift the industry up from its current slump. Increases in newer vehicles' fuel efficiency, changes in behavioral patterns including the rise in telecommuting and ride-hailing, and a continued increase in electric vehicle market share are just a few factors, but you don't have to take our word for it — Murphy's monthly gallons sold per store have fallen by 8.5% over the past five years.

There's another headwind in tobacco product sales, which are Murphy's single largest merchandise category and responsible for an outsized portion of the company's operating profits. And remember how we said the company had a partnership with Walmart? The key word there is "had," because in 2016 Walmart decided to end the partnership and operate all new stations itself (Murphy will continue to operate those that were already in existence prior to 2016).

To make matters even more favorable for our short argument, management has been aggressively repurchasing shares over the past few years in an attempt to prop up the share price, but its recent binges have drained the company of much of the cash it raised in the preceding years, and debt issuances have increased leverage to the point where an unfavorable move in gasoline prices could be dangerous if Murphy issues more debt. We expect share repurchases to largely end for the foreseeable future. Meanwhile, any weakness in employment (a.k.a., the economy) goes right to gasoline sales. Murphy looks like a good short in that it hedges this risk.

SeaWorld Entertainment

Even before it became mired in a debate over the logic of keeping giant killer whales in captivity, SeaWorld was struggling to grow. Revenue this year is running at 2011 levels, and net income has been choppy over the past many years without ever gaining traction. The company carries more than $1.4 billion in long-term debt and only $33.5 million in cash, and the bulk of its operating income is eaten up by $80 million in annual interest expenses.

SeaWorld recently saw an uptick in traffic following a long decline, but we question how sustainable those gains will be. Season-ticket buyers, typically the most devoted customers, are driving the latest improvements; to get other, new feet through the gates, management will need to keep spending to rebuild a positive image and inform customers of the new experiences available at the themed amusement parks.

Meanwhile, the threat of more negative publicity hangs in the air, just waiting to make a splash. SeaWorld management vowed to no longer breed or capture additional Orca whales, but its current slew of whales held around the world continues to perform for audiences. The company confirmed that these whales could live as long as 50 years, and would continue to work at the parks. In other words, SeaWorld doesn't plan to end the main show anytime soon, and that only invites more controversy -- eventually.

The stock has seen a resurgence in price from the low teens to nearly $30 per share as traffic to parks improved this summer, and management is showing skill at cutting costs and increasing EBITDA. But now trading at more than 30 times expected earnings for the year ahead -- much pricier than competitor **Disney** (NYSE: DIS) -- we don't believe SeaWorld is a bargain, and any disappointments, let alone a weaker economy, could send it diving.

The Foolish Bottom Line

Once again, these three 1% short positions are part of our growing short exposure. But remember that shorts are usually shorter-term positions. Maintaining a book of shorts is time-intensive and can be demanding, but it's worth it if this helps the portfolio succeed in weak markets. And it makes us better (and more invested!) long investors, too, with better results overall.

Please bring any questions to the *Pro Shorts* board!

Pro Catch-Up Trades and Expirations: Shorts, Zuora, and More

Published Oct 4, 2018 at 1:16PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.9% stake in the stock.
- **American Tower** (NYSE: AMT): Match our 3.6% stake.
- **CME Group** (NASDAQ: CME): Match our 2.5% stake.

Continue building your portfolio with our Buys, including:

- **OpenText** (NASDAQ: OTEX): Match our 2.8% stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our 1.3% stake.

Shorts:

- **Flexion** (NASDAQ: FLXN): Sell short 1%.
- **Kellogg Company** (NYSE: K): Sell short 1%.
- **Papa John's International** (NASDAQ: PZZA): Sell short 1%.

Options:

- N/A

Upcoming Expirations (October):

- **Johnson & Johnson** (NYSE: JNJ): Our October 2018 $135 short calls are in the money with about two weeks until expiry; we'll have guidance on rolling, or letting the stock go, before expiration.

Close Your Short on International Speedway Corp.

Published Oct 4, 2018 at 11:23AM

Is this for you? This is for all members who followed our recommendation to short **International Speedway Corp.** (NASDAQ: ISCA).

How You Participate

- **Action:** Buy to close, or cover, your short position(s) on International Speedway Corp.
- **Allocation:** Close all of your short — our initial recommendation was to short 1%.
- **Recent Price Range (this morning):** $36.67
- **Price Guidance:** *Use a **limit order***, and aim to pay less that $38.

What We're Thinking

With shares down approximately 15% since we first recommended shorting International Speedway Corp. less than two weeks ago, we believe it's time to close your position and take a victory lap.

Today's large decline on the back of the company lowering fiscal 2018 guidance largely removes the margin of safety we believed we had from shorting shares in the mid-$40s. Although our thesis for shorting the company was long-term in nature, we believe — more often than not — that it's important to take these quick victories when they occur.

Although the stock could fall even lower, we're more than satisfied with this return in such a short timeframe. We can now move to the sidelines for the time being and reconsider shorting this stock in the future if we believe the risk/reward trade-off supports it.

This is how we must run the short part of the portfolio, drawing from a large pool of potential candidates and shorting when we like the risk vs. reward on any stock at a given price. A large short book will change positions quite regularly. As such, this short has played out for now. The checkered flag is waving.

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread:** You should close those positions, too.

Motley Fool Pro Nears 10-Year Anniversary

Published Oct 1, 2018 at 3:30PM

Dear *Pro* members:

This month, we celebrate *Motley Fool Pro's* 10-year anniversary! Although Ellen, J.P., and Billy wanted to rent a Winnebago and tour around the world meeting members, we've opted to stay in town and share our good tidings virtually. We'll devote all month to it.

Ten years is not a long time. We just lived through 3,652 days — or 520 weeks. That's fewer than 2,600 business days. Yet, somehow, we found a way to issue around 500 trade alerts for *Pro*. In other words, ten years is not long, but we've spent a lot of it together, and I've spent the bulk of the time thinking about our investment mix. It has been a privilege to work for you.

We've had our share of agonies, of positions that went against us, tormented us, or that we "missed" and then never considered again (even though it turns out we *hadn't* missed many of them at all, if we had stuck to them). But with many lessons learned, we have more experience now to lean on as go forward. And beyond that, considering everything as a whole, what we have in sum after ten years are returns that we can celebrate, and build on.

The *Pro* Port has 14.2% annualized returns over the last ten years. Our only real enemy is inflation, and we're far ahead of it, vastly growing our real purchasing power in the process. We've also surpassed our guiding North Star (which is up 8.5% annualized), and all of the major market indexes in the U.S. and abroad. That's despite being a more risk-averse portfolio than average, holding cash, and keeping our exposure well below 100% (averaging 74% net long since 2012). Our hedges and shorts have subtracted from our returns, but — like insurance — they would have helped in a downturn. Our end result is still one of success — of goals exceeded.

We wouldn't be here without you. For that, we thank you. At the same time, what we do here is basic. Directing our finite capital into shares of companies that we believe will grow in value is as logical as it gets — and that is what has driven most of our value to date.

When a bear market hits, and nearly every stock falls, we'll be relying on our shorts — which we're building — and on hedges to help us stay ahead of the pack and be better-positioned for a rebound. That, too, is logical — it's just much more difficult partly given that shorting is much more short term than is buying to hold stocks.

But in both cases, what we're doing here is simply hoped to result in you having more money than you began with — much more, we hope. And actually, it's about you having much more purchasing power. That, in turn, should give you and your family more opportunities in life. It's that simple. And that important.

At least doubling our real purchasing power every 10 years was our biggest goal. Our real purchasing power has much more than doubled the last 10 years, with the portfolio up (again) 14.2% annualized before taxes, and inflation running up only about 1.5% annualized (with inflation *plus* 7% running at 8.5% annualized). But our returns have been achieved in a strong stock market, and with low inflation. We need to be ready to be flexible and versatile with our strategies in a persistent down market — or whenever the next recession arrives — and during times of higher inflation.

Right now, we're working on building out shorts, and already we're reminded how timely that pursuit is. **Bed, Bath & Beyond** (NASDAQ: BBBY) was written up to be published as a short, but fell 20% last week after earnings (which we wanted to wait for just in case!). Others have slipped lower for no reason. One other jumped more than 10% in the last week, so now we're reassessing if shorting it is still a logical move, or is the tide turning? All this to get a short book together that should then work as "one," and be actively managed.

Meanwhile, as we get ready to celebrate 10 years with you, we'll be reviewing every position in the portfolio in coming weeks, and talking about what we've learned, what has worked, what hasn't, what we expect, and more. Thank you for being here for this incredible and Foolish journey together! You've made it possible.

To share any thoughts, please visit the Memo Musings board.

Fool on!

Pro Catch-Up Trades and Expirations: Apple, Zuora, and More

Published Sep 27, 2018 at 3:13PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.9% stake in the stock.
- **CME Group** (NASDAQ: CME): Match our 2.4% stake.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): If you don't have a position, start with a 3% stake. If you don't have a full allocation, now is a good time to consider adding incrementally to your position.
- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3% stake.
- **Oracle** (NYSE: ORCL): Match our 3.3% stock stake.
- **Verisk Analytics** (NASDAQ: VRSK): Match our 2.5% stake.
- **Zuora** (NYSE: ZUO): Match our 1.4% stake.

Shorts:

- N/A

Options:

- **Oracle**: If you haven't, you can set up a diagonal call on Oracle by buying to open January 2020 $30 calls and selling to open December 2018 $52.50 calls. Lately, the net debit is about $20.24 per diagonal call, or $2,024. We have a 0.5% allocation (cash value) in the long calls.

Upcoming Expirations (October):

- **Johnson & Johnson** (NYSE: JNJ): Our October 2018 $135 short calls are well in the money; we'll have guidance on rolling, or perhaps letting the stock go, before expiration next month.

More Growth Stocks Mean More Shorts

Published Sep 24, 2018 at 1:37PM

Greetings, *Pro* members!

As some of you know, early this year I began working with Tom Gardner and a small team of Fool analysts (Andy Cross, Abi Malin, and Bill Mann) on some of Tom's new *Motley Fool Discovery* services.

It started for me with *Partnership Portfolio*, where we built a collection of companies (mostly small- to mid-size) that are run by their founders. Founder-led businesses tend to outperform. Many of *Pro*'s best stocks share this trait, and in fact, three of them landed in the Partnership Portfolio. Next, I helped the team with a reopen of the *Rising Stars* service, where we recommended a refreshed portfolio of micro-cap stocks -- in this case, companies with market values of $4 billion or less. Small companies historically return more than large ones.

Both experiences only strengthened my belief that young, often recently public companies with bright prospects are the new lifeblood of a portfolio. Without adding many of these companies to your portfolio every decade, you risk losing some relevance and some growth.

Of course, large and established companies can continue to provide outstanding returns for decades; we own several such businesses. But younger and more novel companies have the potential to push your returns to a new level. Where would *Pro* be without having bought Facebook, Paycom, or Square, not to mention Broadridge Financial Services after it went public?

As members of these new services will know, most of the companies we've bought in *Partnership Portfolio* and *Rising Stars* do *look* expensive. *Pro*'s young companies do, too -- and at least on past results, they are. But each company in these services that continues to impressively succeed should easily outgrow its current price within a handful of years. In the meantime, however, any market downdraft is likely to bring the stock price lower, perhaps significantly so. Many Foolish investors don't mind that. They'll add more money to their favorites, or ride it out. But in *Pro*, we have a mandate to tamp down volatility and have winners in up *and* down markets.

And that means shorting.

I want to continue to add more growth companies to the *Pro* portfolio, and doing so means shorting more stocks. That's necessary for balance against a more turbulent stock market and our own more volatile holdings. Even more important than that, we want to manage *Pro* in a long-short fashion that is more active than we've employed until now; it's been a slow build to get here, but we're at a point where we feel that we should.

Some companies are beginning to warn investors that the U.S. trade war with China will affect earnings next year. Interest rates are rising, making borrowing more expensive, which typically slows economic growth. Lower tax rates will be lapped for most companies in 2019, no longer driving extra year-over-year bottom-line growth. Boomers are retiring *en masse*.

All this is happening against the growing influence of a massive wave of millennials who have increasing purchasing power but don't necessarily want all the material trappings of the Boomers before them. Interest rates are still historically low. And technology continues to bring new opportunity and efficiency to the world. The push and pull of opposing forces are playing on the market as giant cycles of life and business evolve, and stock prices are likely to be more volatile as a result. More businesses are going to suffer and die. Some are going to be incredible winners. We want ongoing stakes on both sides of this battle.

But as always, the shorts that we'll recommend and manage aren't for everyone. And as always, they aren't necessary to follow along with *Pro*. It's nearly impossible to make a fortune shorting (unless you short with leverage such as put buying, and get lucky on timing), because your short exposure is by design capped, as are your potential profits. And it's rare that we'll be hoping for even 50% gains with our short stocks, let alone 100%. Mostly, we're looking for small wins. Naturally, we want our short portfolio as a whole to help most during meaningful downswings in the market. It's hard to imagine a new bear market starting until there's a recession on the horizon -- that's when bears almost exclusively occur -- but it's all but impossible to predict recessions ahead of time. So, after years of economic expansion like we've just had, we're ready to more steadily sell short in anticipation of the next contraction. That might mean running shorts for a few years more while we wait.

It's active. It's time-consuming. It has extra risks. It can be expensive. But shorting also teaches you a lot -- about the investments in question and about your long stocks, too. Shorting should make you a better investor. And, shorting might allow you to comfortably own more volatile growth companies for their long-term upside, too -- even if you appear to be buying them initially at premium prices.

If you're only investing in an IRA, though, shorting can be logistically tough. You can use options, and that limits your risk (Travis posted options ideas for an IRA on our four shorts from Friday), but this approach also decreases the appeal. The options positions can be cumbersome to enter and exit at good prices, and they don't give you the benefit of "cash-in" -- you're actually paying cash *out* to set them up in most cases. By shorting a company's stock, we're bringing in cash, and once our short balance is above $100,000, Interactive Brokers even pays us some interest on it. And if and when our short balances go down (and even earlier if we were using leverage), we will have leeway to invest some of this cash in long positions.

As we go forward, realize that most investors never need to sell short and can and will succeed anyway. Continue to only follow *Pro's* longs if that's what interests you -- and our index hedges as a way to lower your market exposure in general, if you wish. We've always been a long/short service, and at times we've been more than 30% short, but so far our long positions have made all the money. Only by running shorts for years, at considerable effort and expense, can we hope to add meaningfully to our returns with them -- and even then, of course, there's no guarantee they will pay us by themselves. But they should help our long investing results, either way, and help us to comfortably own more growth companies -- likely some of our biggest winners.

To share any thoughts, please visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Sept. 24, 2018

Published Sep 24, 2018 at 1:07PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **MasterCard** (NYSE: MA): Fair-value estimate climbs to $190. The stock remains a Best Buy Now with a 7.2% allocation. Start with half that.
- **Visa** (NYSE: V): Fair-value estimate climbs to $133. The stock remains a Buy with a 3.9% allocation.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **American Tower** (NYSE: AMT): We rolled our short October 2018 $135 calls to January 2019 $135 calls for a credit. Do this *before* the Sept. 27 ex-dividend date.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Sell Short Flexion, International Speedway, Kellogg, and Papa John's

Published Sep 21, 2018 at 3:19PM

Hi *Pro* Fools! We'll have more on our shorting approach in our next Monday Memo and later next week, so, depending on your comfort level, you may want to wait to hear more of our thoughts before implementing these.

Is this for you? These recommendations are only for *Pro* members who are comfortable with the idea of managing a growing basket of short stocks as part of a long/short portfolio strategy, and who have margin accounts with shorting availability on these stocks (there are no IRA-friendly alternatives; the puts are expensive and our timeframe is short). Of course, you don't need to short if you don't wish. The long-term purpose of having a large book of shorts is to raise extra capital that you can invest in long positions, as well as to perform better in market declines.

How You Follow Along

- **Trade:** Sell short 1% in **Flexion Therapeutics** (NASDAQ: FLXN).
- **Shares Available** (Interactive Brokers): 400,000 at a 1.33% annual fee
- **Market Cap:** $714 million
- **Recent Price**: $18.90
- **Alternative Trade**: February 2019 $20 synthetic short
  - Sell to open February 2019 $20 calls; buy to open an equal number of February 2019 $20 puts; set up one synthetic short for every $2,000 in exposure wanted
  - Price: Until the price moves, aim for a net debit of $1.20 or lower (setting up a short around $18.80 net)

- **Trade:** Sell short 1% in **International Speedway Corp** (NASDAQ: ISCA).
- **Shares Available** (IB): 1.1 million at an 0.38% annual fee
- **Dividend Yield:** 1%
- **Market Cap**: $1.1 billion
- **Recent Price**: $44.70
- **Alternative Trade**: December 2018 $45 synthetic short
  - Sell to open December 2018 $45 calls; buy to open an equal number of December 2018 $45 puts; set up one synthetic short for every $4,500 in exposure wanted
  - Price: Unless the stock price moves, aim for approximately no cost or a small credit

- **Trade:** Sell short 1% in **Kellogg** (NYSE: K).
- **Shares Available** (IB): 4.7 million shares at an 0.37% annual fee
- **Dividend Yield:** 3%
- **Market Cap:** $25.4 billion
- **Recent Price:** $73.22

- **Trade:** Sell short 1% in **Papa John's International** (NASDAQ: PZZA).
- **Shares Available** (IB): 350,000 at an 0.86% annual fee
- **Dividend Yield:** 1.9%
- **Recent Price**: $46.70
- **Market Cap:** $1.5 billion
- **Alternative Trade**: If you're experienced with synthetic shorts, you can set one up expiring late this year for about $1 or less in premium to the current share price (so shorting directly is more efficient).

All prices will change as the shares move, but the stocks will continue to be recommended as short positions in *Pro* until we share otherwise.

What We're Thinking

As we wrote last year in this situation, the first point to make is that while this is a mini-basket of short positions, it's only a small part of the mega-basket we'll want to have when ready -- and now is when we want to. We discourage you from setting up just one or two of these four shorts; our advice is either to set up all four and the ones to follow later, or to go with none at all. (Ultimately, of course, it's your call!)

The *Pro* portfolio is managed as a whole, with the goal of earning desirable *overall* returns. It's unrealistic to expect every position to make money, and that's especially true with shorts. Our shorts will be actively managed; if we don't like how one is going, we could close it a mere 10 days from now. But in most cases, each short will last on average a few months, to be steadily replaced with new ones. And the cash we raise from shorting will be available for use.

Flexion Therapeutics

Founded in 2007, Flexion is a biopharmaceutical company that just started selling its first product, called ZILRETTA. A local treatment for musculoskeletal conditions, it's been approved for osteoarthritis (a degenerative arthritis) in the knee. The drug is also in trials -- years from fruition -- for pain applications in other parts of the body.

The treatment is promising. ZILRETTA is a non-opioid therapy that uses proprietary "microsphere" science to provide pain relief, currently in the knee, for up to 12 weeks. The drug is in a late-stage trial to see how patients tolerate and benefit from repeat dosages lasting up to a year. Those results are due by year's end, and odds are they won't disappoint; that's not the story here.

The issue at hand is that last quarter's ZILRETTA sales were $3.8 million, up 73% from the first quarter. Now, more than two full quarters into the launch, the sales numbers appear dauntingly low, calling into question the economic viability of the drug -- or at least the sales system beneath it. Flexion's sales team has already touched base with about 70% of its roughly 3,700 targeted accounts -- that's 2,600. Of those, about 2,240 received a sample or bought ZILRETTA. And more than half have placed a reorder.

This start is unlikely to be strong enough to reach the consensus estimates of nearly $23 million in revenue this year and $120 million next year. And that could be why the stock has been weak since the numbers were revealed.

So far, the company has achieved about $6 million in sales of ZILRETTA, with $170 million in losses the past year. Losses are growing as management spends on sales staff and R&D. And although Flexion has about $340 million in cash and investments, that will steadily burn away, so it can't be counted on as a lasting asset. In short, the company's market value of higher than $700 million looks optimistic given a single product that saw just $3.8 million in revenue last quarter and cost a lot in the process. This may be a case where expectations are too high for this novel product. If that belief continues to set in, we should get our desired 7% to 10% or greater short-term return on the short.

We'll keep a tight rope on Flexion, covering it if it rises much against us. In that case, we might even save it to try shorting again at a later date, all else being equal. Meanwhile, it's not likely to hold up well if the market falls.

International Speedway Corporation

International Speedway Corporation is the largest publicly traded promoter of motorsports-themed entertainment (primarily NASCAR) in the United States, and we believe our short thesis can be best summarized by the following equation:

Structural headwinds + conflicts of interest = suboptimal capital allocation

By themselves, each part of the equation could potentially be enough to make shorting ISCA a worthwhile endeavor. But it's the combination of all three that really caught our eye. Let's take a look at each variable:

Structural headwinds: A lack of star power, increased safety resulting in less exciting racing , the rise of substitute entertainment, increased fuel prices making attendance less affordable, and simply a change in cultural interest -- there's no shortage of theories that have gained traction over the past few years in an attempt to explain the sharp decline in NASCAR's popularity. We believe there is at least a grain of truth to most of these theories, meaning there is little chance of a U-turn back to prior glory days. By our estimate, viewership for the races that took place during the most recent fiscal quarter declined by upwards of 20% from last year (far more than the rise of online streaming can explain). And although NASCAR stopped officially reporting attendance figures in 2013, we feel pretty confident in saying that those are poor as well.

In fact, the attendance figures are even worse than the large swaths of empty seats seen in broadcasts would suggest. That's because ISCA has actually *reduced* the number of seats at its 13 facilities by approximately 24% since 2010! Although these numbers won't correspond with an equally large decline in revenue thanks to the company's current broadcasting deal, which runs through 2024, we're already seeing the fallout with regards to sponsorship. There are well-documented issues even with big names -- the title sponsors for seven-time champion Jimmie Johnson and last year's winner, Martin Truex Jr., both pulled out. NASCAR's own title sponsor will be leaving in 2019, and the organization is planning on taking a new approach to sponsorships, given that nobody is willing to pay anywhere close to what Monster Energy paid for the honor in 2017 (and that amount was already a sizable step down from the previous sponsor). We believe this negative feedback loop will continue for the foreseeable future and that NASCAR will ultimately need to make sizable concessions when it negotiates its next broadcast contract.

Conflict of interest: The France family, otherwise known as the "first family of NASCAR," owns NASCAR and has a controlling stake in ISCA, with more than 74% of voting power. Critically, however, the family's *economic* interest in ISCA is far less than that, which we believe leaves them with the most to gain by having ISCA (not NASCAR) do everything in its power to address the aforementioned structural headwinds -- even if it comes at the expense of ISCA shareholders.

Suboptimal capital allocation: We believe one has to look no further than the returns on invested capital (below 10% for more than a decade and trending lower) and the elevated level of capital expenditures as a percentage of sales (higher than 20% over the past four years) to see what the future holds for ISCA. But don't just take it from us: On a recent earnings call, management noted that they only target an average ROIC in the low to mid-single digits! From our vantage point, this is management admitting they're willing to spend ISCA's money on projects that hurt ISCA shareholders as long as they believe it will help NASCAR.

Kellogg

Kellogg is one of the most venerable American businesses, founded in 1906 and known for its consumer cereal brands including Frosted Flakes, Froot Loops, Rice Krispies, and Raisin Bran. The company has a storied history on Wall Street, having paid a dividend every quarter since 1925. For many decades, Kellogg's products were ubiquitous in American culture, and the company enjoyed a powerhouse position in branded food.

But times have changed. Between 2009 and 2017, cereal sales in the US dropped from $12.7 billion to $10.4 billion (an 18% decline) as new morning challengers such as Greek yogurt, smoothies, breakfast bars, and expanded fast-food breakfast menus have captured share of the market. Cereal has suffered from a reputation of being overly processed and lacking nutritional value.

The cereal category is mature, and long-term trends in nutrition and food consumption suggest that cereal is facing a structural (rather than cyclical) decline. Cereal should continue to struggle as more consumers opt for healthier, fresher breakfast options, and these trends should serve as a persistent headwind for Kellogg moving forward.

The struggles in cereal are represented in Kellogg's financials, with revenue down 12.6% between fiscal years 2013 and 2017 and earnings per share down 27% over the same period. Additionally, Kellogg has been implementing a new distribution model in an attempt to cut costs, but there is financial evidence to suggest that this may be leading to excess inventory in Kellogg's distribution channels (i.e., grocery stores), which suggests possible future underperformance as inventory levels normalize.

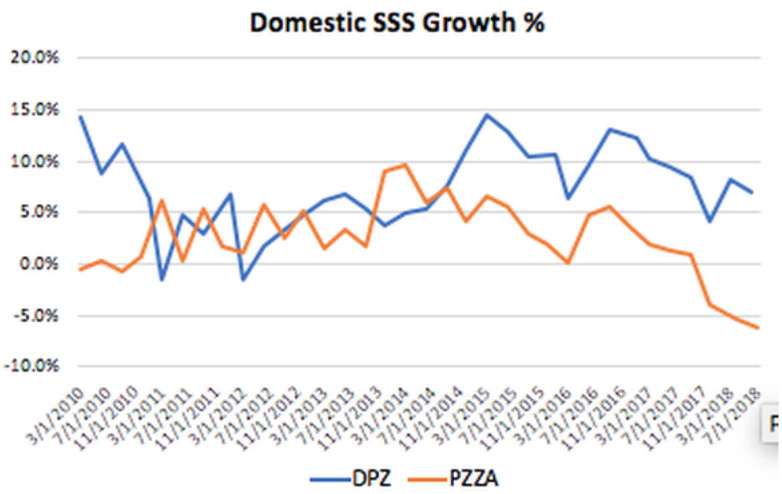
All told, we think it will ultimately be difficult for Kellogg to generate meaningful shareholder returns from its portfolio of mature brands in a structurally declining industry (amid a major distribution overhaul), and with the stock up approximately 30% from its 52-week low of $56.40 (on May 2), we think now is a good time to initiate a short. We don't expect this one to soar in a rising market (and we'll close if it rises more than 10% on us), and it should help us in a market decline.

Papa John's International

Oh, how the mighty have fallen. Papa John's used to be a major source of outperformance in the *Pro* portfolio. We bought our first slice of shares in 2010 at a split-adjusted price of $11.95 and ultimately exited our final holdings in 2017 at $78.56 -- that works out to a 557% ROI over less than seven years (29% CAGR), and that's not including options or dividends.

But since then, Papa John's has faced major troubles, of both the business kind and the "shoot yourself in the foot by doing dumb stuff" kind. The issues started in November 2017 on the third-quarter 2017 conference call, when Papa John's founder John Schnatter (at that point the chairman and CEO) tried to blame subpar business performance in the quarter on NFL players' protests during the National Anthem and "poor leadership" from the NFL. By December, Schnatter was ousted as CEO, stepping down just weeks after the controversial remarks (for which the company later apologized). By February 2018, Papa John's and the NFL ended their exclusive sponsorship.

Since then, perhaps in part because of the controversial NFL remarks but also likely because of managerial turmoil, the company has continued to underperform, posting poor (even negative) same-store sales performance while seeing its rival **Domino's** (NYSE: DPZ) continue to take share of the market with positive growth:



And as if to put a nail in the coffin, in July of this year news broke that Schnatter had used highly offensive, racist language during a conference call with a marketing agency that was intended to *prevent* him from shooting himself in the foot again. Schnatter later confirmed the allegations in an emailed statement to *Forbes*, and he subsequently stepped down from the University of Louisville's board of trustees. The MLB indefinitely suspended its "Papa Slam" promotion with the company, and Schnatter resigned as chairman of the board of Papa John's.

The company has begun removing Schnatter's image from pizza boxes, the University of Louisville is removing his name from its football stadium, and Schnatter's hometown of Jeffersonville, Ind., is returning a $400,000 donation to renovate a historic gym and field house.

And Schnatter, who still has a role on Papa's board and a position as its largest shareholder, is now at war with the company. He continues to talk publicly about his desire to help it make a comeback, and he's even gone so far as to sue Papa John's in response to its adoption of a "poison pill" provision intended to prevent him from amassing a controlling interest in the business.

All told, the stock is down more than 40% since we sold our shares in April 2017, and there may be more room to keep falling. All the points we made in our sell report in 2017 are still valid, business fundamentals are deteriorating, and now the PR nightmare and internal war present another looming overhang for the business's prospects. On top of that, its NFL relationship no longer exists to drive sales this fall, and Major League Baseball is unlikely to be there to help next spring. We're ready to take this opportunity to make a 180-degree turn and short this former *Pro* outperformer.

The Foolish Bottom Line

These four 1% short positions are part of larger short exposure on the way. Remember that shorts are usually shorter-term positions. Maintaining a book of shorts is more time-intensive than long investing, but it's worth it if this helps the portfolio succeed in weak markets and doesn't drag our returns much lower in strong ones (ideally, it won't drag at all -- but that's a high bar).

Bring any questions to the *Pro Shorts* board!

Pro Catch-Up Trades and Expirations: Oracle, Zuora, and More

Published Sep 20, 2018 at 4:00PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Match our 3.7% stake in the stock.
- **CME Group** (NASDAQ: CME): Match our 2.4% stake.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Services** (NYSE: BR): If you don't have a position, start with a 3% stake. If you don't have a full allocation, now is a good time to consider adding incrementally to your position.
- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3% stake.
- **Oracle** (NYSE: ORCL): Match our 3.3% stock stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 3% stake.
- **Zuora** (NYSE: ZUO): Match our 1.4% stake.

Shorts:

- N/A

Options:

- **American Tower**: Roll your diagonal calls per today's alert.
- **Oracle**: If you haven't, you can set up a diagonal call on Oracle by buying to open January 2020 $30 calls, and selling to open December 2018 $52.50 calls. Lately, the net debit is about $19.95 per diagonal call, or $1,995. We have a 0.5% allocation (cash value) in the long calls.

Upcoming Expirations (October):

- **Johnson & Johnson** (NYSE: JNJ): Our October 2018 $135 short calls are well in the money; we'll have guidance on rolling, or perhaps letting the stock go, before expiration next month.

Roll Your Diagonal Calls on American Tower

Published Sep 20, 2018 at 2:18PM

Is this for you? This is for all *Pro* members who wrote October 2018 $135 diagonal calls on **American Tower** (NYSE: AMT) as per our alert in March. If you wrote diagonal calls at different strike prices, please see the Alternative Trades section below. Remember that all members should already own an unencumbered 3.7% stock allocation to American Tower, so if you have yet to establish this, do so before considering this additional diagonal call recommendation.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all October 2018 $135 written calls.
  - "Sell to open" the same number of January 2019 $135 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all five of our calls.
- **Recent Prices** (1:25 p.m. ET):
  - Stock: $148.13
  - Buy to close October 2018 $135 calls (bid/ask): $13/$13.50 (midpoint $13.25)
  - Sell to open January 2019 $135 calls (bid/ask): $14.60/$15.20 (midpoint $14.90)
  - Net credit to roll: Approximately $1.40 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls, and aiming to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $1.40 net credit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. Realize that with expiration 37 days away, the time value on our deep-in-the-money short calls is eroding toward zero, and American Tower's first-quarter ex-dividend date for a $0.79-per-share is Sept. 27. Keep in mind that you should roll these calls soon, and certainly ***before*** Sept. 27, or you risk getting your owned *shares* (rather than calls, assuming both securities are owned in the same account) called away. **We want to avoid that scenario!** So, accept lower credits if need be to complete this trade before the ex-dividend date, but still use a limit order.

  As of the pricing in this alert, the bid/ask spread on the October $135 short call implies about $0.35 or so in time value remaining, so you don't necessarily need to make this trade immediately, but it's getting close. As we approach expiration, time value will continue to erode; the closer time value gets to zero and the longer you wait, the more likely it is that your short calls will be assigned. Again, let's avoid that.

What We're Thinking

The current iteration of our diagonal call strategy on American Tower has now been active for almost two years, having begun in November 2016 when we re-established a diagonal call on the company at advantageous prices. Then, in March and September of 2017 and March of 2018, we rolled our short calls out and up to capture further upside. So far, the position has been a success (recently with a 37% simple return since inception if we were to close the diagonal call), and American Tower's stock price has run up well beyond the strike price of our October $135 short calls.

We're now in a position to roll our calls out again for a credit, aiming to milk some final income out of this position as we approach January 2019 expiration. With this rolling trade, we effectively convert our diagonal call strategy into a bull call spread (with both legs expiring in January 2019). As of right now, our plan is to close this position as we approach January 2019 expiration (likely before American Tower's next ex-dividend date in December), and at that point we will consider whether we want to initiate another diagonal call strategy on American Tower (perhaps using the 2021 LEAPS that list this month), or whether we are content with our simple stock exposure to this company.

Alternative Trades

- **Did you write calls with a higher strike price than *Pro*'s?** If you wrote higher-strike calls than *Pro* did (maybe at the $140, $145, or $150 strike prices), you're in a slightly better position than *Pro*. If your short call is in the money, aim to roll out and/or up for a credit before the Sept. 27 ex-dividend date to be safe. If you can roll to the $145 or $150 strike prices for a credit, those are good choices given our fair-value estimate of $146. If your strike price is out of the money, you can wait until expiration and then write a new iteration of short calls at the $145 or $150 strike prices.

Pro Can Help

Pro Guidance Changes and Completed Trades: Sept. 10, 2018

Published Sep 17, 2018 at 4:54PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Broadridge Financial Services** (NYSE: BR): After receiving clarification from Broadridge investor relations on a financial disclosure in recent presentations, our fair-value estimate increases slightly to $115 (from $110). The stock remains a Buy, and the current price represents the narrowest premium to our fair-value estimate in all of 2018.
- **OpenText** (NASDAQ: OTEX): On continued free cash flow growth, our fair value estimate increases to $37 (from $35). The stock remains a Buy with a 2.9% allocation.

Pro Completed Trades (see transaction log; trades take a day to appear):

- None this week.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Guidance Changes and Completed Trades: Sept. 17, 2018

Published Sep 17, 2018 at 4:52PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Paycom** (NYSE: PAYC): Our fair-value estimate increases to $118. It remains a Best Buy Now (for now; a decision to potentially move it to Buy is pending).
- **Square** (NYSE: SQ): Our fair-value guess increases to $60. It remains a Buy. We have half of our position covered by $80 calls.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Oracle** (NYSE: ORCL): We sold to open ten December 2018 $52.50 calls, reestablishing our diagonal call on Oracle. We were paid $1.10.
- **Square:** We rolled the September short calls that have been written on half our position to January 2019 $80 calls, for a credit.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

The Short Story on Our Next Shorts

Published Sep 17, 2018 at 3:59PM

Greetings, *Pro* members!

You might remember that we closed most of our short positions early this year. Now, with U.S. market indexes continuing to hit new highs, we're preparing to initiate a new "basket of shorts." For most of our nearly 10-year history, we've repeatedly decided to focus on owning promising companies rather than expending the high amount of energy it takes to run shorts. Too much shorting seemed contrary to the opportunities we were seeing in the market.

But we always said that this would change over time, and it is evolving as we speak (er, write). As interest rates increase, as valuation multiples expand, and as growth prospects potentially weaken while trade battles continue, we see more opportunities to fill a basket of shorts that would both help us navigate a down market better and, ideally, not harm us much in a market that continues to rise.

We're hoping to start as many as five individual shorts this week, followed by more next week, as we fill our basket. Each position will start at an allocation of about 0.5% to 1% -- no larger than that. Our general aim is to earn a decent return of approximately 7% or more on any short, and to cap our losses on any position that is moving against us. Most positions will be shorted directly (borrowing and selling the stock and paying the attendant "borrow fees"), and some will be shorted using options.

With our shorts, we're mainly targeting larger companies (and stocks that aren't likely to soar away on surprise good news). We want to seek out companies that are having trouble remaining relevant, expanding their sales, and achieving profits. We want companies that are the mirror *opposite* of our best long investments -- companies that are struggling to keep their heads above the water, or at the very least, flailing in their attempts to grow.

Here are some Foolish guidelines to consider if you're going to be short-selling alongside us again:

1. Don't sell short unless you're comfortable doing so. It's expensive, tricky, and time-consuming! Many people find it stressful. We seek to minimize that stress by having a large basket of short positions that ideally won't harm us much on the whole as prices rise (though some of them surely will). The positions will also ideally add to our returns overall after costs, especially in a falling market. Assuming our ongoing approach for the foreseeable future is to manage a basket of shorts (which is the assumption), the basket will grow, and change, regularly.

2. Aim to sell short every position with us. We don't know which will work out and which won't. We need to diversify our short portfolio, just as you do with a long portfolio, to benefit from the positions that end up working out best.

3. As shared earlier, stick to our allocations. Don't start giant short positions. We aim to keep our exposure to each one capped at a maximum of about 1% to start. If we get up to 20 positions, then our short book would give us up to 20% short exposure. That's a good start. Even ten positions for 10% is a good start.

4. Don't sweat small moves. They'll happen daily. On large jumps, though, we aim to cap our loss on any individual short to ideally no more than about 10%. We're lowering this bar from 20% knowing that it takes us time to issue alerts and get the position closed. And the math of a loss larger than 10% is harder to make up when shorting.

5. Shorts are usually short-term in nature. For many, it will be just weeks before the position turns over. The rare long-term short does exist, but generally we're targeting modest gains in struggling companies. As a short declines in value, it offers the short seller less potential reward, so keeping a fallen short open becomes less logical. We aim to take our gains when we deem it appropriate.

6. One more time: You don't need to sell short if you don't want to. We also have a hedge running on the S&P 500 index that we'll keep managing with you. And we have cash. And we like what we own.

However, after closing our last short positions, we knew we would want to start another basket at some point. We're now reaching the point where we feel we want to. That doesn't mean we believe the market is about to fall. Obviously, we don't know. It just means we're ready to put more of the "short" back into *Pro*'s long/short equation. Nearly 10 years into this adventure, and assessing on a regular basis, we've been patient about using shorts sparingly; but that was never the permanent plan.

To share any thoughts, please visit the Memo Musings board.

Fool on!

Re-Establish a Diagonal Call on Oracle

Published Sep 14, 2018 at 12:55PM

Is this for you? This recommendation is for all *Pro* members who own 0.5% in long calls on **Oracle** (NYSE: ORCL) as part of the diagonal call we set up early this year. We also own a 3.2% stake in Oracle shares that are rated Buy. Those are separate from this position. If you don't yet own Oracle calls for a diagonal call, see alternatives below.

How You Participate

- **Trade:** Sell to open December 2018 $52.50 calls.
- **Allocation:** Sell one new call for every 2020 call you already own. For *Pro*, that's 10 contracts, representing a 0.5% allocation at current value.
- **Price Guidance:** At current prices, **use a limit order** at $1.10 to sell to open December 2018 $52.50 calls. As prices change, we'll have to accept the going price if we want to complete this trade before the market close on Monday.
- **Prices** (as of 10:30 a.m. E.T.):
    - Stock price: $49.24
    - Sell to open December 2018 $52.50 calls: $1.10 ($1.08 bid/$1.13 ask)
- **Alternative Guidance:** If the volume of trading among *Pro* members results in a significant impact on the options in this alert, or if the stock price changes considerably from the prices in this alert, consider looking at modestly different strikes or expirations for your short calls, but no lower than $50.

What We're Thinking

We bought January 2020 $30 calls on Oracle early this year after the stock had declined with the broader market. At the same time, we wrote $52.50 calls that expired this summer as income.

Since then, we've been waiting for shares to recover from last quarter's earnings report; now that they're back near $50, we can write new diagonal calls and benefit from slightly higher premiums. Oracle's next earnings report is due on Monday, Sept. 17, after the market closes, so we're stepping up to write our new calls before then, looking to earn income again on our long calls.

Why This Strategy?

The January 2020 calls we own are worth about $19.35, so writing $52.50 calls on them for a $1.10 credit pays us a 5.6% yield in just more than three months. We also maintain upside on our long calls to $52.50, and we have not capped upside on any of our shares of stock. This diagonal call is an "add-on" position -- not essential.

But with the diagonal call, we're seeking upside on one of our least expensive businesses, as well as leveraged income. Meanwhile, we believe the stock should at least remain steady and slowly appreciate over time.

However, last quarter's earnings report highlighted the risks that still exist in Oracle. Wall Street could frown again this quarter if cloud growth isn't healthy enough. The way we view it at this point, Oracle needs to keep proving its strategy to us some more, too, or there are companies we can replace it with.

In the meantime, though, we appreciate ownership of a stock that trades at below-average valuation multiples and still remains a highly profitable, recurring-revenue business. If Wall Streets starts to believe in Oracle's cloud business, the shares should be repriced much higher. Meanwhile, our diagonal call serves to pay us income.

More That Matters

- **Maximum loss:** Our entire 0.5% investment in our long calls if Oracle stock is less than $30 at January 2020 expiration, less premiums received from sold calls.
- **Maximum gain:** On this trade, we have upside to $52.50 for our owned call. But we hope to keep the strategy going, rolling our short calls if need be.
- **Follow-up**: By expiration, we'll seek to write new calls or roll our $52.50 calls to a later month and higher strike if the stock is above $52.50. If there are no attractive rolling opportunities, we will consider closing the entire position.

Alternative Trades

- **Not yet invested?** If you don't own long calls on Oracle, you can buy to open a 0.5% stake in January 2020 $30 calls, lately for about $19.35 each ($1,935), and simultaneously sell to open these same December 2018 $52.50 calls for a $1.10 credit, leading to a combined net debit of about $18.25 per diagonal call.
- **Want to cover some of your shares instead?** We see arguments for that, if you want to. Just realize the stock might jump after earnings -- if we're lucky. We're not yet covering our stock itself, but you could cover some of your shares with these same short calls, setting up covered calls, if you really want to. Then manage those short calls the same way we manage ours on our diagonal call.

Pro Can Help

- **Want to know more about this strategy?** The Options U guide to writing diagonal calls can keep you on an even keel.
- **Questions about this trade?** Visit Pro's options board.

Pro Catch-Up Trades and Expirations: Square, Zuora, and More

Published Sep 13, 2018 at 3:18PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Match our 2.9% stake.
- **CME Group** (NASDAQ: CME): Match our 2.3% stake.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Services** (NYSE: BR): If you don't have a position, start with a 3% stake. If you don't have a full allocation, now is a good time to consider adding incrementally to your position.
- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3% stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 2.8% stake.
- **Zuora** (NYSE: ZUO): Match our 1.5% stake.

Shorts:

- N/A

Options:

- **Square** (NYSE: SQ): If you're short September 2018 $75 calls, you can roll them to January 2019 $80 calls for about a $0.25 credit, to follow our recent alert. Roll soon, as time value is all but gone, and you risk losing your shares.

Upcoming Expirations:

- **Square**: Our September 2018 short calls are well in-the-money, so we're rolling (see above).

Tracking Pro's 'Fair Value'

Published Sep 10, 2018 at 1:16PM

Dear *Pro* Fools,

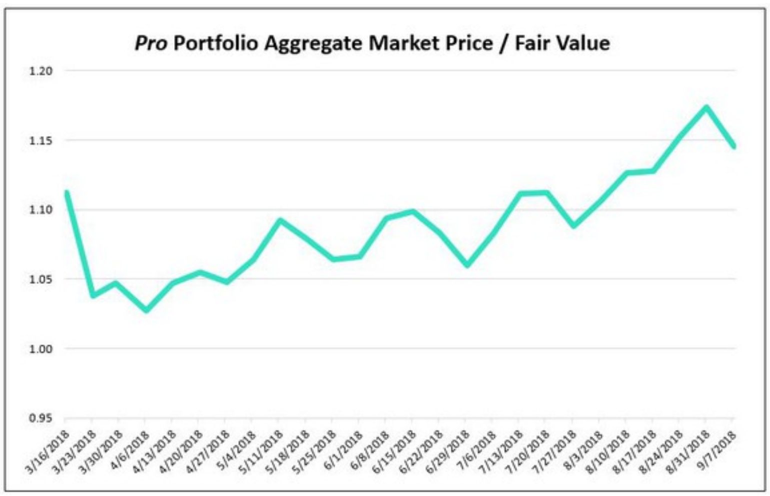
About six months ago, I wrote a Memo detailing a methodology we can use to calculate the theoretical fair value for the long "sleeve" of *Pro*'s portfolio. To summarize: We first use the fair-value estimates for each of our long stocks and compare them to each position's market value. Then, we aggregate all of these individual measurements to find the entire *Pro* portfolio's theoretical fair value.

At the end of that Memo in March, I wrote:

> "By tracking *Pro*'s theoretical fair value (and by tracking the fair value of the stocks that comprise the aggregate portfolio) over time and comparing the discount or premium to the subsequent realized performance, we can determine how good we are at assessing fair value, or whether we are systematically biased with our estimates. I plan to update this data set on a weekly basis and look forward to having enough data to draw historical conclusions."

And although our fair-value estimates are based on long-term (three- to five-year) expectations, now that we have about six months of history to examine, we can take an early look at the data and see if we can find any interesting observations.

The Aggregate Data



Note: The data is calculated on a weekly basis using each position's closing price on Friday.

This graph shows how the *Pro* portfolio's aggregate premium (or discount) to our theoretical fair value has changed since the beginning of the data series in March. Here are some observations from this graph and other relevant metrics:

- The data starts on March 16 with a reading of 1.11 and ends on Sept. 7 with a reading of 1.15, a 3% increase.
- The price-to-fair value ratio ranges from a low of 1.03 (on April 6) to a high of 1.17 (on Aug. 31).
- The average over the data series is 1.09.
- Between March 16 and Sept. 7, the value of the *Pro* portfolio increased by 6.4% (vs. 4.3% for the S&P 500).

It is interesting to note that although the *Pro* portfolio has traded at a premium to its theoretical fair value for the entire duration of this data series, it has still appreciated at a rate higher than the North Star (and the S&P 500).

The significant drop in the price-to-fair value ratio at the beginning of this period is largely attributable to Facebook, which dropped in value from $185.09 on March 16 to $159.39 on March 23 amidst the Cambridge Analytica data-breach scandal. At the time, Facebook was our largest holding; it is now our fourth largest, behind Broadridge, Mastercard, and Square.

Another interesting observation is that the *Pro* portfolio's value has increased at a rate greater than that of our price-to-fair value metric (6.4% vs. 3%). This difference is expected and is driven by increases to our fair-value estimates, which bring downward pressure on the price-to-fair value metric and upward pressure on total portfolio value. Since March 16, we've increased our fair-value estimates for 10 companies and decreased just one.

The Data by Position

In addition to tracking the price-to-fair value aggregate for the entire *Pro* portfolio, I've also been tracking the price-to-fair value metric for each individual position within the portfolio. This helps to demonstrate how undervalued or overvalued each position is, and how the valuation has changed over time. Here's how the individual position-level data looks (red shading indicates overvaluation, and green shading indicates undervaluation. Click to see full size):

In observing the position-level data, here are some relevant observations:

- The data ranges from a minimum of 0.54 (JD on Sept. 7) to a maximum of 2.04 (Square, also on Sept. 7).
- The average price-to-fair value ratio over the entire data series for every position is 1.08, and the median is 1.05.

An interesting insight from this table is that largest positions tend to be our most overvalued (we can see the red shading most prominently on the left side of the table, where our largest positions are found), and our smallest positions tend to be our most undervalued.

Over the life of this analysis (since March), our top five most overvalued positions have been Amazon (with an average price-to-fair value of 1.44), Square (1.41), Paycom (1.29), Mastercard (1.29), and Broadridge (1.28).

Our top five most undervalued active positions have been Coherent (0.64), JD (0.72), Johnson & Johnson (0.92), Skyworks (0.92), and CME (0.93).

The *Pro* Bottom Line

Although six months do not give us enough data to start analyzing for relationships between the price-to-fair value metric and long-term price appreciation (I'd like to start with a minimum of a year's worth), we can still obtain some insights from a preliminary look.

So far, we've seen that the *Pro* portfolio has traded at an aggregate premium to our estimate of fair value for the entire past six months, ranging from a low of 1.03 to a high of 1.17 with a current value of 1.15. This theoretical overvaluation hasn't hindered price appreciation, as the *Pro* portfolio has advanced by 6.4% over this time (vs. a 3% advancement in the price-to-fair value metric over the same time span; the difference was driven by increases to our fair-value estimates).

Additionally, when looking at individual positions, we see that the price-to-fair value metric can vary widely. We've witnessed a range from 0.54 to 2.04, with an average of 1.08 over the life of the data. Our largest positions have tended to be the most overvalued, which makes sense given that our conservative estimates often underestimate the growth and strength of outstanding businesses that compound intrinsic value at high rates. There can also be a lag between real-time market pricing and our fair-value estimates, which are updated at most just four times a year.

This analysis serves as yet another reminder not to anchor too strongly to fair-value estimates, as it shows that our strongest performers have so far been the most overvalued. However, this analysis was performed during a time of rising stock market prices -- and results will likely be much different during a decline.

Finally, *Pro*'s current 15% premium to fair value suggests a headwind to future returns, although as we saw with this analysis, that doesn't necessarily make this a certainty. We'll continue keeping track of this data to see how it trends over time.

Fool on!

Pro Catch-Up Trades and Expirations: Square, Zuora, and More

Published Sep 6, 2018 at 2:44PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Match our 3.7% stake.
- **CME Group** (NASDAQ: CME): Match our 2.4% stake.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Services** (NYSE: BR): If you don't have a position, start with a 3% stake. If you don't have a full allocation, now is a good time to consider adding incrementally to your position.
- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3% stake.
- **Skyworks Solutions** (NASDAQ: SWKS): Match our 2.9% stake.
- **Zuora** (NYSE: ZUO): Match our 1.5% stake.

Shorts:

- N/A

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls, selling one call for every 100 shares you own and want to cover. Lately, they pay $3.65 each, although with the stock trading for more than $135 today, these calls are slightly in-the-money, with a significant chance of seeing your shares called away at expiration. Those who wish to aim for more upside in the stock in exchange for lower income can consider writing October 2018 $140 calls instead.
- **Square** (NYSE: SQ): If you're short September 2018 $75 calls, you can roll them to January 2019 $80 calls for about a $1.10 credit, to follow our recent alert.

Upcoming Expirations:

- **Square**: Our September 2018 short calls are well in-the-money, so we're rolling (see above).

Pro Guidance Changes and Completed Trades: Sept. 4, 2018

Published Sep 4, 2018 at 3:22PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Broadridge Financial Services** (NYSE: BR): After receiving clarification from Broadridge investor relations on a financial disclosure in recent presentations, our fair-value estimate increases slightly to $115 (from $110). The stock remains a Buy, and the current price represents the narrowest premium to our fair-value estimate in all of 2018.
- **JD.com** (NASDAQ: JD): Per our recent memo, we're lowering our rating to Buy from Best Buy Now for the time being.
- **Tencent** (NASDAQOTH: TCEHY): Tencent's rating is also being lowered to Buy from Best Buy Now (which we also addressed in the aforementioned memo).

Pro Completed Trades (see transaction log; trades take a day to appear):

- None this week.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

The Latest on JD.com and Tencent

Published Sep 4, 2018 at 2:13PM

Fellow Fools,

Despite a rocky start, it looks like the markets will beat our North Star for yet another year, with both the S&P 500 and the Nasdaq posting higher returns than the inflation-plus-7% guide that steers our investing behavior. But that wasn't the case for every index around the world; the Hang Song Index in Hong Kong and the Shanghai SE Composite Index in China have had a rough year, having fallen 16% and 23%, respectively, from their 2018 highs. So it should come as no surprise that our two Chinese holdings — **JD.com** (NASDAQ: JD) and **Tencent** (NASDAQOTH: TCEHY) — have been laggards in the *Pro* portfolio, with the former having declined by more than 41% since February and the latter down 30%-plus since its all-time high in January.

Given that we purchased both stocks with the belief that they would ultimately compound value over the next decade-plus, we're not overly concerned about these near-term fluctuations. After all, situations like this are why we go to such great lengths to construct a properly diversified portfolio. We're more interested in how the two businesses are progressing against our investment theses. Let's take a look.

JD.com

The market's reactions to JD's recent financial results look myopic to us. Five of the first six participants on the conference call asked about margins, most of them with a focus on the near future. For our part, we'd much rather see JD continue to invest in its business instead of trying to juice margins in the near term. But there is some news outside of earnings that has us scratching our heads: Founder and CEO Richard Liu was recently arrested during a trip to the United States (and subsequently released and allowed to return to China) on suspicion of criminal sexual misconduct. Unsurprisingly, Liu's lawyers have said that the speed with which he was released is a strong indicator that no charges will be filed. We'll abstain from passing judgment until we have more facts on the matter, but in the meantime, this will likely result in negative press that could send the stock lower. We believe it's prudent to lower JD's rating as well, to Buy from Buy First.

That said, we're nowhere near being ready to jump ship as we believe JD's financial results continue to suggest our thesis is on track. And recently we've heard reports that merchants are beginning to push back at JD's rival Alibaba and its "us or them" ultimatum, which could be a positive sign for JD's apparel business beginning to recover.

Tencent

Recent performance leads me to assert that the market hasn't been thrilled with Tencent's performance over the past two quarters. Although the company continued its string of 30%-plus year-over-year (YOY) revenue growth, this past quarter marked the lowest sequential (quarter-over-quarter) growth rate since the third quarter of 2014, and net YOY income declined for the first time in more than a decade.

The biggest reason for the slowdown was the sharp deceleration in gaming revenue (up just 6% YOY this past quarter), the result of certain games launching later than anticipated and Tencent's inability to monetize some newer offerings. It's important to note that the latter issue is largely out of the company's control -- China's regulatory bodies in charge of monetization are undergoing restructuring. And while the nation's General Administration of Press and Publication (GAPP) has recently implemented a temporary solution, allowing certain games to be monetized for up to one month as a form of relief for the industry, many of Tencent's bigger new games don't meet the requirements. Fortunately, we could see this ban lifted as soon as this month (a recent Deutsche Bank report that noted that a similar regulatory change nine years ago lasted for six months). And Tencent hasn't just been sitting idly by while all this has been happening; management has been leveraging its massive consumer reach to develop creative ways to monetize its free offerings in the meantime, such as giving away "free" items in its games if users subscribe to Tencent Video.

From our vantage point, Tencent's recent gaming struggles are temporary bumps in the road. In fact, if the cross-product promotions end up creating new, long-term users of Tencent Video and other apps, the regulatory challenges could ultimately end up a net positive for the company. However, the path may not smooth out immediately after the GAPP resumes approving games for monetization; just last Thursday, China's Ministry of Education put out a release about limiting screen time for children and adolescents to reduce the rate of myopia. Most of the content just reinforced prior suggestions (age ratings, time restrictions) that Tencent has previously addressed, but there were also recommendations about restricting the number of games approved for release. This could end up delaying some of Tencent's offerings, but in the long run these regulations might benefit the company. Such rules, and the uncertainty they bring, would likely favor large incumbents who can better roll with the punches because their success isn't overly dependent on a single game.

What concerns us now is a recently published essay written by industry insider Li Guofei and translated by Oxford's Jeffrey Ding. Many of Li's points directly contradict our original investment thesis, which centered around how the whole of the company is worth more than the sum of its parts. We argued that Tencent's involvement in countless aspects of people's lives results in a treasure trove of data that management can use to develop new products, monetize existing products, and gain market share, among other things. However, implicit in this thesis is that the company needs to share data amongst its different divisions. Otherwise they're nothing more than a collection of smaller businesses, united in name only.

Unfortunately, Li's essay cites industry insiders (including some who still work at Tencent) to describe how the company has actually adopted a more siloed approach to data that has it falling behind with regards to algorithms, which affect everything from advertising to product development. This approach has given life to competitor

Bytedance, which has placed a much greater emphasis on algorithms and sharing data among different business units. The result: Though Tencent's daily active users and the total time spent on its applications have continued to increase, its market share has declined by more than 6 percentage points, to 48%, while market share for Bytedance's mobile apps jumped by almost the same amount, to 10% (according to data from Questmobile). We're still optimistic that Tencent will ultimately be able to right the ship, but if it doesn't appear as though management is reevaluating its stance on data siloing in the future, we would consider it grounds for closing our position. For now, we're lowering our rating on Tencent from Buy First to Buy.

Final Thoughts

Before I go, I want to put these recent declines into some historical context, to help explain why, in isolation, they don't bother us. The following table shows data regarding sizable declines for four of the largest and most popular U.S. stocks. The most important column here is the last one, as it illustrates the performance relative to the S&P 500 for any investor who unluckily purchased shares right before each decline (e.g., if you purchased shares of Apple in February of 2015 and held them, you'd be outperforming the S&P 500 by about 32%). As you can see, patience was rewarded handsomely, as all four stocks have soundly beaten the market from their pre-decline peak.

Company	Decline	Performance	Peak to Current Performance	vs. S&P 500
Apple	February 2015 — May 2016	(32%)	69%	32%
Amazon	December 2015 — February 2016	(30%)	190%	150%
Facebook	March 2014 — April 2014	(22%)	147%	92%
Netflix	December 2015 — February 2016	(37%)	183%	99%

Source: S&P Global Market Intelligence. Returns as of Aug 31, 2018.

One might argue that I'm cherry-picking results here by selecting stocks that ultimately regained their footing -- but that's exactly my point. Although we try to be mindful of market conditions, we're humble enough to know that timing our buys and predicting changes in market sentiment are fool's errands with a lower-case "f." What we *can* control is our analysis and understanding of a given business, and our knowledge of how that translates into an investment thesis and the creation of intrinsic value for long-term shareholders. If we focus on the latter, and our analysis is correct, then I think we have every right to believe we'll see Tencent and JD.com on the list above one day.

Enjoy your week, Fools.

-- JP (TMFYossarian)

Roll Your Calls on Square

Published Aug 31, 2018 at 10:14AM

Is this for you? This is for *Pro* members who wrote September $75 (or similar) calls on Square with us as part of a protective collar. With the stock well above that price, we're rolling our calls higher to target more returns.

How You Follow Along

- **Trades:** Ideally, use a rolling order to roll your short calls on **Square** (NYSE: SQ):
  - Buy to close all Sept. 21, 2018, $75 calls.
  - Sell to open an equal number of January 2019 $80 calls.
- **Allocation:** Roll all of your existing contracts. *Pro* wrote calls on half its Square position, and will roll all of them -- 14 contracts, covering 1,400 of our 2,800 shares.
- **Price (9:45 a.m. ET) and Guidance:**
  - Stock: $88.35
  - Buy to close Sept. 21, 2018, $75 calls (splitting the bid/ask): $13.75
  - Sell to open January 2019 $80 calls: $14.75
  - Net credit to roll: $1 (use a limit order and aim to roll for $1 in credit; if that doesn't fill, move your limit down over time by a nickel until it fills)
    - Later guidance: If Square moves much in price before you act, you may want to move your *new* call strike price up or down accordingly, so you can still roll for a credit or no cost to a strike price that is most logical at the time.

What We're Thinking

Somewhat remarkably, shares of Square have soared more than 30% since the company's Aug. 1 earnings announcement. As we've written, results were strong again, with total revenue up 48% and adjusted revenue up 60%. Gross payment volume increased 31% to $815 million. For the first time, half of that payment volume came from larger sellers, those moving more than $125,000 in commerce per year. Square's ability to attract large clients bodes well for its related software sales.

For whatever reason, the stock initially sold lower on the results before reversing. Since then, analyst upgrades have added fuel to the ascent -- as has a strong market for "growth" stocks in general. Square is now valued at about $36 billion, a far cry from the $10 billion market capitalization it sported when we bought shares last summer (or is it? If this is going to be a $100 billion-plus company, the difference isn't that meaningful -- but that's a big "if"). We're working to ascertain how sensible the valuation looks when stacked up against the long-term potential for Square's free cash flow and earnings. Square's business is running right around breakeven now on its march to profitability (as of last quarter), and it's seeing non-GAAP profits.

The stock now trades at 73 times the average estimated guess for earnings in 2020, compared with 25 times when we bought it. Many stocks have seen "multiple expansion" in this bull market, though perhaps not as dramatically as Square. But, taking our lessons from other nascent growth investments we made years ago, we're compelled to remain investors and wait for a still bigger payoff in the long run. A strong young company in a promising market can quickly expand enough to merit a higher share price within a time frame that remains attractive. Square still seems to fit this bill.

Why This Strategy

That said, the position has quickly grown to become one of our largest -- our third-largest, in fact, at 6.6%, tied with Facebook. So, having half of our shares covered at this price with in-the-money options that offer us some volatility cushion doesn't seem like an illogical move. The level of speculation in Square's price is notable, so why not guard some of our position with short calls? Especially given that this is where we are now.

We can roll our short calls up incrementally and get a credit for doing so; in the process, we gain more upside in the stock, and then we get to comfortably sit on sizable short call value that we'll earn if the stock price gives back ground. We've done this before -- with Skyworks, to name one -- when a stock has run up a lot against covered calls. We can roll incrementally, at a credit, and reel in some value if the stock stops rising, and a lot more if it declines. This may take a few iterations, until eventually we earn all the credit; and if it doesn't play out that way, we could eventually let these shares get called (though at a higher strike price than we would have originally). For now, though, we aim to keep this half of our shares in the port with in-the-money short calls on them.

Going into this trade, the stock is 17.7% above our $75 strike, and the short calls have about $0.30-$0.50 in time value (depending when you quote it!). They'll likely always carry a little time value, which is one reason we're not waiting longer to roll. A second reason is that, if the stock rises much more, it could get harder to roll reasonably for a credit. Rolling our strike to $80, we move within 10.3% of the current share price (and less than that counting our $1 or so credit to roll). In this iteration, we gain 8% in additional upside on these covered shares by rolling up and including the credit. In other words, this is a good first step toward capturing more upside without having to pay in to do it.

Alternative Trade

- If you wrote something other than $75 calls, such as $80 calls, assess the time value they still hold and roll appropriately as time value dissipates to something around $0.40 or so. Pro wrote Sept. 21, 2018, $80 calls (the best available when we could place our trade), and we'll plan to roll those out to January 2019 within 30 days to be on the same page as members. If prices change drastically before we trade, we'll adjust as needed after letting members know what we're doing.

Home Depot Rebounds in the Second Quarter

Published Aug 30, 2018 at 12:49PM

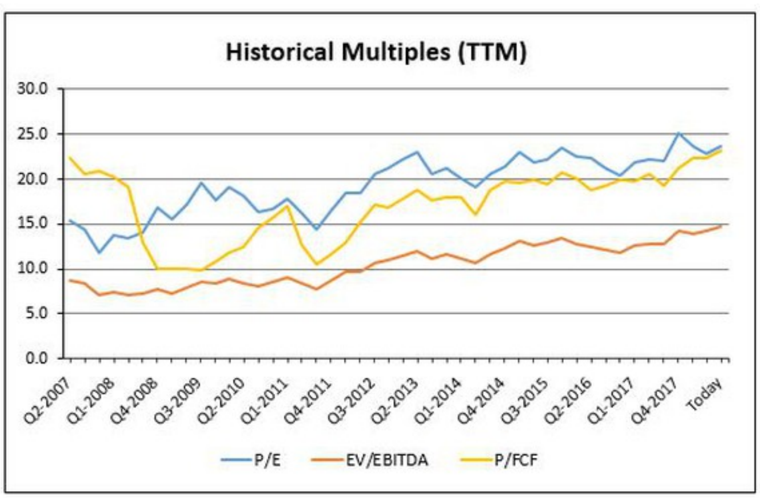
Second-Quarter 2018

- Press Release
- Earnings Infographic
- Conference Call Transcript
- 10-Q Filing

Home Depot (NYSE: HD) rebounded strongly from last quarter's weather-related slowdown, reporting revenue growth of 8.4%, comps growth of 8% (the highest figure since Q2 2013), and earnings-per-share growth of 36%. Growing earnings have led to positive pressure on the stock price, and housing market data continues to support a favorable near-term outlook for this well-managed business. However, rising home price appreciation has led to lower housing affordability, and along with higher interest rates we are beginning to see an effect on the housing market as the supply and demand work their way toward balance.

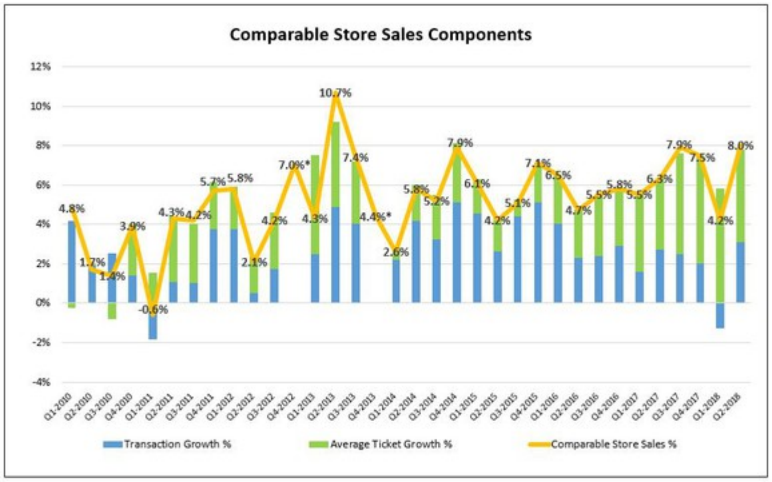
- **Updated guidance**: Buy (Diagonal Call)
- **Recommended allocation**: 1.7% in January 2020/February 2019 $110/$185 diagonal calls.
- **Fair-value range:** $165-$190
- **Current price:** $200

At about $200 per share, the stock is priced at 14.6 times trailing-12-month (TTM) EBITDA, 22.8 times TTM free cash flow, and 23.6 times TTM earnings-per-share (EPS). Management raised its guidance for full-year 2018 EPS to $9.42 per share, and Home Depot is priced at 21.2 times expected 2018 earnings, suggesting multiple contraction if the stock remains at recent prices.

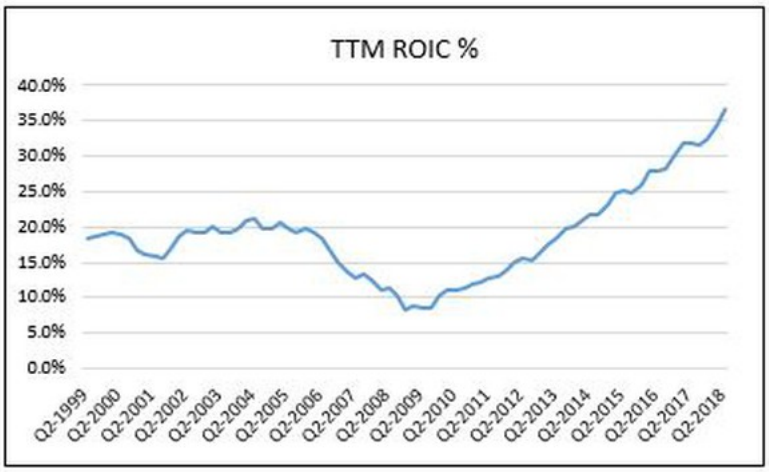


Business Performance

As was expected after last quarter's somewhat weak performance, Home Depot bounced back in the second quarter with strong comparable sales growth. The company reported year-over-year revenue growth of 8.4% and 8% growth in comparable store sales. The 8% growth in comps is the best performance from the company since Q2 2013, and transaction growth rebounded back into positive territory after a decline last quarter. This quarter marked the 29th straight featuring positive comps, a remarkable result for a physical brick-and-mortar retailer in the Amazon era, demonstrating the defensibility of Home Depot's competitive position:



Impressively, Home Depot's ROIC continues to climb. As with last quarter, the acceleration this quarter is thanks to tax reform, as the company's effective tax rate for the quarter came in at 24.7% compared with 36.6% in the same quarter last year. U.S. tax reform continues to be a major contributor to near-term earnings and cash flow growth for many of our companies, and lower tax rates meaningfully increase the cash flows (and thus the intrinsic value) of U.S. businesses:



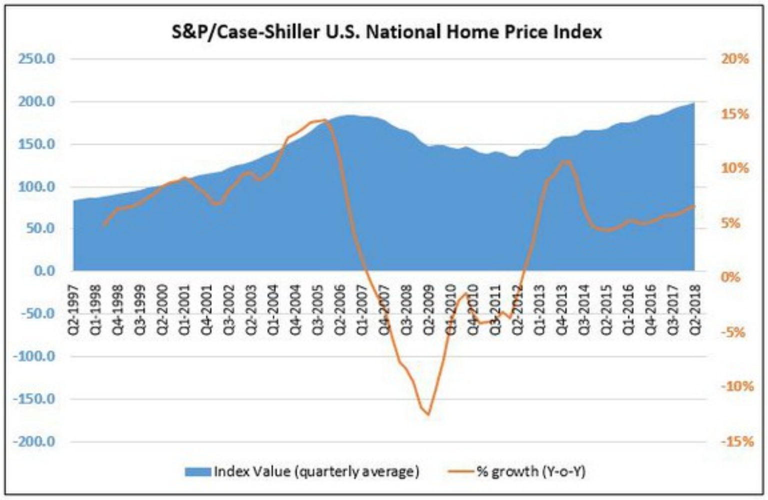
The lower tax rate helped push net margins up to 11.5% for the quarter compared with 9.5% in the same quarter last year, and EPS rose by 36% to $3.05 per share (vs. $2.25 per share last year). Given management's intent to aggressively increase spending on strategic investments (supply chain, new stores, and information technology), lower tax rates should provide most of the boost to earnings in 2018.

Since Q2 is Home Depot's most important quarter with respect to revenue and margins (due to housing market seasonality), strong revenue growth and operating leverage led to higher operating margins, despite an increase in the dollar value of SG&A spending. Quarterly operating margin % rose to a record 16.1%, and 14.5% on a TTM basis. You can clearly see the seasonality trend in margins in the following graph of quarterly operating margins:

Home Depot's "interconnected retail strategy" continues to resonate with consumers, as online sales rose by 26% vs. Q2 of 2017. This is an impressive result given that retail e-commerce sales in the U.S. are rising at about 15%. Home Depot has done an excellent job interfacing its physical stores with its online website (with a sophisticated supply chain network), allowing the company to capture a healthy portion of online sales growth, growing faster than the overall e-commerce market. In fact, Home Depot was the fourth most popular online store in the U.S. in 2017 as measured by net e-commerce sales (behind just Amazon, Walmart, and Apple).

The Housing Market

In addition to Home Depot's strong business performance, recent housing market data suggests continued growth in home improvement spending. Home-price appreciation finally topped out in April 2018 after 21 straight months of acceleration, and the June 2018 reading for the S&P Case-Shiller National Home Price Index shows 6.2% growth compared to June 2017 (down from 6.5% growth in March 2018). Although home-price appreciation is now decelerating, home prices are still certainly rising at a significant pace, and the national index has been above peak pre-crisis levels since January 2017:



Home-price appreciation is being driven by a combination of a healthy economy, low unemployment, and low inventories of homes for sale. There is a pent-up demand for home-buying following the 2008-2009 recession, although low inventory levels are preventing that demand from translating into new household formation. This high-demand/low-supply situation is causing upward pressure on home prices.

Here is an except from the press release that accompanied the announcement of the May Case-Shiller Home Price Index data:

> "Home prices continue to rack up gains two to three times greater than the inflation rate. The year-over-year increases in the S&P CoreLogic Case-Shiller National Index have topped 5% every month since August 2016. Unlike the boom-bust period surrounding the financial crisis, price gains are consistent across the 20 cities tracked in the release; currently, the range of the largest to smallest price change is 10 percentage points compared to a 20 percentage point range since 2001, and a 25 percentage point range between 2006 and 2009. Not only are prices rising consistently, they are doing so across the country.
>
> Continuing price increases appear to be affecting other housing statistics. Sales of existing single family homes – the market covered by the S&P CoreLogic Case-Shiller Indices – peaked last
> November and have declined for three months in a row. The number of pending home sales is drifting lower as is the number of existing homes for sale. Sales of new homes are also down and housing starts are flattening. Affordability – a measure based on income, mortgage rates and home prices – has gotten consistently worse over the last 18 months. All these indicators suggest that the combination of rising home prices and rising mortgage rates are beginning to affect the housing market."

The increases in home prices are certainly affecting housing affordability, and according to the National Association of Home Builders (NAHB) / Wells Fargo Housing Opportunity Index, housing affordability in Q2 2018 was pushed to a 10-year low. 57.1% of new and existing homes sold in Q2 2018 were affordable to families earning, the U.S. median income of $71,900. This is down from 61.6% in Q1 2018, and from 59.4% in Q2 2017. Despite the 10-year low, there is still a long way to go before reaching the lows of 2008-2009 (the affordability index bottomed at 40.4% in Q3 2006). Here are some excerpts from the press release accompanying the announcement of the Q2 index value:

> "Tight inventory conditions and rising construction costs are factors that are holding back housing and putting upward pressure on home prices. Meanwhile, tariffs on Canadian lumber imports into the U.S. are further eroding housing affordability. Builders are struggling to manage these costs to ensure pricing does not outpace expected gains in wage growth.
>
> Rising household formations, along with a strong economic expansion in the second quarter that has fueled job growth, will support housing demand in the second half of 2018. However, growing trade war concerns and the expectation of higher mortgage rates are additional headwinds negatively affecting housing affordability"

All in all, significant demand for housing remains, but low inventory levels, rising costs for homebuilders, and wage growth lower than home price growth are factors influencing a decline in housing affordability. Along with rising interest rates, we're beginning to see affects on the housing market. We'll see how housing trends play out over the rest of 2018, and we may see a home price appreciation start to slow as decreasing affordability impacts home buyer demand.

Pro Catch-Up Trades and Expirations: Broadridge, Square, and More

Published Aug 30, 2018 at 11:33AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **CME Group** (NASDAQ: CME): Buy 2.3%.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Services** (NYSE: BR): If you don't have a position, start with a 3% stake.

Shorts:

- N/A

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls, selling one call for every 100 shares you own and want to cover. Lately, they pay $3.40 each, although with JNJ trading just above $135 today, these calls are slightly in-the-money, with a significant chance of seeing your shares called away at expiration. For those who wish to aim for more upside in the stock in exchange for lower income, you can consider writing October 2018 $140 calls instead.

Upcoming Expirations:

- **Square** (NYSE: SQ): Our September 2018 $75 short calls are now deep in-the-money (as of yesterday) and carry just a smidge of time value. We're preparing to roll them incrementally higher and follow the stock up that way -- to a point, of course. Watch your inbox for a roll alert in the next few days, most likely (unless it turns south).

What We Seek in Pro as Earnings Accelerate

Published Aug 27, 2018 at 1:18PM

Greetings, *Pro* members!

The S&P 500 hit a new high today, probably (one never knows for sure) inspired by recent earnings results across the board. Leading companies are growing strongly, and although the rate of growth should slow next year as lower tax rates are lapped for most, projections see decent growth ahead, too. We'll be managing our hedge (a synthetic short) on the **SPDR S&P 500** (NYSEMKT: SPY) ETF, and our short calls on half of our **Square** (NYSE: SQ) position, as needed, if they keep pushing higher. We'll aim to roll the short calls higher without meaningful cost.

Meanwhile, the *Pro* portfolio is making new highs, too. Not long ago, we were celebrating the tripling of the portfolio at a 200% return, and now our focused portfolio is up 271% as of this morning, well ahead of the North Star and all the indexes we watch. Tragically for their clients, the average hedge fund has returned a tiny fraction of this result over the past 10 years, according to Hedge Fund Research and its indexes. We've purposely shorted and hedged modestly (though we've done our fair share), but that won't always be the case. We've averaged 74.7% net long since January 2012.

From here, this is what's most important to us:

1. As always, be as knowledgable and as confident as possible that we own superior businesses with strong growth prospects.
2. Continue to seek new investments that may improve the portfolio further.
3. Maintain flexibility so a market downturn doesn't handcuff us.
4. Actively consider and manage hedges and shorts so they help us benefit from a downturn.
5. Always remember our time frame of a rolling three years.

We want to own the most promising companies for the coming years, without becoming a portfolio of speculation. We want a mix of young companies and firmly established (but still growing) businesses.

Earnings Acceleration

Meanwhile, it seems the pace of innovation and execution is accelerating at many of our companies.

Square is a primary example, with adjusted revenue up 60% year-over-year last quarter. That's an acceleration from 51% YOY growth the previous quarter. New products, larger customers, and more customer usage keep making Square's interconnected businesses stronger. The company now expects revenue growth of about 55% this year, to $3.2 billion. We're in the process of updating our valuation on Square. The stock now trades at 130 times expected earnings for the year ahead, and 261 times trailing free cash flow, so it's anything but inexpensive. The question is, what is a fair way to measure its valuation at this early stage? Is its market cap, at $32 billion, still reasonable for its potential? We're assessing.

OpenText (NASDAQ: OTEX), which has choppy quarterly results, is finally pushing analysts to analyze it on an annual basis. For its fiscal 2018, which just ended, revenue was up 23% year-over-year to $2.82 billion, and annual recurring revenue represented 73% of that total. Operating cash flow rose 62% to $710 million. Of all this, 5.5% of sales growth was organic, with the rest coming from OpenText's long-running acquisition strategy. The lack of stronger organic growth is probably what has the stock trading at 14.2 times expected earnings for next year, and 18 times trailing free cash flow -- discounts to the broader market. The business has been a good long-term performer for us, and it should fare better than highfliers in a market downturn. That said, our love of software companies continues, and if we need to trim some holdings to add new ones, OpenText and **Oracle** (NYSE: ORCL) are two possibilities. Today, both remain Buys.

Paycom's (NYSE: PAYC) second-quarter revenue was up 32%, with 98.3% of that revenue being recurring. Non-GAAP net income rose 70% to $0.59 per share as business leverage starts pushing margins higher. Management increased 2018 sales guidance to a midpoint of $555 million, up 28% YOY. That's driven by new customer additions. The stock lately trades at 52.3 times expected earnings for the year ahead, and 241 times free cash flow. Before you spit out your coffee in shock, know that Paycom, like Square, is still in building mode; its subscription software model puts the large costs up front and keeps initial revenue modest until the customer base expands. With young software companies, you have to peer into the future to see how the financials will improve as they mature. Importantly, Paycom does continue to sign new clients, taking market share, and sell more to its existing ones. This company is due for a fair-value estimate increase from us.

Long-established **CME Group** (NASDAQ: CME) expanded revenue 15% last quarter, as transaction fee revenue rose by 14%. Average daily volume was up a strong 12% to more than 18 million contracts per day (mostly futures). On May 29, CME had a new peak day with more than 50 million contracts traded. Adjusted net income and earnings per share both jumped 40% for the quarter. Open contract interest across its six product categories is strong, with 123 million open contracts as of July 26, up 10% from the prior year. The stock of the leading futures exchange trades at 25 times expected earnings for the year ahead, a premium price that it has long held. Our fair-value estimate is still higher at $177.

Coherent (NASDAQ: COHR) is one company in our portfolio working through a temporary slowdown. This isn't surprising when you consider its industry -- a capital-intensive behemoth with long lead time, not unlike semiconductor testing equipment. Coherent sees no OLED-manufacturing laser demand problems, but fiscal 2018 revenue in OLED will hit a temporary peak as a diverse new customer base works to set up shop for 2020 and beyond. OLED revenue at Coherent will likely be down 15% to 20% in fiscal 2019 before recovery starts in fiscal 2020. Other business lines, including fiber lasers, will offset much of this headwind, so that 2019 revenue should be within 5 percentage points of 2018's level. The stock trades at 13.8 times expected earnings for the year ahead. Our fair-value estimate is declining from $280, but Coherent remains a well-run, diversified laser business with a promising outlook; we're just in a trough period. It's only a 1.5% position, so we'll consider adding to it at times. That said, if we need cash, this is the type of business we'd consider as a source before many others that have stronger recurring revenue.

We're also in the process of updating valuation estimates on **MasterCard** (NYSE: MA) and **Visa** (NYSE: V).

As September nears, we own a portfolio of heathy businesses, many of which are entering the strongest part of their year. We hope you're enjoying the summer (I fortunately just enjoyed a beautiful lap around central California!), and we thank you for being on this investing journey with us. To share any thoughts, please visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Aug. 27, 2018

Published Aug 27, 2018 at 1:18PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Broadridge Financial Services** (NYSE: BR): Per our earnings review, our fair-value estimate increases to $110 and the stock remains a Buy.
- **Coherent** (NASDAQ: COHR): Our fair-value estimate decreases to $230. The stock remains a Buy.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Home Depot** (NYSE: HD): We rolled our short September 2018 $180 calls to February 2019 $185 calls for a $1.28 debit today. Be sure to roll yours before market close tomorrow, Tuesday, Aug. 28, to avoid an early exercise.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Home Depot, Square, and More

Published Aug 23, 2018 at 2:12PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.3%.
- **JD.com** (NASDAQ: JD): Buy 2.1%.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **NVR** (NYSE: NVR): Buy 2.3%.
- **OpenText** (NASDAQ: OTEX): Buy 2.9%.

Shorts:

-
    - N/A

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls from our recent trade alert, selling one call for every 100 shares you own and want to cover. Lately, they pay $3.20 each, although with JNJ trading just above $135 today, these calls are slightly in-the-money, with a significant chance of seeing your shares called away at expiration. Those who wish to aim for more upside in the stock in exchange for lower income, you can consider writing October 2018 $140 calls instead.
- **Home Depot** (NYSE: HD): Roll, or start, your diagonal call per Tuesday's alert. As of today, the midpoint of the bid/ask spread implies about an $0.85 debit for this roll.

Upcoming Expirations:

- **Square** (NYSE: SQ): Our September 2018 $75 short calls are in-the-money but still carry a lot of time value. Closer to expiration, or when time value dissipates, we'll manage the short calls to keep our shares. We don't plan to let our shares go.

Roll Your Diagonal Calls on Home Depot

Published Aug 21, 2018 at 2:20PM

Is this for you? This is for all *Pro* members who wrote September 2018 $180 diagonal calls on **Home Depot** (NYSE: HD) as per our alert in May. If you have yet to establish a diagonal call position on Home Depot, or if you established a different alternate position, please see the Alternative Trades section below.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
    - "Buy to close" all September 2018 $180 written calls.
    - "Sell to open" the same number of February 2019 $185 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all nine of our calls.

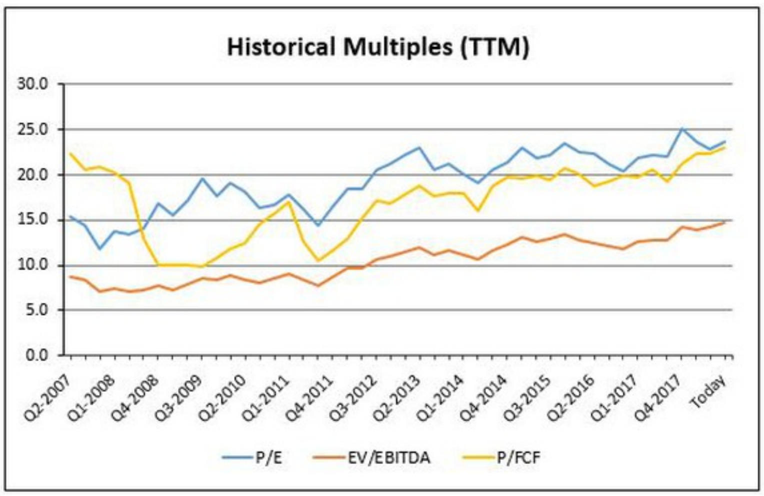
- **Recent Prices** (12:40 p.m. ET):
  - Stock: $200
  - Buy to close September 2018 $180 calls (bid/ask): $20.05/$20.25 (midpoint $20.15)
  - Sell to open February 2019 $185 calls (bid/ask): $19.40/$19.80 (midpoint $19.60)
  - Net debit to roll: Approximately $0.55 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls and to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $0.55 net debit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. The September short calls have only about $0.20 of time value left, and Home Depot goes ex-dividend Aug. 29 with a scheduled dividend payment of $1.03. If you don't complete this roll before the ex-dividend date, you will likely see your call assigned as call owners look to capture the upcoming dividend, **so make sure to complete this trade before then.**

What We're Thinking

We've been running a diagonal call strategy on Home Depot since October 2017 to target leveraged exposure to the well-run home-improvement retailer. With a 27% simple return since inception if we were to close the diagonal call today, the position has so far been a success -- perhaps too much of one, in fact, as the stock has risen well above our short call's strike price. This means that, for the second time, we're being forced to pay a debit to roll to keep the strategy going.

Since our last roll in May, Home Depot has reported second-quarter 2018 earnings. Quarterly results were strong, continuing the company's momentum with 8.4% net revenue growth, 8.1% U.S. comparable-store sales growth, and 36% earnings-per-share growth. The company rebounded from a lackluster start to the year, benefiting in Q2 from healthy organic revenue growth (balanced across transaction and ticket growth) and lower corporate tax rates, all of which led to rising earnings, margins, and returns on invested capital.

Home Depot's valuation multiples have significantly expanded since we initiated our position, some of which has been justified by strong business performance in combination with the lower tax rates:



Sources: S&P Global Market Intelligence, company fillings, author's calculations

Despite the higher multiples, if housing and economic momentum remain strong, Home Depot should continue to expand its revenue and earnings, supporting the stock price. Given our assessment of the company's fair value and business momentum, we're content to pay a modest debit to roll our diagonal calls out and up in order to capture further upside and keep the diagonal call position going. In exchange for $0.55 or so in incremental investment, we gain $5 in additional upside to our position, and we extend our expiration out to February 2019, with the flexibility to potentially continue the position as market and business conditions dictate. As we approach February expiration, we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write September 2018 $180 covered calls?** If you wrote covered calls, you can make the same rolling trade as *Pro*, rolling your covered calls up and out to February 2019 $185 calls.
- **Did you write September diagonal calls at a different strike price?** If your short call is in-the-money but at a higher strike than *Pro*'s ($185, $190, or $195), aim to roll out and/or up for a credit. The $195 and $200 strike prices look like good choices to us, but you can roll to higher strikes if you prefer to target higher upside, or lower strikes if you prefer to be more conservative and target current income. If your short call is out-of-the-money, you can wait until expiration and then write a new iteration of short calls at the $195 or $200 strike prices.
- **New to the position and have yet to set up a diagonal call?** Do so by simultaneously buying ("buy to open") January 2020 $130 calls and selling ("sell to open") February 2019 $200 calls for a net debit of about $61.50 per diagonal call (this price may change). Invest 1.7% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $360,000 or so you manage), and keep in mind that this position is "off-reservation" from *Pro*, so if you're not comfortable managing a position on your own, this choice might not be the best one for you.
- **Have a different position not addressed here?** Check in on the *Pro*'s Options discussion board and we will do our best to answer your questions.

Fiscal 2018 Brings Record Sales for Broadridge

Published Aug 21, 2018 at 1:50PM

Fiscal Q4 2018

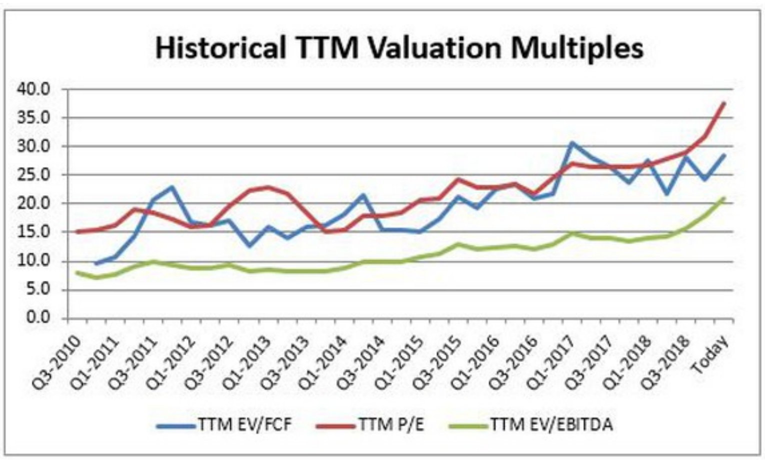
- Recurring fee revenue growth (year over year): Up 6.9% to $862 million (6.5% TTM growth)
- Closed sales growth (year over year): Up 80% to a record $115 million (13% TTM growth)
- EPS growth (year over year): Up 8.8% to $1.72 (31% TTM growth)

Broadridge (NYSE: BR) registered an excellent end to the 2018 fiscal year, reporting a record quarter and full year of closed sales, making up for a slow pace of closed sales through the first three quarters of 2018. With Q4's blowout quarter of $115 million in closed sales (the prior record was $65 million in Q4 2014), Broadridge exceeded the high end of 2018's guidance for closed sales, and 2019 guidance suggests that recent sales momentum will continue, boding well for future revenue growth. Broadridge continues to improve margins and expand its core business at a consistent rate, producing significant amounts of cash flow from a capital-light asset base:

The market responded very favorably to Q4's earnings release, with the stock rising more than 11% on the day of the report. Broadridge has been a notable market-beater in 2018, up more than 47% year-to-date (not including dividends), and as such (and due to Facebook's recent difficulties), Broadridge is now *Pro*'s largest holding by a significant margin at a 7.7% allocation. While we think Broadridge is an outstanding business and we have no intention of selling our shares, the strong recent stock price appreciation may detract from future returns unless the company can continue to outperform our expectations (as it has consistently over the past several years).

- **Updated guidance**: Buy (unchanged)
- **Recommended allocation**: 7.7%
- **Fair-value estimate:** $110 (from $95)
- **Current price:** $133.33

Based on management's 2019 guidance, at $133 per share, the stock is priced at 28.8x projected 2019 cash flow and about 32.9x projected 2019 GAAP earnings per share. Although the forward estimates are more reasonable, we can see that due to the recent stock price appreciation, Broadridge's trailing multiples are significantly elevated:



After incorporating fiscal 2018 results, and updating our valuation model to account for 2019 expectations, **our fair-value estimate increases to $110 per share (from $95)**. The company's valuation multiples are as high as they've ever been during its tenure as a public company, some of which is justified: Lower U.S. corporate tax rates make cash flows more valuable to investors, and the business is as big and strong as it's ever been.

Despite the strong business performance, the current price sits more than 20% above our newly updated fair-value estimate. **Broadridge remains a Buy** on our scorecard, but if you've yet to establish a full position, you may want to consider buying in halves or thirds, or waiting for a narrower premium to our fair-value estimate. However, if Broadridge continues to outperform our estimates, this cautious approach is less preferable to simply buying a full allocation today.

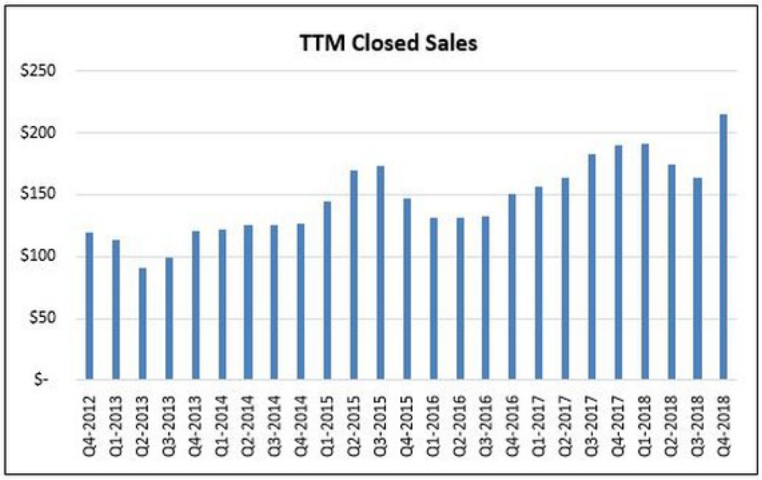
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers offload technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue (augmented by tuck-in acquisitions), slight operating leverage, plenty of free cash flow, and a growing stream of dividends and share repurchases to help achieve North Star-like returns.

The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

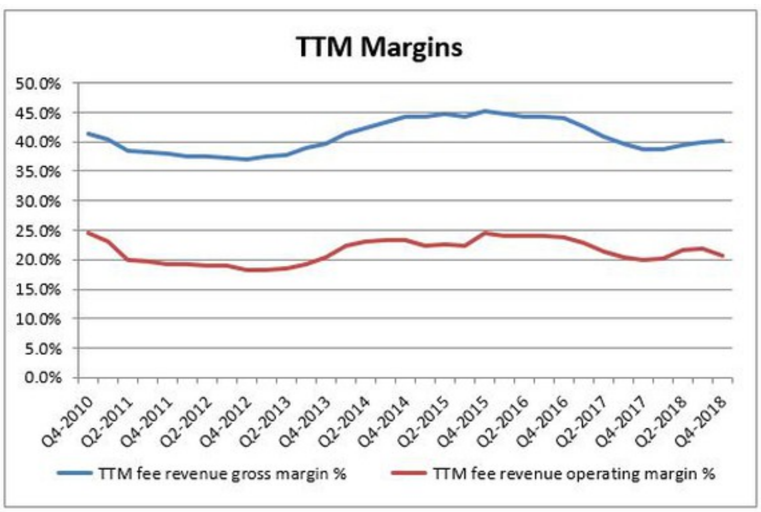
As mentioned above, Broadridge reported a record quarter (and year) for closed sales in Q4 2018 with $115 million in closed sales:



I wrote last quarter that "management and the sales team have work to do to meet reaffirmed guidance of $170 million to $210 million for fiscal 2018", needing "an unprecedented performance in Q4 to reach guided sales levels", and that "I'll be impressed if Broadridge can meet those numbers next quarter".

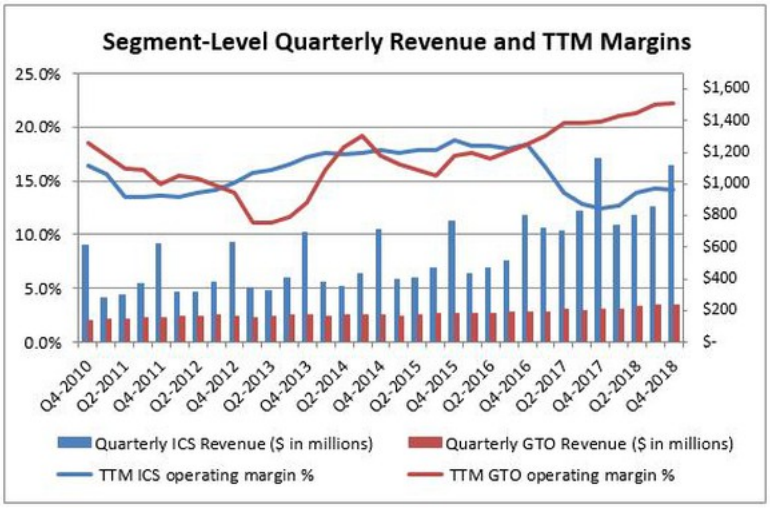
Broadridge not only met but **exceeded** the guided sales levels with a blowout sales quarter that dwarfed the company's previous record quarter of $65 million in closer sales. However, I was a bit surprised by closed sales guidance for fiscal 2019, the midpoint of which suggests a modest decline (-5%) in 2019 closed sales compared to 2018. Broadridge does tend to exceed its own guidance regularly, so we'll see over the next year if management is sandbagging its guidance.

2. Fee-Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers), we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee-revenue gross margins came in at 40.1% (up from 38.7% a year ago), and TTM fee-revenue operating margins came in at 20.6% (up from from 19.9% a year ago):



We've finally lapped the effects of the 2016 acquisition of NACC, with this quarter marking the first quarter that allows a comparison of fully comparable TTM periods. We can see in the financials that Broadridge has been able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency. We are seeing higher margins (both gross and operating) in the most recent TTM period compared with the prior TTM period. The NACC acquisition integration has been outstanding, and margins are continuing their steady march higher.

When looking at Broadridge's separate divisions, we can see that both businesses are improving. While the Investor Communications Solutions (ICS) business has seen significantly lower (though improving) margins because of the NACC acquisition, the acquisition-agnostic Global Technology & Operations (GTO) business has shown continued strong margin expansion, generating a record TTM operating margin of 22.2%:



The margin expansion trends for both segments of the business are exactly what we want to see as investors, and based on management commentary and recent trends, we expect the margin expansion to continue. The business's financial execution since the NACC acquisition is an indication of excellent management, as acquisition integrations often don't go so smoothly.

3. Capital Allocation: In the company's most recent Investor Day presentation, we got a detailed update on how management plans to allocate capital between fiscal 2017 and fiscal 2020: targeting a 45% dividend payout ratio, and using up to $1.4 billion in incremental debt capacity and expected free cash flow for share repurchases and merger-and-acquisition activity.

Management ramped up its share repurchase activity in Q4 2018, spending $247 million in the quarter on share buybacks. I was a bit surprised to see elevated activity with repurchases given the stock's recent price appreciation, but we do know that management has prioritized share repurchases as a part of their capital allocation policy.

Management was also active in fiscal 2018 with acquisitions, spending $148 million on tuck-in acquisitions over a total of 6 acquisitions, including two in the fourth quarter. The acquisitions have focused on digital delivery, data analytics for asset managers, and corporate issuer services. We expect management to continue to be active with M&A throughout 2019.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring organic revenue growth (augmented by tuck-in acquisitions) to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

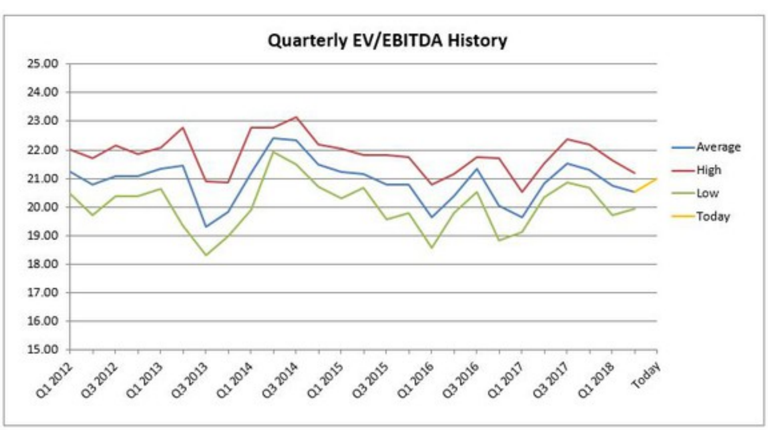
U.S. Growth Accelerates at American Tower

Published Aug 16, 2018 at 3:32PM

U.S. growth picked up considerably at **American Tower** (NYSE: AMT) in the second quarter of 2018 as unlimited data plans from wireless carriers continue to gain acceptance and demand for mobile data continues to grow. Thanks to high levels of network investment activity from all four major U.S. carriers, American Tower expects a robust business environment to persist in the U.S. throughout 2018. Since the U.S. business represents 55% of property revenue and 65% of operating profits, this is great to see for American Tower shareholders.

As we mentioned in our last earnings report, international growth should see ongoing weakness in 2018 because of the disruption in the Indian wireless market. However, the U.S. business continues to improve and the international business ex-India is also performing strongly, and American Tower remains on track to continue to increase its revenue and cash flow and expand ROICs across its growing asset base.

After spending much of the last two quarters trading at the low end of the company's historic ranges, American Tower's valuation is back to average levels, with a current EV/EBITDA (TTM) of 21. The market reacted favorably to this quarter's earnings report (closing up nearly 4% the day of the earnings release), with the stock price breaking out from its 2018 trading range and reaching stock price levels not seen since Q3 2017 (when valuation levels were higher):



What Happened?

CEO Jim Taiclet:

> "The rapid adoption of unlimited data plans in the U.S. wireless market has elevated aggregate year-over-year mobile data usage growth to roughly 40%. This is in turn fueling record levels of U.S. commenced new business for American Tower, resulting in Organic Tenant Billings Growth of 7.4% in the second quarter. Furthermore, given this robust data growth, deployment of new spectrum and the introduction of advanced technology across our U.S. tenant base, we are increasing our full year 2018 expectations for U.S. Organic Tenant Billings Growth to approximately 7%. We also anticipate a multiyear period of elevated demand in the U.S. as our tenants invest in 4G capacity and quality while launching mobile 5G networks, enhanced Internet of Things services and other initiatives that we expect will sustain demand for our comprehensive telecommunications real estate portfolio.
>
> Our Latin America segment posted second quarter Organic Tenant Billings Growth in excess of 12%, reflecting especially strong trends in Mexico and Brazil, and we also saw consistent, steady results in EMEA. In India, where we recently added approximately 20,000 Vodafone and Idea Cellular sites, the carrier consolidation process is progressing as we anticipated. We fully expect the reordered India mobile industry to invest significantly to bring 4G to its subscriber base once the carrier mergers that are under way are completed. Taken together, we expect our highly diversified international business to deliver strong, sustainable growth for many years to come."

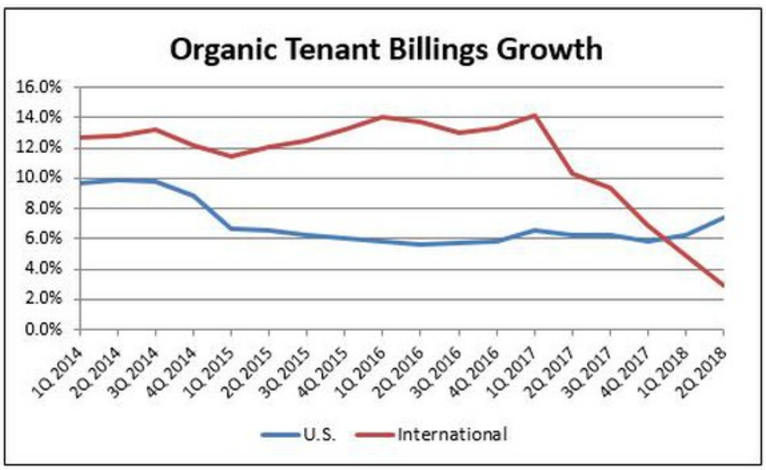
Get More

- Q2 2018 press release
- Q2 2018 supplemental materials
- Q2 2018 earnings presentation

For the second quarter of 2018, organic growth in tenant billings came in at 7.4% in the U.S. and 2.9% internationally, vs. 6.2% and 10.3% in the same quarter a year ago.

The disruption in the Indian market continued into this quarter (as expected), with -10.2% organic growth in the company's Asia (i.e. India) division because of an acceleration in consolidation-driven churn. Management expects that 2018 will be the high-water mark in terms of Indian carrier consolidation-driven churn "by a fairly wide margin," so while there may be continued pressure on this segment throughout 2018, growth should start to normalize in 2019 and be back to typical levels by 2020.

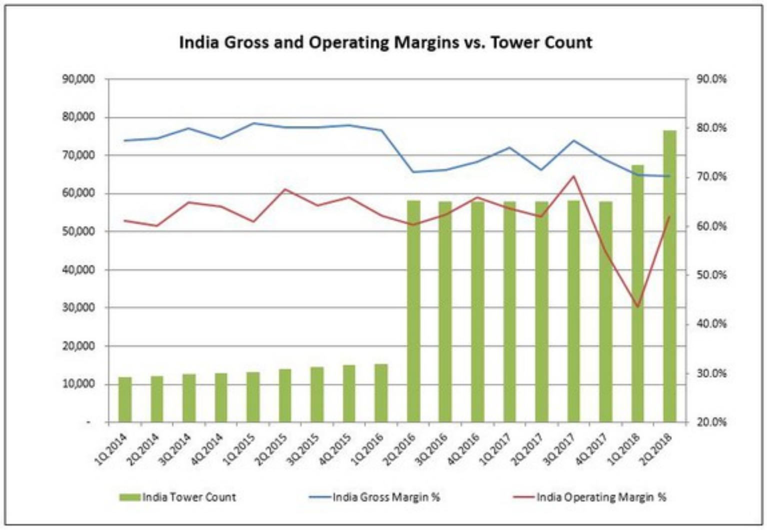
Outside of India, organic growth was more in line with historical growth rates, up 6.8% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda) and 12.4% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Paraguay, and Peru).



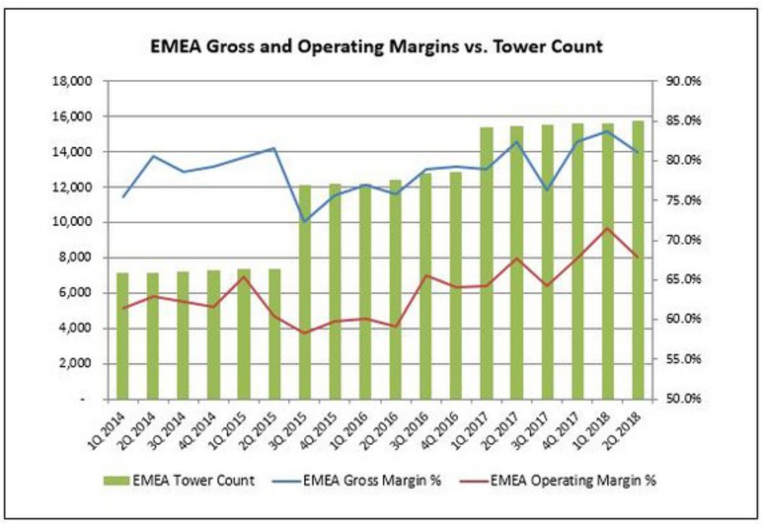
This is the second quarter in a row that U.S. growth outpaced international growth, and given the expected pressure in the Indian market, this result is unsurprising. Once the Indian market stabilizes, international growth should once again eclipse U.S. growth by a few percentage points.

So What?

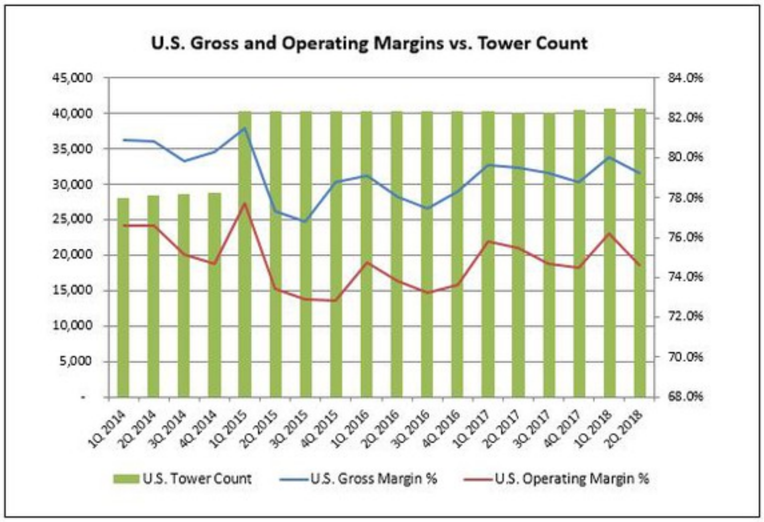
As we expected, the Indian wireless carrier consolidation has continued to affect growth rates and margins in that market throughout 2018, and that should continue through the rest of the year. This quarter featured the highest number of cancellations in the Indian market so far, but impairment charges and bad debt expenses were lower than in the last two quarters, so operating margins bounced upwards back toward historical levels:

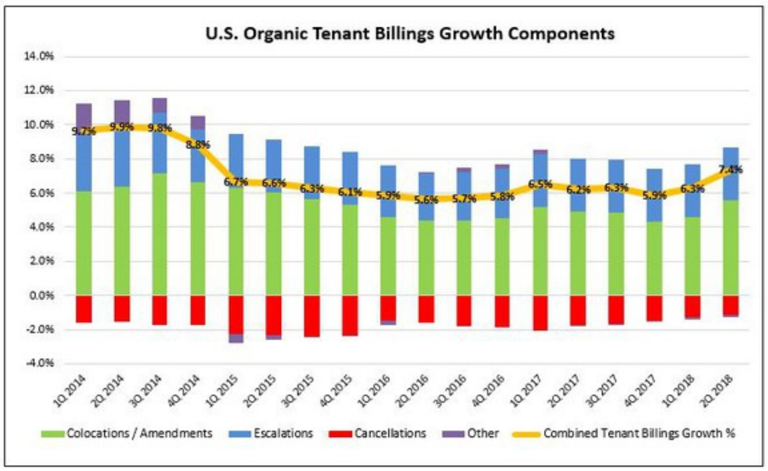


In Europe, the Middle East, and Asia (EMEA) and Latin America, margin trends are a bit lumpy because of some non-core factors (a default on a TV Azteca note in the Latin American segment, volatile foreign currency exchange rates, straight-line expense recognition, lower pass-through revenue), but growth trends are positive and management expects margin expansion over time as the company continues to generate organic growth on its extensive existing portfolio of assets.



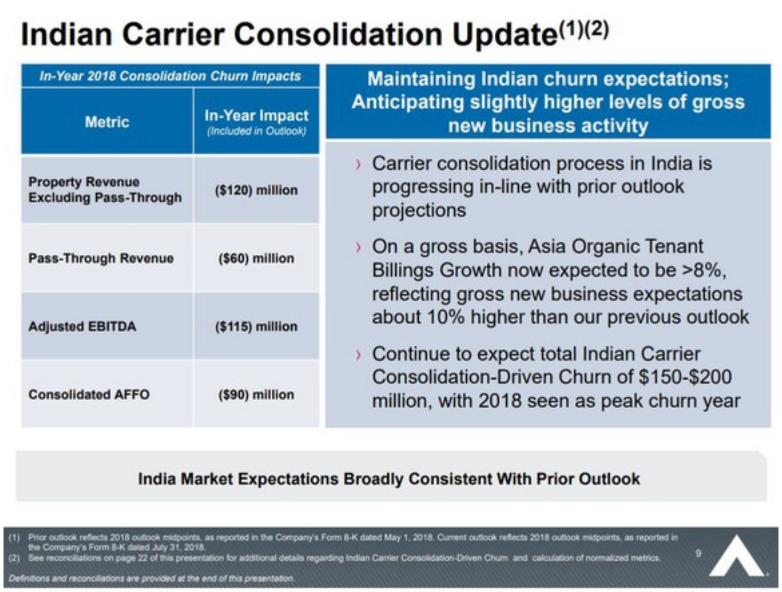
In the U.S., margin trends continue to improve. TTM gross margins increased year-over-year to 79.3% (from 78.8% a year ago), and TTM operating margins increased year-over-year to 75.2% (from 74.6%). We can see in the graph below that, since the significant **Verizon** (NYSE: VZ) acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (thanks to the lower tenancy ratio on those new towers), management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets:





Now What?

The second quarter of 2018 represented a continuation of trends that started in the fourth quarter of 2017, as American Tower continued to digest the impact of Indian carrier consolidation, reporting accelerated churn levels as a result of Aircel's bankruptcy. Churn driven by this consolidation should continue to affect results throughout 2018 before stabilizing in 2019 and returning to normal levels in 2020:



Aside from the Indian market, the rest of American Tower's business continues to perform well. Growth in the U.S. business is accelerating, and prospects for the rest of 2018 and beyond look strong with all four major U.S. carriers in the process of what management expects to be a multi-year rollout of 5G technology. For example, see:

Data and Guidance

- Current Price: $150.11
- Fair-value estimate (unchanged): $146
- Allocation: 3.8%, plus 0.7% in January 2019/October 2018 $80/$135 diagonal calls
- EV/EBITDA (2018 Outlook): 19.22

AMT remains a Best Buy Now, and its fair value is unchanged at $146. We also have 0.8% in diagonal calls, which expire in October (and the long calls expire a few months later in January 2019). With American Tower's next ex-dividend date likely to be sometime in late September, we'll have to make a decision before then about how to proceed; either closing our entire diagonal call position, rolling the short call out to 2019 to convert the position into a bull call spread, rolling out the long calls to 2020 or 2021 to continue a diagonal strategy, or exercising the long calls into stock. As we approach the ex-dividend date, we'll make our decision based on which choice we like best.

Pro Catch-Up Trades and Expirations: American Tower, Cooper, and More

Published Aug 16, 2018 at 2:40PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.8%.
- **CME Group** (NASDAQ: CME): Buy 2.3%.
- **JD.com** (NASDAQ: JD): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **NVR** (NYSE: NVR): Buy 2.4%.

Shorts:

-
    - N/A

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls from our recent trade alert, selling one call for every 100 shares you own and want to cover. Lately, they pay $1.60 each.

Upcoming Expirations:

- **The Cooper Companies** (NYSE: COO): Our August $230 (or $240, if you wrote those from the original alert) covered calls expire on the 17th. We plan to let our shares get sold through the covered calls -- taking no action. With the stock price north of $255 today, it looks like our shares will be called away this weekend.

Pro Guidance Changes and Completed Trades: August 13, 2018

Lately, they pay $1.54 each -- considerably better than last week. For those who wish to aim for more upside in the stock in exchange for lower income, you can consider writing October 2018 $140 calls instead.

Upcoming Expirations:

- **The Cooper Companies** (NYSE: COO): Our August $230 (or $240, if you wrote those from the original alert) covered calls expire on the 17th. We plan to let our shares get sold through the covered calls -- taking no action. So, unless something drastic changes, we are doing nothing and letting our shares get sold away after expiration next weekend.

Sell to Close Your Puts on Square

Published Aug 7, 2018 at 2:58PM

Is this for you? *Pro* members who own September 2018 $55 puts and who want to recover about 30% of their cost can make this closing trade. If the money you'd receive by closing isn't worthwhile to you, you can keep owning the puts as a form of insurance against a (low-probability) big decline in the stock sometime soon.

How You Participate

- **Action:** Sell to close your Sept. 21, 2018, $55 puts on **Square** (NYSE: SQ). (Leave your short calls on Square alone for now.)
- **Allocation:** We're selling all of the $55 puts we own.
- **Price Guidance:** Use a **limit order** at the going prices when you go to enter your trade. Lately, that's $0.25.
    - Stock: $70.50
- **Stock Scorecard Status:** Buy. Allocation is 5.5%.

What We're Thinking

Hybrid payment processor, software and services seller, and small-business lender Square reported accelerating growth again last quarter, with net revenue up 48% to $815 million and adjusted revenue up 60% year-over-year to $385 million. The adjusted revenue compares with 51% annual growth in the first quarter. GAAP net loss in the quarter was $6 million compared with $16 million a year ago in Q2, as Square rolls closer toward GAAP profits.

For the year, the company increased its adjusted revenue growth rate to an estimate of 55%, up from the previous guidance of 49%. This is pretty heady growth, and investors were pleased, sending Square's stock higher -- and helping our portfolio jump ahead of our North Star again so far this year.

Why This Strategy?

We're closing these puts because the stock is lately 22% above our strike price, and with 45 days to expiration -- and good news on Square so far -- it seems unlikely that the stock will lurch back toward $55. Lately, we can recapture about $350 ourselves by selling to close these $55 puts now; that's about 30% of what we paid for them (and that was paid for by selling calls on Square, so this would add to our net credit so far).

Meanwhile, we're leaving our short calls alone. Most members wrote $75 calls as the original alert targeted. By the time we could place our trade more than 24 hours later, the $80 calls paid as much, so we wrote those and bought $55 puts, still at a credit. We'll guide you on the $75 calls as needed, as the time value dissipates. For now, they serve as a small cushion for us, with more than $2 in time value waiting to be earned as long as Square remains below $75. So, let those be for now, is our thinking. We'll close or roll them later if it seems pressing. Or, we'll let them expire if that's their fate.

Meanwhile, we'll continue to consider ways to hedge or protect our Square position, which is now 5.5% of the Pro portfolio -- our fourth-largest position. We'll especially look to do so around the next earnings report.

Pharma Growth Accelerates at Johnson and Johnson

Published Aug 7, 2018 at 2:40PM

Second-Quarter 2018

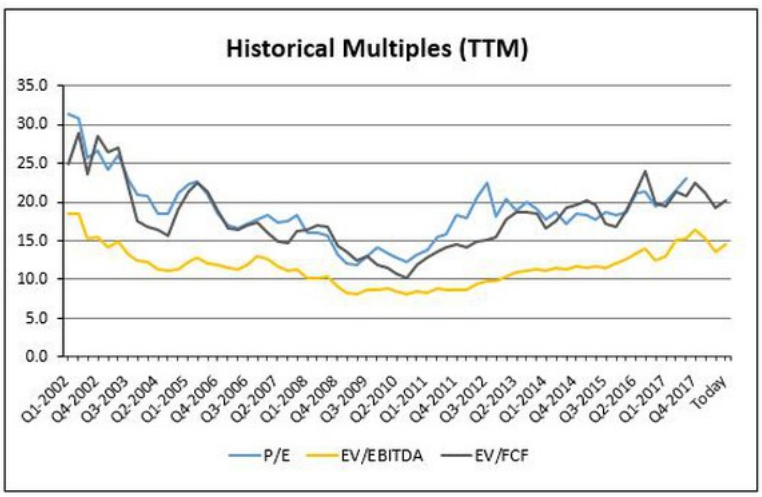
- Press Release
- Earnings Presentation
- Supplementary Sales Data
- Sales of Key Products & Franchises
- 10-Q Filing

Johnson & Johnson (NYSE: JNJ) continued its strong pharmaceutical segment performance in the second quarter of 2018, reporting acceleration in pharmaceutical sales growth for the fourth straight quarter and year-over-year total sales growth of 10%-plus for the fourth straight quarter. Companywide sales growth of 10.6% was paced by 19.9% growth in the pharmaceutical division, which now accounts for 50% of total sales.

Companywide operational sales growth (i.e., ex-currency and ex-acquisitions) came in at 6.3% for the quarter. On an adjusted non-GAAP basis, J&J posted 14.8% year-over-year earnings-per-share growth for the second quarter. Management increased its operational sales growth guidance for 2018 to 5% growth (from 4.5%) and slightly increased its guidance for adjusted EPS growth to 11.2% (from 11%). Since reporting Q2 earnings on July 17, the stock has increased by nearly 6%, with the market assessing the quarter's results favorably.

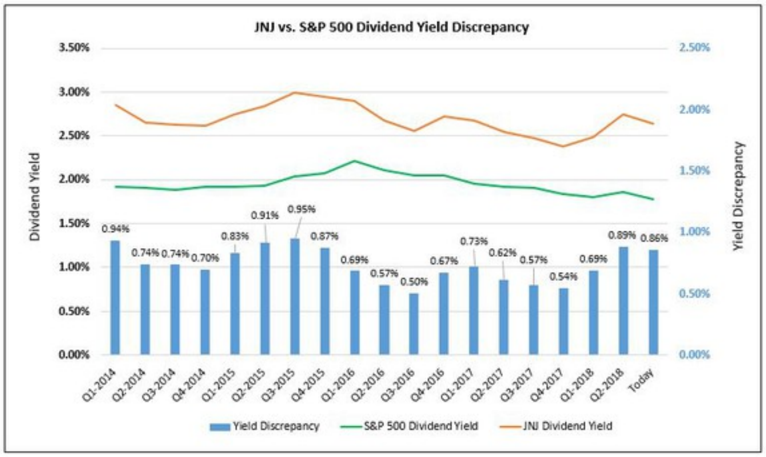
- **Updated guidance**: Buy (no change)
- **Recommended allocation**: 2.6%, with October 2018 $135 covered calls.
- **Fair-value estimate**: $140 (no change)
- **Current price:** $131.84

At about $132 per share, the stock is priced at 14.5 times trailing-12-month (TTM) EBITDA and 20.3 times TTM free cash flow:



Based on management's guidance, J&J is priced at about 16.3 times 2018's non-GAAP earnings -- slightly below the S&P 500, which is trading at about 17.8 times expected 2018 earnings estimates (and 16.5 times 52-week forward earnings estimates). The stock has recovered a bit from recent lows, although the price is still below where it started the year and is 11% below its all-time high of $148.32 set in mid-January.

Because J&J has such a consistent history of dividend payments, one of my favorite ways to monitor the company's relative valuation is to compare its dividend yield to that of the S&P 500. This comparison strips out the confounding effect of interest rates that occurs if you look at J&J's dividend yield in isolation (since dividend-paying stocks tend to fluctuate in price alongside interest rates). When we make this comparison, J&J looks attractively valued relative to the S&P 500, although not as attractive as last quarter:

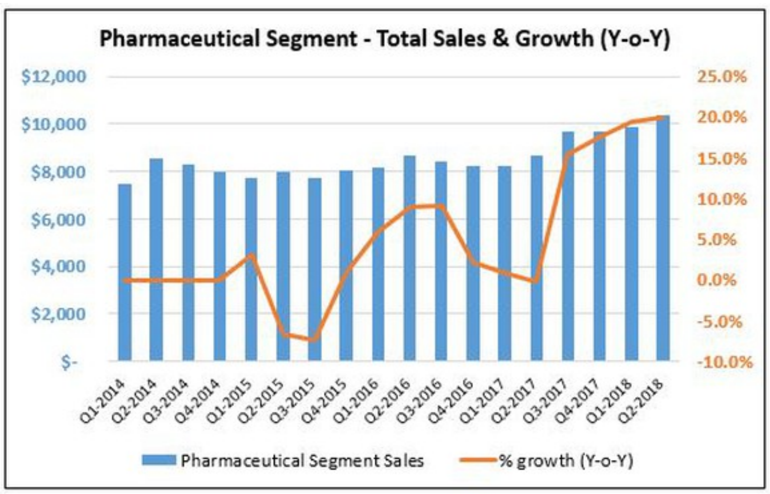


The yield discrepancy between J&J and the S&P 500 has narrowed a bit since last quarter, but is still about as high as it's been since the fourth quarter of 2015. Since 1997, the average yield discrepancy between the S&P 500 and J&J has been 0.65%, and it's currently at 0.86%.

Our fair-value estimate remains at $140, and Johnson & Johnson remains a Buy. Members who have yet to start or fill out their positions can feel comfortable doing so at current prices. We also have October 2018 $135 covered calls, and if you've yet to write these covered calls, pricing is attractive and you can do so now if you wish. With these covered calls, by October expiration we're prepared to sell our shares at or above $135 (if we have to), or if we can roll our calls out and/or up attractively, we will consider that as well.

Division Performance

J&J's pharmaceutical division continued its strong growth in the second quarter, bolstering the entire company's results given that this division is the company's largest by sales volume:



Pharmaceutical sales growth accelerated to 19.9% year over year (18.1% TTM y-o-y growth), up 11% excluding the impact of the Actelion acquisition. Drugs in the oncology market continued to lead the pace, with Darzalex sales up 71%, Zytiga sales up 63%, and Imbruvica sales up 38%. JNJ's pipeline remains promising, with two new launches in 2018 (Erleada and Tremyfa) and the expected regulatory approval of eight other new drugs by 2021, each of which has $1 billion in peak revenue potential. Tremyfa, a new treatment for psoriasis, was called out in the conference call, having launched earlier this year and posted $126 million in sales in the quarter (up from $72 million last quarter). Tremyfa now has more than 15,000 patients on therapy, and already has a 5% share of the psoriasis market. The pulmonary hypertension drugs acquired from Actelion continue to see accelerating growth. We expect the pharmaceutical division to continue to be the predominant driver of growth for Johnson & Johnson.

In addition to the strong growth from the pharmaceutical division, the consumer division and the medical device division posted year-over-year revenue growth of 0.7% and 3.7%, respectively. The company held a review meeting for the consumer and medical device businesses in May, and there were some comments from Jorge Mesquita (the executive VP and chairman of the consumer business) that I found particularly interesting, showing that management at the consumer business is aware of the challenges it faces and that they will need to continue to innovate and market effectively to avoid remaining stagnant:

> "What we're seeing is that the competitive advantages upon which the FMCG industry has been built are not as relevant today as they once were. So for example, it used to be that large companies like J&J had a competitive advantage in terms of attracting the best talent. But what we're seeing today is that for students joining the workforce, joining a smaller company, a start-up enterprise that is more entrepreneurial, has certain appeal to them. It used to be that building and nurturing brands was something expensive that only large companies like ours could do, but the reality is that it's relatively affordable now for you to build a brand online and to create an active community of loyal users very efficiently. It used to be that manufacturing assets, large plants, was a moat, a barrier for entry. But again, you see today across the world that small companies, new entrants can access excellent contract manufacturing in just about every region.
>
> "Retailer relationships are very important, and we're very proud of them. But if you are a newcomer to this industry, you can sell directly to your consumers online efficiently. Innovation, as I said, has been and will continue to be an important source of differentiation. But these small entrants that join our industry can do so as well by outsourcing some of those elements of innovation. And then lastly, financial firepower, a great strength of Johnson & Johnson, is not an impediment for a new entrant to come to this industry. Given this relatively low interest rate environment, abundant VC capital, even crowd financing, it's relatively easy to raise the money you need to start a new business."

Management reiterated multiple times during the review meeting that both the consumer and medical device businesses are "aggressively taking action" to position themselves for better growth in 2018 and beyond, and over time we'll see if the initiatives they are working on will spark growth in those two challenged business segments.

Our Thesis

Johnson & Johnson is is a diversified health-care conglomerate, with more than 260 operating companies organized into three business divisions: consumer, pharmaceutical, and medical devices. At eight out of eight of our *Pro* quality criteria, J&J is a quintessential *Pro*-quality stock. While its large size means we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk from one of the safer stocks you are likely to find in the entire investment universe.

After NVR's Earnings Report, Pro Is Staying the Course

Published Aug 6, 2018 at 3:38PM

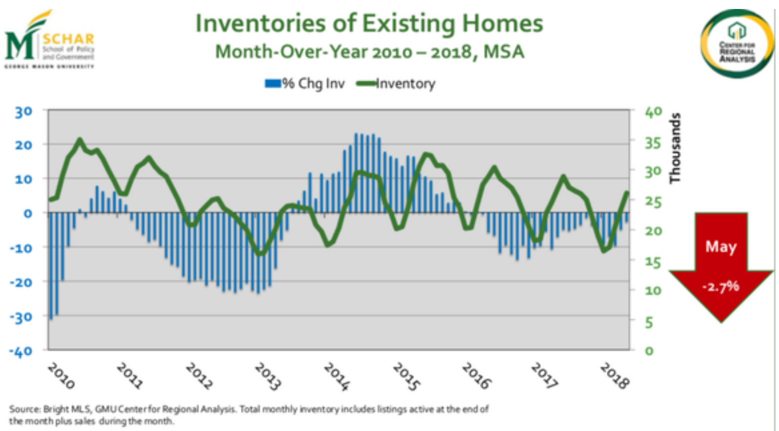
Fellow Fools,

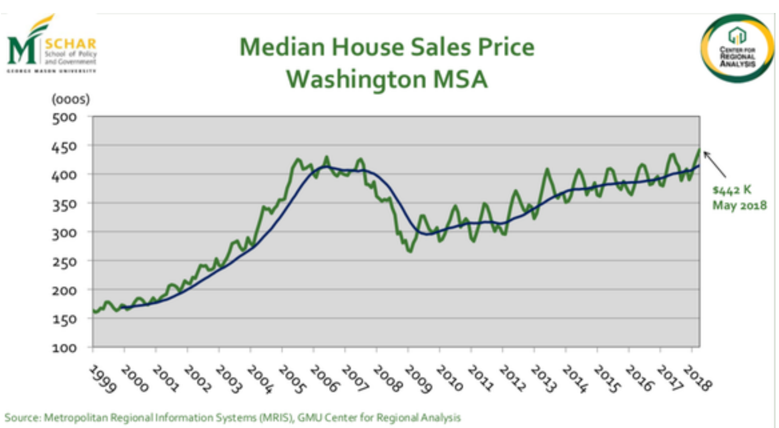
It's not very often you see a stock fall by over 8% after reporting decent quarterly results — and especially where revenue and diluted earnings per share rose 16% and 39%, respectively — but that's exactly what we saw late last month with **NVR** (NYSE: NVR).

If forced to hazard a guess as to why, I'd point to the deceleration in new orders which, at 6% year over year growth, was the slowest we've seen since the first quarter of 2016 and a sharp contrast to the 17%, 18%, and 21% growth we saw in the preceding three quarters. Since new orders are a leading indicator for what the company's financial statements will look like in the future, these numbers probably deepened some investors' fears that rising home prices and rates could lead to an extended slowdown in the housing market.

It's important to keep in mind that we didn't purchase shares of NVR with a short-term thesis in mind; however, we still optimistic that we're not headed for a repeat of a 2007-2008. For starters, NVR's new orders don't look nearly as bad when you look at the results on a six month basis — the 11% growth in the first half of 2018 was the fastest start to a year since 2015.

Although the company is running up against difficult comps for the remainder of the year (new orders rose 19% in the second half of 2017), we believe NVR could be poised for a rebound in 2018 as regional demand appears to still be outpacing supply. That is a favorable setup for NVR, when you consider the continued decline in existing home inventory. And although housing prices have steadily risen, we believe the imbalance between supply and demand will result in the market being able to absorb these price hikes.

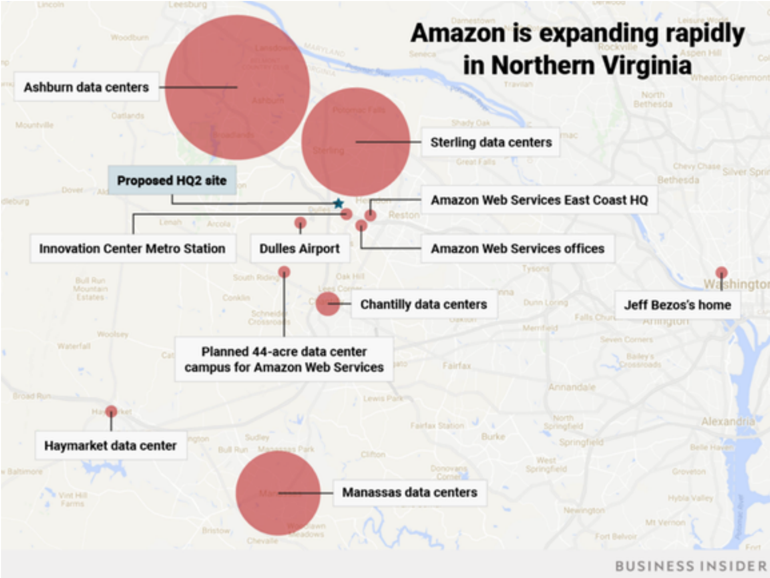




source: GMU Center for Regional Analysis

We'd also be remiss if we didn't mention the potential windfall coming if **Amazon** (NASDAQ: AMZN) decides to build its second headquarters in the region. With three of the 20 finalists located in the DC metro area, Jeff Bezos' ties to the area, and the company already expanding in the region (Northern Virginia's Dulles Technology Corridor has been referred to as both "the Silicon Valley of the East" as well as "Data Center Alley," and was previously estimated to house up to 70% of Amazon Web Services' IP addresses), it's not unreasonable to think that Amazon HQ2 will make its home here.

And with Amazon stating that its expects to bring as many as 50,000 jobs with an average salary of $100,000 to wherever it constructs HQ2, the region's homebuilders would likely benefit for years to come if Northern Virginia, D.C., or Montgomery County win.



Source: Business Insider

That's not to say that there aren't any potential headwinds for NVR.

Outside of a potential slowdown in the housing market, NVR may also have to finally contend with labor issues — namely, a lack of quality builders and rising wages. After years of being able to avoid labor issues that have affected many of the national builders due it to its smaller, regional footprint, NVR now finds itself thrust into the middle of a political battle that could change all that.

As it currently stands, El Salvador is set to lose its Temporary Protected Status next year, meaning an estimated 262,500 Salvadorians currently residing in the U.S. must leave by September of 2019. At less than a tenth of one percent of the population of the U.S., this might initially sound insignificant from an economic perspective — but, ironically enough, this will likely end up being a huge blow to the area, since the greater Washington region relies heavily on foreign born, non-citizen workers. Almost one in every six workers in the region fits this criteria. And the largest country of origin? You guessed it: El Salvador.

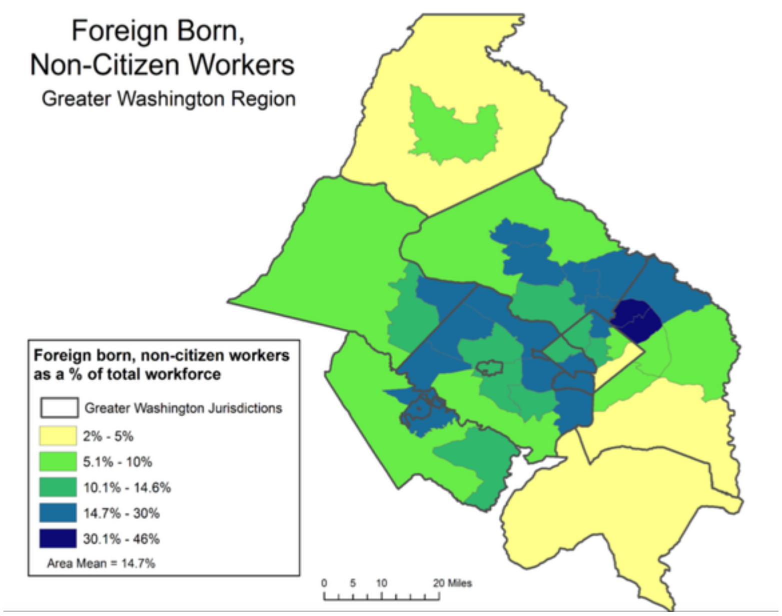


Figure 5: Foreign-born, non-citizen workers in the Greater Washington region by country of origin

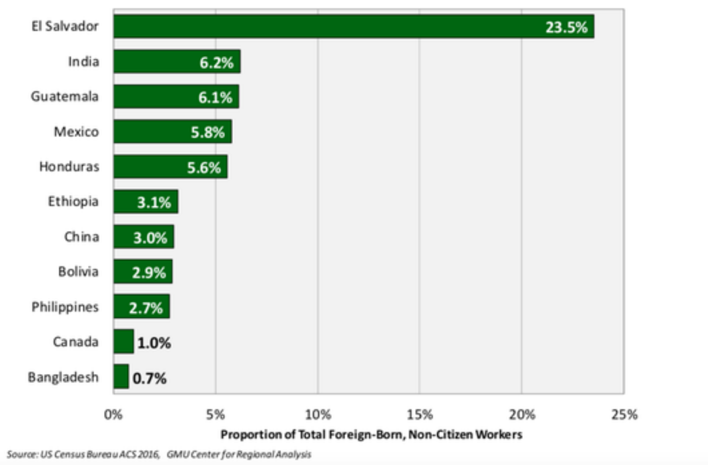

source:GMU Center for Regional Analysis

And for the construction industry, it's even more troublesome. It's currently estimated that more than 52% of the industry workforce is comprised of foreign-born, non-citizen workers, with almost a quarter of the total construction workforce coming from El Salvador. With many of these individuals filling lower paying jobs within the industry, odds are, this will hurt the industry's margins if the situation doesn't change before next year.

Figure 7: Proportion of foreign-born, non-citizen workers in different occupational groups

Occupation Group	Foreign-Born, Non-Citizen Workers	% of Total Occupation Workforce
Construction & extraction	65,940	52.4%
Cleaning & maintenence	52,750	48.6%
Farming, fishing, & forestry	1,150	38.0%
Food preparation & serving	43,770	32.6%
Production	14,220	28.0%
Healthcare support	10,300	21.6%
Personal care & service	21,160	21.3%
Transportation & material moving	22,870	20.7%
Life, physical, & social science	10,890	18.1%

Sales	33,990	14.1%
Computer & mathematical	21,520	10.1%

source: GMU Center for Regional Analysis

With the uncertainties surrounding the business (both good and bad), we've decided to keep our Buy rating on NVR unchanged. However, we are still very optimistic that the company will soundly beat the North Star over the next five years and are increasing our fair value to $3,100.

In the interim, however, odds are good that NVR's share price will continue to fluctuate wildly. Mr. Market's opinions on NVR swing from positive to negative at a moment's notice. But long-term minded Fools should view this volatility favorably, since this provides management with opportunities to repurchase shares at attractive prices.

Pro Catch-Up Trades and Expirations: Apple, Square, and More

Published Aug 2, 2018 at 12:51PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.9%.
- **CME Group** (NASDAQ: CME): Buy 2.3%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): If you don't have a position yet, we're happy to list Apple here as it surpasses $1 trillion in market value today! Buy 3% to start, and later up to 5.2% if you want to match us. We're watching closely to have confidence Apple will keep growing.
- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3.5% stake.
- **Zuora** (NYSE: ZUO): Per last week's trade alert, buy 1.6%, ideally for less than $26 with a limit order.

Shorts:

- **New to the SPDR S&P 500** (NYSEMKT: SPY)**?** If you do not yet have a synthetic short set up and you want one, sell to open Dec. 21, 2018, $287 calls and buy to open an equal number of Dec. 21, 2018, $271 puts. Lately, this can be set up for a net credit of a few cents per synthetic short, or at worst no cost. Set up one synthetic short for every $27,100 in look-through short exposure you want via owned $271 puts and every $28,700 of potential short exposure via short $287 calls. *Pro* has a 15% look-through position, or 17 contracts of each.
- **Rolling your SPY puts?** As in this week's trade alert, roll your January 2019 $255 puts up to Dec. 21, 2018, $271 puts, if you wish (as we are doing) to make them more responsive. The cost is lately a $1.87 debit per put.

    - **Bearish SPY spread instead?** If you're not comfortable setting up synthetic shorts, but do want a short position on SPY, then consider a bear put spread instead. Using a spread order, simultaneously sell to open Dec. 21, 2018, $265 puts, and use the proceeds to buy an equal number of Dec. 21, 2018, $280 puts. Lately, this costs about a $3.50 debit per spread, with a potential maximum value of $15 per spread achieved if SPY ends the expiration below $265, or at least 5.8% lower. If SPY remains above $280, then the spread ends without value. So, every $350 that you risk per spread will be lost in that latter case.

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls from our recent trade alert, selling one call for every 100 shares you own and want to cover. Lately, they pay $2.53 each -- considerably better than last week. For those who wish to aim for more upside in the stock in exchange for lower income, you can consider writing October 2018 $140 calls instead.
- **Square** (NYSE: SQ): If you haven't set up the protective collar yet, earnings are out, and the stock is up, so the collar does not look necessary at this time. But you never know. So, if you still want to set it up, set up a collar on half of your shares by (now) selling to open Sept. 21, 2018, $80 or $85 calls, and using the proceeds to buy an equal number of Sept. 21, 2018, $60 puts. You'll still have some proceeds left over. This does cap upside on half your shares, though, and again -- it appears we won't need this extreme protection unless the market really goes south. So, only set it up at your discretion. We will manage our existing collar as needed before expiration -- or let it expire if Square remains between our strike prices.

Upcoming Expirations:

- **The Cooper Companies** (NYSE: COO): Our August $230 (or $240, if you wrote those from the original alert) covered calls expire on the 17th. Before then, we'll have guidance as needed.

Celebrating Apple and Paycom

Published Aug 1, 2018 at 1:37PM

Greetings, *Pro* members,

Today, I moved aside other obligations to instead spend some time celebrating with you -- with this surprise column. I do this not only to celebrate, but in hopes of making a few Foolish points to remember.

First, **Apple** (NASDAQ: AAPL) is up 5% as I write this, hitting a new all-time high after last night's earnings, which revealed revenue that was up 17% and earnings per share that had risen 40%. At $200, Apple's stock is just a few dollars away from giving the company a $1 trillion market value, which would make it the first company to hit that milestone on the public U.S. market. Given Apple's guidance for the next quarter and the stock's valuation, it's probably only a matter of time -- perhaps days -- before we're all reading the "Trillion Dollar Apple" headline everywhere.

But what can we learn from this? When *Pro* first bought Apple in 2012 (after writing options on it that ended in income in 2011), I remember going a few extra miles to try to make the write-up convincing. I was certain that members would think, "Why Apple now? Aren't we late? Apple is already so big." Indeed, it was the most valuable tech company on the planet in 2012, worth more than $400 billion. Today, it's still the most valuable tech company on the planet, worth nearly $1 trillion.

Although the report provided plenty of details, our main argument was simple. (You can see it atop the report here.) In a nutshell, I wrote that shares were cheap because the world doubted Apple's staying power. And the market opportunity was still large, in our opinion, because mobile computing was still in its infancy. That remains true today. Sure, Apple's phone unit sales indeed seem to have peaked for now (and perhaps forever), but it's making more money per phone, and service revenue continues to increase sharply.

Our investment -- to which we later added a tiny bit more -- is up about 183%, about 190% when you include dividends. So, since our first buy report on Valentine's Day 2012, we're close to tripling our money in Apple in six and a half years. And this was a stock that I was a bit leery to recommend because I knew we would look like latecomers to the iPhone party (even though the iPhone was less than five years old at the time).

Now, companies do of course face greater challenges as they get ever larger (offset at least somewhat by greater advantages), and we should expect lower returns, overall, from the giants of our time. But lower isn't the same as lackluster. As long as Apple and its enormous tech peers (which I don't need to name) can continue to increase value for their customers, keep employees excited, and serve the community, they should be able to expand their value. And how enormous are these companies, really? The market and the economy for tech are all but worldwide now, and still a majority of people aren't connected. Those people typically have the least resources, but over the coming decades, that should change.

Although the ripest fruit has largely already been picked by the tech giants, there's likely still plenty more to harvest -- and enjoy -- from our connected world in the years to come. 5G speeds, advancing artificial intelligence, and safer social communities will all help speed more business online. The opportunity comes from investing in some of the giants, of course, but perhaps even more so from investing in some smaller newcomers.

To that end, one of our Best Buys Now, **Paycom** (NYSE: PAYC), is up 17% today as I write this -- 17% in *one day*, soaring to new highs. It's up more than 20% over the past two days. And in the 21 months since *Pro*'s November 2016 buy recommendation, the stock is up 190% for us -- like Apple, it's nearly tripled. The biggest mistake I made was only buying a 2% stake. That's now 4.6%, the seventh-largest position in the portfolio. And even that starting stake has been enough to make a real difference.

That's not the point I want to make about Paycom today, though. Instead, I want to point out that the stock is up 17% in a day, and most of us are probably just nodding and saying, "Yes, that's right. This is what we expect our stocks to do -- go up." And we move on with our day, a little more happily (I hope). But when a stock *falls* 17%, the anguish we feel can be extreme. Our boards usually light up, too. "What's happening?! What do we do?" And that's natural. That's human nature.

But that's why today we should pause and recognize that these two differing reactions point to somewhat *illogical* human nature. Stocks go up and down. We should be no more surprised by a drop than by a pop. That just happens. Sure, we want to investigate big declines and make certain we want to stay invested; but we shouldn't be anguished by the decline, or feel we did something terribly wrong. It just comes with the territory of investing in stocks. If we're going to accept big jumps as a "given" -- like Paycom today, or **Coherent** (NASDAQ: COHR), which is up 15% today (albeit after a steep decline in past months) -- then we should do our best to accept drops as a given when owning individual stocks, too.

They happen.

In either case, it's enriching to then work to figure out *why*. Why is Paycom up so much today? (I don't know yet, because I haven't had a chance to comb through last night's earnings.) And when a stock falls sharply, we want to know why then, too. But they're two sides of the same coin. And the more calmly you can accept a price decline, the more rational your next investing choices will likely be.

So here's to Apple, and Paycom, and Coherent today! And here's to the drops we'll see with some stocks on another day. If stocks didn't fall sometimes, they wouldn't reward us so well. We need movement in both directions to make the market work the way it does. Here in *Pro*, we do our best to avoid big losers, but we've had our share. We do our best to keep from feeling anguished by them. Instead, we work to rationally learn from what's happened, and improve our next choices from there.

To share any thoughts, please visit the Memo Musings board. And Fool on!

-- Jeff (TMFFischer)

Set Up a Protective Collar on Half of Your Position in Square

Published Jul 31, 2018 at 12:55PM

Is this for you? Any *Pro* members who own at least 100 shares of this stock, and who want to protect against downside, can consider following this recommendation before earnings at market close tomorrow, Aug. 1.

How You Participate

- **Action:** Set up a protective collar on **Square** (NYSE: SQ).
- **Trade:** Simultaneously ...
    - **Sell to open** Sept. 21, 2018, $75 calls.
    - **Buy to open** Sept. 21, 2018, $55 puts.
- **Allocation:** Set up one protective collar (one of each option) for every 100 shares you want to protect. *Pro* will collar 1,400 of our 2,800 shares, setting up 14 contracts of each. This protects half of our position, leaving half of our shares -- a 2.6% allocation -- uncovered.
- **Price Guidance:** Use a **limit order** and initially aim to set this up for **credit**. Prices will fluctuate as the stock moves, with the trade getting less expensive to execute if shares rise, and more expensive if the stock declines. At recent prices, you would aim for a credit of $0.45 or so. If prices change a lot before you make your trade, consider using different strikes, rolling both options up or down accordingly to target no cost or a credit. We will use different strikes if we need to when we make our trade tomorrow.
- **Recent Prices (10 a.m. ET):**
    - Sell to open Sept. 21, 2018, $75 calls (splitting bid/ask): $1.76 credit
    - Buy to open Sept. 21, 2018, $55 puts: $1.31 debit
    - Net credit: $0.45 per collar (use a **limit order**). As that price changes, still aim for any credit, or no cost.
    - Stock: $65
- **Scorecard Status:** Buy. Allocation is 5.3%. We're putting a collar on half of our shares.
- **Special Note:** Square announces earnings tomorrow, Thursday, Aug. 1, after market close, so we plan to execute our trade before that time.

What We're Thinking

Our investment in Square has appreciated about 150% in 13 months, becoming our fourth-largest position, at 5.3%. Today's trade is simple insurance against a price decline of 15% or more in the coming weeks after tomorrow's earnings, while still giving us 15% upside on the covered shares, to $75. By collaring half of our shares for the duration of these options, we lower our allocation risk in the stock to a more reasonable 2.65%. Square has run up fast and is difficult to place a reliable value on. If Square pleases investors with its earnings, the stock could resume its march higher. If not, like Twitter or Facebook before it, it could be taken down a few pegs. Hence, our insurance policy.

Why This Strategy?

A protective collar is a friendly hedge because it can cost little to nothing to set up (or even pay you, as in this case), yet it protects you from big downside. Plus, it gives the stock you cover with short calls some upside before reaching the strike price of your short call. In this case, we have about 15% upside in the shares we're covering, and we have downside protection on these shares starting about 15% below the current share price. We are protecting against big disappointment, and still allowing for big upside.

What happens next? If the stock stays between our two strike prices, the options would be on track to expire unused, and we've earned a small credit. If the stock falls below our long put's $55 strike price, we can sell our puts at a profit, or sell those shares of our stock at the strike price. We would decide that when appropriate (today, we lean toward just selling to close the puts). Finally, if the stock rises above our short call's $75 strike price, we could let our covered shares be sold at $75, or we could close or roll the calls if we want to keep our shares (we would likely need to pay to do so). Half of our position continues to enjoy uncapped upside and the accompanying downside risk.

Alternative Trades

- **Own fewer than 100 shares and want protection?** You shouldn't sell a call option if you own fewer than 100 shares (because the call represents 100 shares), but if your Square stake is still a large enough part of your portfolio that you want to protect it, you can buy a put option and have more protection than you need. The Aug. 17, 2018, $55 put is lately about $0.60, so it's $60 for one put, or about 0.9% of the stock's recent value, and the stock needs to fall 15% to hit your strike. You can buy this insurance if the cost is worth it to you (and I'm saying August rather than September to keep your cost down).
- **Own 100 shares?** You could collar all of it, if you like, even though we're only collaring half of our holdings. It's simply your choice whether you want to collar all or none of your shares.
- **Just own Square calls or a synthetic long?** You can effectively collar a portion or all of those positions, too, if you wish.
- **Not using options?** Make sure you're comfortable with the size of your Square position. The stock remains a Buy, and we don't plan to sell any shares unless the story changes. This insurance is a "just in case." If the story does change, we'll of course issue a trade alert with new guidance.

Roll Your Long Puts on SPY

Published Jul 30, 2018 at 3:10PM

Is this for you? This is for *Pro* members who set up a split-strike synthetic short to hedge this ETF with us in March (or at later dates) and who now own puts on it that are at least $10 out of the money. We're rolling our puts up (and in) to make them more responsive to a market decline. We're leaving our short calls in this synthetic short alone for now; we plan to address those at a later date. (Here's a reminder about why and how we hedge in the first place.)

How You Follow Along

- **Trades:** Ideally, use a rolling order to roll your long puts on the **SPDR S&P 500** (NYSEMKT: SPY):
  - Sell to close all January 2019 $255 puts.
  - Buy to open an equal number of Dec. 21, 2018, $271 puts.
- **Allocation:** Roll all of your existing put contracts. *Pro* originally hedged 15% of its long investments (cash excluded), which for us meant a hedge with a look-through value of approximately $433,000. So we set up 17 puts. At home, for a 15% allocation, you would own one $271 put for every $180,000 or so in long stock you own. But if you already set up this synthetic short in March, just roll all the January 2019 puts you own to December 21, 2018.
- **Price (11:50 a.m. ET) and Guidance:** With the ETF at $280.50, you'll get about $3.95 in credit to sell to close the January 2019 $255 puts, and you can buy to open the new Dec. 21, 2018, $271 puts for the cost of about a $5.95 debit -- for a total net debit of about $2 (or $200) per put you roll. These prices will change a bit as SPY moves.
- **Later Guidance:** If SPY moves much in price before you act, you may want to move your *new* put strike price up or down accordingly, to continue to roughly target puts that are about 3% out-of-the money from SPY's price. If SPY's price changes much before *Pro* can make its rolling trade, we'll adjust our put new strike accordingly.

What We're Thinking

Since we set up this split-strike synthetic short in March as a broad market hedge, the S&P 500 has gained more than 4%. To refresh your memory, the SPY ETF traded at $267 when we recommended a $255/$285 spread on it, and now -- after a good run in July -- the ETF is at about $280. Being well out of the money now, the $255 puts we own will be less responsive when the market declines. In fact, today the delta on these puts is 0.19, meaning they'll only move about 19 cents for every $1 move in SPY itself. By rolling up to $271 puts, we'll reset to a 0.33 delta, so these new puts should be 74% more responsive than our old $255 puts -- and that responsiveness will grow if and as SPY falls.

Other than put ratio spreads -- which require a commitment to potentially buying shares and become a liability during a large decline -- I've yet to find a hedge that doesn't cost you something. You pay for a hedge, just as you pay for insurance. But we can minimize the cost, as this strategy has done so far. We paid almost nothing out of pocket to set up our synthetic short in March, and today we would have to pay about $4 per spread to close it entirely, while the ETF has gained $13 per share. If we had shorted SPY directly, our cost to hedge (or our loss) would be about three times larger than it is. So, the syn short has served us well.

Anyway, rather than paying about a net $4 cost to close our synthetic short entirely, we're paying about $2 just to roll our puts up and earlier to December. Again, this makes the puts more responsive, and still keeps our position going as a hedge. We're keeping our short January $285 calls open for now, given the ample time value they hold. It would be illogical to roll them in to an earlier month; we'd collect less time value by doing so. Instead, we'll manage both options as needed, looking to close both at better prices if and when SPY declines meaningfully anytime between now and Dec. 21.

Why This Strategy

As a refresher, the strategy we're using is called a *split-strike* synthetic short because the two strike prices differ (and now, with today's put roll, our expirations will differ by a month as well -- a not particularly meaningful variance). The two options' effect on our portfolio is similar to that of shorting SPY, but with some leeway or distance on both sides. A synthetic short like this ends in losses if SPY rises above our short call's strike price by expiration. The synthetic short provides gains if SPY declines and we close it early, or if SPY declines below our long put's strike price by expiration (at which point we'll close it). If SPY remains between our two strike prices ($271 and $285 after this roll) and we don't act beforehand, the position will expire unused.

Of course, you don't need to set up any hedge if you don't want to. Only do so if it makes sense for your situation. And if you don't want to roll your existing $255 puts, you can continue waiting. Just realize that those long puts won't be very responsive to a market decline right now, which takes away from the effectiveness of our current hedge -- that's why we're rolling them higher. Plus, we're rolling the puts to December to make them more responsive over the next few months, and to pay less to roll up. It makes sense to roll in and pay less for new puts because we're already planning to close the whole synthetic short around November or early December, depending on the situation at hand.

Alternative Trade (advanced investors only)

- **IRA-Friendly:** If you're using an IRA and can't set up a synthetic short, you can consider a bear put spread. If you did that in March, you sold to open January 2019 $245 puts, and bought to open an equal number of January 2019 $255 puts for about $2.66 per spread. Today, with SPY higher, that spread is worth about $1.24. You can roll it to a Dec. 21, 2018, $270/$260 spread for a new cost of about $1.78 per spread -- so a total net debit of about $0.54 per spread, while rolling your long puts up $15 in strike price. That's a good roll in and up for a potentially more effective spread. Newcomers can consider just setting up this new spread, selling to open Dec. 21, 2018, $260 puts and buying to open an equal number of Dec. 21, 2018, $270 puts -- lately for that $1.78 or so cost per spread. The spread will end worthless if SPY stays above $270. And it will end worth $10 if SPY is at $260 or lower by expiration.
- **Short SPY directly:** You could sell short SPY shares directly if you prefer, in your preferred allocation. It's an immediately responsive position, up or down. You'll need to pay out the quarterly dividend yourself. And you have a growing dilemma as SPY rises -- when do you close the hedge? If you're short SPY directly, you can see we're staying short our $285 calls for right now, and keeping our synthetic short going.

Pro Catch-Up Trades and Expirations: Facebook, SPY, and More

Published Jul 26, 2018 at 3:27PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Buy 3%.

Continue building your portfolio with our Buys, including:

- **Facebook** (NASDAQ: FB): If you don't have a position, start with a 3.5% stake. Note that Facebook moves to Buy from Best Buy Now on lower sales growth and higher costs. Jeff's initial thoughts on today's decline can be found here.
- **NVR** (NYSE: NVR): Buy 2.6%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.2%.
- **Zuora** (NYSE: ZUO): Per last week's trade alert, buy 1.5%, ideally below $26 with a limit order.

Shorts:

- **SPDR S&P 500** (NYSEMKT: SPY): If you do not yet have a synthetic short set up and you want one, sell to open Dec. 21, 2018, $290 calls and buy to open an equal number of Dec. 21, 2018, $271 puts. Lately, this can be set up for a net credit of a few cents per synthetic short, or at worst no cost. Set up one synthetic short for every $27,100 in look-through short exposure you want via owned $271 puts and every $29,000 of potential short exposure via short $290 calls. *Pro* has a 15% look-through position, or 17 contracts of each.
    - **Bearish SPY Spread Instead?** If you're not comfortable setting up synthetic shorts, but do want a short position on SPY, then consider a bear put spread instead. Using a spread order, simultaneously sell to open Dec. 21, 2018, $265 puts, and use the proceeds to buy an equal number of Dec. 21, 2018, $280 puts. Lately, this costs about a $3.20 debit per spread, with a potential maximum value of $15 per spread achieved if SPY ends the expiration below $265, or at least 6.3% lower. If SPY remains above $280, then the spread ends without value. So, every $320 that you risk per spread will be lost in that latter case.

Options:

- **Johnson & Johnson** (NYSE: JNJ): If you've yet to write covered calls, you can "sell to open" the October 2018 $135 calls from our recent trade alert, selling one call for every 100 shares you own and want to cover. Lately, they pay $1.86 each -- considerably better than last week.

Upcoming Expirations:

- **The Cooper Companies** (NYSE: COO): Our August $230 (or $240 if you wrote those, from the original alert) covered calls expire in about a month. Before then, we'll have guidance as needed.

Initial Thoughts on Facebook: Stay the Course

Published Jul 26, 2018 at 1:31PM

Facebook's (NASDAQ: FB) stock is down almost 20% today after a second-quarter conference call Wednesday night that spooked the market. The company said it is expecting lower revenue growth over the next two quarters, as well as a lower operating margin in the coming years. Sales growth should slow as Facebook faces currency headwinds, increases user privacy options, and promotes new content strategies. Margins should decline as it invests in both timely and long-term needs and grows its headcount.

I think Facebook is taking positive steps for the ongoing health and relevance of its community and its business, and it remains a sensible (and still promising) long-term investment in a diversified Foolish portfolio. But investors should prepare for volatility and will need to remain patient as this unfolds.

For more on all this, keep reading.

Facebook reported 42% year-over-year revenue growth for its second quarter but guided for revenue growth rates to decline from that level by the high single digits in each of the next two quarters (think roughly 34% sales growth in the third quarter and 26% in the fourth). That was much steeper than investors expected, considering the reasons given were just modest currency headwinds; more use of "Stories" and other engaging content that aren't yet fully monetized; and users having more say over data privacy.

Meanwhile, the company said it expects operating margins to trend down toward the mid-30% range over the next handful of years. That's down from a huge 44% operating margin in the quarter just ended. This, again, is related to what we believe are worthwhile moves hiring more employees to help safeguard its users and investing in artificial intelligence, virtual reality, video, data centers and more.

It's worth noting that the European Union's new privacy laws took effect the last month of the second quarter, and so far, the vast majority of users have opted to let Facebook keep using extensive data to improve the ads delivered. But Facebook reminded that if more users opt for greater privacy, that could affect ad revenue growth, and it expects some of that may occur. And the company is embracing giving users still more privacy options; spending to combat malicious content; and requiring transparency from all advertising partners.

The best way to look at this may be that management is striving for community quality before ad quantity. Beyond that, Facebook admitted that it is opting to target lower operating margins as a baseline in exchange for ample funds to run the business as it wants. It's a sensible long-term exchange — one that will still leave the company with large annual profits.

Meanwhile, key metrics continue to move in the right direction in the second quarter. Advertisers and site visitors remain engaged and growing. Mobile ad revenue grew 50% and made up 91% of total ad sales. The average price paid per ad increased 17%, and ad impressions grew 21%. Advertisers are sticking with Facebook, and using it more. Daily active users on Facebook grew 11% to 1.47 billion, while monthly active users were 2.23 billion, also up 11%. So, users are sticking with Facebook, too. Against this growth, total expenses grew 50%, while headcount was up 47%. As expected, Facebook reiterated guidance for expense growth of 50% to 60% the rest of this year.

Returning to revenue: Facebook's new revenue guidance suggests approximately $13.8 billion in sales next quarter, and $16.5 billion in the fourth quarter, adding up to $55.4 billion for all of 2018. That would represent 36.4% annual sales growth. With expenses climbing, earnings per share (EPS) will likely grow considerably less than that. The current average estimate calls for 19.8% EPS growth, to $7.38 per share in 2018. The stock is currently trading around 23.9 times that estimate. This looks inexpensive for a business of Facebook's quality, reach, and long-term optionality — remember, many under-monetized Facebook properties are continuing to grow users.

However, the days of steady new highs for Facebook's stock are likely gone until Wall Street gets comfortable with lower growth targets and higher spending at the social media giant. Facebook is likely making the correct long-term choices for its community quality, but the choices come at a cost that could stretch for at least some quarters, and likely longer. Invest with that in mind, and a good dollop of patience, and Facebook still appears likely to return to its winning ways down the road.

Skyworks is Still on Track

Published Jul 23, 2018 at 4:16PM

Long-term investing always rules supreme! We don't have any guidance changes or completed trades in the past week.

Greetings, *Pro* members,

Quarter after quarter, management at **Skyworks Solutions** (NASDAQ: SWKS) hosts one of the clearest thinking, most well-spoken quarterly earnings conference calls of any that I listen to or read. Perhaps CEO Liam Griffin is able to talk about the results and the outlook for Skyworks so well in part because the business is perfectly positioned for the growing, Internet-connected economy.

Even so, last Thursday Skyworks reported quarterly earnings that initially sent the stock higher, until it reversed and went lower. The catalyst for the price swing is not 100% clear, as things are looking promising. The business is doing well, third-quarter results exceeded both revenue and earnings expectations, management issued healthy guidance for the rest of the year, and margins are still marching higher toward a 53% operating margin goal. Plus, the long-term opportunities ahead are monumental, namely in 5G technology and in connected devices or the Internet of Things (IoT). IoT now represents more than 30% of revenue (mobile phones are the rest), while 5G revenue should start to materialize by 2020.

If there are any faults in the results, it's that China isn't "as robust as we would have expected," as CEO Griffin said at the end of the conference call. Skyworks thought its operations in China "would be a little bit better," even though some sequential sales growth was achieved. China is approximately 25% to 30% of sales, Skyworks said, and the trade war — tariffs — have *not* affected Skyworks at all yet, because the company exports product into China rather than out. But the ban on telecommunications equipment-maker ZTE has evaporated $25 million to $30 million in quarterly revenue for Skyworks (though, as a reminder, Skyworks *still* exceeded total expectations). And although at last word the U.S. ban on ZTE has been lifted, it will take at least a few quarters for that revenue to return. Lately, sales to ZTE represent about 3.3% of Skyworks' total $894 million in quarterly revenue.

Other than ZTE's problems, Skyworks is well-positioned in China. Its products are platform agnostic, and it thrives by offering personalized solutions to every device manufacturer — and it's providing products for China's telecom infrastructure buildout, too. The company continues to avoid the "commodity" side of the mobile phone market, forgoing some low margin revenue. That may play a role in management's ongoing comments suggesting they're waiting to see more growth from some phone providers as those providers move upstream to better devices.

Despite the complications in China, Skyworks guidance for the next quarter is healthy and suggests the usual year-end seasonal strength, with revenue expected to rise 11% to 13% sequentially, to just over $1 billion, and earnings per share of $1.91, up 16% sequentially. But note, Skyworks said "sequentially." Both of those guidance numbers are basically flat year-over-year compared to 2017, suggesting that the company's largest customer, **Apple** (NASDAQ: AAPL), is looking to have another good end to the year, but no stronger than a year ago. That stands to reason as Apple struggles to sell more than 50-some million phones each quarter (the world can only take so many iPhones every 90 days). Apple is able to grow earnings by increasing the price of a phone and its services revenue, and Skyworks typically grows its hardware content sold into each unit and thus increases its own revenue per phone, too. So, the lack of year-over-year revenue growth for the rest of 2018 is likely holding the stock back.

That looks like short-term thinking, though. The arrival of 5G technology is going to bring an enormous wave of innovation to mobile computing and the Internet of Things as both speed and latency improve by leaps and bounds, making all kinds of new applications and artificial intelligence possible across the board. Skyworks is a leader in helping make this possible. It has made the investments and has prototypes in play already. Plus, the spread of 5G should help Skyworks continue to move away from having too much reliance on Apple. Its "broad market" Internet of Things business should continue to grow revenue by the low- to mid-teens year over year, becoming an ever-bigger part of the business. Skyworks' customer list, from **Amazon** (NASDAQ: AMZN) to **Alphabet** (NASDAQ: GOOGL) (NASDAQ: GOOG) to **BMW** (NASDAQOTH: BAMXF), is already impressive. Ericsson estimates 29 billion connected IoT devices by 2022.

Lately around $96, Skyworks stock trades at 12.6 times expected earnings per share for the year ahead. Its price is above 21 times free cash flow, but the company has lately spent more capital expenditures to prepare for seasonal product ramps and even 5G, too. Overall, Skyworks expects capital expenditures to still average about 10% of revenue. Indeed, showing confidence, management just raised the dividend a hefty 19% (giving the stock a 1.6% yield), and continues to buy back shares.

The stock remains a "Buy" here in Pro, with a fair value estimate of $105. We have a 3.2% stake. We like it. But, given the reality of iPhone sales remaining perhaps flattish for a long time to come (Apple has other ways to grow profits, so we shouldn't worry too much about Apple yet), we might again start to write covered calls on Skyworks to target income and a potential sale of at least some of our shares at higher prices. We're also mindful of our total exposure to Apple via that stock, Skyworks, and **Coherent** (NASDAQ: COHR), whose share price moves more with Apple's fate now than it used to. We're looking to manage our collective "Apple exposure" carefully, and evolve it over time as directed by our research and the unfolding results at our companies.

To share any thoughts, please visit the Memo Musings board. And Fool on!

-- Jeff (TMFFischer)

Pro Catch-Up Trades and Expirations: SPY, ZUO, and More

Published Jul 19, 2018 at 3:07PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy up to 3.7%.
- **CME Group** (NASDAQ: CME): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **Coherent** (NASDAQ: COHR): Buy 1.5%.
- **FactSet Research Systems** (NYSE: FDS): Buy 2.1%.
- **Zuora** (NYSE: ZUO): Per Tuesday's trade alert, buy 1.5%, ideally below $26 with a limit order.

Shorts:

- **SPDR S&P 500** (NYSEMKT: SPY): If you do not yet have a synthetic short set up and you want one, sell to open December 21, 2018 $289 calls and buy to open an equal number of December 21, 2018 $265 puts. Lately, this can be set up for a net credit of a few cents per synthetic short. Set up one synthetic short for every $26,500 in look-through short exposure you want via owned $265 puts and every $28,900 of potential short exposure via short $289 calls. *Pro* has a 15% look-through position, or 17 contracts of each.
    - **Bearish SPY Spread Instead?** If you're not comfortable setting up synthetic shorts, but do want a short position on SPY, then consider a bear put spread instead. Using a spread order, simultaneously sell to open December 21, 2018 $260 puts, and use the proceeds to buy an equal number of December 21, 2018 $275 puts. Lately, this spread costs about a $3 debit per spread, and has a potential max value of $15 per spread, achieved if SPY ends the expiration below $260, or at least 7.1% lower. If SPY remains above $275, then the spread ends without value. So, every $300 that you risk per spread you set up will be lost in that latter case.

Options:

- None today. We're watching for better pricing, though. Argh.

Upcoming Expirations:

- **The Cooper Companies** (NYSE: COO): Our August $230 (or $240 if you wrote those, from the original alert) covered calls expire in about a month. Before then, we'll have guidance as needed.

Re-Establish Covered Calls on Johnson & Johnson

Published Jul 18, 2018 at 1:57PM

Is this for you? This is for *Pro* members who own at least 100 shares of Johnson & Johnson, and who wouldn't mind capping upside in return for near-term income. Those who *don't* own the stock can buy at least 100 shares to write covered calls, matching our 2.6% allocation. Those who own less than 100 shares as a full allocation can continue to hold them.

How You Participate

- **Action:** Sell to open October 2018 $135 calls on **Johnson & Johnson** (NYSE: JNJ).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover 700 of our 724 shares owned, representing about 2.5% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but **use a limit order** to split the option's current bid/ask spread. When we quoted it, that was $1.28.
- **Prices** (12:40 p.m. ET):
    - Stock: $127.36
    - Sell to open October 2018 $135 calls (bid/ask): $1.26/$1.30
    - $1.28 pays 1% ($1.28/$127.36) in 93 days
- **Important dates:** Johnson & Johnson's next ex-dividend date is August 27th, so we'll need to monitor pricing as we approach that date to make sure we avoid any dividend-poaching complications with this trade.

What We're Thinking

After an earnings report yesterday that beat analyst estimates, Johnson & Johnson's stock bounced up more than 3%. Companywide revenue increased 10.6%, paced by the pharmaceutical division (20% year-over-year revenue growth). The earnings results are aligned with our expectations for the business, that the pharmaceutical division will be the largest growth driver for J&J and should offset the slow-to-no growth consumer and medical device divisions. We'll have a more detailed update on J&J's quarter once the company releases its 10-Q filing (usually within two weeks from the earnings date).

In the meanwhile, although the stock is down slightly today after yesterday's bounce, we'll use this bump in the stock price to reinitiate our covered call strategy on this position, started in March with our first round of covered calls. As we mentioned in the first covered call alert, the options premiums are low because of the company's lower-than-average volatility and its healthy dividend (which lowers pricing on calls as the options market prices in the dividend). Additionally, we will have to watch out for dividend poaching around ex-dividend dates, but ultimately, we think a covered-call strategy should help us achieve our desired returns for this position over the long run. This covered call strategy is not an attempt for explicit income, it's just a way to squeeze out extra yield from our J&J position while still achieving an effective sell price that we're okay with.

If our shares are called in October, we'll be selling at a net price of $136.28, 97% of our fair-value estimate and accounting for about a 16.5% total return (about 9.7% annualized) since the position's inception. We'll manage the calls as needed with future trade alerts, and as is always true with covered calls, we may need to let our shares go if we can't roll our calls higher at a reasonable cost.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call's strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold, or we may roll our calls to a later date and/or higher strike. We'll cross any such bridge near expiration (or the next ex-dividend date), once time value is dissipating from the calls.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.

Submit

Buy Zuora

Published Jul 17, 2018 at 3:05PM

Is this for you? This is for all *Pro* members who want to invest in this company alongside us.

How You Participate

- **Action:** Invest 1.5% of your portfolio in **Zuora** (NYSE: ZUO). For *Pro*, that's about $53,650 worth, or about 2,150 shares.
- **Recent Price Range:** $24-$25.50
- **Scorecard Status:** Buy
- **Price Guidance:** Please, **use a limit order.** It's a smaller company, so set a limit near the current price when you make your investment; lately that's $25.20. And aim to buy below $26.
- **Alternative Trade** (we like the stock purchase best): Seeking a lower buy price? Sell to open puts that appeal to you, selling one put for every $2,250 or so (choose a strike price) in stock you want to buy. The August or September 2018 $22.50 puts pay well; or, sell to open $25 puts if you prefer.

What We're Thinking

ZUORA IN 1 MINUTE

WHAT IT DOES

Zuora sells software that lets any company become a subscription-based business.

WHY YOU SHOULD BUY IT

- Zuora is led by a founder who is passionate about growing what he calls the Subscription Economy. Zuora's customers range from Ford to Box, from industrial to energy to tech, as business models evolve to subscription revenue and require software to match it.

- Zuora's business model lets *it* grow as its customers grow. Annual fees to get Zuora's software are complemented by variable fees that go up as a client's volume usage grows. This resulted in a 112% dollar retention rate last quarter. And Zuora's subscription retention rate with its 441 largest customers is nearly perfect (one client lost in three years).

- With an intense focus on making recurring-revenue, subscription-based business models work for its clients, Zuora is likely to be an expert at making its *own* subscription business excel.

KEY DATA

- **Website:** https://www.zuora.com/
- **Latest Presentation:** April 2018 PDF
- **Market Cap:** $2.7 billion
- **Revenue (TTM):** $187.3 million
- **Earnings (TTM):** ($58.5 million)
- **Free Cash Flow (TTM):** ($34.1 million)
- **Revenue (2016/'17/'18):** $92.2 million / $113 million / $167.9 million
- **Earnings (2016/'17/'18):** ($48.2 million) / ($39.1 million) / ($47.2 million)
- **Free Cash Flow (2016/'17/'18):** ($40.6 million) / ($28.8 million) / ($29.5 million)
- **Cash/Debt:** $203 million / $10.8 million

Financial data from S&P Global Market Intelligence. Data taken on July 16, 2018.

AMC Theaters recently sent me an email asking if I'd like to subscribe to its new Stubs A-List program: For $19.95 per month, I could view up to three movies every week. A movie ticket usually costs around $10 to $12, so if you see two movies per month, the subscription is a money saver, let alone if you see 12. I'll consider subscribing, but I know this is just one of many subscription choices I'll be making soon. You will be, too.

Welcome to the Subscription Economy! That term was coined by the co-founder and CEO of California-based **Zuora** (NYSE: ZUO). Zuora believes that a shift to subscription business models across industries is a giant, unfolding economic wave. As investors, we should cheer this sea change. *Pro* has always been drawn to companies with recurring revenue. It makes a business more stable and predictable, and it provides a steady base from which to grow. And for customers, subscribing spreads out the cost, sometimes lowering it.

As the world embraces the benefits of subscription business models, you're going to see opportunities to subscribe to your favorite restaurants, clothing retailers, car providers, everyday consumer products, airlines, and much more. Corporations are subscribing to one another's services more than ever, too. In both cases, Zuora's software helps make this new wave possible.

The Story

Zuora's mission is to help any company in any industry successfully launch and manage — and become — a subscription business. As companies move from the one-off sales model of our industrial yesteryear to ongoing service-oriented relationships with customers, they'll need versatile software to match. Zuroa estimates that this long-term shift should allow it to achieve 25% to 30% annualized sales growth for years.

MGI Research estimates that Zuora's core recurring billing management software market should grow from $1.8 billion in 2017 to $9.1 billion by 2022. And Zuora believes — and is proving — that it can take market share from legacy enterprise resource planning (ERP) software companies, which Gartner estimates will be a $40.6 billion market by 2021. ERP software was built to track linear sales cycles, rather than the fluid subscription relationships we'll be seeing more of. If Zuora can capture even a slim minority of the ERP and subscription management software markets, it could pull in much more than the $187 million in revenue it rang up over the past year. And it has the products to do so.

Zuora's software, which is sold through a subscription model itself, offers several modules including pricing and payments, subscriptions ordering, accounting, analytics, and more. Access starts with a fixed annual fee of $25,000 to $500,000 and up, depending on a company's needs; and fees paid to Zuora go up with usage or transaction volume. Most contracts are for one to three years, billed annually. And it's sticky. Since fiscal 2015, Zuora has only lost *one* customer that started with a contract worth $100,000 or more. All others renewed. In fact, Zuora's dollar retention rate was 112% last quarter, meaning customers on average pay more as time goes on.

Zuora's two flagship products are called Billing and RevPro. Here's a little more on each:

- Billing drives a client's product and pricing strategy to help foster subscription growth, while automating the recurring ordering, invoicing and collections. In addition to subscription fees, Zuora charges for the dollar volume flowing through Billing, effectively collecting a small toll that grows as volume grows. Last quarter, $7.2 billion flowed through Zuora's Billing platforms, up 46% year over year.

- RevPro is an industry-leading revenue management program for fluid business models, a necessity in today's complex compliance environment. RevPro tracks a company's revenue and performance obligations (which are promises to transfer goods or services); it pulls in related data from third-party software; accounts for acquisitions; and more. Again, the more revenue a client moves through the software, the more Zuora charges. And, increasingly, Zuora's software serves as the system of record for the customer, making it still stickier.

More than 50% of Zuora's approximately 950 customers are in non-technology industries, including transportation, manufacturing and consumer services, and no single customer accounts for an outsized portion of revenue. But Zuora had 441 customers as of last quarter with annual contract values of at least $100,000 each. These companies represent 80% of Zuora's annual earned contract value — and again, the customer retention rate here has been near perfect.

Lately, 70% of revenue is subscription-based, while 30% comes from professional services. It takes months for Zuora's staff to set up most new customers, and Zuora runs its labor-intensive professional services at breakeven, knowing it will make money later on subscriptions. This lowers gross margins for now, but as the subscriber base grows, professional setup costs will shrink in comparison. In other words, high service costs today are a leading indicator to higher subscription sales tomorrow, so we should welcome them.

Co-founder and CEO Tien Tzuo, 49, was employee No. 11 at **Salesforce.com** (NYSE: CRM), the software-as-a-service giant, and he was responsible for building its first billing system. Recognizing early that industries were turning to subscription business models, he and two colleagues launched Zuora in 2007 (the name is a combination of letters from their last names). Tzuo has been CEO all along. With its pure focus on providing software to run subscription business models — and being one itself — Zuora is focused on the long term. That's probably one reason it's received recognition as a top place to work from Glassdoor, the *Silicon Valley Business Journal*, and multiple other publications. Employees are called ZEOs — each is in charge of their Zuora career. Tzuo owns more than 7% of the company's shares, worth more than $200 million, and seems committed to his vision of building the Subscription Economy.

Our own digging and Forrester's Wave tell us that Zuora is a (perhaps *the*) focused leader in its field, and its recent IPO increased its profile.

Zuora leads Forrester Wave 2017. Source: Forrester Wave and Zuora.

Many young software companies lose money for years but remain top-performing stocks because Wall Street sees profits on the horizon. We believe Zuora fits the mold. It's not expected to make money for at least three more years. The company is spending to reach new customers and to fund R&D to keep its offerings tip-top. As annual subscription revenue climbs higher, if all goes to plan, profits should eventually arrive and then quickly grow. When it comes to young SaaS companies, investors seem to treasure revenue growth first and foremost -- because you're in the costly building phase for years. But even while young and small, Zuora is showing how its operating loss shrinks, as a percentage, as revenue grows. The company's GAAP operating margin improved from (52%) in fiscal year 2016, to (32%) in fiscal 2017, to (28%) in fiscal 2018.

In the most recent quarter (reported May 31), Zuora grew revenue 60% to $51.7 million, with subscription revenue up 39%. For fiscal 2019, which is now underway, Zuora guides to about $220 million in revenue, up 31%, and a GAAP loss of about $53.5 million. Zuora had more than $200 million in cash and equivalents as of April 30.

How It Fits Into Pro

Pro is about 13.2% invested in pure software plays, but given the attractive dynamics of the industry, and how most all businesses are software customers now, we are not worried about this exposure. In the short term, sector volatility will strike us harder than average. But in the long run, we expect these businesses we own to each individually deserve and earn strong returns. And we'll trim those that don't. As we see Zuora start to prove out, it may compel us to earlier trim some of our other software companies that are lagging.

Overall, Zuora has a business and mission that we want to be a part of. We believe subscription-driven business models will spread for the rest of our lives. It takes time to change how you do business, but we have time, and change is already unfolding while we wait for more of it. In the mode of **Square** (NYSE: SQ), **JD.com** (NASDAQ: JD), or **Paycom Software** (NYSE: PAYC), among others, Zuora can hopefully drive exceptional future growth in *Pro* and keep our portfolio highly relevant. We're starting small at a 1.5% stake, knowing we can add anytime. Also, a total loss would only nick us, but several doubles over the years would aid us greatly. Meanwhile, since Zuora has been public for only one quarter, expect a lot of stock volatility.

The Bottom Line

Let's run down a non-exhaustive list of what we like about Zuora:

- Recurring subscription revenue with high retention and growing customer value
- A business model that lets Zuora grow as its customers grow
- A large, expanding, worldwide market as the Subscription Economy expands
- A founder-led business with high insider ownership and a vision
- Industry leadership with a pure-play company
- A-level customers, including **FedEx** (NYSE: FDX), **Nvidia** (NASDAQ: NVDA), HBO, **Delta Airlines** (NYSE: DAL) and **DocuSign** (NASDAQ: DOCU)
- A recognizable path to profitability, one that's been well-trodden by countless small companies before it
- Strong revenue growth and the promise of much more for years

We'll close with the words that chief ZEO Tien Tzuo used to open Zuora's first conference call as a public company:

> "Thank you for letting me share our story about Zuora and about the overall Subscription Economy. ... For those of you that are new to Zuora, welcome, welcome to our journey. Welcome to joining our customers, our partners, our shareholders and the roughly 1,000 ZEOs worldwide that make up our company. Welcome to a journey into the future."

Pro Guidance Changes and Completed Trades: July 16, 2018

Published Jul 16, 2018 at 12:32PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- None in the past week!

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Gilead Sciences** (NASDAQ: GILD): We sold our shares at $76.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): We sold our shares at $47.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Portfolio 2018 Mid-Year Review

Published Jul 16, 2018 at 12:32PM

Dear *Pro* members,

Now that we're more than halfway through 2018, it's time for our *Pro* portfolio mid-year review! In this Memo, we will discuss the *Pro* portfolio's performance, inflation, market volatility, portfolio activity, and talk about major drivers of our performance. With the information from this review, we can determine how our results or approach have changed over time (if at all), and we can potentially use this information to our benefit.

The Review

The *Pro* portfolio's performance has been right on track with our goal over the first six months of 2018. Our year-to-date performance as of June 30, 2018, is 5.4%, outperforming both the S&P 500 (up 2.6% during the first six months of the year) and our North Star (up 5.3% in the same time frame). The strong Nasdaq, and our desired concentration there, is a significant contributor to the *Pro* portfolio outperforming our North Star (and the S&P 500) so far this year.

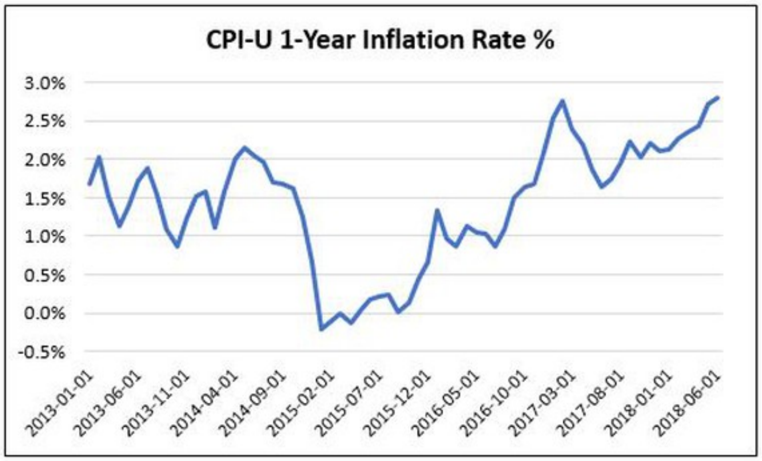
Our net long exposure as of June 30th is about 81%, higher than our historical average of about 74%, indicating our slightly more aggressive stance during the current economic period of tax reform and accelerating U.S. GDP growth. Here's a comparison of the performances of *Pro*, the S&P 500, and our North Star over the first *halves* of 2013, 2014, 2015, 2016, 2017, and 2018:

Year	*Pro*	S&P 500	Nasdaq	North Star
2013	22.4%	12.6%	12.7%	4.1%
2014	7.4%	7%	5.5%	4.4%
2015	9.4%	1.2%	5.3%	4.6%
2016	1.4%	3.8%	-3.3%	5.1%
2017	7.5%	8.2%	14.1%	3.5%
2018	5.4%	2.6%	8.8%	5.3%

Source: U.S. Bureau of Labor Statistics seasonally adjusted, indexed, monthly CPI-U data series.

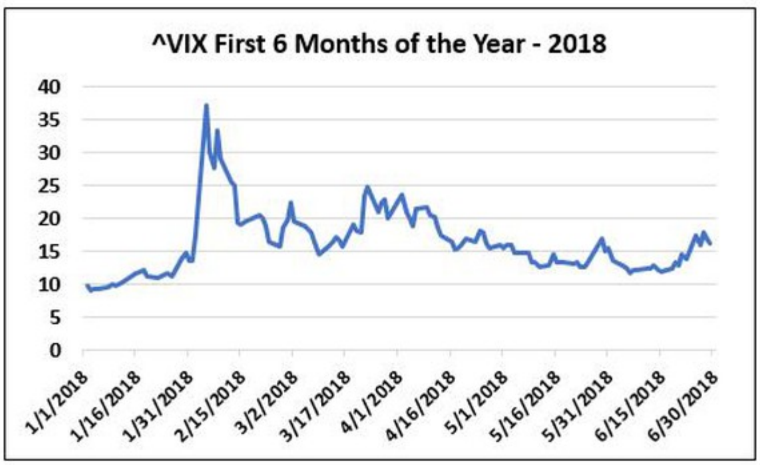
Inflation

Inflation (as measured by the U.S. Bureau of Labor Statistics CPI-U index) has picked up in the first half of 2018 — not a surprise considering the accelerating GDP growth and rising interest rates. The most recent figure from the BLS shows 2.8% year-over-year inflation, which is the highest rate since February 2012. Since inflation is an input for our North Star (which is calculated as inflation + 7%), we need to keep an eye on the inflation rate. With the North Star as our guiding light, we have a higher expectation for future returns as inflation rises, and this dynamic plays a role in our portfolio-level risk tolerance and decision making process.



Volatility

Volatility (as measured by the ^VIX index) started the year at a low level, continuing the trend of low volatility that persisted throughout 2017. However, in early February, a strong jobs report led to a surge in interest rates, spooking the markets and causing significant volatility, leading to a peak ^VIX level of 37.32 on February 5th (the highest ^VIX level since August 2015). Since then, volatility has settled down, but volatility levels remain generally higher in 2018 than they were throughout the abnormally calm 2017.



Source: S&P Capital IQ.

Portfolio Activity

Here's how *Pro's* portfolio activity breaks out for the first halves of 2013-2018:

	2013	2014	2015	2016	2017	2018
New Purchases	2	2	1	1	4	4
Allocation Increases	3	1	0	1	2	1
Options for Income	8	8	8	13	10	5
Options for Leverage	1	1	1	0	0	3
Shorting	1	0	2	2	1	0
Hedging	4	4	4	4	4	3
Sales (or short covering)	3	3	1	4	8	6

Note: 2018 activity includes trades made between June 30 and today.

As we did in 2017, *Pro* has been active both closing older positions and adding new positions. In 2018, through the first six months of the year, we've added a buy/write covered call position on **The Cooper Companies** (NYSE: COO), and new long stock positions in **CME** (NASDAQ: CME), **Adobe** (NASDAQ: ADBE), and **JD.com** (NASDAQ: JD). We also increased our allocation to **Tencent** (NASDAQOTH: TCEHY) with a tactical quarterly dividend reinvestment.

As for closing older positions, we've taken a bucket approach. We closed our positions on **SVXY** (NYSEMKT: SVXY), **SRS** (NYSEMKT: SRS), and **Shake Shack** (NYSE: SHAK) in one fell swoop, and closed our positions on **Gilead Sciences** (NASDAQ: GILD) and **DGS** (NYSEMKT: DGS) in another batch trade. We also closed our position on **Verisign** (NASDAQ: VRSN) by way of option assignment.

We've slowed down a bit compared to the last two years with respect to options for income. However, with the higher volatility levels of 2018 compared to 2017, perhaps this is an area we can target for more activity in the second half of the year.

Our options for leverage strategies have included a new diagonal call position on **Oracle** (NYSE: ORCL) (we await a chance to restart a short call), and maintenance trades on our two other active diagonal call strategies (on **American Tower** (NYSE: AMT) and **Home Depot** (NYSE: HD)). The new Oracle diagonal call position has not so far worked in our favor (currently down about -6%), but the American Tower (up 32% in less than two years) and Home Depot (up 26% in less than a year) positions have been working out well.

Our strongest-performing stocks so far this year have been **Square** (NYSE: SQ) (78% return in the first half of the year), **Amazon** (NASDAQ: AMZN) (45%), **Mastercard** (NYSE: MA) (30%), **Broadridge** (NYSE: BR) (27%), and **Paycom Software** (NYSE: PAYC) (23%).

Our worst (again, so far) stocks have been SVXY (-90%), **Coherent** (NASDAQ: COHR), (-45%), **NVR** (NYSE: NVR) (-15%), **Starbucks** (NASDAQ: SBUX) (-15%), and Oracle (-7%).

All in all, the first six months of 2018 have been more volatile than last year, and that volatility in early February led directly to the severe impairment of our SVXY position, taking a big bite out of our returns. For context, if we exclude the effect of SVXY's collapse on our results, the *Pro* portfolio would have returned 8.3% over the first six months of 2018 (rather than the realized performance of 5.4%). (Of course, that still includes SVXY's earlier gains.)

However, 2018 so far has also been kind to technology companies, which has been a boon to many of our largest positions, boosting our results. That we can take a 90% loss on one of our positions and still post a six-month return that is higher than the S&P 500 and our North Star is a testament to 1) our diversification, and 2) the performance of our larger positions dwarfing the effect of our smaller positions.

Despite a near-implosion of one of our positions and weak performance from others, the *Pro* portfolio as a whole is performing well in a rockier market. We've used the last two years to start to reposition our portfolio, selling out of positions where our confidence had waned, and buying new positions that we like for the long term. We have outperformed both the S&P 500 and our North Star over the first six months of 2018, and though we know we must keep evolving — including on our shorts and hedges — we believe we can continue to set ourselves up well to achieve our collective goals over the long term.

The *Pro* Bottom Line

Pro's low-turnover approach is patient, flexible, and focused on an absolute-return strategy. While we aren't perfect with every decision, we try to keep our underlying philosophy in mind with every choice we make. We like the portfolio moves we've made in the first half of 2018, and we think that our general strategy of closing laggards / non-core positions and adding strong, Pro-like businesses should be beneficial to our results over the long run. I like to conclude our mid-year review columns with a nod to the first *Pro* mid-year review column written in 2014. It's still completely applicable today, demonstrating the consistency of our investing process. Here it is, with edits in brackets only to change the reference to the year:

> "While we aren't market prognosticators and we can't tell you what to expect from the market over the second half of [2018], we can tell you what our approach to portfolio management will be. We will continue to invest in core stock positions (i.e., compounding machines) when the balance of risk and reward looks favorable. We will continue to use options strategies either for income, to add to our positions at lower prices, or for leverage, depending on what opportunities present themselves. We will seek to short weak, disadvantaged companies that appear poised for a stock price decline, and we will manage our net long exposure via index hedges as market conditions dictate."

Fool on!

— Billy (TMFBillyTheKid)

Pro Catch-Up Trades and Expirations: Adobe, SPY, and More

Published Jul 12, 2018 at 2:09PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.9%
- **CME Group** (NASDAQ: CME): Buy 2.4%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.6%.

Continue building your portfolio with our Buys, including:

- **FactSet Research Systems** (NYSE: FDS): Buy 2.1%.

Shorts:

- **SPDR S&P 500** (NYSEMKT: SPY): If you do not yet have a synthetic short set up and you want one, sell to open January 2019 $285 calls and buy to open an equal number of January 2019 $270 puts. Lately, this can be set up for a net debit of about $0.25 per synthetic short. Set up one synthetic short for every $27,000 in look-through short exposure you want via owned $270 puts and every $28,500 of potential short exposure via short $285 calls. Pro has a 15% look-through position, or 17 contracts of each. Be mindful that SPY is closer to $285 now than it was when we originally set up the position.

Options:

- **The Cooper Companies** (NYSE: COO): If you've yet to write covered calls yet, you can now "sell to open" the August 2018 $240 calls from the original trade alert, selling one call for every 100 shares you own and want to cover. These are slightly in-the-money, but that's OK. Lately, they pay about $8.80 each. (We'll manage our August $230 calls as needed, later, as time value dissipates.)

Upcoming Expirations:

- None until mid-August.

FactSet's Steady Earnings

Published Jul 9, 2018 at 3:21PM

Greetings, *Pro* members,

In late June, **FactSet Research Systems** (NYSE: FDS) announced earnings that sent the stock a bit lower -- and it's still recovering. Lately at $204, FactSet trades 4.6% lower than it did right before earnings. But the news itself was fine: The specialized investment data provider increased GAAP revenue by nearly 9% in the third quarter, to $340 million, and adjusted diluted earnings per share jumped 18%. This growth was helped by a lower tax rate, which dropped to 16.5% from 23.2% last year. In 2019, FactSet will see a full year of benefits from lower taxes, helping the bottom line further.

But for us, the real story of FactSet is steady free cash flow growth. From $265 million in the year ended August 2014, free cash flow has grown each year to hit $320 million in the year ended August 2017. Now, trailing-12-month free cash flow is $380 million. Free cash flow increased 42% last quarter compared to a year ago. With about 90% of customers renewing, a relatively low-expense business, and annual price increases, FactSet is a steady free-cash-flow machine. And hosting nearly 5,000 clients and 89,000 workstation users, FactSet has the depth to go after new markets.

The company is positioned to serve a lot more desks at a lower price point that still provides a good profit margin for the business. Overall, even as it adds smaller clients, operating margins are expected to increase. Another new product called "Open: FactSet Marketplace" has shown a promising start since its recent launch. This is a royalty-based model in which data providers publish their content into the FactSet system, gaining access to institutional clients. FactSet ties the data sets to other relevant data sets, increasing the value. Royalties are paid to FactSet by users and shared with the data providers. As investors look farther afield for an edge, they want everything from social media data to smart satellite-driven analysis of traffic flow to more quant data and beyond.

Basically, if you're not a passive index investor and you are concerned about relative returns, it's more important now than ever to prove your worth by earning returns above those of the passive investors, and various sets of data can help. Money managers and wealth management offices are on the hunt. That said, the overall industry environment for FactSet's business is still cost-challenged. Most investment shops have spending restraints, and those that underperform continue to close. But FactSet has been able to grow by pursuing new markets. Organic annual subscription value (a form of revenue) in Asia was up more than 13%, and FactSet just opened its first office in China, in Shanghai. It is already finding advantages in the new office compared with its previous arrangement, under which it served China from Hong Kong.

FactSet bought back 620,000 shares last quarter for $122 million, or about $196 per share. And it increased the dividend by 14% to $0.64 per share quarterly, for a 1.25% current yield. It's not a lot, but it's something. For the year, earnings per share should increase by about 16%, and the stock trades at 21.7 times estimated earnings one year ahead. The company put together a good summary of its financial results in a nifty presentation.

The stock is up by an average of 27% for us (we've made a few purchases) since our first purchase just over two years ago. With dividends, it's up about 30%, in line with a strong S&P 500, and above our North Star. **Shares remain a Buy. We have a 2.1% stake. Our fair-value estimate increases to $205.**

A Closing Reflection

"Nobody gets everything." My wife repeats that fact frequently. Some people have amazing children but live in poverty. Some are rich but lack friends. Some are young but have poor health. Nobody gets everything. Further, most people are forced to accept loss as a part of life early on, and then forced to revisit it again and again. Whether you lose your home in a storm, or lose a friend or parent to illness, or lose some of your energy (or hair!) over the years, we all know loss.

Investing losses are typically much less devastating, and we aim in *Pro* to ensure they are never catastrophic. No loss or event should derail our long-term strategy. Nobody gets everything, but when it comes to investing, it's just a matter of increasing a numerical value. We want to be set up to have our numbers work out in the end no matter what. That's why owning the portfolio -- being diversified -- and sticking to the strategy are so important. Nobody gets everything, but investing success is one thing we should all achieve here.

To share any thoughts, please visit the Memo Musings board. And Fool on!

-- Jeff (TMFFischer)

P.S. Nobody gets every investment winner, either, but we look forward to adding some new potential winners to the port. :)

Pro Guidance Changes and Completed Trades: July 9, 2018

Published Jul 9, 2018 at 3:20PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **FactSet Research Systems** (NYSE: FDS): Fair-value estimate increases to $205. The stock remains a Buy with a 2.1% allocation.

Pro Completed Trades (see transaction log; trades take a day to appear):

- None the past week.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Sell Gilead Sciences and DGS

Published Jul 2, 2018 at 2:42PM

Is this for you? This recommendation is for all *Pro* members who own these shares and are following our portfolio moves.

How You Participate

- **Actions:**
  - Sell all 1.9% held in **Gilead Sciences** (NASDAQ: GILD).
  - Sell all 1.7% held in **WisdomTree Emerging Market SmallCap Dividend** (NYSEMKT: DGS).

- **Guidance:** Sell.
- **Price Guidance:** Please don't rush; **calmly use a limit order** to sell each investment around the going price when you place your trade. Without rushing, *Pro* will sell within the next 30 days. We hope to get more than $70 for Gilead and more than $47 for DGS, but we'll see what the market gives us when we're ready to trade.

What We're Thinking

The *Pro* Portfolio is as invested as it has ever been, holding only 5.6% cash. Steadily investing the cash we held as of a few years ago has been lucrative, leading us to buy stocks in several new companies that are highly profitable as a group -- some greatly so individually. But it has reduced our cash balance, even after we recently sold our shares of **Verisign** (NASDAQ: VRSN) through covered calls.

We have some new buys in our sights now, but we don't want to take our cash down to basically zero, so we're going to sell some laggards -- stocks in which we now lack much conviction -- to raise some cash. In the coming 30 days, as we sell, this will raise 3.8% more cash at current prices, bringing our cash balance to 9.4% of the portfolio. That's enough to leave us with some left over even after we make some new buys and options positions.

Meanwhile, these two positions have been among our longest-term disappointments. We've given both investments a long time to improve, and both have come up short so far.

Gilead Sciences' Hepatitis C sales have continued to fall precipitously as competition leads to much lower prices and lost market share. Although management believes these sales will stabilize this year, we have concerns that when new contracts are written for 2019, pricing will likely decline again. There is still a lot of margin left in the drugs, so competitors will likely continue to compete on price to maintain and gain new business.

Gilead's future relies on its world-leading HIV franchise and a drug pipeline that will require some years of further patience to potentially bear fruit. If we were steadily adding new cash to *Pro*, we might be inclined to sit and wait for this proven company to eventually succeed anew. But given our limited cash -- and our desire for it to perform -- such a wait may be one luxury we don't want to afford. Just as importantly, we knowingly strayed from our *Pro* principles when we bought Gilead. The company lacks several key elements we look for: pricing power, an expanding market for many of the products that drive its revenue, and recurring revenue (at least in the Hepatitis C division). Being low on our checklist for *Pro* qualities makes Gilead high on our list of stocks to cut. As of last quarter, management believes its business can return to earnings growth in 2019, but we're still not compelled to hold out.

Meanwhile, WisdomTree Emerging Markets Small-Cap Dividend Fund has been even more disappointing, though this is through no fault of its own. Emerging-market stocks have lagged U.S. stocks severely over the past decade. Our ETF has outperformed the other emerging-market indexes we've watched, but its performance has still resulted in only very modest annualized returns, including dividends. That trend appeared to be changing early this year as our ETF jumped, but at-risk trade agreements around the world, and a big drop in China's market, have taken emerging-market stocks back down to where they started the year.

In addition, here in *Pro*, we've been buying shares of **Tencent** (NASDAQOTH: TCEHY) and **JD.com** (NASDAQ: JD), and we now have a combined 5.5% position in these two Chinese leaders. We follow these companies closely and we have high conviction in their potential, so at this point we'd rather put our capital into these ideas rather than into an emerging-market ETF. We believe we can perform better using our hard-won knowledge about investing in individual stocks.

How These Decisions Fit Into *Pro*

We continue to evolve and strive for better. Our ultimate goal in *Pro* is to steadily improve over time -- alongside you, we want to become better and better investors, with an ever-stronger collection of investments in the portfolio. We will almost always have some problem positions and some that disappoint, but our drive in those cases is to learn. We want to give positions as much time as they might need, but not let them go to seed longer than may be beneficial.

In addition, *Pro* wants to focus on companies that have sustainable competitive advantages that ideally grant them some pricing power, as well as recurring-revenue business models and ample opportunity to reinvest cash flow into new opportunities that have attractive returns.

With Gilead, we assumed that the hepatitis market would build over many years, creating investor confidence along the way, rather than exploding higher in just a few years and then crashing as it is doing now. With emerging markets, we assumed a price recovery from the Great Recession which, surprisingly, has only occurred in very modest fashion. But looking ahead, neither stock matches the profile of the type of individual business (or investment) we want to own in *Pro*, so even if they recover, these holdings would be oddities in the type of portfolio we're striving to build and maintain.

We'll sell our positions in these two stocks in the next one to 30 days.

Pro Guidance Changes and Completed Trades: July 2, 2018

Published Jul 2, 2018 at 2:13PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

Thanks to increased earnings estimates and a higher fair-value estimate of $186, **Facebook** (NASDAQ: FB) joins our recently revised Best Buy Now list. The full list, which debuted last week, is repeated below with the addition of Facebook:

- **Gilead Sciences** (NASDAQ: GILD) moves to Sell, per our trade alert.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) also moves to Sell.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Tencent** (NASDAQOTH: TCEHY): We bought 130 more shares at $50.37, bringing our total stake to 2.8%.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Buy (More) Tencent

Published Jun 27, 2018 at 2:57PM

Is this for you? This recommendation is for all *Pro* members who have year-to-date dividends to reinvest, or who have ample cash to make a small additional investment and want to match us.

How You Participate

- **Action and Allocation:** Buy 0.18% more in **Tencent** (NASDAQOTH: TCEHY), increasing your position size to 2.78%. At recent prices, *Pro* will buy about 130 more shares.
- **Price Guidance:** Use a **limit order** at the prices available when you place your order. We'll buy in the next one to 30 days.
- **Recent Price (June 27, 2018):** $48.23
- **Guidance:** Tencent is rated a Best Buy Now with a fair-value estimate of $50.

What We're Thinking

With shares down roughly 20% since Tencent's stock set an all-time high this past January, we believe now is a great time to invest the $6,313 in dividends we collected in the first quarter of 2018 and pick up some additional shares. We think there are two most likely culprits for the decline in the share price of our favorite Chinese powerhouse in the worlds of social media, payments, gaming, venture capital, and more:

1. Management acknowledged that they are more than willing to sacrifice margins in the near term in order to position the company for long-term success. The market reacted myopically, but we believe this is ultimately the right move to ensure Tencent doesn't become the next AOL or MySpace.
2. The recent tensions between the political leaders in the U.S. and China. In the long run, we believe these will sort themselves out.

Besides that, though it's pretty much impossible to keep up with everything Tencent is doing, there have been plenty of headlines over the past few months that suggest our thesis is still on track:

- Tencent Music may go public later this year as one of the largest tech IPOs ever
- Meituan, the Tencent-backed 'one-stop super app,' files for IPO in Hong Kong
- *League of Legends* was selected as an Official Demonstration of Sport for the 2018 Asian Games, and eSports will become an official medal event at the 2022 games
- WeChat mini games have now amassed roughly half a billion users (despite many skeptics calling Tencent's mini program a flop when it first came out)
- Tencent's $300 million investment for 40% of Epic Games is now worth upwards of $12 billion (that's an annualized return of 85%!)
- China's share of global venture capital funding was 24% last year, up from less than 5% a decade ago. Consulting firm McKinsey recently estimated that Tencent and Alibaba alone accounted for upwards of 50% of fund flows in China. We see this as a positive because we think Tencent investments provide the company with new ways to make its current products even stickier and greatly reduce the risk of the company losing relevance over the next decade.
- We are likely to see shares of major Chinese public companies listed on domestic exchanges by the end of the year, which could be met with strong domestic demand. (For context, the current situation is roughly analogous to a world in which Facebook shares are un-investible for most U.S. residents.)

Those bearish on the company frequently like to point to Tencent's large market capitalization and "expensive" valuation as signs that it's destined to underperform the market going forward. But the same could have been said for Microsoft in 1998 -- the year it first became the largest publicly traded company in the world and boasted financials not too far off from what we've recently seen from Tencent.

Metric	Microsoft (fiscal 1998)	Tencent (TTM)
Financials		
3-year revenue growth rate	37%	47%
Net income margin	29%	31%
3-year net income growth rate	46%	49%
ROE	33%	32%
Valuation		
Earnings multiple	69x	39x
Free cash flow multiple	46x	44x
Market cap	$267 billion	$493 billion
Inflation adjusted market cap	$412 billion	
Size rank as a public company	2nd (Microsoft's fiscal year ended in June and by September it had claimed the top spot)	9th

Source: S&P Global Market Intelligence

With the benefit of hindsight bias, we can see that size and valuation were certainly not the enemy of performance for Microsoft — including dividends, the stock has outperformed the market by 5% annually since the end of its fiscal 1998. Only time will tell whether Tencent will be able to follow a similar path and beat the market over the coming decade-plus, but we believe it's misguided to hold Tencent's size against it. And if our thesis plays out as we hope, Tencent will have little trouble growing into its current valuation.

The Foolish Bottom Line

We were a bit more tactical with our dividend investment this time around , preferring to wait until we saw an attractive opportunity instead of redeploying the capital as soon as the quarter finished. Sentiment for Chinese stocks may remain muted if the current political environment doesn't improve, but we believe Tencent's current valuation represents an attractive opportunity for long-term-focused investors. Nudge this position up by 0.18% or so if you have dividends you want to reinvest or more than ample cash and want to follow along. Helping to make this economically feasible, our trading commissions at Interactive Brokers are very low. Hopefully, given the commission wars going on, yours are, too. Fool on!

Mr. Market, and Oracle

Published Jun 25, 2018 at 1:53PM

Note: We don't have any guidance changes or completed trades to share over this past week. A continued huzzah for status-quo, long-term investing!

Greetings, *Pro* members,

The stock market has entered one of its (presumably) typical periods of decline, something that usually happens a handful of times per year, with stocks falling a few percent (3%, 5% ...) in a matter of days.

Some volatility seems merited given the ascent many stocks have enjoyed since April earnings. Whatever the market is trading on right now -- presumably trade-war-related concerns -- earnings will come into focus again in a few short weeks, and with them, valuation. The S&P 500 on average remains reasonably valued at about 16 times expected earnings, as long as those earnings don't decelerate. Perhaps trade tariffs represent the biggest risk to near-term earnings right now, because of the risk poised to global commerce.

Is the White House aiming for short-term pain in hopes of long-term gains? Who knows. Time will tell whether any strategy works. Most countries have enough to lose that they'll want to find solutions.

Oracle's Fate

Meanwhile, last week **Oracle** (NYSE: ORCL) reported earnings that sent the large-cap stock tumbling. This leaves us with a choice. We can sell this beaten-down stock because we fear it's a long-term value trap and reinvest the money somewhere we like better. Or we can keep investing in Oracle's potential to continue evolving into a cloud company that regains Wall Street's respect and a better valuation.

Let's talk about the results, and the stock.

Revenue was up 3% to $11.3 billion. That's nothing to write home about, but keep in mind that tepid revenue growth is expected as Oracle continues to shift from long-term licenses to monthly cloud revenue. This will eventually result in higher margins -- and even higher revenue -- once cloud infrastructure spending slows and the cloud revenue base is large enough, but initially it increases costs and lowers immediate revenue. Next year, Oracle expects revenue growth to tick upward, toward 5%, and earnings-per-share growth to remain above 10%. That's nothing to sneeze at on the bottom line, but Wall Street seems bored by it.

Lately at $44, the shares are back to lows last seen in March 2017. That doesn't sound bad, but this price level was first hit in late 2014, so if you bought at that point, you've had nothing but dividends to show for it for three years as Oracle transitioned to the cloud. The stock now trades at 13 times expected earnings for the year ahead, as low as it's been valued since early 2016, and 9.2% below its five-year average of 14.2.

Oracle trades at 13 times forward earnings. Source: S&P Capital IQ.

At today's price, it seems reasonable to assume Oracle's downside should continue to be minimal -- even more so than usual. It's only been a few days, but the stock has held up during the recent market meltdown. More importantly, will growth pick up from here to at least get the stock's return near our North Star?

The bottom-line earnings growth expected (of at least 10%) and a 1.7% dividend, coupled with aggressive share buybacks, suggest the North Star could be in reach. Management has bought back $11.5 billion worth of shares over the past 12 months, at an average of $48.31 per share. And they said last week they view the stock as "very inexpensive," so they'll continue to ramp up the buyback.

For the year just ended (Oracle's 2018 ended May 31), total cloud services and license revenue grew 7% to $26.3 billion. Non-GAAP EPS was up 11% in constant currency, and 14% in U.S. dollars. Free cash flow was up 13% year-over-year in the past year, to $13.7 billion. And ideally all these growth rates will be stronger in the 2019 that just started.

In the next quarter, revenue is expected to grow 1% to 3% in constant currency, with non-GAAP EPS growth of 9% to 13%. For the year, revenue growth should be closer to 5%.

But with cloud growth still tepid, Wall Street is left waiting and wanting. We need to decide if we want to wait and see whether cloud revenue finally begins to spring upward along with margins, or decide whether our patience is running out.

Right now, I believe our money invested in Oracle will certainly (as certainly as possible in the market) do better than cash and inflation. It could -- from this price -- even challenge our North Star over the next three years. So, if we're going to move money from Oracle, we need to be highly confident in where we put it next, since most stocks we're considering right now will likely have higher risk than Oracle at this point.

Market Opportunities?!

And with that, I'm going to head off from this column and plug into the market to see if there are any pricing opportunities that we like enough to act on already this week.

To share any thoughts, please visit the [Memo Musings board](). And Fool on!

-- Jeff (TMFFischer)

Pro Catch-Up Trades and Expirations: Cooper Companies, SPY, and More

Published Jun 21, 2018 at 3:26PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.4%.
- **JD.com** (NASDAQ: JD): Buy 2.8%.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.6%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy 4.7%
- **Medtronic** (NYSE: MDT): Buy 2.4%.

Shorts:

- **SPDR S&P 500** (NYSEMKT: SPY): If you do not yet have a synthetic short set up and you want one, sell to open January 2019 $285 calls and buy to open an equal number of January 2019 $260 puts. Lately, this can be set up for a net debit of about $0.70 per synthetic short. Set up one synthetic short for every $26,000 in look-through short exposure you want via owned $260 puts and every $28,500 of potential short exposure via short $285 calls. Pro has a 15% look-through position, or 17 contracts of each.

Options:

- **The Cooper Companies** (NYSE: COO): Although the stock price is higher than it was when we issued the adjusted $230-strike-price recommendation last week (for those who hadn't made the original trade yet), we decided in favor of writing the August $230 calls ourselves. Naturally, they now pay more than before (lately about $10.20). If you're new to the trade, buy shares in 100-round lots and sell to open these same August $230 calls, capturing some intrinsic value and a more than 2.5% yield in just over two months. (As we said in the adjustment alert, if you wrote the $240 calls originally, you can continue to keep those open instead.)

Upcoming Expirations:

Record Revenue and Earnings for Adobe

Published Jun 19, 2018 at 1:20PM

Second Quarter 2018

- Press Release
- Earnings Call Script and Slides
- Investor Datasheet
- 10-Q Filing

Adobe (NASDAQ: ADBE) continued its recent business momentum in the second quarter of 2018, achieving record quarterly revenue and earnings-per-share of $2.2 billion (+24% year-over-year, +25% trailing-12-months) and $1.33 (+78% year-over-year, +51% TTM), respectively. Earnings growth was bolstered by lower-than-expected tax rates due to the new U.S. Tax Act. Revenue growth is balanced across the company's two major segments, with the Digital Media (i.e. content creation) segment posting +28% year-over-year growth and the Digital Experience (i.e. digital advertising) segment posting +18% year-over-year growth.

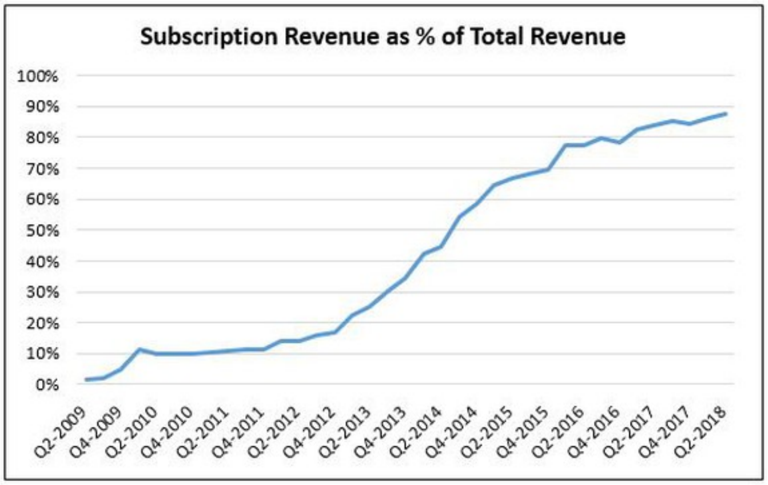
Adobe also made a relatively big acquisition in Q2, a $1.68 billion acquisition of Magento Commerce, a market-leading commerce platform. Adobe plans to integrate the Magento Commerce Cloud into the Adobe Experience Cloud, delivering a single platform that serves both business-to-business (B2B) and business-to-consumer (B2C) customers. This acquisition should bolster Adobe's Digital Experience business as it broaden's the company's addressable market by an estimated $13 billion, and it should help Adobe cross-sell its current offerings to a wider customer base.

The company outperformed its guidance in the quarter across almost all of its metrics...

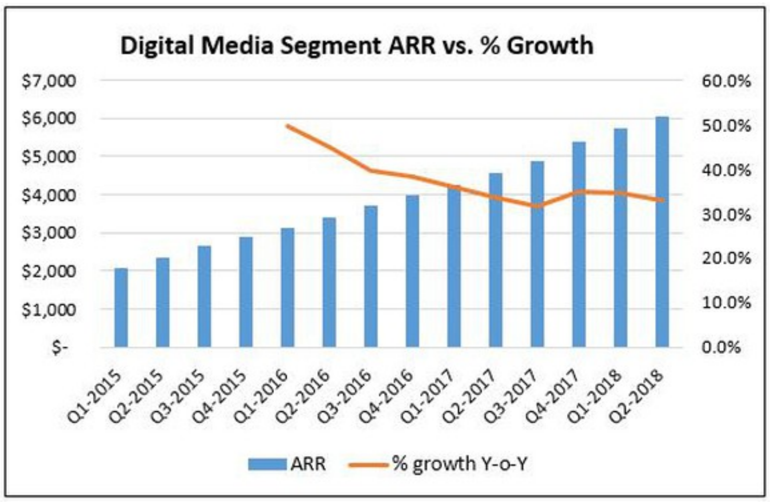
Metric	Q2 Guidance	Q2 Actual
Total Revenue	$2.15 billion	$2.20 billion
Digital Media Revenue	25% growth	28%
Digital Experience Revenue	15% growth	18%
GAAP Earnings-Per-Share	$1.16	$1.33
Net New Digital Media Annualized Recurring Revenue (ARR)	$330 million	$343 million

...and management expects business momentum to continue in the second half of 2018.

The company continues to do an excellent job at converting legacy license users (and adding new users altogether) to subscription-based products, and subscription revenue accounted for a record 88% of companywide revenue in the quarter:

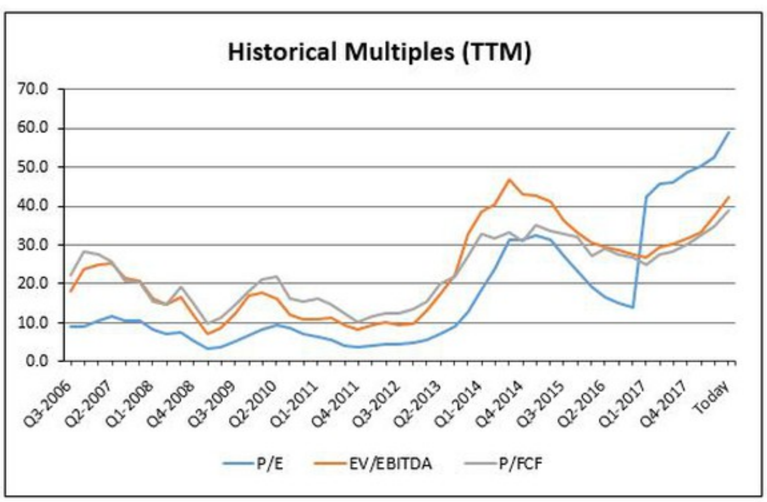


Annualized recurring revenue (ARR) in the Digital Media segment is now greater than $6 billion, and the recurring revenue base is still growing at a robust 30%+ pace:

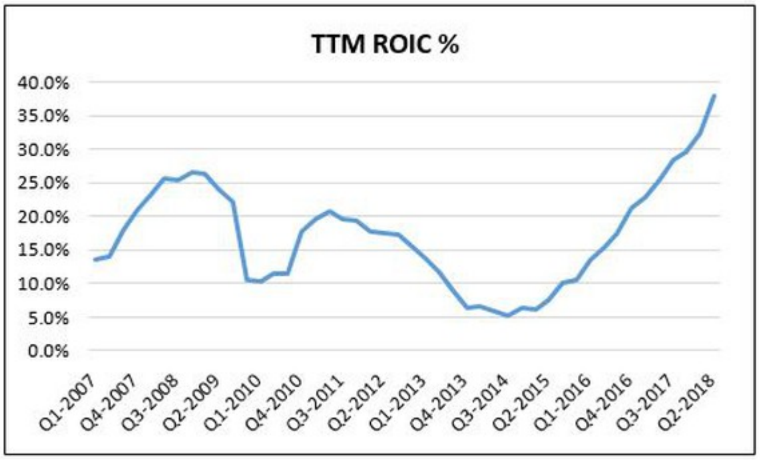


- **Updated guidance**: Best Buy Now (from Buy)
- **Recommended allocation**: 2.9%
- **Fair-value estimate**: $235 (up from $220)
- **Current price:** $255

At about $255 per share, the stock is priced at 59 times trailing-12-month (TTM) earnings-per share (EPS) and 39 times TTM free cash flow:



The stock has appreciated strongly over the last several years; up 216% over the last three years, 79% over the last year, 42% year-to-date, and up 12.7% since we added the company to the *Pro* portfolio in April. Although the business has been growing very strongly, the stock has been appreciating faster than earnings and cash-flow growth, leading to expanding multiples. Nonetheless, the company's expanding free cash flow generation and positive ROIC trends provide support for those higher multiples:

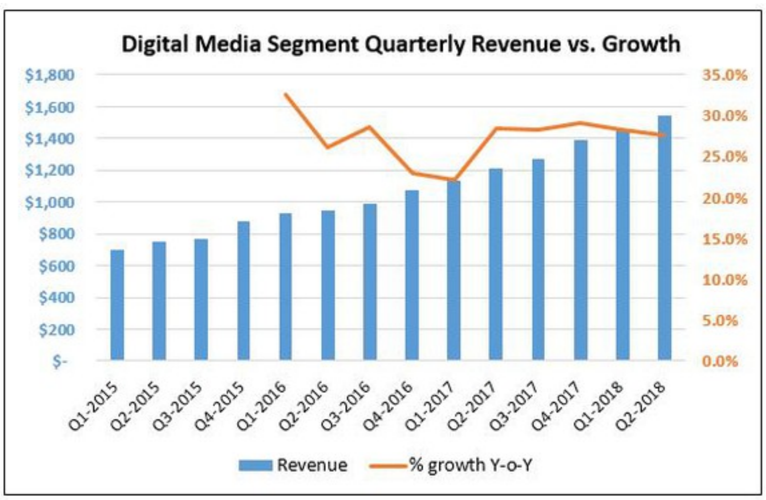


Despite the expanded multiples, we think that Adobe is likely to continue its recent business momentum, allowing the stock to grow into its valuation. We expect continued strong growth in revenue, earnings, and free-cash flow, although the stock's elevated multiples may eventually put a lid on stock-price appreciation until the business can catch up.

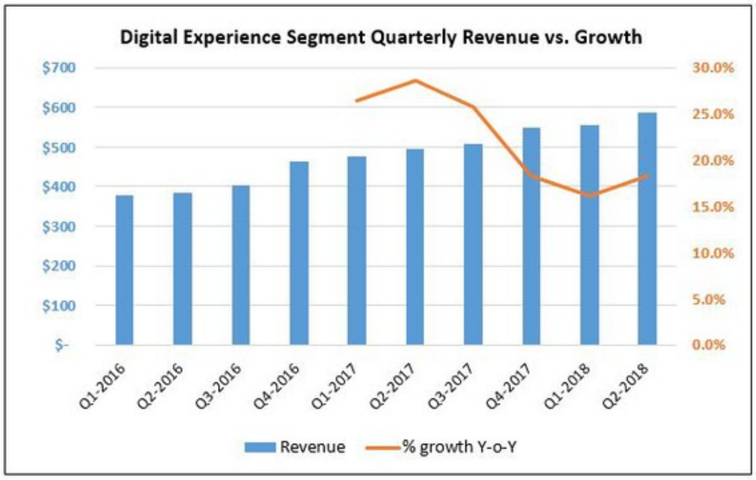
Our fair-value estimate increases to $235 (from $220), and Adobe moves to Best Buy Now (from Buy). With our new interpretation of the "Best Buy Now" terminology (outlined here in a recent Memo from Jeff), we think that Adobe is one of the highest-conviction ideas in the *Pro* portfolio, with a strong ability to earn healthy returns over the coming three years and beyond. Members who have yet to fill out their positions can feel comfortable doing so at current prices. However, due to recent stock price appreciation, Adobe is approaching the upper end of our valuation range, and we'd start to become a bit more cautious once the stock price reaches levels of about $265 or so.

Segment Performance

Looking at the individual business segments, the Digital Media segment (which is Adobe's largest and most profitable segment, representing 70% of TTM companywide revenue and 78% of companywide gross profit) continues to post strong, consistent growth. Revenue in Q2 for the Digital Media segment came in at $1.55 billion, up 28% year-over-year. Revenue growth in this segment is slowly decelerating (as we expect it to), but growth is still very healthy at 25%+ rates, and management is guiding for ~25% growth in the segment in the third quarter:



The Digital Experience (i.e. digital marketing) segment is also performing very well, although growth is less robust than in the Digital Media segment. Q2 Digital Experience revenue came in at $586 million, up 18% year-over-year. Management is guiding for ~15% growth for the segment in the third quarter. Due to higher competition in the digital advertising business, and due to Adobe's newer presence in this segment and its shifting product offerings (in part due to acquisitions), growth will likely be lumpier in this segment than in the larger, more stable Digital Media segment:



Our Thesis

Adobe is one of the largest software companies in the world, providing products and services used by creative professionals to create, deliver, manage, and measure multi-media content and experiences. Adobe a growing, high-quality business that operates with competitive advantages in two complementary markets with strong secular tailwinds (digital content creation and digital advertising), and the company should be able to increase its revenue and earnings at healthy rates for years to come, giving us a strong chance at North Star-beating returns over the long run.

We Evolve to Keep Performing

Published Jun 18, 2018 at 3:47PM

Greetings, *Pro* members,

I'm usually eager to admit and discuss our mistakes, because we learn valuable lessons from them, and we try to view mistakes as an opportunity to grow. But I believe we can learn even more from our exceptional investments. The Motley Fool as a whole has evolved in its ability to spot potential winners, knowing to focus on companies with unique offerings, driven leaders, and something that protects their profits from copycats, among other factors.

Our 25 years of investing in the service of our members has led the Fool to become ever smarter and do ever better, and we still keep progressing. The pace and scope of change in the world only accelerates. Companies need to adapt, too, or suffer at the hands of those that do. Investors need to adapt or risk weaker returns and, potentially, some big, permanent losers.

Pro Nears 10 Years

All of our mistakes included, *Motley Fool Pro* has achieved exactly what it set out to do at the outset. As we near our 10-year anniversary this fall, we have achieved a decade of fairly steady returns with less volatility than the stock market, and with less risk (or less market exposure) because of our ample cash and hedges along the way. Thanks to an unwavering belief in our economic recovery and a time-honored Foolish approach of letting our winners run, we've in fact done much better than we hoped.

We've returned 13.6% annualized (not counting the very strong June we're having), while our never-negative North Star -- our guiding light -- has returned 8.5% annualized. Our total return through the end of May is 241.8% against 120% for the North Star (see, compounding leads to larger discrepancies in total returns -- in our favor, here -- than the annualized number would suggest). You can always see our returns at the bottom of the portfolio page.

Overall, we're in an enviable position as we approach our 10-year anniversary. We're achieving what we set out to do, and we've greatly enjoyed our time with you (a handful of really stressful events aside). But ... I think we can do even better. Everyone needs to evolve; *Pro* needs to keep evolving, too, while maintaining its overarching goal of steady returns with reasonable risk.

I've been saying for years now that we need to keep adding younger, growing companies if we hope to maintain a lead on the North Star even during periods of low market returns. Such younger companies could lead the way during those times, because they'll likely keep growing. Under this argument, we added **Facebook** (NASDAQ: FB) when it was relatively wee -- and more to the point, we brought smaller companies like **Paycom** (NYSE: PAYC), **Square** (NYSE: SQ), and even **JD.com** (NASDAQ: JD) on board as well.

We should be adding more each year. We're now at a point where we generally need to raise cash to buy new stocks, which means selling laggards or selling some winners. It might be easier to add cash to *Pro* on a regular basis, but, good Fools, that's not our mandate. The cash we deposited in 2008 is what we have to work with. And we like the challenge. So, among those in the bubble to potentially be sold in whole or in part are **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS), **Gilead Sciences** (NASDAQ: GILD), and **Oracle** (NYSE: ORCL).

Why? Well, we probably don't need to tell you, being the wise market observer that you are. But just in case ...

Emerging-market economies like those DGS represents may suffer if the U.S. continues to get tougher on trade. In direct contrast, smaller U.S.-based companies, especially those selling software or other intangibles, should largely sidestep those trade concerns. Gilead, as we all know, has disappointed investors for a long time, mainly because the Hepatitis C market become competitive quickly. And Oracle will be a challenge to maintain at our full allocation *if* it doesn't start to gain traction on its cloud results.

Several young, growing software companies interest us right now. We'll see Oracle's earnings Tuesday after the market closes, and that may help us with our next step.

At the same time, the stocks above remain Buys in *Pro*. We need to be mindful that so-called "growth stocks" are lately soaring -- we've benefited from this ourselves -- and this obviously brings more valuation risk. We need to proceed carefully, using the "first, do no harm" rule. We don't want to sell a stable if sleepy business for a shooting star that's about to enter a long, North-Star-trailing descent, even if it eventually recovers.

Yet evolve we must, doing our best to keep buying stock in young companies that will continue to perform exceptionally well. Many of today's darlings will find challenges ahead, so we need to choose carefully. But we're going to keep moving *Pro* forward with small batches of trades, like the one we completed two weeks ago. Stay tuned.

The *Pro* Boards

A word to the Foolish! We've created some new *Pro*-only discussion boards and closed some others. Please get the rundown here, and then look forward to the *Pro* team visiting our focused *Pro* boards as you have questions for us. Meanwhile, also enjoy the entire Premium Community world to which you now have access! There, you can discuss countless companies, including *Pro* holdings, alongside other Foolish investors who share similar goals.

To share your thoughts, please visit the Memo Musings board. And Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: June 18, 2018

Published Jun 18, 2018 at 2:54PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

Thanks to increased earnings estimates and a higher fair-value estimate of $186, **Facebook** (NASDAQ: FB) joins our recently revised Best Buy Now list. The full list, which debuted last week, is repeated below with the addition of Facebook:

- **Adobe Systems** (NASDAQ: ADBE); our fair-value estimate also increases today to $235 from $220
- **American Tower** (NYSE: AMT)
- **CME Group** (NASDAQ: CME)
- **Facebook**(NASDAQ: FB)
- **JD.com** (NASDAQ: JD)
- **Mastercard** (NYSE: MA)
- **Paycom** (NYSE: PAYC)
- **Tencent Holdings** (NASDAQOTH: TCEHY)

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Oracle** (NYSE: ORCL): Our June $52.50 short calls expired as income. Sometime after earnings on Tuesday, we'll make our next decisions for our diagonal call.
- **The Cooper Companies** (NYSE: COO): We sold to open August 2018 $130 calls on our long shares, selling four contracts at $11.59 each.
- **Verisign** (NASDAQ: VRSN): All 500 of our shares were sold as our June $115/$110 covered strangle reached expiration. We don't have a Verisign stake as of now.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Cooper Companies, JD.com, and More

Published Jun 14, 2018 at 2:06PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.4%.
- **JD.com** (NASDAQ: JD): Buy 2.9%.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Coherent** (NASDAQ: COHR): Buy 1.5%.
- **Medtronic** (NYSE: MDT): Buy 2.4%.

Shorts:

- N/A

Options:

- **The Cooper Companies** (NYSE: COO): Although the stock is now above the adjusted $230 strike price recommendation we issued this week (for those who hadn't made the original trade yet), we still plan to write these August $230 calls ourselves. Naturally, they now pay more than before (lately about $9.25). If you're new to the trade, buy shares in 100-round lots and sell to open these same August $230 calls, capturing some intrinsic value, and a more than 3% yield or return potential in just over two months. Finally, as we said with the adjustment alert, if you wrote the $240 calls originally, you can continue to keep those open instead.

Upcoming Expirations (June 15):

- **Oracle** (NYSE: ORCL): Our short $52.50 calls -- as part of our 2020 diagonal call -- will expire as income this weekend. We're watching to write new ones when they pay enough.
- **Verisign** (NASDAQ: VRSN): Our short $110/$115 covered strangle is in-the-money on the call side. As explained in a recent Monday Memo, we plan to let our shares go, meaning no action is required. Our shares will be sold this weekend. Given they were capped, they haven't contributed to our returns for some time now. We'll raise 2% cash through the sale.

Trade Adjustment: Cooper Companies Covered Call

Published Jun 13, 2018 at 10:26AM

Is this for you? This is for *Pro* members currently participating in our covered-call position on **The Cooper Companies** (NYSE: COO), especially those who have yet to fulfill our May 22 trade alert. *Pro* was unable to follow that May 22 guidance; if this applies to you, too, you can join in the updated guidance below. If you *did* complete that original covered-call trade already, you don't need to do anything today but wait for August.

How You Participate

- **Action:** Write ("sell to open") August 2018 $230 calls.
- **Allocation:** Write ("sell to open") one call for every 100 shares you already own.
- **Price Guidance: It is imperative that you use a limit order, given the wide bid-ask spread for the August calls**. With shares at **$227.80,** the minimum to accept is currently **$6.70.** We'll provide updated guidance this Thursday in our Catch-Up Trades column.
- **Prices** (10:03 a.m. ET):
  - Cooper Companies: $227.80
  - Sell to open August 2018 $230 calls (bid/ask): $6.60/$7.20
  - Current bid-ask midpoint: $6.90

What We're Thinking

Timing was not on our side with our recent Cooper Companies covered-call recommendation. With the stock at about $234, we were hoping to collect a decent yield writing the August $240 calls ahead of earnings. But the stock declined shortly after our alert went out, taking the $240 call premiums with it. Since the calls currently pay less than half of what we were initially targeting, we're left with two options -- either adjust our strike price, or stay on the sidelines and wait for the stock to recover before writing calls. Lowering our strike price increases the odds we'll need to roll this position come August expiration, but we're willing to take that risk to help fill the income vacuum left by our soon-to-be-closed Verisign covered strangle. Assuming we're unable to roll up and out come August (the upside worst-case scenario), we'd be locked into a 2.4% loss on the stock and a 7.1% option yield on our initial purchase price earned since our Jan. 17 initiation.

Why didn't we do this sooner, or accept a lower yield on the August $240 calls? Because *Pro* must wait to make our trade until 24 hours after we issue our recommendation, and by that time, our target yield was no longer achievable. Thus, we felt it was best to wait to see what earnings would bring. Now that earnings are past, and with no foreseeable catalyst to drive the stock much higher over the next few months (although of course one never knows!), we're comfortable with the idea of lowering our strike price and advising members who are still sitting this one out to do the same. This is, after all, an income position, so we want to keep targeting reasonable income.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call's strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold; right now, though, it's more likely that we'd roll our calls to a later date or a higher strike. We'll cross any such bridge near expiration, once time value is dissipating from the calls.

Alternative Recommendations

- **Coming new today?** Buy stock in lots of 100 shares. Then, write ("sell to open") one August 2018 $230 call for every 100 shares owned. Aim for a net debit (what you pay for shares, less what you are paid for writing the call) of roughly **$221.30.**

- **Want to write puts?** Currently, you can write the August 2018 $220 puts for **$4**, or a 1.8% yield in 65 days.

Pro Can Help

- **Blurry vision?** You're probably going to want to get that checked out, but if you have any Cooper-related questions, please head on over to our *Pro* Trade Alerts board.

Breaking News on Best Buys Now

Published Jun 11, 2018 at 4:07PM

Greetings, *Pro* members,

Our Best Buys Now in *Pro* have always represented what we believed were our strongest risk-vs.-reward investments. When seeking stocks for the list, we asked ourselves: Which stocks will provide our desired return (or greater) with the least amount of risk to the thesis -- and probably a lower-than-average amount of price volatility as a result?

This approach meant that our Best Buys Now were often less volatile stocks, such as **Oracle** (NYSE: ORCL). If we believed a stock would return at least 10% annualized with lower-than-average risk, we thought *Pro* members should buy it before others that appeared to have much higher risk.

However, when our more volatile stocks went on sale -- which happened with **Square** (NYSE: SQ) in past quarters and with **Facebook** (NASDAQ: FB) at several points over the years -- we'd move those to Best Buy Now status as well, because the potential reward had grown to dwarf the risk. Facebook stayed a Best Buy Now for a long, long time, and it could arguably remain one today.

But *Pro*'s approach to Best Buys Now has evolved recently to better match the Motley Fool-wide definition of the term. From here forward, our Best Buys Now are our highest-conviction ideas, period. These stocks are those we think have the strongest ability to earn healthy returns over the coming three years and beyond. The time frame is always the next three years -- and we roll our thinking forward day by day, indefinitely. We're less concerned about potential volatility now, and more focused on the ultimate outcome.

Why do we believe so strongly in these Best Buys Now for the coming years? Because the current share price allows for handsome appreciation -- and each business is in a special position to keep on winning. **American Tower** (NYSE: AMT) enjoys long-term tower rental contracts that have price escalations, and connectivity needs are only growing. **CME Group** (NASDAQ: CME) dominates in many areas of futures trading, should continue to see record trading volume as interest rates rise, and enjoys remarkable margins. With a giant payroll market to address, **Paycom** (NYSE: PAYC) trades at 39 times expected earnings for the year ahead -- not a crazy premium for a company estimated to expand earnings per share by 56% from 2018 levels by 2020.

And on the list goes. You can see our latest Best Buys Now here. We'll write a summary paragraph with each Best Buy Now update going forward, too, so you'll have more (and very current) context.

Our Best Buys Now are not likely to change that often (remember our long-term outlook), but we'll officially provide an update once each month, and we'll make a change at any point when we see new opportunities. If one of our holdings declines sharply without good reason, for example, or a business is excelling and we want to move it to Best Buy Now status right away, we'll send that update that day.

As you review the updated list, please realize that we could make *half or more* of the stocks in our portfolio into Best Buys Now and feel great about that. We have a concentrated portfolio of about two dozen positions, meaning we need to believe strongly in all of them (and we do; when we have issues with a position, we let you know). But for the purposes of Best Buys Now, we work to whittle the list down and focus on a handful, guiding *Pro* members into half a dozen stocks or so to start.

Bottom line: *Pro* is a full portfolio service, so remember that we like (and/or have hope for) all of our holdings. That includes current laggards, or we wouldn't keep them! Also, we don't know which stocks will ultimately create the most value for us, so we suggest owning all of them, as you're meant to with a portfolio.

The Market

According to S&P Capital IQ, today the S&P 500 trades at 16.6 times expected earnings per share for the year ahead. According to FactSet, the average for this multiple over the past five years is 16.2; over 10 years, it's 14.4. Generally speaking, the S&P is trading about where we'd expect it, especially if companies continue to grow well. Earnings for the index as a whole are expected to expand by 19% in the quarter now under way (another good showing after 24% last quarter) as revenue growth picks up pace over prior years. Like everyone else, we're studying to see how international trade may shake out.

Pro Guidance Changes and Completed Trades: June 11, 2018

Published Jun 11, 2018 at 12:35PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

Our updated Best Buy Now list is:

- **Adobe Systems** (NASDAQ: ADBE)
- **American Tower** (NYSE: AMT)
- **CME Group** (NASDAQ: CME)
- **JD.com** (NASDAQ: JD)
- **MasterCard** (NYSE: MA)
- **Paycom** (NYSE: PAYC)
- **Tencent Holdings** (NASDAQOTH: TCEHY)

Every other position is rated Buy, except **Verisign** (NASDAQ: VRSN), which is a Hold as our shares are slated to be called away this coming weekend.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): We sold all of our shares last week at $13.48.
- **ProShares Ultrashort Real Estate** (NYSEMKT: SRS): We covered all of our shares at $29.74.
- **Shake Shack** (NYSE: SHAK): We covered all of our shares at $62.25.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Coherent, JD.com, Paycom, and Tencent

Published Jun 7, 2018 at 2:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **JD.com** (NASDAQ: JD): Buy 2.6% per our recent alert.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Coherent** (NASDAQ: COHR): Buy 1.5%.
- **Paycom** (NYSE: PAYC): Buy 3.9%.

Shorts:

- N/A

Options:

- N/A right now.

Upcoming Expirations (June):

- **Oracle** (NYSE: ORCL): Our short $52.50 calls -- as part of our 2020 diagonal call -- are on track to expire as income before earnings next week. We're watching to write new ones, if and when they pay enough.
- **Verisign** (NASDAQ: VRSN): Our short $110/$115 covered strangle is in-the-money on the call side. As explained in Monday's Memo, we plan to let our shares go, meaning no action is required.

Verisign and the Great Valuation Debate

Published Jun 4, 2018 at 3:45PM

Performance as of 5/31/2018

	Annualized		Total Return	
	Since Inception	Rolling 3-Year	YTD	Inception
Pro Portfolio	**13.6%**	**11.4%**	**5.1%**	**241.8%**
North Star	**8.5%**	**8.9%**	**4.5%**	**120.0%**
S&P 500 Total Return	12.6%	11.4%	2.0%	215.2%
MSCI World	7.2%	5.6%	-0.5%	95.1%

*Start close of 10/6/08.

Pro is up 13.6% annualized since inception, and 5.1% year-to-date.

Dear *Pro* member:

When we initially set up our covered strangle on **Verisign** (NASDAQ: VRSN) a little more than 17 months ago, we were seeking both income and capital gains. We expected a slow recovery in the stock price after what we considered to be the market's overreaction to an influx of speculative domain-name purchases by Chinese investors. But although we were correct about the recovery, its pace surprised us -- the stock is currently up 70% from when we first purchased shares, and we've been playing catch-up for much of the time we've had Verisign in our portfolio. In each of our four subsequent strangle-rolling trade alerts, we ended up rolling our short call's strike price higher. Recently, this meant little to no additional income as we tried to keep up with the stock's market-beating returns.

Today, our short call's strike price of $115 is well below the stock's recent price of $134.85. The only way we could conceivably keep the position alive would be by paying a significant net debit to roll our short calls higher. (That debit will be nudged upward by the effect *Pro* member volume will have on option prices -- but we're not complaining!) After considering the possibilities, we've decided the best course is to let our shares be called away unless the stock price falls by a noticeable amount before June 15 expiration.

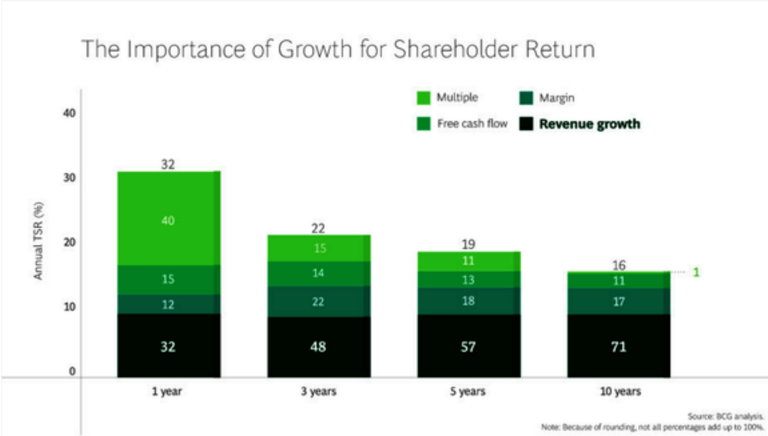
Foolish or foolish?

As the promo for this Memo notes, our decision here was largely driven by valuation concerns. This may seem surprising at first, given our general stance that selling shares of a great company for valuation reasons frequently ends up looking foolish (with a lower-case "f") down the road. But we believe our position in Verisign currently qualifies as an exception to this rule.

To see why, we need to get back to basics. What determines exactly how much a company is worth? If a company's value is ultimately based upon how much money it can make in the future, then I think we can value that company by trying to solve for two variables: growth and margins. Everything else that could have an effect — excellent management, intangible assets, competitive positioning, total addressable market, etc. — ultimately ends up being reflected in the company's growth rate and/or margins.

We'll take margins first: A quick glance at Verisign's financial statements is all it takes to see that the company is anything but average. As the sole registry for .com and .net top-level domains, Verisign has little need for marketing, maintenance spending, and other activities that typically eat away at margins. The end result is that, year in and year out, Verisign remains one of the best public companies around when it comes to margins and returns on invested capital -- this business converts more than 56% of its revenue (!) into free cash flow. (Contrast this with the S&P 500, whose constituents convert, on average, less than 15% of revenue into free cash flow. In a good year.)

The issue is that Verisign simply doesn't have all that many opportunities to invest new capital to expand the business beyond the low-single-digit rate we've forecast for the foreseeable future. Think about the companies that are citied as classic examples of why selling based on valuation is foolish — Google, Amazon, Apple, Facebook, just to name a few. There's one thing these businesses had in common when people thought their stocks were "expensive": growth. Specifically, a giant addressable market and business model that allowed them to grow at an above-average rate for far longer than even most bulls thought possible. In fact, The Boston Consulting Group has found that the longer your timeframe, the most important growth becomes. Their study of the top-quartile value creators in the S&P Global 1200 from 1993 through 2013 found that revenue growth accounted for 71% of 10-year total shareholder returns:



Verisign is a great company, but the part of the business that brings in most of its revenue and profits — the .com registry — is mature, and there is nothing management can do to change this. There may be an infinite number of .com domain names available for registration, but the vast majority of these domains will remain worthless (I'm currently selling the sdgwedgs353234sdser45gsrfs.com domain name for the low, low price of $1 million, if you're interested?). And the massive size of the .com registry means any other new initiatives to generate additional registry-based revenue will have a marginal impact on the overall results of the business unless the company moves away from its current modus operandi of focusing on its core business and buying back shares by the fistful -- and we'd be opposed to that. The end result is a business where 5% annual revenue growth appears to be the best-case scenario.

Why is below-average revenue growth problematic? Because there's currently a big disconnect between the current stock price and our estimate of Verisign's fair value. This means that either (a) our fair-value estimate is wrong or (b) the stock is overvalued. For the former to be true (and to be able to justify keeping the position open), we would need to be significantly underestimating how fast the company can grow, how high margins can ultimately climb, or some combination of the two. And it's hard to believe we're being too conservative, given that our current estimates of Verisign's incremental operating margin hover around an extremely impressive 85% (meaning the company generates $0.85 of operating profits on each additional dollar of revenue it collects). There simply isn't much room for margins to go any higher. This means the burden of reconciling our fair value with the current price falls largely on Verisign's growth rate, but even if we aggressively increase our estimates for top-line growth, our estimate still lags the current price by a noticeable margin.

The Foolish Bottom Line

When we originally recommended setting up a covered strangle on Verisign, our our five-year price target (2021) for the stock was $135 to $145, meaning today's price of $134.85 is within striking distance of our target -- more than three years ahead of schedule. To date, we have yet to see anything in the company's financial results to suggest that our estimates were overly conservative. What we have seen, however, is significant multiple expansion. At more than 30 times free cash flow, Verisign could end up struggling to beat the North Star over the next three to five years, especially if our position requires us to put a significant amount of capital in the position to play catch-up with the current stock price. Because of this, we plan to say bye.com to Verisign as of June 15, expiration, barring a big drop in the stock.

To discuss Verisign, please visit its board.

Pro Guidance Changes and Completed Trades: June 4, 2018

Published Jun 4, 2018 at 1:06PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **JD.com** (NASDAQ: JD): Moves to Best Buy Now from Buy.
- **Medtronic** (NYSE: MDT): Moves to Buy from Best Best Now on recent sharp price appreciation.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **JD.com**: On May 25, we bought 2,400 shares at $36.93, starting a 2.6% position.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Spring Is Off to a Late Start for Home Depot

Published May 31, 2018 at 2:40PM

First-Quarter 2018

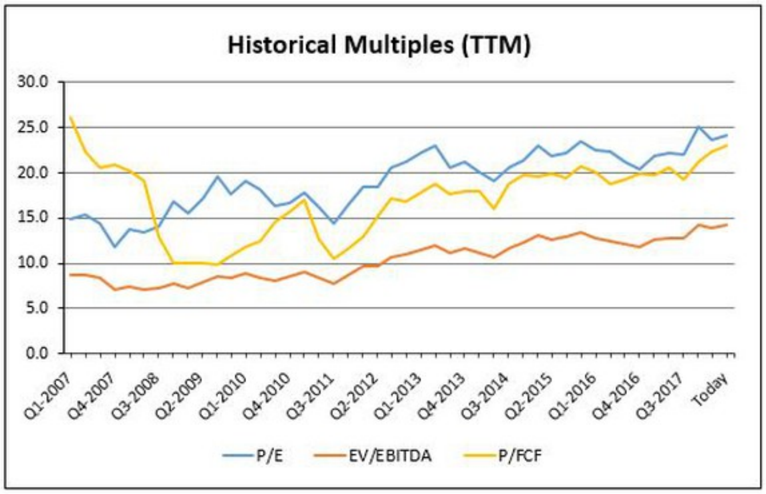
- Press Release
- Earnings Infographic
- Conference Call Transcript
- 10-Q Filing

Home Depot (NYSE: HD) had a weather-related slowdown in growth in the first quarter of 2018, reporting revenue growth of 4.4%, comps growth of 4.2%, and earnings-per-share growth of 24%. Despite a volatile stock price over the past six months or so, Home Depot continues to post steady sales growth and housing market data continues to support a favorable forward outlook for this well-managed business.

- **Updated guidance**: Buy (Diagonal Call)
- **Recommended allocation**: 1.7% in January 2020/October 2018 $110/$180 diagonal calls.
- **Fair-value range:** $160-$190

- **Current price:** $185.79

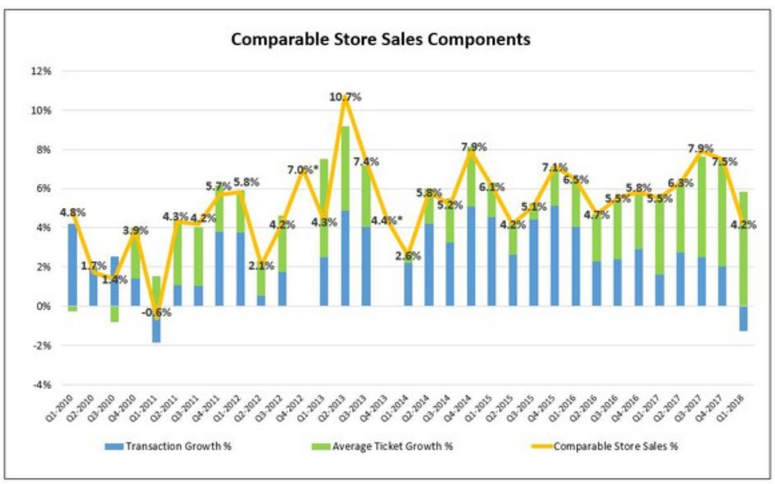
At about $186 per share, the stock is priced at 14.1 times trailing-12-month (TTM) EBITDA, 22.7 times TTM free cash flow, and 24.1 times TTM earnings-per-share (EPS):



Based on management's guidance of $9.31 for full-year 2018 EPS, Home Depot is priced at about 20 times expected 2018 earnings, suggesting significant multiple contraction if the stock remains at recent prices. As we can see from the graph above, since 2013 Home Depot has rarely traded at (or below) a P/E multiple of 20, indicating likely upward pressure on the stock if the company can expand earnings in 2018 as it expects.

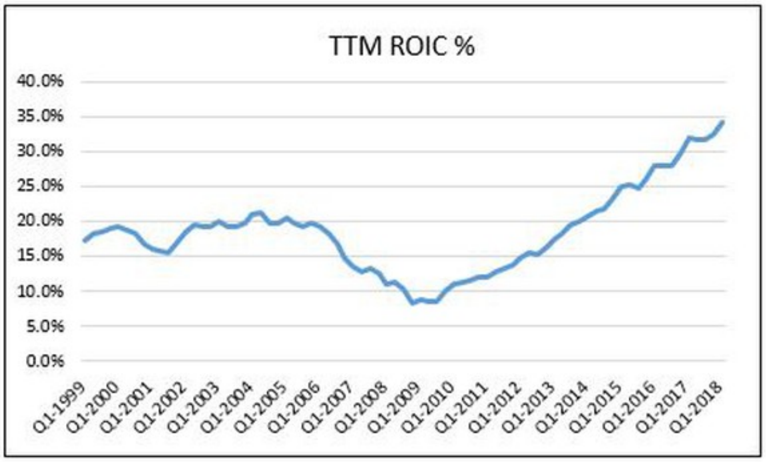
Business Performance

As has been typical of Home Depot since its inclusion in our portfolio in October 2017, business performance in the first quarter of 2018 was strong. The company reported year-over-year revenue growth of 4.4% and 4.2% growth in comparable store sales. This quarter marked the 28th straight featuring positive comps, a remarkable result for a physical brick-and-mortar retailer in the Amazon era:



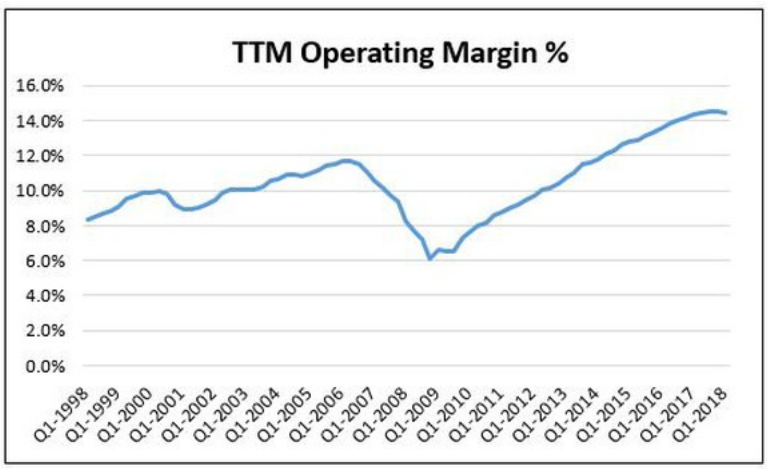
However, as we can see in the graph above, comps performance was a bit lighter than usual. This quarter was the lowest growth figure for comps since Q2 of 2015, and the first quarter since Q1 of 2011 that transaction growth was negative compared with the prior year. Management's explanation for the somewhat weaker performance this quarter was unusually cold weather, which seems reasonable given the record cold and snow in the northern U.S. in April (weather was also the culprit for that weak quarter back in Q1 of 2011). Additionally, management mentioned on the earnings call that so far in May, comp sales are double-digit positive as lost sales from April are seemingly being recaptured.

Home Depot's ROIC continues to climb. This quarter it's mostly thanks to tax reform, as the company's effective tax rate for the quarter came in at 23.5% compared with 35.2% in the same quarter last year:



The lower tax rate helped push net margins up to 9.6% for the quarter compared with 8.4% in the same quarter last year, and EPS rose by 24% to $2.08 per share (vs. $1.67 per share last year). Given management's intent to aggressively increase spending on strategic investments (supply chain, new stores, and information technology), lower tax rates should provide most of the boost to earnings in 2018.

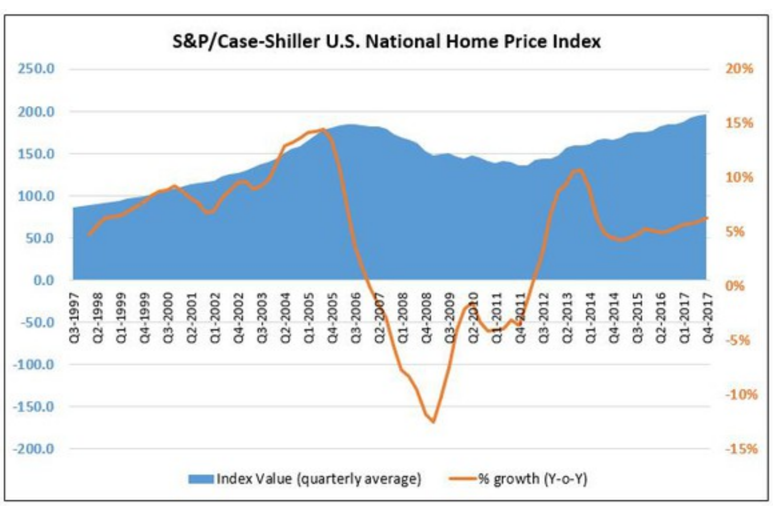
We can already see the effect of higher spending on the company's operating margins, as SG&A spending increased from 18.3% of sales in the same quarter last year to 19.2% of sales this quarter, leading to lower operating margins:



Home Depot's "interconnected retail strategy" continues to resonate with consumers, as online sales rose by approximately 20% vs. Q1 of 2018. This is an impressive result given that retail e-commerce sales in the U.S. are rising at about 13%. Home Depot has done an excellent job interfacing its physical stores with its online website (with a sophisticated supply-chain network), allowing the company to capture a healthy portion of online sales growth. In fact, Home Depot was the fourth most popular online store in the U.S. in 2017 as measured by net e-commerce sales (behind just Amazon, Walmart, and Apple).

The Housing Market

In addition to Home Depot's strong business performance, recent housing market data suggests continued growth in home improvement spending. Home-price appreciation is accelerating, with the most recent reading in March showing 6.5% growth in the S&P Case-Shiller National Home Price Index. This is the highest growth rate since May 2014, and we've seen home-price growth accelerate on a year-over-year basis for 21 straight months:



Home-price appreciation is being driven by a combination of a healthy economy, low unemployment, and low inventories of homes for sale. There is a pent-up demand for home-buying following the 2008-2009 recession, although low inventory levels are preventing that demand from translating into new household formation. This high-demand/low-supply situation is causing upward pressure on home prices.

Here is an except from the press release that accompanied the announcement of the March Case-Shiller Home Price Index data:

> "Looking across various national statistics on sales of new or existing homes, permits for new construction, and financing terms, two figures that stand out are rapidly rising home prices and low inventories of existing homes for sale. Months-supply, which combines inventory levels and sales, is currently at 3.8 months, lower than the levels of the 1990s, before the housing boom and bust. Until inventories increase faster than sales, or the economy slows significantly, home prices are likely to continue rising. Compared to the price gains of the last boom in the early 2000s, things are calmer today. Gains in the National Index peaked at 14.5% in September 2005, more quickly than Seattle is rising now."

As further evidence for the robustness of housing demand, the NAHB/Wells Fargo Housing Market index (a measure of builder confidence) rose to 70 in May after a downward revision in April. Here is an excerpt from the press release for the NAHB index:

> "Builder confidence in the market for newly built single-family homes rose two points to a level of 70 in May after a downwardly revised April reading on the National Association of Home Builders/Wells Fargo Housing Market Index (HMI). This is the fourth time the HMI has reached 70 or higher this year.
>
> "The solid May report shows that builders are buoyed by growing consumer demand for single-family homes," said NAHB Chairman Randy Noel, a custom home builder from LaPlace, La. "However, the record-high cost of lumber is hurting builders' bottom lines and making it more difficult to produce competitively priced houses for newcomers to the market."
>
> "Tight housing inventory, employment gains and demographic tailwinds should continue to boost demand for newly built single-family homes," said NAHB Chief Economist Robert Dietz. "With these fundamentals in place, the housing market should improve at a steady, gradual pace in the months ahead.""

Pro Catch-Up Trades and Expirations: JD.com, Paycom, and More

Published May 31, 2018 at 12:41PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.9%.
- **Coherent** (NASDAQ: COHR): Buy 1.5%.
- **JD.com** (NASDAQ: JD): Buy 2.6% per our recent alert.
- **Paycom** (NYSE: PAYC): Buy up to 4.1%.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): We're selling our entire 0.3% position, per today's alert.
- **The Cooper Companies** (NYSE: COO): Buy 2.7% to write covered calls (so at least 100 shares) per that alert as the stock recovers.

Shorts:

- We'll be buying to close two positions -- **UltraShort Real Estate** (NYSEMKT: SRS) and **Shake Shack** (NYSE: SHAK) -- per today's alert.

Options:

- N/A right now.

Upcoming Expirations (June):

- **Oracle** (NYSE: ORCL): Our short $52.50 calls -- as part of our 2020 diagonal call -- are on track to expire as income. We're watching to write new ones.
- **Verisign** (NASDAQ: VRSN): Our short $110/$115 covered strangle is in-the-money on the call side. We'll have guidance before expiration, but we expect to let our shares go unless pricing changes.

Close Your Positions on SVXY, SRS, and Shake Shack

Published May 31, 2018 at 12:41PM

Is this for you? Everyone with these positions open should consider this recommendation. These positions are small, and we're cleaning house.

How You Follow Along

- **Trades:**
  - Use a limit order around the recent NAV or higher to sell all shares of **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY). We have a 0.3% allocation.
  - Use a limit order around the recent NAV or *lower* to close (cover) all short shares of **ProShares Ultra Short Real Estate** (NYSEMKT: SRS). We have a 0.1% allocation.
  - Use a limit order at the going share price or lower to close (or cover) all short shares of **Shake Shack** (NYSE: SHAK). We have a 0.7% allocation.
    - Take your time and use limit orders. *Pro* has 30 days to complete these trades.

What We're Thinking

With a mature portfolio, it often makes sense to make position adjustments and changes in small baskets of trades, two or three at a time, with the context of the whole portfolio in mind. Today's alert is the first time we've made such a change in awhile, but it won't be the last. In fact, it's just the start of some housecleaning in store at *Pro*, making room for new positions and strategies we like better. That's especially true in cases where we're clearing out failing positions.

After these three trades are completed, we intend to move forward with more trade alerts, making other adjustments, working to get the portfolio back to pure 100% conviction. We've been patient with these three, perhaps to a fault; we sometimes allow our conviction to dip for months on some positions, in hopes that the tide will turn. This patience is also what helps us keep our long-term winners in the portfolio during times of duress, and overall, patience rewards us much more than it hurts.

So why now? Let's run through the thinking behind these three closures.

SVXY

Why Close? This exchange-traded note's price crashed in February, when VIX futures increased more in one day than ever before. Afterward, SVXY changed its mandate; instead of being short the short-term VIX futures on a 1:1 ratio, it began targeting just *half* of the inverse of those futures' price move. That has made the vehicle much less volatile, and less likely to suffer catastrophic losses. But this also makes appreciation slower (and perhaps more difficult) for the ETF to achieve. In short, the vehicle is no longer what we invested in; it isn't set up to appreciate the way it once had.

What's Next? After selling our shares (and getting a tax loss), we'll consider a *different* way to short VIX short-term futures on a 1:1 basis again -- and different ways to profit on volatility, period. So, we're not done with this strategy, but we need to change our vehicle and approach. We're closing our 0.3% stake at a large percentage loss, but we're confident over time that we should profit using a different method of investing against VIX futures.

SRS

Why Close? This position is basically now the cigar-butt ending of a successful short. Our 0.1% short in this ultra-short real-estate ETF has made us a majority of what it can. Meanwhile, the ETF is tiny now, with only about $25 million in assets (so be very, very careful closing it! Use a limit order, and don't push it above its NAV price). It's currently so small, in fact, that shares to short aren't easy to obtain anywhere. At Interactive Brokers, they now cost 7% a year to borrow, with only 2,000 shares lately available for the purpose (and sometimes none). In other words, this is a tired position with much more risk than reward remaining, and now that it's again near its all-time low (after a big spike to start the year), we're cleaning house by closing it here.

What's Next? The gains we made on this short are fully offset (for tax purposes) by the losses on the other shorts we're closing. So, at least it's a tax-free profit. Next up: With interest rates rising, we will tread cautiously into any future real-estate investments. We're happy that we already hold **NVR** (NYSE: NVR) and **American Tower** (NYSE: AMT) in the *Pro* port, along with a diagonal call on **Home Depot** (NYSE: HD). We have exposure to real estate that we like.

Shake Shack

Why Close? We've gotten this one very wrong so far. We shorted Shake Shack, the little hamburger chain that could, when it traded at more than 60 times expected earnings. But rather than see Wall Street let that valuation shrink, as we'd hoped, we've watched investors push shares much higher, to a level that's now more than 100 times expected earnings. Although our predictions -- lower store traffic, higher expenses, slowing earnings growth -- all came true, the stock has soared. The only things we did right here were to start small and never add to the position, despite temptations along the way.

What's Next? Still, even as we close this short sometime in the next 30 days, I don't believe we're done here. Shake Shack has grown from 0.5% to 0.7% of the portfolio, even as the whole port is much more valuable. Since we've been so wrong on Shake Shack so far, closing to end this hurt is sensible. But once it's closed, I want to reassess the situation, and consider other strategies to invest against Shake Shack that we've been considering, mainly using options. I wouldn't be surprised if we could eventually make back the $12,000 or so we lost on this short with some sensible neutral-to-bearish strategies.

So, we may soon return to investing against this one. But only some time apart will tell us for certain if that's the next move we want to make. Other pending portfolio changes, including new shorts, will also play a role in our eventual decision. Either way, you'll be the first to know through a trade alert.

The Foolish Bottom Line

Each November, I look at my own personal portfolio and consider selling persistent laggards or struggling businesses whose losses I could use to offset taxable gains that year. We're partly doing that exercise early this year for *Pro* (and will again near year-end). It feels like the right time, right now, to exit struggling or played-out positions and focus on those -- including new ones -- that we like much better. Periodically clearing out "dead wood" is an excellent way to set the stage for future growth. And it helps clear your mind in a way that you only realize once you've done it.

In this spirit, we're selling SVXY as it changes its return objective to one-half of what it used to be. We're closing SRS because its triple-leveraged status offers too much risk for just 0.1% of the portfolio in potential return remaining. And we're closing Shake Shack because the share price keeps rising despite its valuation and other business pressures, so we must be missing something. As shared above, we might revisit two of these three theses soon in new ways or vehicles. Once we clean house a bit more, we'll see if that's what we still want, and we'll issue alerts if so.

In closing: While two of these positions are among our biggest percentage losers ever, and both hit us this year, our portfolio's winners are leading us to new highs right now anyway. And we're ahead of the S&P 500 for 2018, and close to our North Star. This says that allocation and diversification matter a lot. We must keep sizing riskier positions appropriately, and leave our most promising positions alone to keep appreciating. This refresh is driving us to do more of both those good practices.

Alternative Trades

- **iShares U.S. Real Estate ETF** (NYSEMKT: IYR): If you own shares of IYR rather than shorting SRS, sell those shares. We aren't providing coverage and do believe that rising interest rates could be a long-term headwind, along with changing consumer habits when it comes to malls. We like our existing real estate investments in *Pro* better. Move money there if you lack those, or raise a little cash.
- **Are you short VIX futures through other means?** If you're comfortable with your short -- perhaps you're short the **iPath S&P 500 VIX Futures ETF** (NYSEMKT: VXX) -- then you can keep it open. We're considering such vehicles, after all. SVXY's story has changed, though, so we're selling it.
- **Are you short Shake Shack in other ways?** We don't know how you're expressing this position, so please post on the board below if you have questions about it. Most likely, you'll want to close it, but not necessarily. It'll depend on your strike prices and strategy.

Pro Guidance Changes and Completed Trades: May 29, 2018

Published May 29, 2018 at 2:34PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Broadridge Financial Services** (NYSE: BR): Our fair-value estimate increases to $95 from $82. The stock remains a Buy. We have a 7.1% holding, and recommend newcomers start with 3%.
- **Verisign** (NASDAQ: VRSN): Moves to Hold from Buy, because we might let the stock go next month via our covered strangle.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **JD.com** (NASDAQ: JD): We bought 2,400 shares at $36.93, starting a 2.6% position.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Broadridge's Valuation Grows on Tax Reform and Strong Business Performance

Published May 25, 2018 at 10:24AM

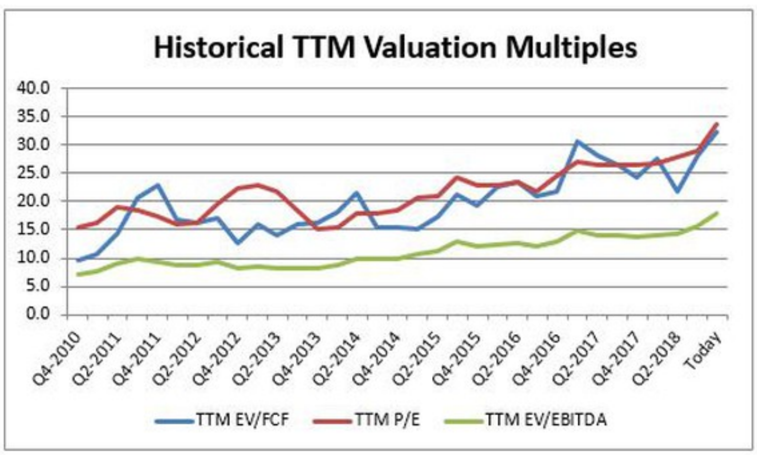
Fiscal Q3 2018

- Recurring fee revenue growth (year over year): Up 7.9% to $639 million (11.4% TTM growth)
- Closed sales growth (year over year): Down 20.8% to $38 million (-10.4% TTM growth)
- EPS growth (year over year): Up 43.2% to $0.90 (33.5% TTM growth)

Broadridge (NYSE: BR) reported an excellent fiscal third quarter for 2018, and as a result, management raised its full-year guidance for earnings per share. However, closed sales for the fiscal year have been lackluster to date, and the company will need to make up the sales deficit in fiscal Q4 in order to meet its guidance. Nonetheless, recurring fee revenue continues to grow at a steady pace, and Broadridge is poised for continued growth through the end of fiscal 2018 and beyond. Our provider of investor communications continues to improve margins and expand its core business at a consistent clip, producing significant amounts of cash flow from a capital-light asset base. Broadridge is well positioned to continue to achieve North Star-like returns over at least the next three years, although the strong recent stock price performance (up 28% year-to-date) may detract from future returns unless the company can continue to outperform our expectations (as it has consistently over the past several years).

- **Updated guidance**: Buy (unchanged)
- **Recommended allocation**: 7.2%
- **Fair-value estimate**: $95 (from $82)
- **Current price:** $115.90

Based on management's recently raised guidance, at $116 per share, the stock is priced at about 28.5 times projected 2018 cash flow and about 32.5 times projected 2018 GAAP earnings per share:



After incorporating fiscal Q3 2018 results and adjusting for the impact of tax reform, **our fair-value estimate increases to $95 per share (from $82)**. The company's valuation multiples are as high as they've ever been during its tenure as a public company, some of which is justified: Lower U.S. corporate tax rates make cash flows more valuable to investors, and the business is as big and strong as it's ever been.

Despite the strong business performance, the current price sits more than 20% above our newly updated fair-value estimate. After fiscal Q4 2018 results next quarter, we'll get management's guidance for 2019 and make the big annual adjustment to our valuation model. **Broadridge remains a Buy** on our scorecard, but if you've yet to establish a full position, you may want to consider buying in halves or thirds, waiting for a narrower premium to our fair-value estimate, or waiting until we have the increased clarity of fiscal Q4 results (the company's most important quarter) and a fully updated valuation model before filling out your position.

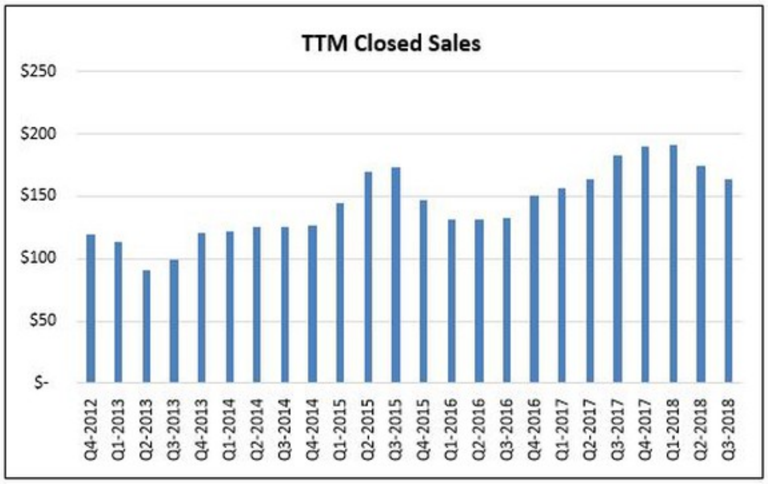
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers offload technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue (augmented by tuck-in acquisitions), slight operating leverage, plenty of free cash flow, and a growing stream of dividends and share repurchases to help achieve North Star-like returns.

The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

For the second straight quarter, closed sales were underwhelming despite a strong showing on almost all other metrics. Broadridge reported $38 million in closed sales for the second quarter, down 21% from the second quarter last year. For the second straight quarter, closed sales were lower than in the same quarter a year prior:

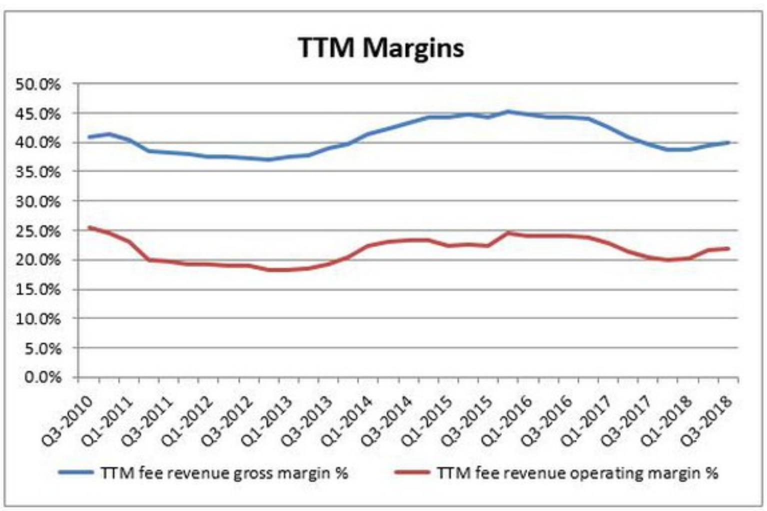


Although closed sales performance does tend to be lumpy and weighted toward the back half (or final quarter) of the year, management and the sales team have work to do to meet reaffirmed guidance of $170 million to $210 million for fiscal 2018. With just $100 million in closed sales through the first three quarters of the year, the company needs to post at least $70 million in closed sales in fiscal Q4 to hit the low end of guidance. The company's highest quarter of closed sales in its history is $65 million (set in Q4 2014), so we'd need an unprecedented performance in Q4 to reach guided sales levels. However, revenue has increased by 70% since the last record quarter, so I think the implied closed sales guidance for Q4 2018 ($70 million to $110 million) is feasible, if not challenging. I'll be impressed if Broadridge can meet those numbers next quarter.

Here are some relevant comments on the earnings call from CEO Richard Daly:

"We remain on track to hit our full-year sales targets, as we expect a very healthy close to fiscal 2018. As you know, Broadridge's quarterly Closed sales results have historically been weighted toward the fourth quarter, and results for any single quarter can be heavily influenced by the timing of large deals. Our pipeline today is very strong, and it includes some large deals where we are in active dialogues with clients. These dialogues are progressing well, and we expect one or more of these deals to contribute meaningfully in the fourth quarter."

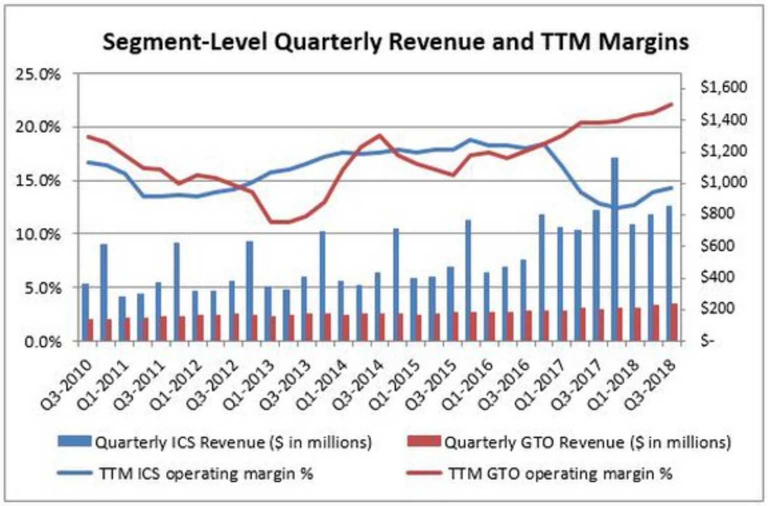
2. Fee-Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers), we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee-revenue gross margins came in at 39.9% (up from 39.9% a year ago), and TTM fee-revenue operating margins came in at 21.8% (up from from 20.4% a year ago):



We're finally lapping the effects of the 2016 acquisition of NACC, with this quarter marking the final quarter in which TTM margin percentage comparisons are still affected by the impact of pre-NACC margin levels. Next quarter will represent the first quarter that allows a comparison of fully comparable TTM periods.

Even without a fully comparable TTM period, we can see in the financials that Broadridge has been able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency. Even including a quarter where NACC's margin-reducing impact was not present, we are still seeing higher margins (both gross and operating) in the most recent TTM period compared with the prior TTM period, which is impressive. The NACC acquisition integration has been outstanding, and margins are continuing their steady march higher.

When looking at Broadridge's separate divisions, we can see that both businesses are improving. While the Investor Communications Solutions (ICS) business has seen significantly lower (though improving) margins because of the NACC acquisition, the acquisition-agnostic Global Technology & Operations (GTO) business has shown continued strong margin expansion, generating a record TTM operating margin of 22.1%:



The margin expansion trends for both segments of the business are exactly what we want to see as investors, and based on management commentary and recent trends, we expect the margin expansion to continue. The business's financial execution since the NACC acquisition is an indication of excellent management, as acquisition integrations often don't go so smoothly.

3. Capital Allocation: In the company's most recent Investor Day presentation, we got a detailed update on how management plans to allocate capital between fiscal 2017 and fiscal 2020: targeting a 45% dividend payout ratio, and using up to $1.4 billion in incremental debt capacity and expected free cash flow for share repurchases and merger-and-acquisition activity.

Interestingly, we've recently seen the pace of Broadridge's share repurchases slow as the stock price has climbed over the past year. After spending more than $240 million combined in Q3 and Q4 2017 on discretionary share repurchases when Broadridge's stock price was between $65 and $78 per share, the company has spent just $30 million on share repurchases in the first half of 2018 (mostly to offset share dilution, by the looks of it), with the stock price ranging between $73 and $110. I appreciate management's non-mechanical approach to share repurchases.

Additionally, management has been a bit more active lately with acquisitions and purchase of IP. In fiscal Q3 2018, management spent $25 million to acquire Israeli company ActivePath, which focuses on technology to enhance the consumer experience associated with statements, bills, and regulatory communications. The company also spent $40 million in the quarter for the delivery of a new blockchain technology application related to its 2016 acquisition of IP from Inveshare.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring organic revenue growth (augmented by tuck-in acquisitions) to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Pro Catch-Up Trades and Expirations: CME Group, JD.com, and More

Published May 24, 2018 at 12:39PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.3%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.9%.
- **Coherent** (NASDAQ: COHR): Buy 1.6%.
- **JD.com** (NASDAQ: JD): Buy 2.6% per our recent alert. [Note: this said "2.8%" in an earlier version. That was an error. But if you bought 2.8% it's also fine. Once we buy our shares it may round toward that, and either way, it's a small difference. Apologies for the error.]
- **OpenText** (NASDAQ: OTEX): Buy 2.8%.
- **Paycom** (NYSE: PAYC): Buy up to 3.9%.

Shorts:

- N/A

Options:

- N/A right now.

Upcoming Expirations (June):

- **Oracle** (NYSE: ORCL): Our short $52.50 calls -- as part of our 2020 diagonal call -- are on track to expire as income. We're watching to write new ones, and have been, but we're hoping for a higher share price on the stock.
- **Verisign** (NASDAQ: VRSN): Our short $110/$115 covered strangle is in-the-money on the call side. We'll have guidance before expiration.

Buy JD.com

Published May 22, 2018 at 3:24PM

Is this for you? This is for all *Pro* members who lack exposure to **JD.com** (NASDAQ: JD) and wish to match *Pro*. If you already have exposure to the company by way of our recommendation over in *Motley Fool Options*, consider your look-through exposure (the value of your position should your puts be exercised) in relation to our recommended allocation.

How You Participate

- **Action:** Invest 2.6% of your portfolio in JD.com. (That's $2,600 for every $100,000 you manage; for *Pro*, that's 2,400 shares, or $86,900 worth.)
- **Price Guidance:** Use a limit order to buy at going prices, lately about $36.60 per share. Later, the stock will remain a Buy until we guide otherwise.
- **Guidance:** Buy
- **Fair-Value Estimate:** $50

For our money, there's no better way to achieve *Pro*'s goal of doubling our real purchasing power every 10 years than by investing in strong businesses riding long-lasting secular tailwinds. For some time now, we've thought that the Chinese e-commerce market was just such a tailwind, and it's pretty easy to see why. At more than $1.1 trillion in sales, China's e-commerce market is already 2.4 times larger than the United States', and last year it expanded at twice the pace (32% growth vs. 16%). We believe the conditions are ripe for this market to eclipse even some of the loftiest expectations over the next decade, and with the recent sell-off of JD.com, China's second-largest e-commerce platform and its largest online direct sales retailer, we think we've found the perfect company to invest in and ride this tailwind for the next decade.

Why We Like the Industry

Despite its massive size, we believe China's e-commerce market is set to continue to outpace its U.S. counterpart, growing by 20% to 30% annually for at least the next three to five years. There are many reasons for this, but here are what we consider to be some of the most important:

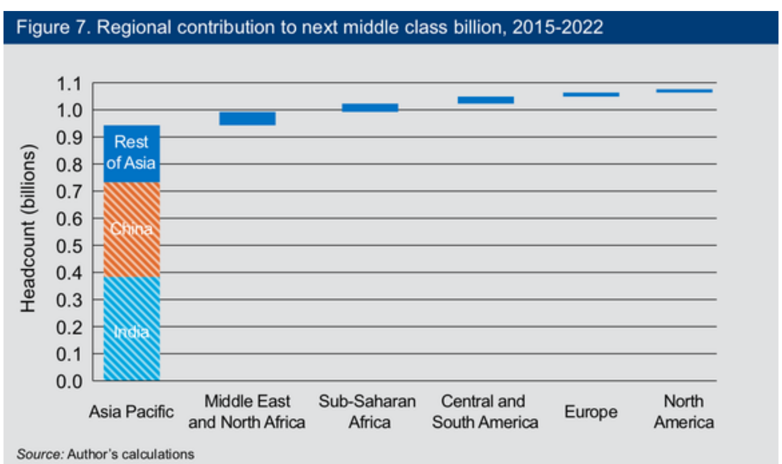
More shoppers ...

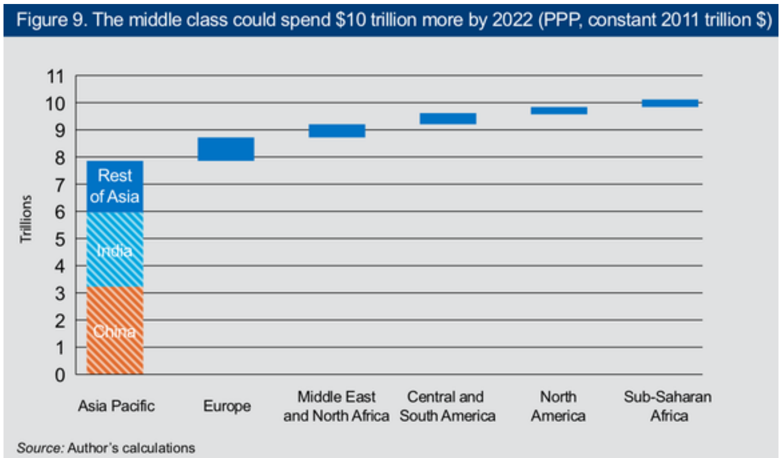
Consisting of more than 533 million shoppers last year, China's e-commerce market was 1.6 times bigger than the entire population of the United States. That may sound like it doesn't leave much more room for growth, but consider that China's Internet penetration rate is still more than 25 percentage points behind that of the U.S., and e-commerce adoption (as a percentage of total internet users) is still a full 10 percentage points behind. Currently we're forecasting that 150 million more shoppers will come online as early as 2020 as these two figures slowly converge with their Western counterparts.

Making more money ...

In just the past decade, we've seen the percentage of urban Chinese households classified as "middle income" or better rise by more than 30 percentage points, to higher than 85%. And with urban incomes averaging about 2.5 to 3 times their rural counterparts, it's no surprise that we've also seen a massive rural-to-urban migration. Income for those who have already achieved middle-class status will likely continue to grow in the mid- to high single digits, but the massively positive impact of this migratory trend on China's consumer economy is likely far from over: China's current 57/43 urban/rural population split, while up from 50/50 in 2010, is a long way from the U.S.' 81/19 -- closer to what we typically see in more advanced economies.

With many of China's larger cities approaching what the government considers to be maximum capacity, much of this growth will be centered around lower-tiered cities (where e-commerce is just starting to take off). If China is able to successfully transition to relying on lower-tiered cities for growth — and although the process may be rockier than some are expecting, we ultimately believe it will — odds are the nation will continue to be a driving force behind the continued rise of the global middle class.





source: Homi Kharas, Brookings Institution

And shifting more of their purchases online

We currently expect China's retail sales growth rate to average somewhere in the high single digits over the next decade, continuing to decelerate until it more closely approximates growth in disposable income. But we expect e-commerce to continue rapidly gaining share of the total retail pie, averaging between 20% and 30% growth over the next five years at a minimum.

Many of the reasons for our optimism parallel what we said about Tencent back in October. Specifically: Inefficiencies in the status quo have resulted in a Chinese consumer who is eager to adopt new technologies. Chinese brick-and-mortar retail is not only highly fragmented — the top 20 retailers command a market share of just 14%, compared with 47% in the U.S. — but it also has an underdeveloped infrastructure and an inefficient distribution system. In 2015, China's logistics and supply chain management spending as a percentage of GDP was almost twice as high as in the United States.

But don't just take it from us. China's urban e-commerce shoppers are already making their voices heard with what ultimately matters the most to retailers: their wallets. We currently estimate that these shoppers are spending roughly half as much as their American counterparts on online orders, despite having less than a seventh of the disposable income.

Most e-commerce shoppers understand that the added convenience of buying online often comes at the cost of speed, meaning that time-sensitive purchases remain one of the final bastions for brick-and-mortar stores. However, we believe this defense will soon be dismantled in China. One big reason why: Ninety-four percent of the country's population is clustered east of what is known as the Heihe–Tengchong Line, an area that covers roughly 43% of China. That means more than 1.3 billion people in an area roughly 51% the size of the contiguous 48 states plus D.C., resulting in a population density that's almost 10 times higher than in the States.

We believe this density will continue to help China lead the way in making same-day delivery more widely available and cost-effective. This should create a positive feedback loop: Faster deliveries mean customers spend more on e-commerce, meaning companies invest even more in logistics, resulting in even faster delivery times and even more e-commerce spending. Not only that, but widely available same-day delivery opens up entirely new segments of the retail industry to e-commerce disruption. For example, we currently anticipate that fast-moving consumer goods (FMCGs -- think milk, gum, aspirin, etc.), a market set to eclipse $2 trillion over the next three years, will be the next area where e-commerce takes off.

Why We Like JD.com

At this point, you might be wondering, "Why not Baba?" In addition to its dominant consumer-to-consumer (C2C) marketplace, Taobao, Alibaba's Tmall has a commanding share of the business-to-consumer (B2C) e-commerce market (where JD.com competes), and its lower-cost business model results in higher margins and returns on capital. To be fair, we believe the industry tailwinds are so strong that both businesses could ultimately end up beating the market over the next decade. But we ultimately consider JD.com to be a more attractive investment today for multiple reasons, including the following.

The Tencent partnership

It's hard to overestimate the value of Tencent -- the company behind WeChat, arguably the most dominant social app in the world -- as both a partner and an investor (it's JD.com's largest shareholder, at more than 18%). For example, in 2015, JD.com saw a 130% spike in orders on Singles Day — globally the biggest single e-commerce day of the year — thanks in large part to Tencent's social apps, which were responsible for delivering 52% of new first-time buyers. And in Tencent's latest conference call, management noted that daily active users and transaction volume for the retailer category of "mini programs" (essentially apps within the WeChat app) increased 50% from the previous quarter. Going forward, we anticipate that Tencent's ecosystem will only get stickier, and we have a hard time seeing this as anything but a huge positive for JD.com.

Logistics

From the start, JD.com has differentiated its business from its biggest competitor by its approach to logistics. In contrast with Alibaba's higher-margin, capital-light approach of outsourcing logistics, JD.com's management prefers to have as much control over the entire value chain as possible. The initial rationale was that delivery was the company's only in-person touchpoint with the consumer, so controlling it was imperative for building customer loyalty. But we believe this approach gives the company a distinct advantage in the battle for same-day delivery, and as a result it should help JD.com continue to take share from Alibaba and other competitors.

Market share opportunities

As the online retailer that built its brand around customer satisfaction and product authenticity in an environment where poor quality and fake products are commonplace, it should come as no surprise that surveys have constantly shown JD.com to be the preferred e-commerce retailer among higher-income Chinese households. If this continues to hold true, the continued rise of household income across China should bode well for JD.com's market-share aspirations. We also believe the company has more than a fighting chance to capture significant market share in FMCG, luxury, and other emerging e-commerce battlegrounds.

Valuation

With a market cap of $52 billion and a stock price that's down almost 30% from its all-time high, we believe JD.com is presenting us with a flash-sale-esque opportunity. The stock's recent decline appears to have to do with concerns about the effects of increased competition with Alibaba on JD.com's business plan, which is similar to that of Amazon -- heavy investments now with the aim of generating outsized profits later.

Although we agree that the pathway to profits isn't as straightforward here as it is for Amazon in the U.S., where it's essentially a one-horse race, we believe JD.com's long-term plan is still on track. Interestingly enough, one of the biggest reasons for the market's concern is something we just listed as a long-term competitive advantage — JD Logistics. Increased spending in this part of the business has hurt overall margins, and many analysts no longer expect the logistics business to start generating operating profits for up to three years, but we believe the stock would still be undervalued today if it took more than five. As it currently stands, JD.com is priced similarly to various brick-and-mortar retailers here in the United States.

Risks

Our thesis for JD.com is predicated on the belief that the company's investments will ultimately lead to market-share gains and outsized profits, so it goes without saying that if things don't play out this way, we'll likely be disappointed with the performance of the stock. We're also somewhat leery of JD.com's international aspirations. With such a large opportunity domestically, we'd consider it a major red flag if the company ends up shifting too many resources toward international growth. And as with Tencent, although we believe JD.com is currently in good standing with the ruling political party, at the end of the day we're investing in a Chinese company, and we need to be aware of the additional risks this entails.

Write Covered Calls on The Cooper Companies

Published May 22, 2018 at 11:52AM

Is this for you? This is for *Pro* members currently participating in our covered call position on **The Cooper Companies** (NYSE: COO). If you're new to this position, please see the alternative trades section at the end of this report.

How You Participate

- **Action:** Write ("sell to open") August 2018 $240 calls.
- **Allocation:** Write ("sell to open") one call for every 100 shares you already own.
- **Price Guidance: It is imperative that you use a limit order, given the wide bid-ask spread for the August calls**. Fools should aim to split the bid-ask spread as long as it results in a per-month yield higher than 1.1% (option premium/current price of the stock). With shares at $233.91, the minimum to accept is currently $7.38. However, please check current prices first before submitting a limit order for this amount -- with a current bid of $7.40, you're leaving free money on the table if you submit a limit order for $7.38.
- **Prices** (11:34 a.m. ET):
  - Cooper Companies: $233.91
  - Sell to open August 2018 $240 calls (bid/ask): $7.40/$7.70
  - Current bid-ask midpoint: $7.55

What We're Thinking

With our first round of covered calls on Cooper Companies having expired worthless over the weekend, we see little reason not to immediately write new calls. Having already collected $10.12 per share, we're hoping to collect at worst an additional $7.38 this round, resulting in a 7.4% yield on our initial purchase price and a total return of roughly 9.3% in seven months if we need to let our shares get called away in August.

First-quarter results, which were reported back in March, were largely in line with our expectations. CooperVision (75% of the business) continued to post impressive results despite difficult one-year comparisons (up 12%) in its Americas segment, as consolidated revenues rose 14% (up 8% on an organic basis) and gross margins came in at 67.1% (up 4 percentage points). CooperSurgical saw revenues increase 32%, but most of this growth was inorganic, the result of the recent PARAGARD acquisition. Gross margins rose to 68.8%, but this was also primarily the result of the PARAGARD deal; the hormone-free birth control device has margins higher than 90%.

Cooper's consolidated operating margin came in at 27.6%, putting the company on pace to hit its 2021 target of 28% before the year is out (mid-30s is a reasonable long-term expectation here). We believe the rest of the year is shaping up favorably for CooperVision. Comps in the Americas will become easier as the year progresses, which might mean we should wait for a higher strike price to become attractive before writing new calls. But we believe the $240 strike is more appropriate, given the potential for the positives in CooperVision to be largely offset by additional growing pains associated with the PARAGARD deal over in CooperSurgical.

Further steering us toward the $240 strike price was the announcement of the retirement of former CEO Robert Weiss. Although we believe this has been in the works for quite some time now, given both his age (70) and tenure (41 years), we're in the "wait and see" camp with respect to how we feel about the replacement. While management said it will be business as usual under the leadership of the new CEO, Albert White, his previous role as CEO of Cooper Medical (the parent company of the CooperSurgical segment) worries us somewhat. We think White might end up misallocating resources away from CooperVision, our favorite part of the business, to CooperSurgical.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold; it's more likely right now, though, that we'd roll our calls to a later date or higher strike. We'll cross any such bridge near expiration once time value is dissipating from the calls.

Alternative Recommendations

- **Coming new today?** Buy stock in lots of 100 shares. Then, write ("sell to open") one August 2018 $240 call for every 100 shares owned. Aim for a net debit (what you pay for shares, less what you are paid for writing the call) of roughly $226.40.
- **Want to write puts?** Currently you can write the August 2018 $230 puts for $7.50, or a 3.3% yield in 87 days.

Pro Can Help

- **Blurry vision?** You're probably going to want to get that checked out, but if you have any Cooper-related questions, please head on over to our Cooper Companies discussion board.

Coherent and OpenText Offer Promise Ahead

Published May 21, 2018 at 3:28PM

Greetings, *Pro* members,

As of last Friday, 93% of companies in the S&P 500 had reported first-quarter results, and 78% of those exceeded expectations. Companies manage this. More important is the fact that, [according to FactSet](), the blended earnings-per-share growth rate in Q1 was a stellar 24.5%. That's the best quarterly result since the third quarter of 2010. And even if a third of that gain is driven by a lower tax rate, it's impressive, especially because revenue rose more than expected at 77% of companies, too.

Now the S&P 500 trades at 16.4 times expected earnings per share for the year ahead. The five-year average multiple is 16.1. The 10-year average is 14.3. Generally speaking, the S&P 500 is trading right where you would expect it to in relation to the past five years, especially if companies continue to top estimates. All else equal, in a bear market, the index would have to fall by 12.8% to trade at its 10-year average multiple.

At any rate, we have a few more earnings reviews, after which we can look over the whole portfolio and finalize some possible (and likely) changes.

Coherent Keepin' It Real

Laser provider **Coherent** (NASDAQ: COHR) reported 14% sales growth, to $481 million, with its microelectronics division posting 23.9% revenue growth to drive $3.37 per share in non-GAAP earnings. The microelectronics division accounted for 54% of sales, followed by materials processing at 28%, and OEM components, instrumentation, science, and government making up the rest of laser sales. Other product and services revenue -- parts, accessories, consumables -- rose by 21% to $132 million, 27% of total sales. For the third quarter under way, Coherent expects revenue of between $480 million and $500 million.

The company is booking business for 2019 already, but management only provides guidance one quarter at a time, so we don't know how booked it is. We know that the OLED market continues to be soft because of flagging smartphone unit volume, both at Samsung and **Apple** (NASDAQ: AAPL). Rumor has it that three new Apple phones will debut this fall (two reportedly with OLED screens, one with LCD), but what drives Coherent's smartphone OLED business most of all are the new fabrication facilities being built. A few are slated to open in 2019, and Coherent is already taking some orders for machines to fit them. More new fab facilities are expected to be announced soon.

The company's semiconductor-related business remains strong, with double-digit (at least 10%) booking growth in the quarter. A directive called Made In China 2025 calls for that country to reduce its dependence on integrated circuit imports, so the country is investing $150 billion (to start) to produce its own supply. This should keep demand for Coherent strong there, as will the burgeoning Internet of Things, connected cars, the artificial intelligence industry, and more. The digitization of the world feeds directly into Coherent's line of business in semiconductor manufacturing. Relatedly, Coherent's advanced packaging market (safeguarding delicate semiconductor parts) is running at five-year highs on continued growth in demand. This shouldn't relent.

Coherent's materials processing business was also "very strong across all submarkets," CEO John Ambroseo said in the conference call. Its fiber laser orders were up significantly for cutting and welding, driven by Chinese customers. Fiber components also benefited from strong China demand.

The company addressed the market's microLED concerns head-on. First, microLED is a long way from becoming a commercial product that replaces OLED, and second, if microLED is commercialized, it should be a net benefit to Coherent. Coherent is in a leading position to help commercialize microLEDs with its laser manufacturing, and doing so could lead to market expansion for the company into new display screens. But for now, OLED remains the screen of choice for mobile displays, restrained by capacity constraints -- another factor in recent softness, because Samsung is the only company making quality OLED screens at quantity, supplying Apple and others.

Beaten up, Coherent trades at 7.1 times EBITDA, 17 times trailing earnings per share, and 10.7 times expected earnings for the year ahead. It's at 15.5 times free cash flow. For a growing business operating in many key areas of today's sophisticated manufacturing processes, the company is well positioned to keep growing in relevance and in market size. We only own a 1.5% stake now, as the portfolio has grown while Coherent has shrunk. We're content with that size as we watch to see how 2019 starts to shape up -- but adding to the position isn't off the table. It's rated Buy for long-termers like us.

OpenText Bores 'Em This Time

Results at enterprise information management company **OpenText** (NASDAQ: OTEX) didn't excite the market during the company's seasonally softer third quarter. Yet revenue was up 16% year-over-year, to $686 million, and operating cash flow hit a record $271 million, up 73%. Cloud revenue rose 18% to $209 million. Organic growth, though, remains in the low single digits, with acquisitions driving most gains. On the plus side, the company's net-debt-to-adjusted EBITDA ratio declined to 2.1 from 3 a year ago, as the balance sheet strengthens after large buyouts.

Year-to-date, revenue is up 27% to $2.06 billion, and annual recurring revenue grew 26% to $1.53 billion. The cloud business is at $611 million in sales year-to-date, up 17%. Confidence led the board to increase the dividend 15% to $0.1518 per share.

Looking far ahead, management is aiming for $1 billion in operating cash flow by 2021 (the company's market cap is below $10 billion today) and adjusted operating margins of 36% to 40%, up by 200 basis points from earlier goals.

OpenText seems sleepy compared with the software leaders that grab headlines, but it has gained 1,550% in the past 20 years while the Nasdaq gained 343%. Over the past five years, the stock has returned 15.6% annualized, well above our North Star. In the past three years, it gained 13.5% a year. Although the stock hasn't moved much since September 2016, our patience should be rewarded eventually should the business keep trending the way it has.

It's trading at 12.5 times expected earnings for the year ahead and 18.8 times trailing free cash flow, and we see fair value a bit higher than today's price. We target a North Star-beating return on a rolling three-year basis. Shares remain a Buy at our 2.8% allocation -- although we reserve the right to replace them with something we like better, of course, should it come to that.

To share thoughts, please visit the [Memo Musings board](). We look forward to what's next with you.

Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: May 21, 2018

Published May 21, 2018 at 2:58PM

Pro Guidance Changes (see any related [trade alerts]() or [earnings coverage]()):

- N/A

Pro Completed Trades (see [transaction log](); trades take a day to appear):

- **Home Depot** (NYSE: HD): We rolled our short May $175 calls to September $180 calls for a small credit, keeping our diagonal call going.

You can see all of our guidance, positions, returns, and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: CME Group, Paycom, and More

Published May 17, 2018 at 2:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.4%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.8%.
- **Paycom** (NYSE: PAYC): Buy up to 3.9%.

Shorts:

- N/A

Options:

- **Home Depot** (NYSE: HD): Roll, or start, your diagonal call per yesterday's alert.

Upcoming Expirations (May):

- We have written calls expiring on **The Cooper Companies** (NYSE: COO), **Gilead Sciences** (NASDAQ: GILD), and Johnson & Johnson on May 18. All three are set to expire as income.

Roll Your Diagonal Calls on Home Depot

Published May 16, 2018 at 1:04PM

Is this for you? This is for all *Pro* members who wrote May 2018 $175 diagonal calls on **Home Depot** (NYSE: HD) as per our alert in December. If you have yet to establish a diagonal call position on Home Depot, or if you established a different alternate position, please see the Alternative Trades section below.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all May 18, 2018, $175 written calls.
  - "Sell to open" the same number of Sept. 21, 2018, $180 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all nine of our calls.
- **Recent Prices** (11 a.m. ET):
  - Stock: $186.65
  - Buy to close May 18, 2018, $175 calls (bid/ask): $11.60/$11.80 (midpoint $11.70)
  - Sell to open Sept. 21, 2018, $180 calls (bid/ask): $12.40/$12.55 (midpoint $12.48)
  - Net credit to roll: Approximately $0.78 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls and to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $0.78 net credit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. The May short calls expire on Friday, so you need to complete this trade promptly or risk getting assigned on your short calls.

What We're Thinking

The current iteration of our diagonal call strategy on Home Depot has now been active for almost seven months, having begun in October last year when we initiated a diagonal call position on the company with the goal of leveraged upside and income with moderate risk. In December, we rolled our short calls up and out for a modest debit to capture further upside. So far, the position is working out exactly as we intended, with a 20% simple return since inception if we were to close the diagonal call today (compared with a 14% return for Home Depot stock over the same period).

Home Depot reported somewhat tepid earnings yesterday, including the lowest comparable-store sales growth since the second quarter of 2015. The fact that 4.2% growth represents the lowest figure in 11 quarters demonstrates the strength of Home Depot's business -- few other retailers have posted such consistently positive same-store sales during a challenging time for brick-and-mortar sales. Additionally, management indicated on the earnings call that comp sales in the first quarter were affected by unusually cold weather, as record cold and snow prevailed across the northern U.S. in April. Although weather is a common excuse for poor performance among retailers, given the quality of Home Depot's business and management team, I'm inclined to believe them. As evidence to the veracity of the claim, management mentioned on the earnings call that so far in May, comp sales are double-digit positive as lost sales appear to be recaptured.

With respect to our diagonal call, we're now in a position to roll our calls up and out again for a small credit, aiming to capture further upside in this high-quality business. With this rolling trade, we increase our upside by $5 and extend our expiration out to September. As we approach September expiration (or a relevant ex-dividend date prior to expiration), we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write May 2018 $175 covered calls?** If you wrote covered calls, you can make the same rolling trade as *Pro*, rolling your May 2018 $175 calls up and out to September 2018 $180 calls.
- **Did you write May diagonal calls at a different strike price?** If your short call is in-the-money but at a higher strike than Pro ($180 or $185), aim to roll out and/or up for a credit. The $185 and $190 strike prices look like good choices to us, but you can roll to higher strikes if you prefer to target higher upside, or lower strikes if you prefer to be more conservative and target current income. If your short call is out-of-the-money, you can wait until expiration and then write a new iteration of short calls at the $185 or $190 strike prices.
- **New to the position and have yet to set up a diagonal call?** Do so by simultaneously buying ("buy to open") January 2020 $125 calls and selling ("sell to open") September 2018 $190 calls for a net debit of about $57.90 per diagonal call (this price may change). Invest 1.8% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $320,000 or so you manage), and keep in mind that this position is "off-reservation" from *Pro*, so if you're not comfortable managing a position on your own, this choice might not be the best one for you.
- **Have a different position not addressed here?** Check in on the Home Depot discussion board and we will do our best to answer your questions.

Square Rolls On!

Published May 14, 2018 at 4:07PM

Note: We don't have any guidance changes or completed trades to share over this past week. A continued huzzah for status-quo, long-term investing!

Greetings, *Pro* members,

The *Pro* portfolio has lately been setting new all-time highs, up more than 243%, despite the Nasdaq Composite and S&P 500 still trading decently below their respective high-water marks. Our results are being driven by many of our larger positions, including **Square** (NYSE: SQ). Let's continue our earnings review there.

Square Stacks Up

Square (NYSE: SQ) continued to roll forward, and increased its velocity. Once again, sales increased both year-over-year and sequentially, with adjusted first-quarter revenue up 51%. As a result, management massively increased sales guidance for the year; they now target 44% year-over-year revenue growth in 2018, compared with the guidance given just 90 days ago for 34%. This result would see Square expand sales even faster in 2018 than it did in 2017, putting this year's net revenue at more than $3 billion and adjusted revenue at about $1.4 billion.

But rather than rising along with sales, guidance for Square's earnings before interest, taxes, depreciation and amortization (better known as EBITDA) stood pat at $245 million. That's because Square plans to reinvest even more dough into its many growth opportunities. We agree with heightening investments to capture more opportunities, and we hope this situation will remain for years. For 2018, Square still expects its adjusted non-GAAP earnings per share to be $0.46 at the midpoint of its guidance. That hasn't changed.

Going beyond guidance to see what's driving results, we note that Square's "omnichannel" commerce products are easy for customers to implement, and they expand as a business does. Gross payment volume (GPV) was up 31% to $18 billion last quarter, and Square's commerce transaction-based ecosystem creates numerous opportunities to add software subscription sales (on top of the 1.09% average fee Square earned on each transaction last quarter), fueling additional growth. Subscription and service-based revenue was up 98% in the first quarter to represent 32% of Square's adjusted revenue, up from 24% a year ago.

As larger sellers are attracted to Square, more fuel is added to the growth fire. They're making the move because they value the cohesion of Square's products, their cost, and the ease of getting started. Adjusted revenue from sellers with retail sales of at least $300,000 per year was up 60%, and more than half of Square's largest customers used two or more Square products in 2017.

Products leading in popularity include Instant Deposit (which lets a business collect its revenue quickly for a small fee), Caviar (for restaurant delivery), and Square Capital (small, short-term loans). Cash Card is also growing fast. And the new Square Register product helped hardware revenue — which is not essential to the story here — expand by 60%.

Beyond all this, Square recently announced that it will acquire website-building business Weebly for $365 million in cash and stock. Weebly will bring Square 625,000 new subscription-paying customers who maintain a website with Weebly, with nearly 40% of them outside the U.S., helping expand Square's international footprint. Because Square wants to provide complete commerce solutions online and off, a website offering seems essential and expands its customer base to new and varied niches.

Revenue from Square's commerce customers is already nicely spread, with about 20% of gross payment volume from retail, 20% from restaurants, and services, health, and beauty each hitting the high teens. Square is working to serve each niche better with targeted software products, or "verticals." Operating today in the U.S., Canada, the U.K., Japan, and Australia, Square has large international opportunities ahead and should move as efficiently as possible to enter new markets, because competition exists.

The stock is expensive, but the price signifies the market's recognition of the opportunities ahead as Square's ecosystem keeps locking in new customers. Recently $54, shares trade at 102 times expected earnings for the year ahead. We've seen this before with high-growth companies. If management keeps executing well, the stock may not look back much. Either way, as with most young growth companies that keep growing, the business won't likely look traditionally valued for some years to come. Now at a 4.6% allocation, up 113% in less than a year, Square remains a Buy.

Fool on!

-- Jeff (TMFFischer)

Recent Trends Continue at American Tower

Published May 11, 2018 at 1:18PM

American Tower (NYSE: AMT) reported a solid first quarter for 2018 that showed a continuation of trends from the fourth quarter of 2017. Consolidation-driven churn in India accelerated as local wireless carrier Aircel filed for bankruptcy in the quarter, leading to impairment charges and bad debt expenses that reduced companywide profitability.

Although international growth should see ongoing weakness in 2018 because of the disruption in the Indian wireless market, the U.S. business continues to improve, and the international business is performing strongly outside India. The Indian market should start to normalize in 2019 and be back to typical growth levels by 2020.

With the stock trading at the low end of the company's historic ranges (the current EV/EBITDA multiple is 19, compared with a long-term average of 21), American Tower's valuation reflects the near-term weakness in India as well as recent uncertainty surrounding the announcement of a merger between T-Mobile and Sprint. Management spoke about the merger on the earnings call, noting that they are "highly confident" that the transaction will be neutral to positive for the U.S. business, thanks to an expected increase in capital expenditures and network densification for the new combined entity. The potential for an accelerated 5G deployment by the wider U.S. mobile industry in response to 5G network investment plans by the Sprint/T-Mobile combined entity should provide another boost.

What Happened?

CEO Jim Taiclet:

> "The strong demand we experienced in late 2017 for our telecommunications real estate further accelerated in the U.S. as well as in our Latin America and EMEA regions in the first quarter of 2018. Notably, record levels of new business commencements, along with a robust pipeline of applications or both amendments and new colocations resulted in our increase in expectations for full year U.S. Organic Tenant Billings Growth to approximately 6.5% in 2018.
>
> Significant network investment initiatives announced by the major U.S. wireless carriers, coupled with aggressive network deployments in key markets such as Mexico and Brazil, enabled us to drive Consolidated AFFO per Share growth of nearly 10% in the first quarter while growing our common stock dividend by approximately 21%. We remain confident that our U.S. macro tower business, complemented by our franchise small cell installations, extensive international portfolio and emerging innovation initiatives will continue to drive strong growth and attractive total returns for many years to come."

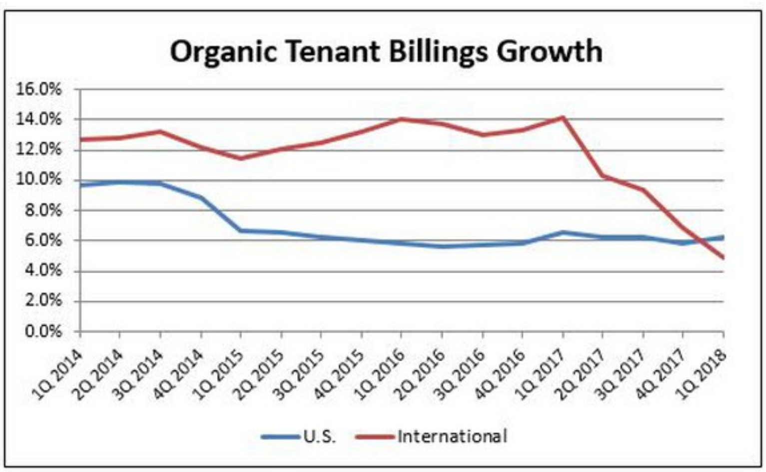
Get More

- Q1 2018 press release
- Q1 2018 supplemental materials
- Q1 2018 earnings presentation

For the first quarter of 2018, organic growth in tenant billings came in at 6.3% in the U.S. and 4.9% internationally, vs. 6.5% and 14.1% in the same quarter a year ago.

The disruption in the Indian market continued into this quarter (as expected), with -4.7% organic growth in the company's Asia (i.e. India) division because of an acceleration in consolidation-driven churn, a result of the bankruptcy of Indian mobile carrier Aircel. This is the first quarter of negative organic growth in India (or any geographic region) since American Tower began breaking out region-specific data in 2014. Management expects that 2018 will be the high-water mark in terms of Indian carrier consolidation-driven churn "by a fairly wide margin," so while there may be continued pressure on this segment throughout 2018, growth should start to normalize in 2019 and be back to typical levels by 2020.

Outside of India, organic growth was more in line with historical growth rates, up 7.4% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda) and 11.7% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Paraguay, and Peru).

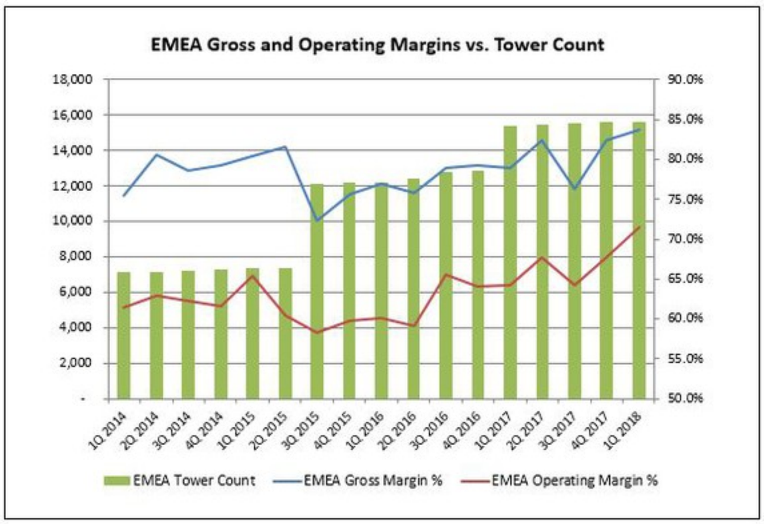


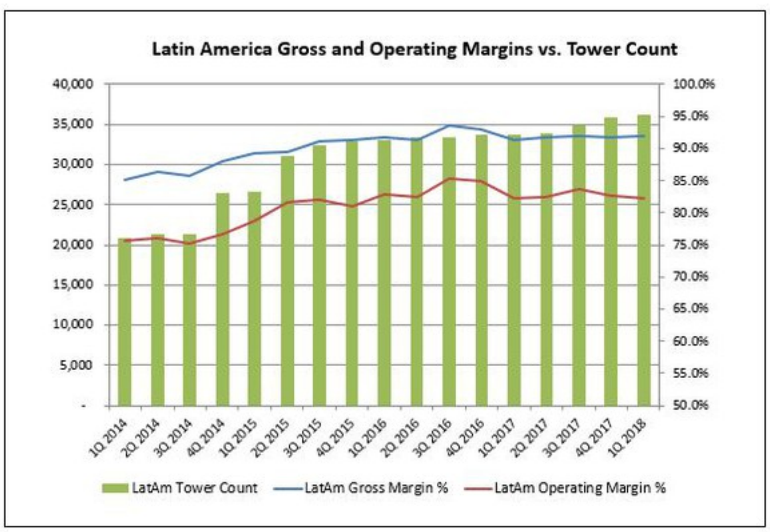
This is the first time since I've been covering American Tower that U.S. growth outpaced international growth in a given quarter. Given the expected pressure in the Indian market, this result is unsurprising. Once the Indian market stabilizes, international growth should once again eclipse U.S. growth by a few percentage points.

So What?

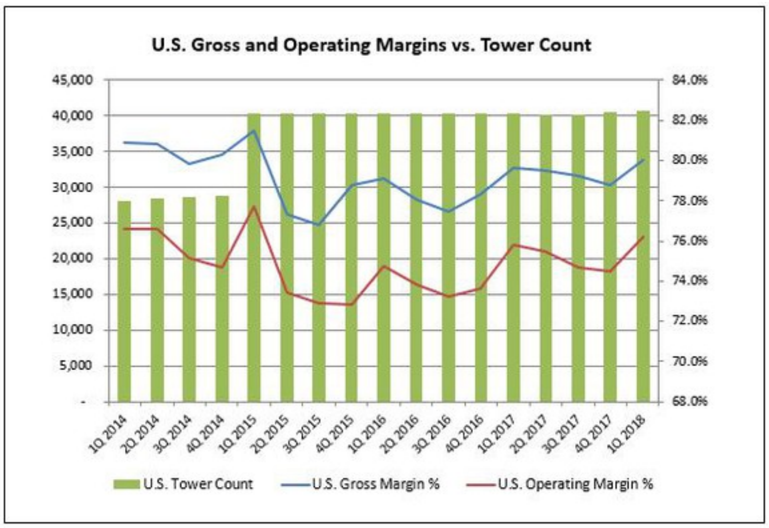
As we expected, the Indian wireless carrier consolidation has continued to affect growth rates and margins in that market throughout 2018, and that should continue through the rest of the year. Similar to last quarter, the company booked another impairment charge ($147 million) and some bad debt expenses ($29 million) in the first quarter related to India carrier consolidation. The graph below shows how margins were affected in India both before and after adjusting for the one-time expenses:

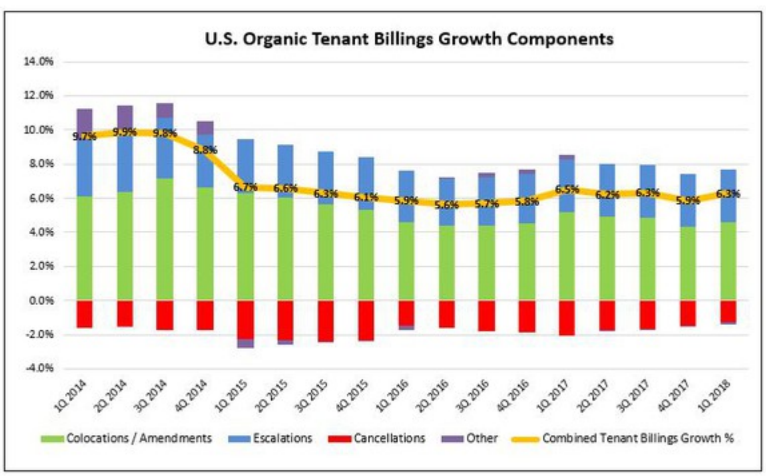
In EMEA and Latin America, margin trends are positive and management expects margin expansion over time as the company continues to generate organic growth on its extensive existing portfolio of assets.





In the U.S., margin trends continue to improve. TTM gross margins increased year-over-year to 79.4% (from 78.4%), and TTM operating margins increased year-over-year to 75.2% (from 74.1%). We can see in the graph below that, since the significant **Verizon** (NYSE: VZ) acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (thanks to the lower tenancy ratio on those new towers), management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets. We've now seen five straight quarters of TTM gross margin percentage improvement and eight straight quarters of TTM operating margin percentage improvement for the U.S. business:

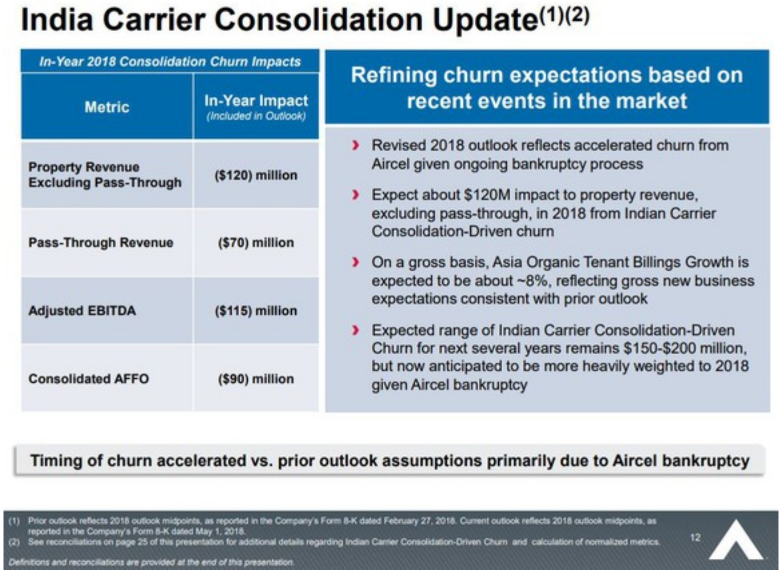




Continued improvement in the U.S. business is especially nice to see given the disruption in the Indian market, and given that the U.S. business still generates about 55% of companywide revenue and 65% of operating profit.

Now What?

As noted, the first quarter of 2018 represented a continuation of trends that started in the fourth quarter of 2017, as American Tower continued to digest the impact of Indian carrier consolidation, reporting accelerated churn levels as a result of Aircel's bankruptcy. Churn driven by this consolidation should continue to affect results throughout 2018 before stabilizing in 2019 and returning to normal levels in 2020:

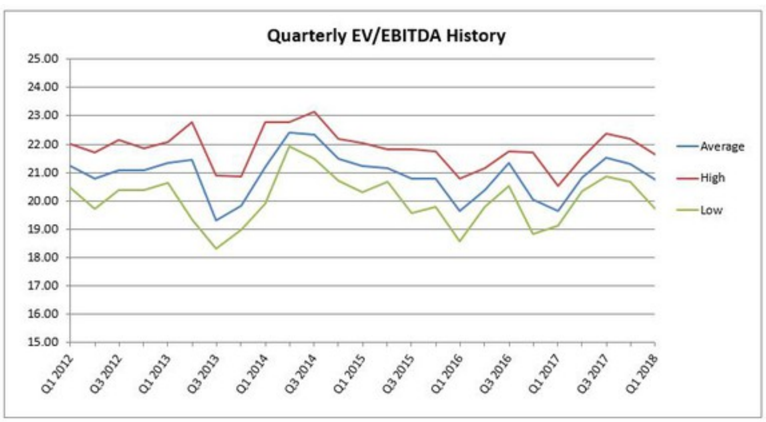


Aside from the Indian market, the rest of American Tower's business continues to perform well. The U.S. business is showing continued growth and margin improvement, and EMEA/Latin America are expanding at a rate higher than that of the United States. Management has an outstanding track record of growth and capital allocation over the past decade, and we expect that to continue despite the near-term disruption in India.

Data and Guidance

- Current Price: $139.69
- Fair-value estimate (unchanged): $146
- Allocation: 3.8%, plus 0.7% in January 2019/October 2018 $80/$135 diagonal calls
- EV/EBITDA (2018 Outlook): 19.22

American Tower is trading at EV/EBITDA levels at the low end of the company's ranges since 2012, as the stock has generally spent most of its time with an EV/EBITDA multiple higher than 20. However, there is plenty of uncertainty that accounts for the reduced multiple (Indian market pressure, the Sprint/T-Mobile merger in the U.S.):



AMT remains a Best Buy Now, and fair value is unchanged at $146. We also have 0.7% in diagonal calls, which expire in October (and the long calls expire a few months later in January 2019). By January 2019, we will need to decide whether we want to close our entire diagonal call position, roll out the long calls to 2020 or 2021, or exercise the long calls into stock.

Pro Catch-Up Trades and Expirations: CME Group, Coherent, and More

Published May 10, 2018 at 12:12PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.3%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.7%.
- **Coherent** (NASDAQ: COHR): Buy 1.6%.
- **Facebook** (NASDAQ: FB): Buy at least half of our 7.6% stake.
- **Paycom** (NYSE: PAYC): Buy up to 4.2%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.4%.
- **Square** (NYSE: SQ): Buy up to 4.5%.

Shorts:

- N/A

Options:

- **Oracle** (NYSE: ORCL): Invest 0.6% to "buy to open" January 2020 $30 calls. Once you own those, wait for a price recovery to write diagonal calls with us at about a $50 to $52.50 strike price for a worthwhile yield. We'll have an alert when we're ready.

Upcoming Expirations (May):

- We have written calls expiring on **The Cooper Companies** (NYSE: COO), **Gilead Sciences** (NASDAQ: GILD), and **Home Depot** (NYSE: HD) on May 18. We'll have guidance soon. Right now, we only need to roll the Home Depot $175 diagonal calls.

Pharma Spurs Growth at Johnson and Johnson

Published May 7, 2018 at 1:54PM

First-Quarter 2018

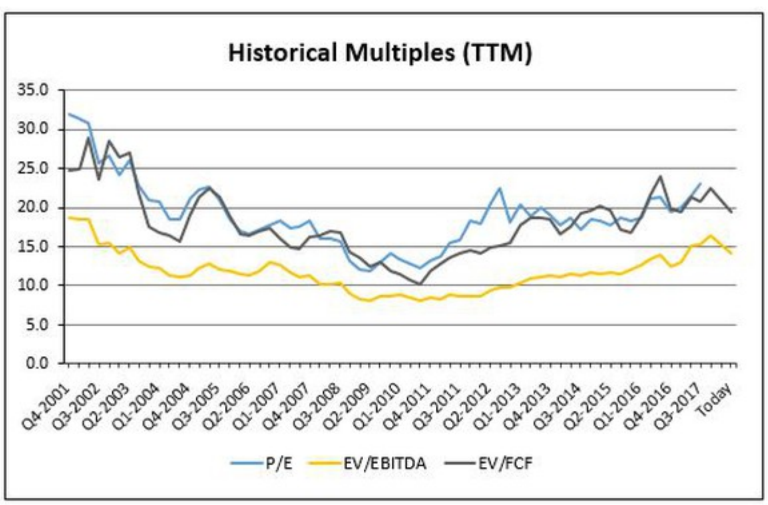
- [Press Release]
- [Earnings Presentation]
- [Supplementary Sales Data]
- [Sales of Key Products & Franchises]
- [10-Q Filing]

Johnson & Johnson (NYSE: JNJ) continued its recent business momentum in the first quarter of 2018, reporting acceleration in revenue growth for the fourth straight quarter. Company-wide sales growth of 12.6% was led by 19.4% growth in the pharmaceutical division, which accounts for 48% of total sales. On an adjusted non-GAAP basis, J&J posted 12.6% year-over-year earnings-per-share (EPS) growth for the first quarter. Management increased its sales guidance for 2018 to 6.5% revenue growth (from 6%) and reaffirmed its guidance for 11% adjusted EPS growth.

Although J&J's stock price has come under pressure in 2018 because of rising interest rates, the business is performing up to our expectations. J&J will hold an Analyst/Investor Day on May 16 to discuss its consumer and medical-devices businesses, and I'm looking forward to hearing about how management plans to maximize value from those slower-growth segments.

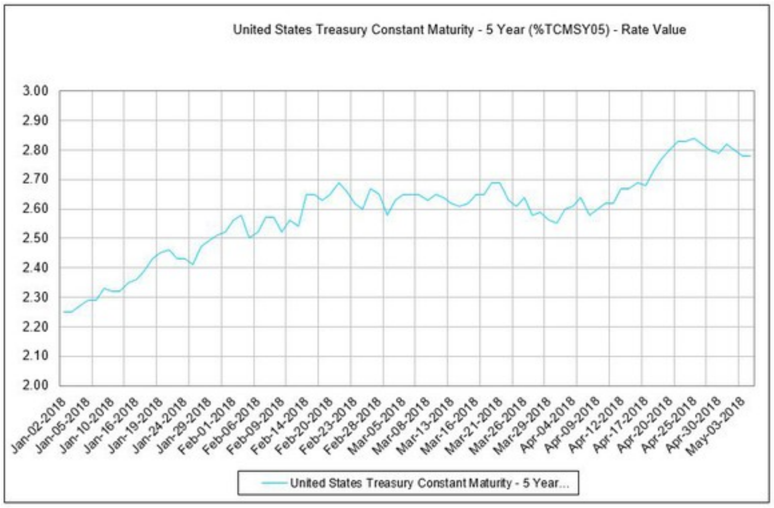
- **Updated guidance**: Best Buy Now (no change)
- **Recommended allocation**: 2.7%, with May 2018 $135 covered calls that are set to expire as income next week.
- **Fair-value estimate**: $140 (up from $137)
- **Current price:** $124.80

At about $125 per share, the stock is priced at 14.2 times trailing-12-month (TTM) EBITDA and 19.6 times TTM free cash flow:

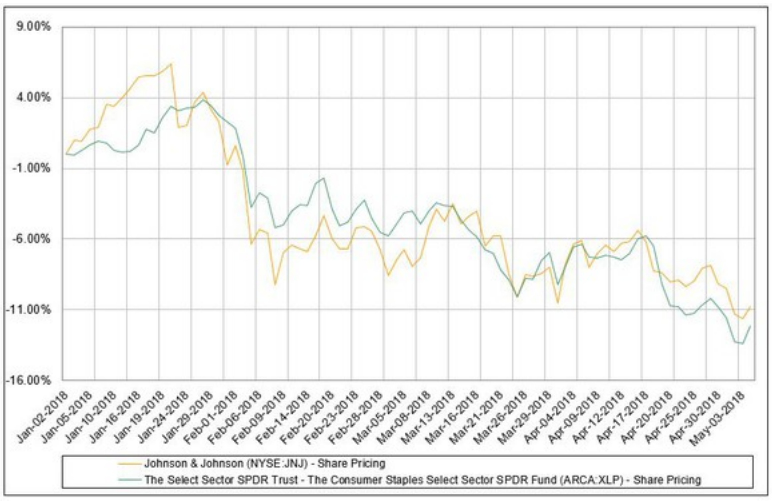


Based on management's guidance, J&J is priced at about 15.4 times 2018's non-GAAP earnings -- attractive compared with the S&P 500, which is trading at 17.2 times expected 2018 earnings estimates. The stock has experienced multiple compression in 2018, with the price yet to recover from the early February volatility spike that rocked the market.

This is likely because of its association with the consumer staples sector, which in turn has an inverse correlation to interest rates (because dividend-paying consumer-staples stocks are seen as replacements for other interest-yielding assets, such as U.S. Treasury bonds). As the five-year yield has increased from 2.25% to start the year to 2.78% as of Friday's close...

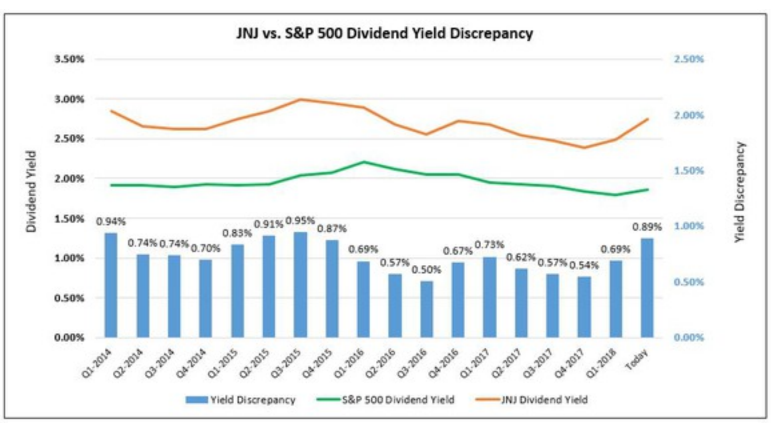


... the consumer staples sector has declined by about 12% and J&J has declined by about 11% over the same span:



If interest rates keep rising, J&J's stock price may remain pressured. If that happens, J&J's dividend yield should keep rising thanks to consistent yearly dividend increases. J&J recently increased its dividend from $0.84 per share to $0.90 per share (a 7.1% increase), meaning that the current forward dividend yield is 2.9%, a level we haven't seen since Q1 2016 when the stock was trading a about $100 per share.

Because J&J has such a consistent history of dividend payments, one of my favorite ways to monitor the company's relative valuation is to compare its dividend yield to that of the S&P 500. This comparison strips out the confounding effect of interest rates that occurs if you look at J&J's dividend yield in isolation (since dividend-paying stocks tend to fluctuate in price alongside interest rates). When we make this comparison, J&J again looks attractively valued:

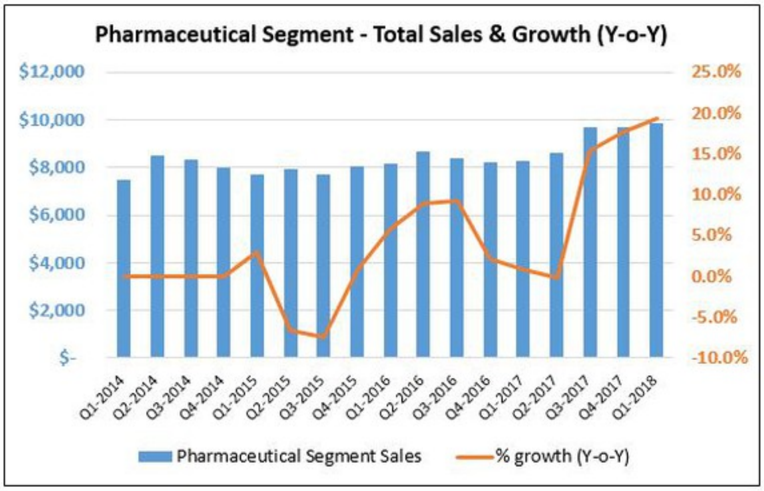


The yield discrepancy between J&J and the S&P 500 hasn't been this high since the fourth quarter of 2015. Since 1997, the average yield discrepancy between the S&P 500 and J&J has been 0.63%, and it's currently at 0.89%.

Our fair-value estimate increases slightly to $140 (from $137), and Johnson & Johnson remains a Best Buy Now. Members who have yet to start or fill out their positions can feel comfortable doing so at current prices. We also have May 2018 $135 covered calls, which look set to expire as income next week. We will let those calls expire and wait for higher stock prices to reinitiate the covered-call strategy.

Division Performance

J&J's pharmaceutical division continued its strong growth in the first quarter, bolstering the entire company's results given that this division is the company's largest by sales volume:



Pharmaceutical sales growth accelerated to 19.4% year over year, up 7.5% excluding the impact of the Actelion acquisition. Drugs in the oncology market continued to lead the pace, with Darzalex sales up 69%, Zytiga sales up 62%, and Imbruvica sales up 44%. JNJ's pipeline remains promising, with two new launches in 2018 and the expected regulatory approval of eight other new drugs by 2021, each of which has $1 billion in peak revenue potential.

In addition to the strong growth from the pharmaceutical division, the consumer division and the medical device division posted year-over-year revenue growth of 5.3% and 7.5%, respectively. Companywide operational sales growth (ex-acquisitions) came in at 4.3% for the quarter.

Our Thesis

Johnson & Johnson is is a diversified health-care conglomerate, with more than 260 operating companies organized into three business divisions: consumer, pharmaceutical, and medical devices. At eight out of eight of our *Pro* quality criteria, J&J is a quintessential *Pro*-quality stock. While its large size means we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk from one of the safer stocks you are likely to find in the entire investment universe.

Good Earnings Results Help Drive Our Portfolio

Published May 7, 2018 at 1:20PM

Greetings, *Pro* members, from Hong Kong!

I've just been part of a dinner event with Fool members here in celebration of the launch of www.Fool.hk. It was great to meet members and share our passion for investing while getting to know each other better. You all live amazing lives!

Today's Memo shares the earnings summaries that I have ready so far. But before we dive in: The *Pro* team and I have been talking about continuing to improve our approach. I know that permanent losses of capital are a part of investing, but I still want to avoid them more than we have lately. The *Pro* process of buying stocks and shorting is strong. It's when we *stray* (giving in to a desire to push boundaries) that we most often get hurt. **Shake Shack** (NYSE: SHAK) wasn't our usual "buzzard bait" short, and now we have an issue to address. We're considering using options on it, as well as other possibilities, including closing it. More before long.

Meanwhile, the *Pro* Port is nearing new highs again on earnings results from our largest holdings. Let's look at some results.

Earnings Roll In

CME Group (NASDAQ: CME): In its first quarter of 2018, the world's largest derivative marketplace reported record quarterly average daily volume in five of its six product categories, with total volume up 30% to 22.2 million average daily contracts. As financial markets become more volatile, investors turn to the options and futures listed on CME's exchange to hedge risk in interest rates, equities, energy, metals and more.

Last quarter, CME's revenue rose nearly 20% to $1.1 billion, and net income was up a strong 49%. The company maintains market-leading operating margins of more than 60%. Its U.S. business is strong, but small and fast-growing markets overseas may hold the most long-term promise. Volume rose by 41% in Asia and 37% in Europe last quarter, with non-U.S. customers making up more than 30% of this business.

Despite record results, investors focused on CME's market data revenue, which fell 2% year-over-year to $95 million. CME notes that this number fluctuates partly because of the resolution delay for trade settlements; overall, this revenue is running at similar levels to last year. Meanwhile, a price increase went into effect April 1 (from $85 to $105 per screen). At less than 10% of the total, market data revenue should be kept in perspective as long as it remains healthy.

CME Group is slated to buy NEX Group for its foreign exchange and fixed-income cash execution platforms. This should continue CME's long history of growing by smart acquisition. The company has also been able to return $9.8 billion in free cash flow to shareholders since 2012, averaging about a 5% annual cash yield, along with market-beating stock appreciation. Lately at about $157, the stock trades at 23 times expected earnings for the year ahead -- a premium valuation multiple, but a lower one than in recent years. It's a Best Buy Now here at 2.4%.

Facebook (NASDAQ: FB): Despite investing heavily in its business, Facebook is growing strongly. Ad revenue was up 50% in the first quarter of 2018, and mobile ad revenue jumped 60% to $10.7 billion, representing 91% of total ad sales. The average price per ad rose by 39%, and ad impressions served increased by 8%. Against this strong growth, total expenses rose 39%, leaving Facebook with about $5 billion in first-quarter free cash flow and a top-notch 46% operating margin. For the year, Facebook still expects expenses to increase by 50% to 60%.

Investors may be willing to look past those costs as long as ad revenue continues to increase nearly as rapidly and traffic stays healthy. Daily active users on Facebook properties climbed 13% from a year ago, to 1.45 billion, led by growth in India, Indonesia, and Vietnam. Monthly active users grew 13% to 2.2 billion. With the largest, most engaged Internet audience in the world, Facebook remains focused on making its advertising business effective, transparent, and safe. It has tremendous room to keep increasing this revenue, and down the road management could also monetize Messenger, Marketplace, and countless other services if it so desires. This optionality is valuable.

But CEO Mark Zuckerberg opened the conference call focused on the multiple efforts under way to make the Facebook community a force for good, including tools that automatically remove dangerous content, transparent ads that users can eliminate if desired, limiting the data that app developers see, and continuing a policy of never selling data. An advertiser can target you based on stats, but does not know who you are. Facebook also shared that advertisers haven't left.

At $178, the stock trades at about 24 times expected earnings for 2018 and 26 times its free-cash-flow run rate. Facebook remains a high-conviction recommendation here, and our largest position at 7.5%.

Gilead Sciences (NASDAQ: GILD) surprised Wall Street last week. That was evident in the stock's sharp drop. Although management maintained and reiterated the total annual sales guidance they gave three months ago, calling for $20 billion to $21 billion in 2018 revenue, investors seem skeptical after revenue only clocked in at $5.1 billion in the first quarter, down from $6.5 billion a year ago. Sales for the HIV franchise were up just 2%, to $3.3 billion; for the Hepatitis C franchise, they fell a giant 59% to $1 billion, with competition weighing on results.

Management suggested last quarter that Gilead's Hepatitis C market share and some pricing stability were around the corner. Pricing has now "largely stabilized," they said last week, and they expect market share to stabilize by mid-year. They maintain Hep C revenue guidance of $3.5 billion to $4 billion this year. That said, it's easy to be skeptical, because they also foresee a continued, slow, steady decline in patient starts.

On the bright side, management is calling 2018 a trough year for Gilead's earnings, with confidence that earnings growth will return in 2019. At this point, after a few years of poorly managing Wall Street's expectations, investors like us would need to see it to believe it. With the Hepatitis C franchise shrinking, the HIV franchise remains the key pillar holding Gilead high. Generic pressures in Europe are being addressed with new drugs, but we've still been burned by having added a company here that doesn't meet our usual *Pro* requirements, such as pricing power and recurring revenue. We're debating what to do next, whether covered calls or something else. If Gilead can truly start to grow again next year -- *if* -- then the stock should do much better. But will it? For now, it remains a buy at just 1.8%. It trades at 10.4 times earnings expected for the next year -- but without growth, the struggle would continue.

Mastercard (NYSE: MA) reported first-quarter earnings-per-share (EPS) growth of 43% on revenue gains of 27%. Excluding the impact of accounting changes, currency, and special items, net revenue growth was still 20% and operating income was up 27%.

Business is strong around the world as economic activity remains robust. Worldwide gross dollar volume rose by 14% in local currency, 10% in the United States. Results are strong enough that management increased 2018 revenue guidance to suggest growth in the high teens (up from the mid-teens). As the company continues to invest in new initiatives, expenses are expected to grow as well, with those numbers now in the mid-teens up from the low teens.

Mastercard continues to expand its business in numerous related but novel directions. It's working on faster payments with its PromptPay, which enables bank transfers using a mobile number or citizen I.D. VocaLink, an acquisition from one year ago, is part of that. The company has a broad partnership with PayPal, including debit. And in other ventures, it's working on a standard checkout button for e-commerce, where sales were up 25%. Mastercard's services revenue was up 33%, including data analytics, and it's ready for Europe's General Data Protection Regulation in late May. In fact, Mastercard founded an independent trust, named Truata, to offer commercial data analytics based on anonymized data that meets GDPR requirements.

Meanwhile, Mastercard's debit business in India is taking off and holds great long-term potential. The company continues to seek approval to be a domestic processor in China, where it currently works with AliPay and TenPay "in a number of ways," CEO Ajay Banga said in the call, noting that "[CFO Martina Hund-Mejean] actually has willingly raised our expectations for the year ... which is a first."

The stock trades at 28 times year-ahead earnings estimates, a premium, but in line with the EPS growth rate. As with **Visa** (NYSE: V), management sees transaction growth of above 10% this year. It remains a Buy here with a 6.7% allocation. (Visa is a Buy at 3.7%.) If you're just starting, you can even those allocations out a bit more if you like; just realize that MasterCard is a smaller business and the stock has recently outperformed Visa again.

There's plenty more, but to spare Ellen as she edits, it'll have to come a bit later. [*Editor's note: This is not actually how editorial decisions are made, I promise.*] **Square** (NYSE: SQ) had strong results. Visa did, too. **Apple** (NASDAQ: AAPL) and **Skyworks** (NASDAQ: SWKS) did not disappoint, either.

Have a Foolish day!

-- Jeff (TMFFischer)

Shaken by Shake Shack

Published May 4, 2018 at 3:14PM

Dear *Pro* Member:

Even after years of investing, lessons will be learned and relearned. In most cases, they're learned after the fact, and it's only in hindsight that you wonder why you didn't see something earlier. In other cases, a Fool's overriding desire to leave investments alone for the long term rather than fiddling with them can lead to growing losses, but that long-term outlook should still produce many more wins for you overall.

That's our situation with **Shake Shack** (NYSE: SHAK). It's now the worst-performing short in *Pro*'s history, soaring today on earnings that were surprisingly bland. The stock is up on positive "same-shack" sales growth of 1.7% and revenue growth that was modestly above expectations. But traffic to stores dropped yet again, and it's unlikely any business can keep raising prices as often as Shake Shack has, so the overall story here hasn't changed. Nonetheless, investors are climbing aboard and short-sellers are getting squeezed out.

We will likely be closing our short in the coming days, too, with an official alert to you. I'm hesitant to issue that alert today — the best day ever for the stock — especially in light of the apparent short squeeze artificially pushing shares higher. Assuming we do close soon, though, we'll lock in a loss that has cost about 0.2% of the portfolio. At last count (the last day of April), the *Pro* port was up more than 1% for the year, while the S&P 500 is down a fraction. We're trailing our North Star, but we're in the green overall and doing better than the index. However, the hits we've taken this year haven't been fun.

What happened with Shake Shack is telling. Our thesis -- weaker same-shack sales, slowing sales growth, and higher costs -- has played out. But despite negative same-shack trends over most of the past year, the stock price has held up. In fact, now it's even jumping -- on same-shack sales guidance of just flat to 1% this year. And that guidance was issued only because this quarter improved. The rest of the year, it's still going to be a struggle to improve this metric.

Wall Street is instead focused on total revenue growth, up 29% last quarter, and Shake Shack's goal of 200 domestic-owned shacks by 2020 and 450 in the long run. The store count should increase by 36% to 39% this year. Expanding expenses and lower foot traffic will keep profits and revenue from growing nearly as much (look for a figure in the mid-20s instead). Yet the stock now trades at more than 70 times expected earnings, making it the most expensive among its profitable peers.

We are not likely to keep fighting this stock's trend. We're on the losing end for a reason. Investors simply like the long-term story, the management, the stable revenue growth. They like the brand. They like the company's digital initiatives. Overall, we've been wrong to short it. The numbers show that plainly.

How can we do better next time? Several ways, which start here in *Pro* immediately.

1. We're not going to short brands with buzz and well-known founders or management.
2. We never short on valuation alone, but when valuation is a core argument, we also need a business that is stagnant or shrinking, not growing.
3. We're going to stick to our 20% "max loss" rule on shorts. We reviewed this short every step of the way, and opted to keep it, as an exception. We shouldn't do that. We need to stick to our rules on shorts to contain losses.

One thing we did do exceptionally right: We never added to the short. We started it at a small size of about 0.45%, and we never shorted more. We considered adding to it often, in the high $30s and low $40s, but a strong enough reason to short more of it was elusive. The risks seemed too large. Our exposure was ample. This only reinforces our ongoing belief that shorts should start very small and you should add to them rarely, partly because a short grows anyway as it rises.

All told, this was a poor short choice. I should have seen that. I was not — am not — impressed by the product or the company's long-term plan against the backdrop of its current share price. The stock is already pricing in at least 200 stores, if not 300. It will take years to get there. If you discount that value to today, even assuming the best-case results for earnings, the stock is priced to an extreme that it is hard to imagine lasting forever. But we also don't want to stay short forever and risk a growing loss. We can exit soon and still have a strong, thriving portfolio, and still be in the green for 2018 so far, too. We can exit and be wiser for it, more lessons learned and relearned. We'll write about those with time.

Finally, there's another change I want to start in *Pro*:

Any position we short in *Pro*, I'm going to short it myself, too. I haven't always in the past, largely because our trading restrictions put hurdles in place. But now I want to. Just as I own most *Pro* stocks and want to get to a point of owning them all, I will short every stock we short in *Pro* right from the start -- a few days after our alert. That should help us all succeed better together.

In closing, to be clear, this isn't a close report. I'm hoping the stock gives back some of these gains as the short squeeze relents. But we could issue a close report as soon as next week. We'll see. And we'll be in touch. We've had some hits this week with earnings, but our largest positions are doing very well and carrying the portfolio. That's generally how it's hoped, and meant, to work. Your winners keep winning and growing more important. Your losers you end up cutting, especially with a short. We're on watch to do that soon with Shake Shack, because even if the momentum changes at some point down the road, hanging on is risky while we wait. We'll want to clear it out and do much better with our next short decision.

On a personal note, I'm traveling with a band of Fools to Hong Kong right now, where next week we'll celebrate the launch of Fool Hong Kong! We're happy to keep spreading Foolishness around the world. Thank you for being a key part of it. Have a good weekend.

-- Jeff (TMFFischer)

Pro Catch-Up Trades and Expirations: CME Group, Paycom, Square, and More

Published May 3, 2018 at 1:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.8%.
- **CME Group** (NASDAQ: CME): Buy 2.4%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.7%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.7%.
- **Coherent** (NASDAQ: COHR): Buy 1.6%.
- **Facebook** (NASDAQ: FB): Buy at least half of our 7.5% stake.
- **Paycom** (NYSE: PAYC): Buy up to 4.1%.
- **Square** (NYSE: SQ): Buy up to 4.1%.

Shorts:

- N/A

Options:

- **Oracle** (NYSE: ORCL): Invest 0.6% to "buy to open" January 2020 $30 calls. They're lately about $16.50 each. Once you own those, wait for a price recovery to write diagonal calls with us at about a $50 to $52.50 strike price for a worthwhile yield. We'll have an alert when we're ready.

Upcoming Expirations (May):

- We have written calls expiring on **The Cooper Companies** (NYSE: COO), **Gilead Sciences** (NASDAQ: GILD), and **Home Depot** (NYSE: HD) on May 18. We'll have guidance beforehand. Right now, we only need to roll the Home Depot $175 diagonal calls (the stock is $183 lately).

Volatility Re-Examined

Published Apr 30, 2018 at 1:34PM

Note: We don't have any guidance changes or completed trades to share over this past week. A continued huzzah for status-quo, long-term investing!

Dear *Pro* Fools,

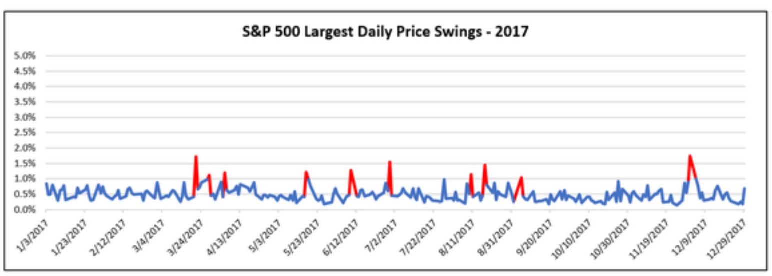
Last year at about this time, I wrote a Memo called "The Least Volatile Market Period in History." In that distant, faraway time, we had just endured exactly what the title said: literally the least volatile market period in history. The S&P 500 had recently gone 64 consecutive trading days without a 1% intraday move, by far the longest streak of low volatility in market history (crushing the previous record of 34 consecutive days set in 1995).

That Memo discussed the persistently low levels of volatility in the CBOE Volatility Index, or ^VIX, and the association of low volatility with higher stock prices over the next year. I closed it with a warning:

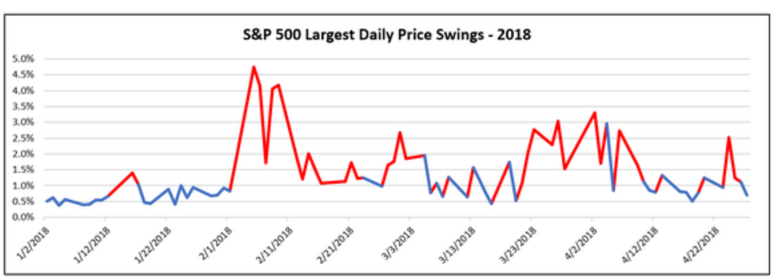
> "Will volatility increase in the future? The answer is most likely yes, as volatility is mean-reverting and market swings of 1% or more are very common. The relatively higher volatility of stocks (compared with bonds or other asset classes) is one of the reasons why stocks generate higher returns over time, as the risk/return principle implies that higher risk is correlated with higher returns.
>
> "After enduring such a long period of low volatility, it is easy to allow psychological biases (such as the recency bias) to trick you into believing that low volatility is the norm. The next period of significant market volatility may feel especially jarring when compared with the current calm. However, keep in mind that volatility is very normal, and significant swings in stock prices will happen -- it's just a question of when. If you mentally prepare yourself in advance for such volatility, it will take you a long way toward making proper decisions when the time comes."

Oh, How Times Have Changed

Upon reexamining volatility in 2018, we see that the warning note from that Memo has proved prescient. As you may have noticed, 2018 has been a far cry from the atypical low-volatility environment of 2017. Take a look at this set of charts, which details the largest intraday price swings (measured via the highest and lowest intraday price from each trading day) for 2017 vs. 2018, with swings greater than 1% shown in red:



In 2017, maximum intraday price swings ranged between 0.15% and 1.73%, averaging 0.51% per day. There were 10 trading days (out of 251 for the whole year) where the maximum intraday price swing was greater than 1%. Now here's 2018:



Whoa. If we were shown the two preceding graphs without any titles or context, we'd think we were looking at two completely different systems. This example of the inconsistency of data when measured across differing time periods is one of the defining characteristics of stock markets. (And it's one of the main reasons why stock-market predictions based on linear models or normal distributions don't work.)

In 2018, maximum intraday price swings have ranged between 0.38% and 4.75%, averaging 1.39% per day. So far, out of 81 trading days this year (not including today), 45 of them have seen intraday price swings greater than 1%.

Volatility and Market History

While 2017 was atypically calm, 2018 has over-corrected to the opposite extreme of the spectrum. When measured by the number of 1% intraday moves (up and down), 2017 was the least volatile year since 1972. Conversely, when the data from 2018 so far is extrapolated out to a full year, it marks the most volatile year since 1938:

S&P 500: Number of 1% Up and Down Days (1928 - 2018)								
Year	1% Down Days	1% Up Days	Year	1% Down Days	1% Up Days	Year	1% Down Days	1% Up Days
1928	27	40	1958	5	13	1988	31	37
1929	48	66	1959	14	8	1989	14	26
1930	70	58	1960	17	14	1990	42	33
1931	97	69	1961	3	11	1991	25	34
1932	95	86	1962	34	24	1992	11	17
1933	75	87	1963	3	3	1993	7	10
1934	59	61	1964	3	0	1994	15	12
1935	40	51	1965	7	1	1995	4	9
1936	29	59	1966	25	16	1996	17	21
1937	62	55	1967	9	10	1997	31	50
1938	67	74	1968	9	10	1998	32	47
1939	52	52	1969	18	7	1999	40	52
1940	35	36	1970	33	30	2000	54	48
1941	29	25	1971	14	18	2001	54	51
1942	26	33	1972	6	4	2002	72	53
1943	17	25	1973	43	35	2003	37	45
1944	8	8	1974	67	47	2004	20	21
1945	21	25	1975	35	45	2005	17	13
1946	37	39	1976	14	25	2006	13	16
1947	30	30	1977	12	5	2007	34	31
1948	26	28	1978	24	19	2008	75	59
1949	15	17	1979	13	17	2009	55	62
1950	22	33	1980	37	43	2010	37	39
1951	17	19	1981	30	24	2011	48	48
1952	8	5	1982	38	44	2012	21	29
1953	16	8	1983	26	29	2013	17	21
1954	5	10	1984	16	25	2014	19	19
1955	19	23	1985	7	22	2015	31	41
1956	21	23	1986	25	35	2016	22	26
1957	25	17	1987	42	53	2017	9	1
						2018	*78**	*62**

Note: 2018 represents a full-year run rate based on the data as of April 27.

Based on the mean-reverting nature of volatility, I'd guess that the rest of 2018 won't be as volatile as the beginning of the year (although I reserve the right to be wrong!).

Low Volatility and Higher Stock Prices

In last year's volatility Memo, I also examined a phenomenon I'd noticed: In every single instance following a long streak of low volatility, the S&P 500 has been higher one year later. Now that we're more than a year removed from last year's data point, we can see that the relationship between low volatility and higher stock prices has held in this case. Last year's streak of 64 consecutive trading days without a 1% intraday move ended on March 20, 2017; one year later, the S&P 500 was higher by 14.5%.

The *Pro* Bottom Line

After an atypically placid 2017, we've shifted gears into a turbulent start to 2018. Although we knew volatility was likely to increase from 2017's historically low levels, it would have been difficult to predict that this turnaround would lead into a period of volatility that will, if the pace continues, be the most extreme in 80 years.

Nonetheless, we know that volatility is a normal and healthy part of stock-market investing, and we know that volatility is one of the main reasons why stocks generate higher returns over time compared to other, less-volatile asset classes. And because we didn't allow the tranquility of 2017 to lull us into a false sense of security, we were able to weather the beginning of 2018 with composure, using the volatility as an opportunity to initiate new positions and to reexamine our approach to hedging.

Fool on!

Pro Catch-Up Trades and Expirations: CME Group, Facebook, and More

Published Apr 26, 2018 at 1:57PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **Oracle** (NYSE: ORCL): Buy 3.4%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.7% per our recent alert.
- **Coherent** (NASDAQ: COHR): Buy 1.5%.

- **Facebook** (NASDAQ: FB): Buy at least half of our 7.5% stake.
- **Visa** (NYSE: V): Buy 3.7%.

Shorts:

- **Shake Shack** (NYSE: SHAK): You can short 0.5%, but please realize that we may close this soon if the short doesn't start to go our way after earnings in early May.

Options:

- **Oracle**: Invest 0.6% to "buy to open" January 2020 $30 calls. They're lately about $17.50 each. Owning those, wait for a price recovery to write diagonal calls with us at about a $52.50 strike price for a worthwhile yield.

Upcoming Expirations (May):

- We have written calls expiring on **The Cooper Companies** (NYSE: COO), **Gilead Sciences** (NASDAQ: GILD), and **Home Depot** (NYSE: HD) on May 18. We'll have guidance well before then. Right now, we only need to consider rolling the Home Depot diagonal calls.

Pro Video Chat, May 2018

Published Apr 24, 2018 at 12:53PM

The *Pro* team held **a live video chat on this page at 2 p.m. Eastern on Thursday, May 24**! A replay and a transcript are available below.

Jeff Fischer: Greetings, *Motley Fool Pro* members and welcome to the May *Motley Fool Pro* chat. I'm joined at the table by JP Bennett...

JP Bennett: Happy to be here.

Fischer: ...and via phone we have Billy Kipersztok.

Billy Kipersztok: Hey, Jeff.

Fischer: Hey, Billy. How are you doing?

Kipersztok: Doing well, thank you.

Fischer: And we are grateful that you're here, as well. We are, as usual, taking your questions in real time at Slido.com. If you go to Slido.com and enter #ProChatMay, you can and should get into that forum and ask your questions. Thumb up the questions that you like best and we'll answer them in order of popularity for the most part, assuming we have an answer, and we'll try to answer all of them over the course of the live time spent with you.

As for *Pro* itself, we are now five months through the year, practically, JP...

Bennett: Time is flying.

Fischer: It's been an interesting year.

Bennett: Yes, it has.

Fischer: The S&P, after a record-strong start pretty much, is now up about 2% on the year, including dividends, I believe, and PRO port was up a little more than that. We have some dividends to reinvest. We'll have dividend reinvestment trades soon (that's the plan), and we have had some new positions put into the portfolio this year, already, including Adobe and just this week JD.com and others that we look forward to talking about.

Overall, if I had to rate ourselves on the portfolio, I'd say we're doing pretty well. You can do very poorly in investing. You can have large losses. Most major hedge funds have done horribly the past five to 10 years. We're doing well -- overall very well -- this year. I wish we were a little stronger given the strength in Nasdaq holdings, where we benefitted so far with Facebook, Square, Paycom and things like that.

But we've had some hits this year, as well, some hits meaning some negative hits from (SVXY), Gilead, and Shake Shack short. We have our mix of wins and losses, as usual, but a few more losses this year than we normally would have in a flat year. But overall our largest positions are the ones driving the portfolio and are where we spend the most time, because they're the most important.

It's great to see new leadership climbing through the ranks of our holdings. By that I do mean Paycom, Square, and Tencent, to some degree, are already growing enough to rise up to become larger holdings among our 25 positions. Our top 10 positions are about 55% of the portfolio, and we really like all those stocks, as well as our smaller stocks, which are less consequential, but to which we might be adding to or letting go of to move into something we like better.

So, it's always fun, always Foolish, and we're glad to be here with you, and that you're here with us. I look forward to the rest of the year. We just wrapped up most earnings. Medtronic reported yesterday and looked quite good. As we wrap up, you know we frequently follow earnings season with some trades as we adjust the portfolio and look forward with it, so we can probably look forward to that very soon, too.

Without much further ado, let's get into the questions that we have so far, here. We'll start right at the top. We have Lon asking, "Hey, *Pro* Fools, may I again request a return to monthly chats. Thank you."

Lon, we are chatting almost monthly with you. We have a chat in *Options* and a chat here in *Pro*; therefore, we do have at least face-to-face time almost every month between these two services. But it's really about the Fool's resources and what the Fool wants to do across its many services and how it uses studio time.

We enjoy these chats. The Fool appreciates them, too, and wants us to have access to you, obviously, and vice versa, and so we'll see. This is, as we said when it rolled out, kind of an experiment to see how it goes bimonthly or quarterly instead. We're only two quarters into this, but we'll see what we can decide. I better not say much more. Your question, your comment is duly noted and definitely heard.

Bruce has leapt up into the lead right now with, "What is the plan for Coherent trading below the recommended price? For those who have less than a block," (I imagine he's saying 100 shares), "what alternatives will be considered?"

Well, Coherent is now a 1.7% position. It was never more than 2.0-2.5% when it started. I think 2.0%? Billy?

Kipersztok: I'll check on that.

Fischer: OK. And we have added to it in at least one small amount once with a dividend reinvestment and maybe twice, I want to say. Anyway, it's still a pretty new position for us. Just over a year old or so. I don't know that anything needs to be considered for it. A block isn't important unless you're trying to use options on it. You don't need to own 100 shares, which is about $17,000 worth of stock.

More important, of course, is your allocation and we're comfortable with our sub-2% allocation right now. I just wrote about Coherent in the recent memo this week. The business is doing well. Revenue is growing. Earnings are growing. They're booking new business for 2019. The market is concerned about MicroLED evolution. Where most screens, right now, are made in LED, OLED; MicroLED would be a new way of making screens. That said, Coherent addressed that, again, with the strong belief that they are in a position to benefit should MicroLED become the next thing.

They believe it's still a ways from commercialization -- quite a ways from it -- but they're already working with manufacturers and they already have product on the market being tested to aid in the manufacture of that new technology. They think it would actually expand their market to bigger screens, as well.

So, overall, Coherent is on track. The market hasn't liked the long-term risk of technologies changing, but let's keep in mind Coherent is more than 50 years old. Technology has changed constantly in the laser space. They're typically one step ahead of the game and they seem to be right now, too.

We're not overly concerned, although we are, of course, watching that they're about to lose their strategic positioning. I don't believe that's the case. I think that company is most likely to keep growing and so right now we're keeping our stake, keeping it at a buy, and we consider adding to it, as we do all our positions pretty much every quarter. If we decide to do that, you'll get an alert to that extent.

Right now, we recommend everyone have the position size that matches us -- 1.7% or so -- and we are delighted to be owners in that business for the coming five years and longer, hopefully. As long as it keeps performing financially, we think the stock will eventually follow suit.

Kipersztok: To clarify, Jeff, we did start with a 2.5% allocation.

Fischer: OK, thanks, Billy. That hurts. Now it's 1.7% because the portfolio has risen. Coherent has fallen about 30% the last I looked, so it's shrunk, but in a way that's good. In most ways that is good when your losers become less meaningful, but I don't think Coherent is going to be a long-term loser. It was, in fact, a winner just a quarter or two ago. It was up around $300 a share. It's a volatile stock, and I think in those cases, especially where the business is one you believe in, it bodes well to hold onto shares rather than sell when it's down.

Now we get to hear from somebody else, thankfully, meaning JP, because Lana is asking, "Could we elaborate on our thoughts on China regarding JD.com, please?" JP, your thoughts on JD, other than we know it's the initials you like. They're kind of close to yours...

Bennett: Yes. That, now, is the sole reasoning behind...

Fischer: Close enough.

Bennett: ...the sole reasoning behind my recommendation. How much time do we have? Can I use the rest of our *Pro* chat time here?

Fischer: Knowing how much we've talked about JD in the past two months and how long you could go on, I think I have to put a limit on you.

Bennett: OK, fair enough.

Fischer: Let's say four minutes. Three minutes.

Bennett: Fair enough. In a nutshell, for me the biggest concern was I didn't want to be investing in a company that I thought would get caught up in a winner-take-all market two, three, or four years down the road. You layer that risk -- being the company that doesn't win -- on top of country-specific risk and China and political risk and it just wasn't that appealing to me.

I would say the vast majority of the time starting out was just looking at China and the e-commerce market. Not only that, but for me, when you have a really complex issue like this, I prefer to take a step back and try to come up with a couple of really key questions (questions I believe will ultimately drive the thesis) and spent all my time drilling into those and yet using those questions to move the research forward. It was something like this.

It's incredibly easy to get caught in the weeds, get bogged down, and go off on weird tangents, and then you take a step back and it's like, "Wow. I just spent two days doing something that was completely useless." I wanted to get more comfortable with what disposable household income is going to look like going forward. Ultimately, I felt like that was probably going to be the biggest driver when I was done with everything. That was the first question.

The other three were how much people are going to spend, what are savings rates versus consumption rates going to look like, and where are they going to spend it? You have that money. You can spend it wherever you want. They're not going to spend it all on retail. I needed to get a better feel for what retail slice of the consumer-spending pie was going to be like, and then what is e-commerce's share of that retail spending going to be.

Ultimately, what it got down to was after spending Lord knows how much time on it, I felt pretty confident you're going to see 20-30% growth in e-commerce for the next five years and for the next decade in all likelihood it's going to continue to outpace the U.S. e-commerce market, which obviously gets all the attention. It's not a perfect comparison, and oftentimes I hesitate to compare Chinese companies to U.S. companies or Chinese markets to U.S. markets.

In that case, I feel like because the Chinese market is just so big, there's so many people. They're spending all this money. Even though they're spending a fraction of what they ultimately could be spending, one of the most interesting things is that the savings rate in China is just incredibly high. There are a bunch of reasons for that, and I actually don't think that's going to change in the next five to 10 years. If it does, it would be a huge boom to the economy, but I don't believe it's going to change. I think they're still going to have an extremely high savings rate.

But you look at all of that stuff and ultimately I felt like using the U.S. helps put it in perspective -- that this opportunity is so massive, even though it's already bigger than you could really fathom -- so, once we got to the point where this market is huge, the opportunity is huge, we would love to invest in it more directly than by way of Tencent, because obviously Tencent has, in addition to their stake in JD, fingers in a bunch of other companies.

They have got countless investments. I know, just like a reign of statistics, that Chinese companies (primarily like Alibaba and JD) accounted for I think was upwards of like 40-50% of venture capital funding last year on a global basis. They are investing heavily in the next leading companies. We wanted more exposure to that, so then it was how we were going to do this. Do we want Alibaba? Do we want JD? They're obviously very different business models.

I was sitting on the sidelines, not really sure what to do, and then you just watch JD get absolutely clocked. This makes it a much easier decision. The final stepping point for me was just modeling out. Assuming what I believe to be somewhat conservative expectations are correct, this stock is simply too cheap. It's just way too cheap. And whenever that happens, I always get extremely nervous, because [I'm concerned] I'm missing something.

We ultimately had enough conviction (I know you looked at it, too, for both *Pro* and some other Foolish services and recommendations). You just thought the opportunity was so big it was worth taking it. Two and a half percent may not seem like a big stake, and that's perfect, because if it doesn't work out, the stock's not going to do great, but like you mentioned early, it's not going to hurt us to the point where we can't overcome it. But if it works out, it's not going to be just like a 5-7% growth annually. We're talking about huge returns and it will get to the point where it will definitely have a huge positive impact on the portfolio.

Fischer: Definitely. That leads right into the top-rated question from Lance. "Hello, Fools. I saw a commentator on CNBC who said that Alibaba is a Raymond James top pick. Can you discuss Alibaba versus JD?"

I'll throw in that personally I like JD.com better, obviously, for a few reasons. You can't simplify -- we don't want to oversimplify...

Bennett: I didn't have enough time to go into the details.

Fischer: ...the two, though JD is more of the Amazon model, where they're holding inventory. They're fulfilling delivery. They control the whole experience start to finish. Alibaba is more an eBay model, where they put disparate buyers and sellers together from across the country. It's interesting, because early on eBay looked like such a better business compared to Amazon. In fact, I bought more eBay than Amazon back in the day.

EBay was profitable. It was, of course, growing quickly. Amazon was growing sales, but growing its losses to an even greater degree, so I thought eBay looked like the better business. But in the long run, Amazon has proven to be, by far, the more valuable business, and I think that's because it controls the experience start to finish. It's the company that has the relationship with the customers. It controls the whole value chain in a nutshell, and that has allowed it to pro revenue to outrageous proportions compared to eBay, and that revenue produced, all these years, cash flow for Amazon that it could then invest into other projects. Look at how that's turned out really well.

I think JD.com is hopefully much more like Amazon than...

Bennett: Both in company and stock performance.

Fischer: Exactly. And Alibaba, while it's interesting and we've recommended it in other services like the Everlasting Portfolio (we put some options on it there, as well), between the two we like JD's long-term prospects better.

Bennett: And I would say as full disclosure, I own both companies. That paints a picture for what I think about the e-commerce opportunity.

Fischer: And you filed, because you're a majority stake owner in...

Bennett: Yes, exactly. That is the case, so I have to make the disclosure. For me, it was a couple of things just laying on top of what you said already, and they're all interrelated. You look at where e-commerce is going. For me, the next battleground is in getting delivery times as low as possible. We talked a little bit about why we thought that would be the case in terms of population density and opening other segments of the retail market for e-commerce disruption. I just believe that is going to be a huge opportunity. I think having complete control over the logistics of all of that is going to prove to be extremely valuable.

You've seen Alibaba recognize that they can't just continue to go down the path they were going in terms of completely pushing away and not dealing all that much with taking a majority stake in Cainiao. Trying to copy a little bit in terms of what JD is doing with logistics. But I believe that that push, that lead that they're investing so heavily to stay in front will ultimately pay off.

The big fear, like I alluded to in the write-up, is that all these investments that JD is making is to simply stay in place. To tread water as opposed to furthering their advantages, because some investors think Alibaba is going to ultimately catch up in that respect and whittle away at their advantages. And if that's the case, then Alibaba's got the better higher-margin business model and they'll end up being a better investment.

But I don't believe that's the case. I think they are following the Amazon idea of investing heavily, trying to continue to gain additional advantages, push the envelope and, ultimately, they'll be able to reap the rewards in terms of moving consumer goods and other segments.

And if you take a step back and look at it, as both companies build out their offerings and the market becomes a little bit more mature, and the user acquisition costs are lowered over time, you have to think about what is going to determine who goes with JD and who goes with Alibaba. It will largely center around consumer experience. Whoever offers the better experience will win.

I believe that JD's focusing on the right things to have the better experience. If you look at surveys in Tier 1 to Tier 2 cities, the higher-income individuals, by and far, prefer shopping on JD.com. They think it's a better experience. They get the authentic products or the assured reinforcement that they know buying on JD is the way to go. They don't have to deal with fakes and they don't have to deal with all the headaches that may come with working with an eBay seller. I know buying stuff on eBay sometimes was a bit of a hassle for me.

I think having the better experience will ultimately lead to them being able to not just establish a niche but establish themselves and take a big slug of the business-to-consumer marketplace and hopefully generate a lot of free cash flow and profits and give us a good stock return.

Fischer: Great. Thank you, JP. It's anecdotal, but just this month I was in Hong Kong as we launched Motley Fool Hong Kong, and it was great to meet several Fool members, both from Hong Kong and those from China who came in for this event. And several of them -- the majority of the ones I spoke with -- were most excited by JD.com.

I didn't go fishing for it because we were working on this report, so I didn't say anything. You were working on the report here, but when talking about Chinese companies, JD came up as one that was taking the right steps, as you just described. Obviously, Alibaba's a little more well-known and had a longer track record on the market, anyway, for appreciation. That's why they like JD better, because it's quietly behind the scenes building up for something much bigger. This, again, parallels a little bit eBay and Amazon way back when.

My next thought is I misspoke. It wasn't Alibaba that we did options on in Everlasting Portfolio.

Bennett: Baidu.

Fischer: It was Baidu. It's interesting how even though I wasn't thinking about it, your mind still corrects you a few minutes later. *Oh, you made a mistake*.

Bennett: It always happens on live TV, right?

Fischer: It's still working. My mind is still working well, except I maybe just archived the right question.

Bennett: Remotely asking is dangerous. Do you remember what it was?

Fischer: Maybe I didn't. I don't think I did.

Bennett: If Jeff prematurely archived your question, put it in again, and put in all caps, "JEFF GOT RID OF THIS QUESTION."

Fischer: There you go.

Bennett: So, everyone knows to bump it back up.

Fischer: Thanks, JP. That's why we need Ellen, here, for so many reasons, as one who would be able...

Bennett: We'd fall apart without Ellen.

Fischer: ...to manage it. I know this was the top next question, though, so I think we're okay. Bruce is asking about our preliminary thoughts on the VeriSign roll.

Bennett: Well, I plan on having a memo for this in the coming weeks. I don't believe it will be ready for the following week, but two or three weeks. And spoiler alert. Odds are if the stock stays where it is, we're just going to let it go.

To me this centers around valuation, and that's always a hot-button topic. Why sell based on valuation? Great companies continue to compound, and they always make people who sell Amazon when it's at $100 or Apple presplit $50 look like fools down the road. They compound so incredibly well over time.

That is true but for me, when it comes to valuation, there's two things. There's the margins and growth, and that will ultimately determine the value of the company. We've got a pretty firm handle on what the margins are going to look like, and that is where VeriSign is so special.

My estimates are that the incremental gross margins on each additional dollar that they generate is somewhere around 90%. They generate an additional dollar and they capture 90 cents of that. That is insane. And then their operating margins aren't that far behind. Their incremental operating margins, by my estimate, are 80-85% which, again, is pretty much unheard of for most public companies, so we know that part of the business is extremely special. That was part of the reason we were attracted to it when it got hit and it sold off based on those fears surrounding China.

But that, alone, can't compound because there is a natural ceiling that you hit in terms of generating impressive free cash flow growth over time. You can't have 200% gross margin -- it's impossible -- so the way those companies that I alluded to earlier are able to compound value at such an impressive clip over the long run is yes, many of them have great margins, but they're able to grow. Their total addressable market is just massive, and their ability to sustain above above-average growth defies expectations. That's where you really see the drivers play out in terms of the stock doing much better than anyone expected.

Let's be perfectly frank. We do not have that with VeriSign. That's simply not the case. At best, you're going to see 4% revenue growth. That is the best-case scenario. In many years over the next decade we may see 2-3%. This is excluding a proven price increase for dot-com. If you see that, you'll see a one-time bump, and then it will go back to the low single digits.

Essentially what we are dealing with, here, is an annuity that has a tail risk that if they lose dot-com, this business is worth a fraction of what it was originally worth, but that's beside the point. It's essentially an annuity, and those businesses aren't that hard to value. From my perspective, I just can't see how this is a price that is worth chasing and putting additional cash back into the position to try and go up higher, because to be perfectly frank, I think the stock is overvalued by a noticeable margin.

Fischer: So, sometimes paying 30x free cash flow for a company that's only growing revenue at 3-4% is tough to do compared to paying that multiple for a Visa or Mastercard when it's growing revenue at 18%, so it's a big difference.

Bennett: Yes, my best-case scenario, excluding a dot-com price increase. When the stock was trading in the $70s and $80s, and it was trading 10x or 11x EBITDA, it's much easier to look at that in terms of optionality. You're not banking on it, but you think, "Ooh, if that happens, that is a huge additional plus to our thesis." I don't want to hang my hat for this thesis on that, so I try to put that aside, especially when you're dealing with a stock that has moved up so. I mean, the multiples have essentially gone up 50% since we bought it. They're somewhere around that mark.

Fischer: Yes.

Bennett: And so, you look at the valuation, and best-case scenario over the next five to 10 years is that the free cash flow growth is 5% or so. That is best case for what I believe can happen. And you go back and you look at what I was modeling when we bought the stock. I looked at my notes yesterday when we were talking about it, and the numbers they've produced compared to what we were modeling for are pretty much spot-on and my notes were like "best-case scenario, in five years this is like a $138 stock." Well, guess what? We're only eight dollars away from that and only two to two-and-a-half years into owning it. So, what are our prospective returns?

Now we're at a scenario where if you can't have the option premiums to juice the position and layer that on top of the capital gains -- because these guys don't pay a dividend and they're not going to for the foreseeable future -- that's the only way you will get to North-Star-like returns. At this valuation I simply don't see it and I feel uncomfortable because (a) should we roll up, I would not advocate for writing puts, because I don't want to write puts at a strike price that I believe is still overvalued.

And (b) that would switch to just making this a covered call position. Well, I don't want to keep funneling cash into a position that the strike we roll up to, even if it's still noticeably below the stock price, is still overvalued. It would be the worst-case scenario. You pay to roll up and the stock gets hit, so (a) you've put money into the position that is now gone, because the stock finished below your call strike price and then (b) you've also lost capital gains, because the stock has fallen, and it's the exact opposite of what you want to happen. You want capital gains and premiums to go along with it as the stock rises. Well, I'm not excited about the idea of the opposite happening, and I think the chances of that happening are much higher.

Fischer: So, odds are very high, Fools, that VeriSign will be let go in June, in just a few short weeks. It's been a great investment. The stock itself is up about 61% for us in under two years. We've made some put option income as well.

Bennett: Unless the stock falls and then a covered call roll is attractive. That would be the one thing that would make us consider it, potentially; but, even then, you have to remember this is one of the positions where the options aren't traded all that frequently, so *Pro* volume tends to have a huge negative impact on prices. We have been burned net pro when we go in to make our trades. We have been burned for the last two or three times by a dollar, two dollars, or more.

Fischer: That's very true. Thank you, JP. That concludes VeriSign for now, unless the stock falls a fair amount and we talked about that yesterday, too. We let it go and we watch it. It's one of those businesses where if everything else stays the course with its business and the stock falls in the next market downturn, we can look at writing puts or getting back in. It's good to raise a little cash, too. We've been spending cash, lately, on new things.

A question about the Shake Shack short. "Updates and thoughts." We've been talking about that one a lot each week in our meetings, too. It's a 0.7% position. It's down a lot for us as a loser. A short debt has risen against us, of course. What bothers me most, right now, are just the growing monthly fees that we pay to short it. I haven't looked at the fee ratio lately (in the last few days), but, of course, the position is larger than it used to be, so our fees go up because of that.

And so, I still believe in the thesis. The stock is very expensive. That said, shorting on valuation is a tough thesis. You don't want to do that alone. We're also shorting on weakening fundamentals, which I think we've seen. Same-store or same-Shack sales have stagnated since we shorted, and expenses have gone up. They're adding more stores now than they are growing revenue. Let me make sure I get that right. Yes. They have to add more stores to grow their profits only two-thirds as much, so if they grow the store base 35%, their profits might grow 25%. You don't really like to see that with a retailer of any sort.

So, I'm comfortable with the short, still, especially at our position. That said, we might turn it into an option short, instead. A synthetic short with a split strike. Something to give us more room on the upside and something that would capitalize if the stock fell a lot. It's either going to hold up, obviously, or keep rising because the market just likes the story.

Or once it does disappoint the market, it's likely to fall a lot, because shares trade at more than 100x expected earnings; basically, in my opinion, pricing in all the growth through at least 2020 or 2021, and that assumes everything goes perfectly. There's a really good chance the stock is much lower before then. Do we want to sit on our short and wait for that and pay fees every month to do it? Not really. Not when it's going against us like this. And I also don't like just letting the short grow and grow on us.

So, we might change that position up and turn it into options, or just close it outright, see how we feel, and then get back into it via options or some other way. But right now, I'm not uncomfortable keeping it. I like having at least that short in the portfolio. I think our thesis has been right. The market just hasn't agreed with us and when valuation is part of your shorting thesis, you're more likely to be wrong, because the market won't readily agree with you on valuation most of the time in a lot of cases. We've been right on the business and how it's happened, so I'm glad about that, but we might have some news on the Shake Shack short before long.

Now let's start moving quicker. We have questions piling up and we're about halfway through. I'll try to set a good example. "Please discuss overall technology sector exposure. It's very high."

I don't think it is that high. I think most companies, these days, use technology. A lot of our companies are selling technology of a sort. Our biggest positions are not really technology companies. Facebook is a community company. It makes money on advertising. Amazon makes money on web services (so that's technology), but also on retail. Broadridge Financial is proxy statements. It's corporate communications. Mastercard and Visa -- you want to call those technology or financial services. It's kind of a combination.

We never really do invest by sector or sector allocations. We invest in the best businesses we can find. A lot of them happen to combine financial businesses with use of technology or technology itself to reach large amounts of people (and that's very true), but I'm comfortable with what we own, and I think these companies will continue to lead the charge in the coming five to 10 years, as well. And I think almost every company is going to need to use technology in order to compete. We want to own companies that are using it well and that are selling it well, too, in cases where they're selling it.

We're also heavy in software. We're aware of that and there are other software companies I want to add, so we may sell some software providers. But I've been saying that for years, so don't hold your breath. This is how I've invested for 25 years (as far back as I can remember), and it's probably how we'll stay concentrated because we're all drawn to these types of dynamic businesses. With pricing power and recurring revenue, they're in the middle of things right now with growing demand and a growing market potential, as well. So, a great question.

Bennett: For me, just a quick add-on is what's the future? Industrials to me aren't the future. Manufacturing isn't the future. The future is technology, like it or not, so even if you look at it from a traditional perspective, maybe we're overweight technology, but if that's where things are headed, it would be a detriment to not have as much exposure to that as you feel comfortable.

Fischer: JP, really quickly. Any adjustments to Cooper's yet? We recommended covered calls just a few days ago. The stock has fallen a bit since then, so the calls pay much less. Personally, we're waiting and hoping the stock recovers a bit, and then we'll write the same August 2040 calls.

Bennett: Yes, we were chatting about this, this morning with the one-two punch of the stock and members hitting pricing, it just didn't make sense for us to place our trades; so, we're waiting. For those who are super eager for income, I guess you could write at the money ($2.30s), but I would advocate for waiting a little bit to see. Hopefully the stock will recover some and pricing will mellow out and then we can get the $2.40s for a decent price.

Fischer: So, we may not get $7.00 per share as originally thought, but maybe above $6.00 per share to write those calls is our hope right now. Of course, we take a chance by waiting, but it's a chance we're willing to take. "Any *Pro* activities planned for FoolFest?"

In a way, nothing specific; but in a way, yes. And we can't wait to see everyone at FoolFest. There are more than 800 Fools coming into Alexandria, Virginia next Friday, June 1, for the big day of FoolFest and Thursday, May 31 for the *Motley Fool ONE* event. We're talking about shorting. We're talking about top market opportunities. You and Jim Mueller are talking about option income.

These festivals are more centered around investment styles and themes than they are services. That's how the Fool does things partly because a lot of Fool members have multiple services and they've put together their own portfolio that way. That's why it's more themes like growth companies, income, and shorting instead of *Pro* and *Rising Stars*, etc. But we look forward to seeing you there and talking about it with you.

Lance: "If you could choose only one of these war-on-cash stocks," which is a tough choice, "which would you choose? Mastercard, Visa, or Square?" Well, we have all three, so our choice is a basket of all three. I can't think of a scenario where you could only choose one, given that commissions are so low, now, so put a little money in each one.

"If you had to choose just one?" Well, you don't have to, so I don't know if I'll play that game, Lance. I like being put into a corner. If you had to, I'd probably choose Mastercard because it's smaller than Visa. Obviously much larger and more established than Square. It's growing nicely. A multiple similar to Visa. I like Square a lot, clearly, but it's still more speculative at this early stage in its life.

"Have we thought about adding PayPal yet?" Yes, we have. We've talked about it, but we have a lot of exposure to the space.

Bennett: I would personally advocate against it. I own PayPal. I still think there's a lot of opportunity, there, but I think PayPal's valuation is reliant upon it being extremely successful outside of the U.S., as well, and to no surprise to some people, I think that the Chinese companies with their digital payment offerings are going to make it extremely hard for them to win, especially with how aggressively they are planning on pushing outside of China with regards to payments, whether it's directly pushing their services out there or investing in local businesses that are essentially offering the same thing.

It can't be understated the extent to which the Chinese consumer has adopted digital payments gives, at least in my opinion, those companies a big head start in terms of understanding how to make a product that benefits the local consumer, that does everything they want to do, and is able to be adopted at a fast pace.

Fischer: PayPal is recommended in other services and JP has done options on them in *Motley Fool Options*, as well.

Bennett: And I own it, so it's not like I am a "let's go short PayPal" type of person right now. I just think there's definitely enough concerns that I don't feel strongly about advocating for getting it into *Pro*, as well.

Fischer: A Fool member is saying, "I'm almost fully invested in *Pro*." Thank you for your trust. We appreciate that. "It represents about 70-80% of my RRSP assets. Looking to retire within one to two years and am concerned about the transition." I think they mean the transition to retirement. "Any tips?"

I think the most obvious tip is to have living expenses not in the market. To have cash that you'll need in the next three years or so not invested in stocks so that you can rest easy. And if you're always doing that so you always have a three-year cushion of cash, you should not worry nearly that much about your stocks knowing they really have time to recover. Most market declines -- even 2008 and 2009 -- start to recover in earnest well within three years.

I think that's just the golden rule. Don't invest the money that you need in the next year or two. As far as your investments themselves, especially if you're early in retirement and you're just starting, you should have a long life ahead of you. A long, active life ahead of you, and so being invested in companies that are dynamic and growing is most likely going to be the way to go. You still want your money to grow more than inflation and just grow, period, so I think the *Pro* portfolio is a good representation of how you should look to invest in retirement, at least for the good part of your assets.

I hope that helps. Congratulations on your one-to-two-year time frame until retirement. That's exciting. I hope you have a lot of fun things planned. If you have more questions, you can visit the retirement board in *Pro* and please post them. We have many retired *Pro* members.

"Has *Pro* ever considered swapping out Oracle for, say, Microsoft; a more expensive company but seemingly for good reason? Firing on all cylinders."

Microsoft has had a few great years, at least, and is doing very well. Oracle -- we're invested in the transition of the company from on-premise licensed software to cloud software, which ultimately should drive much stronger revenue and margins, and so stronger earnings, too.

That roll off into cloud has been a long time coming -- three or four years at least -- but it's happening now, and so we're really hoping that we will see Oracle get more respect in the market as its results improve from that transition. If not, then we've done okay with Oracle. It hasn't been that great, but it's done well for us from the start. But if it really doesn't start doing better with its cloud business within the coming few quarters (where our time frame is), then we have to really consider moving that substantial amount of funds into something more dynamic. We'll see.

Another question for me. "Is Gilead a long-term loser? Will it ever regain $80? Will it top $100?" Well, who knows? Should we take a loss and move on? Possibly. The last quarter was disappointing. Management in the first quarter was very optimistic about the year and mainly about the hepatitis C market stabilizing, and then that market really got hit.

Revenue fell 59% last quarter, and they're still saying market share is in transition and pricing, they think, is stabilizing. But, I'm not so sure. I think pricing could again, next year, when contracts reset be hit again, because there's competition out there around the world, so they really got hit in Europe, as well.

The lesson, here, is we strayed from a *Pro*-type business that has recurring revenue and pricing power. Gilead has the opposite. It was opportunistic that we did it. I'm glad we did it. We learned from it. We've lost a bit of money, but not enough to change the dynamics of where we're going or the ultimate outcome.

What we do now with it -- it's less than a 2% position. It will have less influence on our future by itself than if we were to sell it and invest it elsewhere. If we can do that right, then that would be better, I think, at this point.

So, as we're talking about after earnings, we're talking about many positions. Gilead is one of them, as I shared in a memo, recently, that's on the docket for potentially being replaced unless we can make decent income on it from covered calls and we want to keep it, as well, for its own merits.

But other than that, we may sell it and move on this year because it's been disappointing and my confidence in management after the last several quarters has curtailed quite a bit. I think they've made some mistakes along the way, at least in their estimates, and I'm also concerned that they're really dependent, now, on the HIV market almost entirely and there's competition, there, too, of course.

It's not a *Pro*-type company. We didn't want to hold it forever, and we may just have to move on from it. Right now, it's still a buy. It's super cheap stock and it's a great business that's done really well over the years, and so we're not discouraged owning it. I'm glad to own it. I think it's a quality of company that deserves to be with us, but it may just not fit where we're trying to go next.

"Can you discuss IPGP versus Coherent?" In a nutshell, Bruce, IPGP is fiber lasers that are used for manufacturing primarily. Coherent is lasers that are used, more, for microelectronics and semiconductors. That's what drew us to it -- its connection to AI, the Internet of Things, semiconductors, iPhones and iPads, etc., as opposed to just manufacturing which is mostly what IPGP does.

And Coherent, also with this Rofin acquisition, has gotten into fiber lasers for manufacturing, as well, and that business side is growing, especially in China. They have both going now. I like the prospects of Coherent having that dual kind of business model, but IPGP has been an outstanding business and stock and is a full recommendation elsewhere, as well. Both probably have good long-term prospects given that lasers are essential to so many forms of manufacturing, now.

Now with about 13 minutes to go, let's go into speed mode, if we can and try to answer these questions as much as we can. Anonymous: "With JD as a new position, is it possible to give us an options strategy instead of just the common stock?" I'll say, JP, we really want our members to buy the stock at this price.

Bennett: Yes.

Fischer: Any thoughts to add to that?

Bennett: Not really. I was starting to write up the alternative trades at the bottom of the trade alert and I was [thinking], "You know what?"

Fischer: You can write puts.

Bennett: Yes.

Fischer: You're writing puts on it in *Motley Fool Options*.

Bennett: That was our way to get into it, and then it just kept falling. We needed to take a more bullish stance on this in *Pro*.

Fischer: So, if you're looking for put writing, check out *Motley Fool Options* trades, there, just recently on JD.com. Hey, [JohnnyLovesBeaches]. Great to see you. Johnny would like to ask if we think an overweight position in Apple would be reason enough to use puts for Skyworks. "Thanks for the great work." Thank you for the kind words. We appreciate that.

It's funny. We've been talking about Skyworks and Apple lately, as well. Apple's doing great. The stock has really surged since earnings. Skyworks has been typically volatile. But having the two become really sizeable positions in the portfolio, combined, especially makes us more aware of the connection with Skyworks where about 40% of Skyworks' revenue comes from Apple. That's a risk we're aware of and we were talking about potentially putting the collar out of the money on Skyworks just in case to be safe.

Meanwhile, though, Skyworks feels very good about its long-term relationship with Apple, and products are being planned a few years out, so we know that is good. But the minute that relationship was to scale down or go away, Skyworks would get hit hard. That's our biggest risk in Skyworks. And it may be worth minimizing your exposure to the two of them combined, or at least keeping a really close eye on it and hedging some of that risk, and we're talking about that, as well.

Premier Pass, Miles. We're all part of Premier Pass. It consolidates content -- recommendations from across the Fool Universe -- and puts them into kind of a portfolio format for members, depending on what members are looking for. That's all of us, not just me (all the analysts at the Fool). JP, do you want to share anything more about Premier Pass? Any other thoughts on that? It's a pretty new service. It's popular. You get Motley Fool research from across most services, I believe.

Bennett: Yes, it's just a quick and easy way to get what most analysts believe are their best ideas right now. Just a streamlined way to go about it.

Fischer: Thank you for the question, Miles. And if you have more questions about Premier Pass, I think I did maybe a "C" on that answer...

Bennett: We did both sort of a C+.

Fischer: ...give a call to Member Services. I'm so focused on *Pro* and *Options*. Premier Pass uses AI. There's a lot of "I" to go around here, and they're using "A" to bring it together. Does that make sense? The intelligence of Fool analysts and they're putting it together into Premier Pass.

Bennett: That sounds about right.

Fischer: All right. Bob: "I sold a put on Coherent and got an assignment due to the price drop in the stock. What should I do? Covered call?" No, Bob, I would just own the stock. We own the stock. It's a 1.7% position and we like it for the long term. No need to use options on it right now.

Nate. "Why not buy puts?" We talked about that. We're looking at possibly an out-of-money synthetic short, Nate, to stop paying fees every month, because it may just take a lot longer for this to play out. We might have a thought on that soon, but yes, you could consider puts. But buying puts alone on Shake Shack is expensive. You'll pay probably as much as we are paying or more in fees.

"What kind of puts would you do in JD?" You can go to *Motley Fool Options* and look at that with the stock around $37 or $36 for puts because we like it.

Bennett: Yes, we're bullish enough that depending on how much income you're looking to generate and what your risk appetite is for taking shares, you can go as close to the money as you want. Obviously, we're buying shares, so we're pretty bullish, but the last I knew they paid halfway decent, so you can go to 3-4% out of the money and still get an attractive yield.

Fischer: Yes. "Our relationship to the new Market Pass." Again, the service brings in research from across Fool services, and mostly Best Buys Now. Those from *Pro* will show up in there. That's about the extent of our relationship with it. It consolidates research and highlights it for members depending on what members are looking for.

Skyworks -- this is good. We talked about it. About 40% of revenue at Skyworks comes from Apple. Maybe it's 35% now. It's shrinking as their Internet of Things business grows. Something we keep a really close eye on (that relationship), but it's definitely a risk that we planned out since day one. So far that relationship stays strong and, in fact, Skyworks is getting more content in Apple products rather than less. And as these phones become more complex, that becomes truer. 5G is a big opportunity for Skyworks and a lot of other companies, too.

"Any thoughts on Amazon doing a split soon," Todd is asking. JP? Ten seconds on that?

Bennett: I have no thoughts on it, really. I have no idea whether or not they're interested in splitting the stock.

Fischer: It wouldn't change anything. Make it easier to own more shares, but not a greater dollar amount. So, I don't know. We'll see. It would be better for options use, so I would welcome it. We'll have to give Jeff a call and see what he thinks. Tweet to him.

"Can we discuss the plan on SVXY?" You know, we're discussing that ourselves, too, and with our portfolio transition we might do something with that, because it now trades at half the volatility of the short-term VIX futures and I'd rather have full exposure. So, we might adjust our SVXY, our short volatility exposure soon. Right now, though, it's a tiny position. Kind of irrelevant. That's another reason to address it and make it more of a factor, again.

AC is asking, "Hey, Jeff and team. Are you using your cash position as a de facto hedge against the market rather than too much actual short exposure with 92% long?" Yes, a great question, AC and yes, the answer is we've used cash for quite a while as a de facto hedge. As an opportunity within our portfolio to invest it when the market falls. We haven't really seen that that much, though, and it has allowed us to not short as much which has been a good thing for the most part.

Now, though, I think our long-term exposure is as high as it's been in a long time (maybe ever), and so again, as we transition after this quarter, we're looking at that and possibly bringing our cash up a bit. Or, shorting and hedging more to get our net exposure back down a little bit. A great question, but cash, AC is, as you know, a great way to hedge without the stress of shorting.

"Can I use the *Pro* portfolio for retirement drawdown and take out 4% a year forever?" JP, I definitely have thoughts on that; that you could do that. That's certainly our goal that you should be able to take out 4% a year forever, and the portfolio should still ultimately grow. Now, not every year. Some years will have down years, but over every three to five years, hopefully the portfolio is higher than it was three to five years prior, even as you take out 4%. That's my thought.

Bennett: I will just add to that. It, to me, would depend on how comfortable you are with volatility, because like you said, we're not a bond, so we're not going to be super stable and reliable in terms of the amount of appreciation or income we'd generate year in and year out. So, if your portfolio is of a size that those types of fluctuation don't really matter to you and say there's a year where we only do 1%, 2%, 0%; maybe you have a slightly down year because the market is down, too. And that doesn't impact you because you can still withdraw your 4% and you're still fine in terms of your capital base being large enough for them, I don't see why not.

Fischer: The top question, right now, is Gilead, which we talked about quite a bit, and so we're considering that very same thing (what to do with it next). Thank you for the recommendation, GlobalRhino. It's true. Tax considerations differ based where you are and, in some cases, where the company is located. We'll add that to our list of possible considerations to add to the portfolio. Our space there is limited, otherwise we could have more things on there.

Lance has a question about JD. "Are third-party sellers similar to Amazon?"

Bennett: Yes, they are. They're the largest direct e-commerce retailer. In that space they're the largest. They do also work with third-party sellers. That's an area where they've increased their focus as of late. Alibaba still, unsurprisingly, dominates that space, but this is an area of increased focus for them, especially in terms of when they're building out their warehouses. They now have all these logistical capabilities -- warehousing and things like that -- that they want to be able to work more with them and create a more competitive and attractive offering and pull in some of those companies to work with them, as well.

Fischer: I think we can fly through these and answer almost all of them, which would feel great. "Please explain why North Star returns are different from *Pro* returns." Well, North Star returns is inflation plus 7% a year and that's a set amount. So, whatever inflation is plus 7% each year is what North Star will be.

Pro, so far, thanks to the strong market, in part, and thanks to steady management, has done better than the North Star since inception (quite a bit better), but during weaker markets it's going to be challenging to keep up with the North Star all the time, but we'll work our best to do it, because North Star is always positive. But, Miles, we have more in the Pro Guidebook about the North Star and how it's calculated. It's a steady thing.

"FAZ shorts still going for me. Any thoughts on keeping it going or closing it out?" I still have it short personally, as well. And if you're not paying fees to short it, as I'm not at TD Ameritrade, why not keep it going as long as you believe in the thesis, as I do? We've looked at adding it back to *Pro*, but the costs have just been prohibitive, so far, and we have a lot of financial exposure, as it is.

"So, what's with all the buying? We have so many good companies now. There's nothing to sell. What a dilemma." True, [Fox]. [ThinkingOutsidetheFox.] I think I might know who this is. A good comment. It is great that we're finding companies that we like to buy, even now, and speaking of that, the S&P 500 trades at 16x expected earnings for the year ahead. That's a five-year average.

"A synthetic long on JD?" Arista [Networks] is a recommendation in other Fool services. We've taken a look at it. They're doing a great job with their software.

Bennett: There are a couple of questions on the interest of a synthetic long on JD. I think you're going to have to pay around 5% total to go out to 2020 if you do it at the money syn long, so it's not unattractive. It was just something where we wanted direct exposure. Although we believe in the long-term possibilities, there is a significant chance that at some point it gets hit, and so [we decided] we'd have the cash. We think we can do better with it and we know that we may be adding to it, again, in the future, so it made sense to just buy the stock.

Fischer: We are basically out of time, but I think in the last minute we can answer all these questions. No more questions today, please, Fools.

Bennett: Everybody submit your questions right now.

Fischer: "Setting covered calls up on Coherent?" I'd say no, not while the stock price is this low. We wouldn't do it and it's so volatile.

Fair value estimate on Shake Shack is around $30 per share, which would be around 48x earnings. It's still generous, even with the growth rate that it has, and that's on the *Pro* portfolio page, too.

"FoolFest. Can we bring a guest? Does it cost?" I don't know. I think it's free to members and yes, you can bring a guest, but I think that door is closed for this year's FoolFest. It's all booked up. Hopefully next year. We'd love to have everybody. We just fill the rooms that we have. We fill all the space we have. I don't know how they go about doing that (how they contact people).

Anything else that you guys want to answer?

Bennett: Where is Baidu in the JD/Alibaba? Well, they are obviously more like Google than Amazon or eBay, so they're a player in terms of investments, venture capital, and things like that, but they're not necessarily a direct competitor in terms of e-commerce and retailing.

Fischer: "Why not go through the questions faster in the first half of the call next time?" That's true. That's good hindsight.

Bennett: You can say that every time we meet.

Fischer: You could, because you start calling, we just want to hang out with you and then we realize, "Oh my gosh, the time is flying by." We'll try next time. It's fun to just to luxuriate in a few answers, though, and it was good to talk about JD, a new position, for quite a long time.

Bennett: It also depends on the rate they come in, because we're trying to manage our questions and how quickly we answer them.

Fischer: True. If everyone puts their questions in early, then we know what we have to manage. "Why does the put side of a covered strangle add to the margin requirement when you already own the stock?" Well, because when you sell a put, you are committing to buying more stock, and so that's why there's a margin requirement. Remember, selling a put is just an agreement to buy the stock if it falls. If you already own the stock, that doesn't matter. That agreement is still out there to buy more stock. So, that's very important to know. Anytime you sell a put, even if you own the shares, you are obligating yourself to buy more stock.

Finally, thank you guys for not asking more questions. That's awesome. "*Pro* team, what's your view on the potential disruption of AMT?" We can work Billy into the chat, finally, if he's still here.

Kipersztok: Yes, I'm here.

Fischer: That's good.

Kipersztok: So, I'll answer this one. The first question I've had the entire chat about any of my holdings, so I take that as a good sign, meaning that I'm keeping you updated on the site with my communications. But yes, potential disruption of American Tower is something that we've discussed in the past. Small cells or maybe even satellites could disrupt American Tower, but that's not technology that is expected to take effect in the marketplace anytime soon.

Even as we talk about 5G, which is the next generation of wireless technology and the next stage; macro towers, which is the model that American Tower uses, still seem to be a very important part of managing a network for the wireless carriers. So long as you continue to use cell phones, and you are using data through those phones, and you're still subscribing to companies like Verizon, T-Mobile, and Sprint, American Tower here in the United States should still be a big part of delivering that content. Disruption is quite a way off, but we still do have our eye on that.

Fischer: Thank you, Billy, and regarding Visa, Mastercard, and plastic, of course Visa and Mastercard's transactions are going largely to digital and you have less need for your card. Apple Pay is leading the way in that, in fact, in the U.S., which is interesting to see.

As far as cryptocurrencies, it's something we certainly keep an eye on. We think it's a long way from becoming common-use currency. Visa and Mastercard, for what it's worth, believe the same thing and are watching it very closely. But for a lot of reasons, it's maybe a long time, if ever, before we see cryptocurrency being a multinational or global currency that people use to buy a pack of gum at the airport, for example.

We have our eye on that. Right now, though, we love the relationships Visa and Mastercard have with the PayPals of the world (Apple Pay, etc.) They're doing a great job staying entrenched in the latest digital movement of currency into just being bits and bytes, so we feel good about that and clearly the market does, so far, about those companies, too.

And *Options* opened Slido a few days before the chat to get answers in sooner. I think, Jim, that's a great idea, and we'll have to try to remember to do that next time with *Pro*, as well, so we can have questions in earlier and see what they are and manage them better.

Thank you all for joining us today. We appreciate it a lot. Thank you, JP and Billy.

Kipersztok: Thank you.

Fischer: I apologize after the fact for talking so much. It was in an effort to get through as many questions as possible that I just plowed through. Hopefully the answers were passable, at least.

We look forward to the next half year with you. We have seven months to perform this year, anyway. We're really thinking longer term than that, but we look forward to the rest of 2018 with you. Hope your summer gets off to a good start next month. We'll see you soon in an *Options* chat, I hope. That's the plan. Maybe we'll see you at FoolFest next week. All of you will be with us in spirit, there. In our spirits you're with us. Take care. Thank you for joining this chat.

Bennett: Fool on!

Kipersztok: Fool on!

[End]

Earnings and Pro Port Considerations

Published Apr 23, 2018 at 2:19PM

Note: We don't have any guidance changes or completed trades to share over this past week. Huzzah for status-quo, long-term investing!

Greetings, Fools,

We hope you're feeling well and rested, because the next few weeks promise to be action-packed! We're about to be treated to another round of earnings reports, starting with bigwigs **Facebook** (NASDAQ: FB) and **Visa** (NYSE: V) due Wednesday, and **Amazon.com** (NASDAQ: AMZN), **Starbucks** (NASDAQ: SBUX), **Verisign** (NASDAQ: VRSN), and portfolio newcomer **CME Group** (NASDAQ: CME) on Thursday.

All eyes are on Facebook's financials as it shows us how much more money it's spending on hiring (largely for community security) and how much advertising revenue is growing despite the reconfiguration of its news feed to be more personal for users. Wall Street expects revenue to expand by a hearty 42%, as ad prices climb close to 40% compared with last year and monthly active users rise by 13%. These are strong numbers.

If Facebook doesn't deliver, or delivers moderated guidance for the year, we should expect the stock to stay tepid, just as it has been since the Cambridge Analytica scandal broke in March. We expect the conference call to cover the data breach extensively. Despite any black eye, it's a positive that the stock trades at only 22.8 times expected earnings for the year ahead. I think the odds favor Facebook trading much higher the next few years as it continues to grow.

Visa, which trades at 27 times expected earnings for the year ahead, is expected to increase its non-GAAP earnings per share by 26.7% this year as transaction growth continues, including lucrative cross-border transactions. That a company Visa's size can grow like a small cap gives us the benefit of its size and scale alongside the enjoyment of accelerated return prospects. That's a combination we often seek, whether it's through Visa and **MasterCard** (NYSE: MA), **Adobe Systems** (NASDAQ: ADBE), or CME Group.

Next up: Amazon.com. Excluding results from Whole Foods, sales should grow 29%; that number is 42% including the grocer, to more than $50 billion total. Wall Street is looking for hearty cloud revenue growth of 46%, to $5.3 billion for the quarter. That will drive profits, which are expected to be a modest $1.22 per share. Amazon still isn't valued on its earnings (and rightly so, as it keeps investing in distribution and international), but it does trade at about 76 times trailing free cash flow despite ongoing massive capital investments.

There's a good chance Amazon truly will ultimately be one of the most amazing companies of our lifetime. Assuming the trajectory it's on continues in even a moderated fashion, it's going to be one of the largest companies the world has ever seen, selling more items than any other, in more places around the world.

But that excellence is true of many of our stocks. Apple generates more profit than any other. Facebook reaches more individuals than any other. These giants are awe-inspiring, but we also need to ferret out great emerging companies like **Paycom** (NYSE: PAYC) and **Square** (NYSE: SQ) -- to own positions that could compound more easily from here. We want to have a stake in both types of companies.

Port Considerations

As we think forward, a few considerations are nearing completion. **Shake Shack** (NYSE: SHAK) has worked against us despite our thesis (stalling same-store sales growth and higher costs) playing out. Wall Street is happy because new stores keep revenue growing at more than 30% anyway. If the coming quarterly report doesn't turn things our way, we will likely exit the short rather than fight the trend.

Skyworks (NASDAQ: SWKS) is an excellent business at a very good price, but its dependence on Apple makes down periods for both stocks twice as hard. We're comfortable writing lucrative options on Skyworks, so we might start writing covered calls on it again for income -- after we see earnings and hopefully a pop in the share price on the results.

Speaking of Apple, we need reassurance from **Coherent** (NASDAQ: COHR) management that the company's long-term outlook continues to look bright. We believe it does. But here, too, as with dozens of other stocks, the market is trading Coherent alongside Apple's prospects. Having all of these shares move together isn't ideal for us, so we might also employ Coherent's lucrative options after this earnings report (assuming earnings are encouraging). We have a small stake, so we may write puts targeting income, or consider covered strangles.

Gilead Sciences (NASDAQ: GILD) is expecting to have a more stable year when it comes to revenue, yet the stock has given back all the gains it made on that news. Hopefully earnings will help send it higher again, and we'll look to keep making covered-call income on it. Same with **Johnson & Johnson** (NYSE: JNJ).

Finally, **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY) is relatively sleepy now that it inversely tracks only half of the daily moves in the VIX's futures. How will this change alter its long-term prospects? We may come to want to swap this for a vehicle that is more true to our original intentions. We'll see.

I'm glad to share some thoughts that are "in the works," but realize there's nothing final about them. Earnings could change other dynamics of the portfolio. Time will tell! Let's enjoy the week.

Foolishly,

Jeff (TMFFischer)

Pro Catch-Up Trades and Expirations: Adobe, Coherent, and More

Published Apr 19, 2018 at 2:05PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.8%.
- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Oracle** (NYSE: ORCL): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Adobe Systems** (NASDAQ: ADBE): Buy 2.7% per our recent alert.
- **Coherent** (NASDAQ: COHR): Buy 1.6%.
- **OpenText** (NASDAQ: OTEX): Buy 3%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.4%.
- **The Cooper Companies** (NYSE: COO): Buy 2.7% to later cover with calls.

Shorts:

- **Shake Shack** (NYSE: SHAK): You can short 0.5%, but realize we may close this soon if the short doesn't start to go our way after earnings.

Options:

- **Oracle**: Invest 0.6% to buy to open January 2020 $30 calls. Then wait for a price recovery to write diagonal calls with us at about a $52.50 strike price for a worthwhile yield.

Upcoming Expirations (May):

- We have short calls expiring on Cooper, **Gilead Sciences** (NASDAQ: GILD), and **Home Depot** (NYSE: HD) on May 18. We'll have relevant guidance well before then.

Pro Guidance Changes and Completed Trades: April 16, 2018

Published Apr 16, 2018 at 3:33PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Adobe Systems** (NASDAQ: ADBE): The stock joined our merry *Pro* portfolio with a Buy recommendation at a 2.7% allocation.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Adobe Systems:** We bought 400 shares at $226 and change, to get to our 2.7% allocation.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Helping Hands in Puerto Rico; Facebook Avoids a Facepalm

Published Apr 16, 2018 at 3:22PM

Dear *Pro* Fools,

Last week, I joined seven of my full-time Foolish colleagues and one Fool member (CMFFuskie) on a Fool-sponsored trip to Puerto Rico. There, we volunteered with our holiday Foolanthropy partner, All Hands and Hearts, working with them in two of the regions on the island that were hardest hit by Hurricane Maria in September. Many of the people in these two areas are still without power.

Joining forces with other All Hands and Hearts volunteers, we did muck and gut work on ruined homes, repaired roofs, remediated mold, chainsawed downed trees, and more, putting in an intense week of work by day and sleeping in screened-in common rooms full of bunk beds by night.

(From left to right, back row first: Hassan Malik, Kelsey Ryan, Nick Travis, Jeff Fischer, Lauren Danker, David Deitch, Anne Henry, Jen Parker and Taylor Harris)

We especially enjoyed meeting our fellow Americans in Puerto Rico and their families who were most affected. Their resilience and kindness -- bringing us coffee, snacks, lunch, and smiles -- was remarkable on the heels of six months without power and without much outside help.

We left glad to have had an opportunity to help for a few days, but knowing that months -- truly years -- of work lie ahead. Life will never be the same for many who live there; in fact, as widely reported, so many have moved off the island since the storm. The hillsides and roads feel more quiet than usual.

Damage remains widespread across the broad third of the island that we traveled, with downed power lines, street poles, signs, and trees commonplace. Be sure to stop at each intersection: In many cases, the traffic lights aren't working. The giant wind-power turbines that we saw on the east coast were stuck still, inoperable, half of them missing their blades, destroyed by the wind.

Now that Motley Fool employees have worked with All Hands and Hearts on the ground in both Houston last year and Puerto Rico last week, we can endorse the organization's helpful activities even further. Puerto Ricans on the street walked up to ask us for help, and All Hands set up new appointments with them. The organization plans to be on the island for at least the next few years. Most everyone doing the hard labor is a volunteer, some there for days like us, others for weeks or months -- even years.

If you're getting a tax refund, or just want to help, you can still donate to All Hands and Hearts in Puerto Rico, and you can do it through our Fool page. Every dollar counts. The Fool vetted this transparent and effective charity thoroughly before partnering last year. Members like you stepped up and donated more than $150,000 in our holiday drive (they're still very grateful, and said so repeatedly). That money helped put countless people back in their homes. Thank you for anything you give.

The Investing Beat Goes On

While I was away, Billy issued the **Adobe Systems** (NASDAQ: ADBE) buy report that we (the team) had been talking about at our meetings in recent weeks. The company's business has greatly accelerated in the past few years, and its margins with it. But we believe there's much more ahead as Adobe has positioned itself to help any customer develop and deliver their digital experience to the world. From that digital media division, to its Creative Cloud for design, to Adobe Spark for video and more, all of Adobe's product lines are driving growth. Revenue was up 24% in the quarter just reported. We're glad to start a 2.7% stake.

Back in my adopted hometown of Washington, D.C., Mark Zuckerberg appeared on Capitol Hill last week and explained to lawmakers what **Facebook** (NASDAQ: FB) does and how it made mistakes. We'll see whether lawmakers get around to putting meaningful regulations in place soon; I'd give that a 50/50 chance at best. In the meantime, Europe remains far in the lead with data privacy laws, including new ones that go into effect next month. Facebook and other tech giants will need to adapt to Europe's demands.

Overall, though, as Fool co-founder Tom Gardner adeptly points out, more regulation may actually make Facebook's competitive moat stronger. If it becomes more expensive and more difficult to operate social networks, it becomes harder for new or smaller entrants to succeed. Zuckerberg avoided committing any facepalm moments in his testimony, but Facebook's regulatory future is still in flux, and we expect volatility from the stock. Over time, we expect the business to keep growing nicely, despite higher costs.

Visit the Memo Musings board to share your thoughts! Thank you again, and Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Expirations: Adobe, CME Group, and More

Published Apr 12, 2018 at 2:21PM

Upcoming Expirations (May):

- We have short calls expiring on Cooper, Gilead, and **Home Depot** (NYSE: HD) on May 18. If they don't seem set to expire as income, we'll have guidance closer to expiration.

Pro Guidance Changes and Completed Trades: April 9, 2018

Published Apr 9, 2018 at 12:58PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- Nothing new over the past week. See all of our Best Buys Now and Buys.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Johnson & Johnson** (NYSE: JNJ): Running low on time to make our recommended trade (we need to within 30 days of issuance), we sold to open May 2018 $140 calls, covering 700 of our shares. We were paid $0.49 each. We'll of course continue to manage these covered calls in the way that is best for members, waiting for expiration or acting earlier with a new alert.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Buy Adobe Systems

Published Apr 9, 2018 at 12:25PM

Is this for you? This is for all *Pro* members who lack exposure to this company and wish to match *Pro*.

How You Participate

- **Action:** Invest 2.7% of your portfolio in **Adobe Systems** (NASDAQ: ADBE). (That's $2,700 for every $100,000 you manage; for *Pro*, that's about 400 shares, or $89,000 worth.)
- **Price Guidance:** Use a limit order to buy at going prices, lately about $223 per share. Later, the stock will remain a Buy until we guide otherwise.
- **Recent Price Range:** $219-$224
- **Guidance:** Buy
- **Fair-Value Estimate:** $220
- **Alternative Trades:**
  - **Seeking a lower buy price?** Sell to open any puts that appeal to you, selling one put for every $19,000 to $22,000 (or choose your strike) in stock you can afford, up to a 2.7% allocation.
  - **Want upside with less capital?** Set up a synthetic long. Sell to open January 2020 $220 puts and buy to open an equal number of January 2020 $220 calls, aiming to pay little time value in the process. Each synthetic long represents exposure to 100 shares worth $22,000.

The Business

Adobe Systems is one of the largest software companies in the world, offering products and services in two main business divisions: digital media and digital experience. The digital media division provides products, services, and solutions that enable individuals, teams, and enterprises to create, publish, and promote their digital content. The digital experience segment provides solutions and services for creating, managing, executing, measuring, and optimizing digital marketing and advertising campaigns across multiple channels.

The media division's flagship product is Creative Cloud, a subscription service that allows members to use Adobe's creative products integrated with cloud-delivered services across desktop, web, and mobile devices. Creative Cloud includes programs such as Photoshop, Illustrator, Premiere Pro, InDesign, and Lightroom. Adobe's digital media products are the gold standard of content creation software, and the company's products are mission-critical among the worldwide community of creative professionals (including artists, web designers, graphic designers, photographers, videographers, animators, and other creative minds). The digital media division also includes Adobe's Document Cloud business, built around the Acrobat family of products that allow users to view, create, manipulate, print, and manage files in Portable Document Format (PDF).

The digital experience division consists of the Adobe Marketing Cloud, the Adobe Analytics Cloud, and the Adobe Advertising Cloud. These solutions allow customers to create and manage personalized marketing campaigns, gain intelligence about their customers, and manage advertising across TV and digital formats.

Pro Quality Checklist

Here's how Adobe scores against our *Pro* Quality Checklist criteria:

1. Sustainable Competitive Advantage

Yes, especially within its digital media offerings. Adobe has an essential monopoly in creative software, with its products serving as the industry standard among its customer base. No other creative software company can match the breadth of products, robust feature sets, and functionality of Adobe's highly specialized solutions. Adobe's creative software products are taught to students in higher-education design programs, creating a renewable source of users who rely on its products to perform their jobs. A significant level of training and experience is required to learn and properly use the software, which means switching costs for anyone who wants to make a change.

The digital experience division has many more competitors, including Google, IBM, Oracle, and Salesforce.com. However, Adobe's synergistic presence in content creation makes it stand out from the pack, and solid growth in this division indicates that Adobe is carving out a defensible niche in a large and growing market that has room for several winners.

2. Pricing Power

Yes, especially in digital media. Adobe's products are mission-critical to its users, and the company has the leverage to slowly increase pricing over time. In fact, Adobe began to increase prices in its Creative Cloud subscription in March of this year, after announcing the coming increase in October.

3. Dependent Customer Base

Yes, especially in digital media. Adobe's products are taught in higher-education design programs, and customers rely on its industry-standard offerings for digital content creation across a wide range of creative professions.

4. Predictable Revenue

Sort of. Adobe's successful transition from license-based sales to subscription-based sales has done wonders for the company's recurring revenue. Since fiscal 2014, in the Creative Cloud business, Adobe has increased its subscription-based revenue from 61% of total revenue to more than 95%. And in Q1 2018, a record 88% of companywide revenue was described as both subscription-based and recurring -- but I'm not so sure about "recurring." We're currently in the midst of an economic expansion and a growing market for advertising and digital expenditure. If and when a recession comes around, I'd suspect that advertising and creative budgets will be reduced, employment for creative professionals will come under pressure, and churn rates for Adobe's subscriptions will be much higher than they are now.

5. Growing Free Cash Flow With Compounding Returns

Yes. Adobe generates copious free cash flow, with about a 38% margin. Its return metrics are strong and increasing as margins rise thanks to scale and revenue growth. Adobe has plenty of opportunity to reinvest its cash flow into research and development, expansion of product lines, and acquisitions with high rates of return.

6. Financial Resilience

Yes. Adobe has a cash-rich balance sheet with more than $4.2 billion in net cash, and its recurring revenue base (which should remain robust even in the face of recession-related churn) and strong free cash flow give it plenty of cushion to absorb more difficult times.

7. Expanding Possibilities

Yes. As mentioned above, Adobe has plenty of opportunity to use its money on hand -- and its ample free cash flow -- to introduce new products, expand into complementary lines of business, and make acquisitions. Digital content creation and digital marketing are growing markets, and Adobe's resources and strong competitive position make it an excellent candidate to profitably capitalize on both.

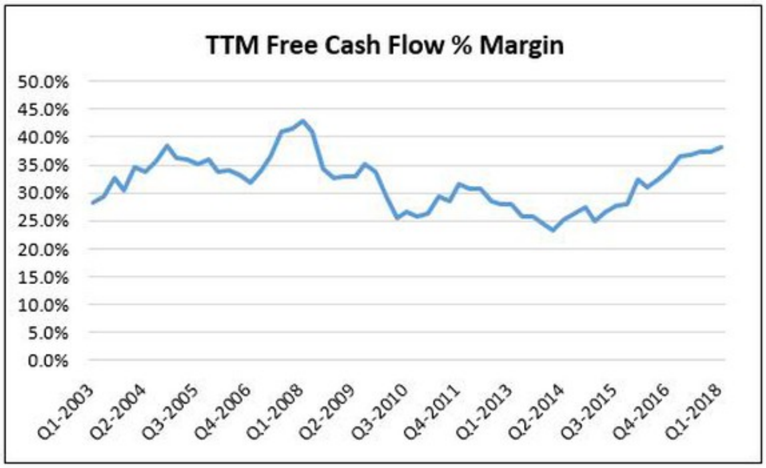
8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. Adobe has a strong record of allocating capital soundly and generating excess returns. Management expertly anticipated the transition to cloud-based software delivery and capitalized on that opportunity much earlier than many companies, leading to the strong growth and expanding margins we see today in its financials. CEO Shantanu Narayen is very highly regarded, with a 97% approval rating on Glassdoor that places him as the 19th highest-rated CEO among large companies in 2017.

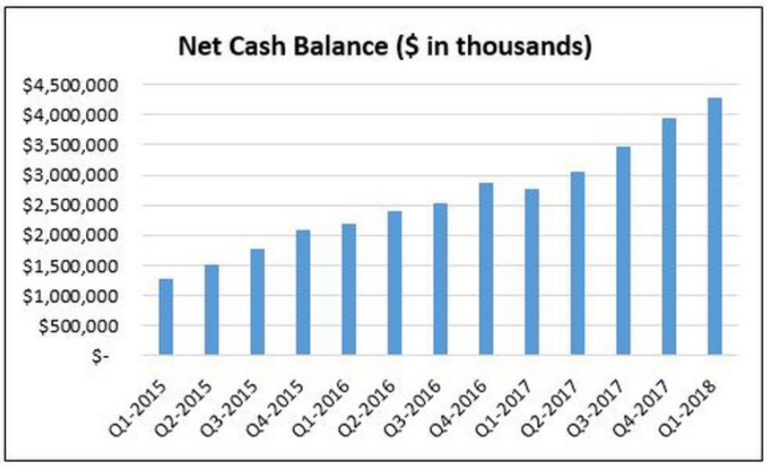
Financials and Valuation

Adobe's financial profile is sterling. The company's successful transition from product-based to subscription-based revenue has given customers more flexibility to pick and choose which apps they need, and lower initial price points and "revenue optimization initiatives" (i.e., differential pricing) have invigorated user growth and and reduced the incentive for customers to illegally pirate Adobe's software. As a result, since mid-2015, Adobe has consistently increased its revenue at 20%-plus per year, a rate that should continue through 2018, though it may slow to perhaps the mid-teens beyond that as subscription revenue growth decelerates.

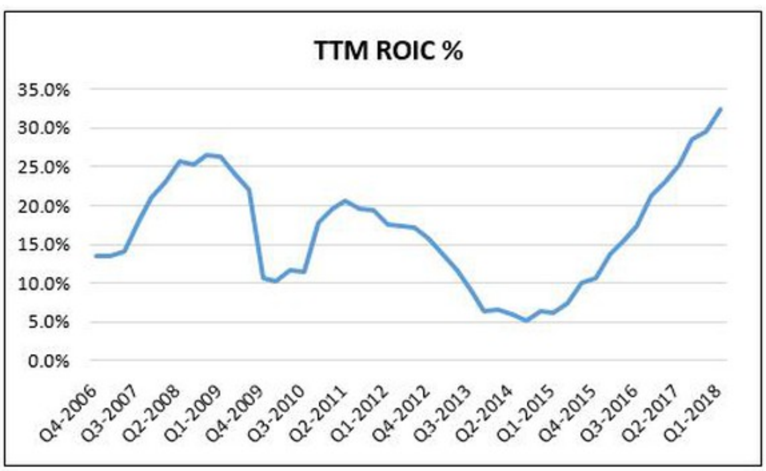
The company generates strong free cash flow, with margins lately north of 35% (and rising) ...



... leading to about $3 billion per year of free cash flow, of which management spends only about $200 million to $250 million (about 3% of annual sales) on capital expenditures. The rest goes to share repurchases (more than $1 billion went to buybacks in fiscal 2017), acquisitions ($460 million), and research and development expenses ($1.2 billion), and some also finds its way back to the balance sheet in the form of Adobe's growing cash balance:



The company's strong competitive advantages are evidenced by its return on invested capital (ROIC) trends. ROIC has accelerated upward over the last few years as Adobe has increased its revenue and cash flow rapidly without investing much additional capital:



It's difficult to value a large company that is expanding its revenue and margins as quickly as Adobe, but a conservative multiple-based approach leads to a fair-value range of $200-$250 per share, with a point estimate of $220. Conservative assumptions from this range lead us to North Star-like returns over the next three to five years, and based on the company's recent financial trajectory, there is a decent likelihood of significant outperformance.

The *Pro* Bottom Line

At 7.5 out of 8 of our *Pro* quality criteria, and with a stellar financial profile and trajectory, Adobe definitely fits the bill as a *Pro*-level stock. Adobe is a growing, high-quality business that operates with competitive advantages in two complementary markets with strong secular tailwinds (digital content creation and digital advertising), and the company should be able to increase its revenue and earnings at healthy rates for years to come, giving us a strong chance at North Star-beating returns over the long run.

Pro Catch-Up Trades and Expirations: CME Group, Square, and More

Published Apr 5, 2018 at 3:22PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Amazon.com** (NASDAQ: AMZN): Buy 4.4% (or start with half if preferred).
- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Oracle** (NYSE: ORCL): Buy 3.3%.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.9%.

Continue building your portfolio with our Buys, including:

- **Facebook** (NASDAQ: FB): Buy half of our 6.7% position to start. Expect volatility.
- **Gilead Sciences** (NASDAQ: GILD): Buy 2.1% to later cover with calls.
- **OpenText** (NASDAQ: OTEX): Buy 2.9%.
- **Square** (NYSE: SQ): Buy at least half of our 4.1%.
- **The Cooper Companies** (NYSE: COO): Buy 2.7% to later cover with calls.

Shorts:

- **Shake Shack** (NYSE: SHAK): You can short 0.5%, but realize we may be closing this soon if the short doesn't start to go our way.

Options:

- **Oracle** (NYSE: ORCL): Invest 0.5% to buy to open January 2020 $30 calls. Then wait for a price recovery to write diagonal calls with us at about a $52.50 strike price for a worthwhile yield.

Upcoming Expirations (May):

- We have short calls expiring on Cooper, Gilead, and **Home Depot** (NYSE: HD) on May 18. If they don't seem set to expire as income, we'll have guidance closer to expiration.

Pro Guidance Changes and Completed Trades: April 2, 2018

Published Apr 2, 2018 at 2:47PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- Nothing new over the past four days. See all of our Best Buys Now and Buys.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **American Tower** (NYSE: AMT): Using a rolling order, we rolled our diagonal calls today for a $0.15 credit, buying to close all five of our April 2018 $130 calls, and selling to open five October 2018 $135 calls.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Rocky Days Are Here Again!

Published Apr 2, 2018 at 2:33PM

Dear *Pro* Fools,

The good news is: As of the end of March, our portfolio was up a bit for this year.

Performance as of 3/31/2018

	Annualized		Total Return	
	Since Inception	Rolling 3-Year	YTD	Inception
Pro Portfolio	**13.3%**	**10.2%**	**1.1%**	**228.7%**
North Star	**8.5%**	**9.0%**	**2.9%**	**116.7%**
S&P 500 Total Return	12.5%	10.2%	-0.8%	206.6%
MSCI World	7.1%	5.2%	-1.7%	92.6%

Pro Port up 1.1% YTD.

We're trailing our hero, the North Star, but plenty of months remain in 2018 to get closer to it. Last year, after suffering some early losers, we recommended new buys to reposition our portfolio to slug it out, and we closed out 2017 up a hearty 21.5%. That capped six consecutive years of gains for us, and we averaged 73.5% net long over those years (about where we sit today, too). We would be mighty pleased if the portfolio ended 2018 in positive territory again, but we won't be surprised if the investing environment makes that difficult.

This morning, China said it would impose $3 billion in tariffs on 128 U.S. products; that news likely drove investors to sell. The U.S. president reportedly has $50 billion in additional tariffs in the works for China, so we might expect those soon; Beijing has already said it would respond in kind. This already looks like a trade war, and we might already know the end result all too well: higher prices for consumers, putting a strain on the economy.

Meanwhile, the amount of daily uncertainty regarding the American playbook on the global economic stage means we need to expect more surprises, perhaps often. That will likely continue to drive higher stock-market volatility. Investors generally like stable policies that lend some visibility into the future. When clouds form, it's harder to guess where earnings will go from here. Add rising interest rates to today's mix, and the siren song of competing investment classes increases volatility, too.

The good news is that we already hold many stocks in the portfolio that look inexpensive. That's surprising, given how much we've gained in recent years, but if we're right, our analysis bodes well for our future returns. **Facebook** (NASDAQ: FB), **Oracle** (NYSE: ORCL), **American Tower** (NYSE: AMT), **Skyworks** (NASDAQ: SWKS), and many of our other positions -- including the larger ones -- look attractively priced.

That's encouraging. (We might even go to Disneyland!) Assuming earnings hold up and grow -- which is a lot to assume, but still seems likely at our companies -- these stocks should do well over the time frame that matters to us, even if they're being battered in a storm along with everything else right now.

When it comes to Facebook, the height of its volatility might arrive around the same time CEO Mark Zuckerberg testifies before Congress later this month. We obviously can't know yet, but I don't believe Facebook is ultimately going to be accused of nefarious actions -- only of making very bad choices, lacking any foresight about its own risks, and being much too lax about data security. Those are all faults that it can admit and address, and it has started to do so of late. Baby steps, at least.

Other stocks in our portfolio that are limping along, wounded, include Oracle and **Coherent** (NASDAQ: COHR). I don't believe either business is suffering or that the stocks merit the beating being dished out. Oracle is on track to expand its margins as its cloud revenue expands, something we've been watching it work toward for years. And Coherent's business is all but booked for the year, with management investing for growth in 2019. Both trade at valuation multiples ranging from about 12 to 14 based on 2018 earnings and free cash flow expectations. That's inexpensive.

The S&P 500 is down more than 10% from its Jan. 26 high, and it's down about 3% year-to-date as of 1 p.m. today. Of course, some volatile stocks are down much more. But it's encouraging that we can already see good value in some of the stocks that have declined, including many of the ones we own. We're happy with our holdings, and it will only get easier to add more money to some of them -- either by buying more stock or by using options -- if they get cheaper.

Given that we likely have a long year of surprises ahead of us, we're still aiming to be patient. We're also looking at additional market hedges and at adding a new basket of shorts, and we're always considering whether we should sell or lighten up on anything we own. We may sometimes move slowly, but we move with purpose, and with our eyes focused on the results we want to achieve down the road.

Visit the Memo Musings board to share your own market musings. (Share 'em now, before earnings season starts next week!) Thank you, and Fool on!

— Jeff (TMFFischer)

P.S. Did you know that David Gardner and I met Donald Trump for an hour in his office many years ago? You can read David's take on it here. That we were once short the sitting U.S. president simply sounds like good Foolery, whatever your politics.

Pro Catch-Up Trades and Expirations: CME, Facebook, and More

Published Mar 29, 2018 at 1:40PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Amazon.com** (NASDAQ: AMZN): Buy at least half of our 4.3% stake.
- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Oracle** (NYSE: ORCL): Buy 3.3%.
- **Tencent** (NASDAQOTH: TCEHY): Buy 2.9%.

Continue building your portfolio with our Buys, including:

- **Coherent** (NASDAQ: COHR): Match our 1.8%.
- **Facebook** (NASDAQ: FB): Buy half of our 6.8% position (so, 3.4%) to start. Expect volatility now, but we also expect the business to grow over the coming years.
- **Gilead Sciences** (NASDAQ: GILD): Buy 2.1% to later cover with calls.

Shorts:

- N/A

Options:

- **Oracle** (NYSE: ORCL): Invest 0.5% to buy to open January 2020 $30 calls. Then wait for a price recovery to write diagonal calls with us at about a $52.50 strike price for a worthwhile yield.

Upcoming Expirations (April 20):

- **American Tower** (NYSE: AMT): We recommend you roll your $130 diagonal calls.

Roll Your Diagonal Calls on American Tower

Published Mar 29, 2018 at 10:27AM

Is this for you? This is for all *Pro* members who wrote April 2018 $130 diagonal calls on **American Tower** (NYSE: AMT) as per our alert in September. If you wrote diagonal calls at different strike prices, please see the Alternative Trades section below. Remember that all members should already own an unencumbered 4.1% stock allocation to American Tower, so if you have yet to establish your stock allocation, do that first before considering this additional diagonal call recommendation.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all April 20, 2018, $130 written calls.
  - "Sell to open" the same number of Oct. 19, 2018, $135 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all five of our calls.
- **Recent Prices** (10:20 a.m. ET):
  - Stock: $144.50
  - Buy to close April 20, 2018, $130 calls (bid/ask): $14.50/$15 (midpoint $14.75)
  - Sell to open Oct. 19, 2018, $135 calls (bid/ask): $14.80/$15.50 (midpoint $15.15)
  - Net credit to roll: Approximately $0.40 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls, and aiming to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $0.40 net credit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. Realize that with expiration 23 days away, the time value on our deep-in-the-money short calls is eroding toward zero, and American Tower's first-quarter ex-dividend date is on April 10. Keep in mind that you should roll these calls soon, and certainly before April 10, or you risk getting your owned *shares* (rather than calls, assuming both securities are owned in the same account) called away. **We want to avoid that scenario!** So, accept lower credits or even pay a slight debit if need be, but still use a limit order. As of the pricing in this alert, the bid/ask spread on the April $130 short call implies about $0.25 or so in time value remaining, so you don't necessarily need to make this trade immediately, but it's getting close. As we approach expiration, time value will continue to erode; the closer time value gets to zero and the longer you wait, the more likely it is that your short calls will be assigned. Let's avoid that.

What We're Thinking

The current iteration of our diagonal call strategy on American Tower has now been active for more than a year, having begun in November 2016 when we re-established a diagonal call on the company at advantageous prices. Then, in March and September of 2017, we rolled our short calls out and up to capture further upside. So far, the position has been a success (with a 27% simple return since inception if we were to close the diagonal call today), and American Tower's stock price has run up well beyond the strike price of our April $130 short calls. We're now in a position to roll our calls up and out again for little to no cost (and hopefully for a small credit), aiming to capture further upside. With this rolling trade, we increase our upside by $5 and extend our expiration out to October. As we approach October expiration, we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write calls with a higher strike price than *Pro*'s?** If you wrote higher-strike calls than *Pro* did (maybe the $135, $140, $145, or $150 strike prices), you're in a slightly better position than *Pro*. If your short call is in-the-money, aim to roll out and/or up for a credit. If you can roll to the $145 or $150 strike price for a credit, those strikes are good choices given our fair-value estimate of $146. If your strike price is out-of-the-money, you can wait until expiration and then write a new iteration of short calls at the $145 or $150 strike price.
- **Have a different position or question not addressed here?** Check in on the American Tower discussion board and we will do our best to help.

Facing Down Facebook

Published Mar 26, 2018 at 3:38PM

Dear *Pro* Fools,

As of noon today, the S&P 500 was *down* nearly 2% year-to-date, while the *Pro* portfolio was up 1%. Our North Star, though, will be up by 2% at the end of this month. Of course, we dream of always being near our North Star (just as we dream of unicorns and translucent dragons), but we know that won't always happen. Instead of a goal, the North Star is meant as a guide to our decisions. It quietly continues to be just that. Volatility in stocks is a given -- that's why the market generates returns that beat everything else over decades -- but our steady North Star reminds us that we want to own the most *resilient* businesses we can find, and hedge ourselves reasonably.

Resilience, Thy Name Is Facebook?

Is **Facebook** (NASDAQ: FB) going to prove resilient? We believe so, but we're disappointed in its leaders today. The stock has declined from its perch as our largest portfolio holding, ceding that spot to sleepy **Broadridge Financial** (NYSE: BR). What's much more upsetting to me, though, is that Facebook knew in 2015 that the data of 50 million customers (and let's face it: probably many more) had been compromised.

As you probably know, the allegations are that a professor who had legitimately acquired massive amounts of data from Facebook decided to go against Facebook policies and sell that data. Among the purchasers was British-based Cambridge Analytica, which then used the data to drive election-based campaigns, including the Trump presidential campaign. When Facebook learned of this improper data use back in 2015, the proper thing to do would have been to tell authorities, alert the affected users, investigate how this happened, put in place systems to keep it from happening again, and then be forthright with *everyone* about this chain of events and its new solutions. Apparently, the company did none of that.

Only now is Facebook management saying it will work to make sure this doesn't happen again. Sure, the company has changed how much information outside apps can get about users, but the changes sound slight, and as yet there's no solution to what I'll dub "data spread" -- the illegitimate sharing of Facebook data originally purchased legitimately. So, all Facebook users remain vulnerable to further breaches, even as we have no idea who already has our data and how they're using it. That cat is out of the bag, and even Facebook can't coerce it back.

Facebook's board of directors is a relatively small lineup of seven men and two women, dominated by insiders and founders. Kenneth Chenault, formerly CEO at **American Express** (NYSE: AXP), was a welcome addition in February (he may be regretting it right now). Prior to that, the highest-profile members outside of Facebook officers were Reed Hastings from **Netflix** (NASDAQ: NFLX), serving as a board member since 2011; venture capitalist Marc Andreessen, on the board since 2008; and Susan Desmond-Hellman, CEO of The Gates Foundation, on the board since 2013. I deeply hope that the board members all knew contemporaneously about the data spread in 2015 -- but assuming they did, it's incredibly disappointing, almost unforgivable, that they didn't vote to inform the public at the time. For now, we have to assume that we don't know the whole story, and that people of this caliber wouldn't be so reckless without good reason.

But last week didn't add much to our confidence regarding Facebook's savvy. The company's leaders were mum on the issue until Wednesday. A much better PR approach would have been incremental involvement with the public: On day one, tell us you're on it, invite confidence, and say you'll have another update soon; on day two, share more information; on day three, even more. Saying nothing for five days was an absurd choice compared with immediately starting an incremental dialogue that Facebook itself could have then controlled, in the process showing itself to be in charge.

As investors, meanwhile, we're concerned with more than the PR department (though it clearly needs help). We want to make sure that the company's financials are secure and that earnings and cash flow will grow. So far, that's almost certainly the case. User numbers in North America have flattened, but last year Facebook still added nearly 1 million new users per day, most of them international. Odds are that the service will hit 3 billion monthly active users (up from 2.2 billion monthly last quarter) in the next four years. How well Facebook can monetize those users will depend on how effective advertising is on the site, whether regulations impinge on the ability to monetize data, and how actively users want to be on Facebook, among countless less influential factors.

So far, we know that advertising is becoming more effective, and customers have been willing to pay much more per ad on Facebook over the past year. As for regulation, Facebook has said that it welcomes some oversight, and with the FTC investigating it and Congress demanding hearings, such a result is ultimately likely. Barring a breakup of Facebook properties, my belief is that most forms of regulation won't add much risk to the business, and some may even help it. Facebook wants all advertisers to be required to state where their funding comes from, for example. But overall, regulation uncertainty remains a risk. As for active users: In international markets, Facebook is one of the cheapest ways to stay connected with friends, family, and news (which puts even more responsibility on Facebook to squash destructive content). And in North America, Facebook is ingrained into how many people use the Internet itself. For one, Facebook is the way many sign into apps. And network effects work to keep bringing users back into the site.

Still, we don't take repeated user visits for granted. It's easy to delete an app from your phone, where most repeat traffic is derived. And even a giant like Facebook is vulnerable to changing whims. So we're watching its next steps very closely -- and we expect much more from its leaders. Facebook is sitting on perhaps the most detailed trove of user data ever assembled on the Internet. If they don't respect it and protect it, bodies of power will gradually conspire across the globe to defang this business. And either way, we believe some regulation is in order.

But that's not just true for Facebook. **Alphabet** (NASDAQ: GOOG) (Nasdaq: GOOGL) has years of data on users, too. **Twitter** (NYSE: TWTR) is rich with data and reeks of abusive accounts. **Apple** (NASDAQ: AAPL) is painting itself as an ethical protector of privacy and data rights, but while the company isn't known to have sold any of its user data, it does retain reams of it, meaning Apple should be monitored, too. Its leaders will change over the years, perhaps bringing different attitudes to this issue, and its data pile will keep growing. And those are just some of the relevant companies -- we should also mention **Comcast** (NASDAQ: CMCSA) and **AT&T** (NYSE: T). And **Equifax** (NYSE: EFX) and **Target** (NYSE: TGT). And **Amazon.com** (NASDAQ: AMZN). And others.

The reality is, as the Internet has become an indispensable part of our daily lives, the regulations governing it have not grown to match. Nothing you do online is private. Along every touchpoint, someone is collecting data about you. What you "like" on Facebook might belong among the *least* of your concerns, given that Google knows what you've searched for, Amazon knows what you buy, and so forth. That said, Facebook's breadth, reach, and data manipulation by outsiders makes it the primary target today, and that's not likely to change this year. What gives us hope is an indication that CEO Mark Zuckerberg and company want to do right. They don't want to destroy what they're building. They know they need to find solutions that will work for multiple parties. The first paragraph of their January 31 press release said they want to make sure Facebook is good for society.

We believe that Facebook -- perhaps like Equifax, whose stock has recovered considerably from last year's low -- will prove its staying power and its financial resilience. Recently at $159, Facebook stock traded at 21.3 times expected earnings for the year ahead. This is not expensive for a company expected to increase that earnings number by more than 20% annually over each of the next two years. But until Wall Street has confidence in the staying power of those earnings, we're likely to see the stock bounce around with the news headlines. We still have Facebook as a Buy, and as of now, we believe today's setbacks present a long-term opportunity for investors. But when it comes to the issues at hand, this prognosis assumes management will start to do much better than it has in the past.

To discuss Facebook, please head to our Facebook board.

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: March 26, 2018

Published Mar 26, 2018 at 3:33PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **CME Group** (NASDAQ: CME): Moves to Best Buy Now, with a 2.5% stake.
- **Coherent** (NASDAQ: COHR): Moves to Buy (from Best Buy Now) as we watch the OLED market. Our overall positive view on this business and its price has not changed.
- See all of our Best Buy Nows and Buys.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Johnson & Johnson** (NYSE: JNJ): Unfortunately, we at *Pro* did not get our desired price to sell covered calls, as the stock fell. We're still waiting.
- **SPDR S&P 500** (NYSEMKT: SPY): We set up our January 2019 synthetic short, selling to open $185 calls, and buying to open an equal number of $155 puts. For a 15% allocation, we set up 17 contracts of each. Our net debit was $1.21 per synthetic short.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Expirations: Facebook, Oracle, and More

Published Mar 22, 2018 at 12:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Johnson & Johnson** (NYSE: JNJ): Buy 2.8%.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Oracle** (NYSE: ORCL): Buy 3.3%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy 4.5%.
- **Facebook** (NASDAQ: FB): Buy half of our 7% (so, 3.5%) to start. Expect volatility now, but also expect the business to grow the coming years.
- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **OpenText** (NASDAQ: OTEX): Buy 2.9%.
- **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Home Depot** (NYSE: HD): If you've yet to join our diagonal call position, you can do so today by simultaneously buying ("buy to open") January 2020 $125 calls and selling ("sell to open") May 2018 $175 calls for a combined net debit of about $50.40 per diagonal call (that's $5,040). Invest about 1.6% of your Pro funds in this diagonal call position.
- **Oracle** (NYSE: ORCL): Invest 0.5% to buy to open January 2020 $30 calls. Wait for some price recovery to write diagonal calls at around a $52.50 strike for a worthwhile yield.
- **SPDR S&P 500** (NYSEMKT: SPY): Set up a $285/$255 synthetic short per our recent alert. If you use the same strikes as the alert, note that because SPY is a bit higher now, the position can be implemented for about a $1.70 net debit.

Upcoming Expirations (April 20):

- **American Tower** (NYSE: AMT): Our $130 diagonal calls will expire, and the stock goes ex-dividend on April 11th with a dividend of $0.75 per share. We plan to roll soon, and certainly before the ex-dividend date to avoid dividend poaching.

Tencent Is Investing in Its Future

Published Mar 22, 2018 at 5:21AM

Tencent Holdings (NASDAQOTH: TCEHY) announced fourth-quarter 2017 results on Wednesday morning, detailing higher-than-expected earnings driven by the sustained momentum of its social media platforms, smartphone games, and wildly popular video-streaming services.

But the Chinese tech giant also outlined plans to ramp up strategic investments aimed at taking market share and driving long-term growth, sparking concerns from skittish investors over its near-term profitability.

With shares down around 3% as of this writing, let's take a deeper look at how Tencent ended the year, as well as what we can expect in the coming quarters.

Image source: Getty Images.

Tencent Results: The Raw Numbers

Metric	Q4 2017	Q4 2016	Year-Over-Year Growth
Revenue	RMB 66.392 billion ($10.161 billion)	RMB 43.864 billion	51.4%
Net profit attributable to Tencent shareholders	RMB 20.797 billion ($3.183 billion)	RMB 10.529 billion	97.5%
Earnings per diluted share	RMB 2.177 ($0.33)	RMB 1.108	96.5%

Data source: Tencent Holdings.

What Happened With Tencent This Quarter?

- On an adjusted (non-GAAP) basis, which excludes non-cash items and acquisition expenses, profit attributable to shareholders grew 42% year over year to RMB 17.454 billion ($2.671 billion), or RMB 1.827 per diluted share ($0.28).
- Tencent doesn't provide specific quarterly guidance. So for perspective -- and while we don't usually pay close attention to Wall Street's demands -- consensus estimates predicted lower adjusted earnings of $0.27 per share on higher revenue of $10.5 billion.
- Fee-based registered subscriptions for Tencent's value-added services (VAS) grew to 135 million for growth of 22.1% year over year -- up from 125 million last quarter.
- Weixin and WeChat monthly average users grew 11.2% year over year to 989 million and exceeded 1 billion following the Chinese New Year.
  - Accelerated growth was driven by a fine-tuned Weixin user interface to more prominently feature Mini Programs and Mini Games.
- Monthly active user (MAU) accounts on Tencent's QQ instant messaging service fell 9.8% year over year to 783 million. However, smart device MAUs grew 1.7% to 683 million, driven by growth in both time spent by and the number of younger users (aged 21 and below).
- Qzone MAUs declined 11.7% year over year to 563 million, and smart device Qzone MAUs declined 9.1% to 554 million.
- VAS revenue grew 37% year over year to RMB 39.947 billion, including the following:
  - Online games revenue grew 32% to RMB 24.367 billion, driven primarily by growth in both existing smartphone games, like *Honour of Kings*, and new smartphone games, including *Kings of Chaos* and *Legacy TLBB Mobile*.
  - Social networks revenue grew 45% to RMB 15.58 billion, driven by growth in subscription video streaming, live broadcast, and in-game virtual item sales.
- Online advertising sales climbed 49% to RMB 12.361 billion, including the following:
  - Media advertising grew 22%, driven by Tencent Video, which is now the largest streaming platform in China, with over 137 million mobile daily active users and 56 million paying subscribers (up from 43 million last quarter).
  - "Social and other" segment ad revenue grew 68%, driven by Weixin and Tencent's ad network.
- Other business revenue grew 121% to RMB 14.084 billion, driven by payment and cloud services.
- Free cash flow grew 41% year over year to RMB 24.17 billion.

What Management Had to Say

Tencent Chairman and CEO Ma Huateng stated the following:

> During 2017 and continuing in 2018, Tencent made important strategic moves that reinforced our leadership. Our streaming video service became the China market leader with the most mobile daily active users and monthly subscriptions. Our Weixin Mini Program platform rapidly expanded its developer base and user adoption. Our QQ *Speed Mobile* racing game and *PUBG: Exciting Battleground* shooter game achieved absolute leadership in, and grew the audiences of, their respective genres. Looking forward, we are substantially increasing our investment in areas including video, payment, cloud, AI technologies, and smart retail, which will impact our near-term earnings but which we believe can generate long-term value and growth opportunities.

Looking Forward

More specifically, Tencent says it will "more aggressively invest" in 2018 with the aim of strengthening its positions in "areas including online video, payment services, cloud services, AI technologies, and smart retail."

Of course, the market is unsurprisingly frowning at the prospect of that growth coming at the expense of Tencent's short-term profitability, which helps explain today's modest pullback. Meanwhile -- and putting aside the fact that forsaking profits in the name of driving top-line growth and securing market share is hardly an uncommon approach -- long-term investors will recognize that Tencent is making these investments from a position of strength.

Pro's Theoretical Fair Value

Published Mar 20, 2018 at 2:47PM

Dear *Pro* Fools –

Last week, *Pro* member spiggy unearthed an old discussion on the boards from 2013 (before my time with *Pro*). This discussion focused on an analysis from longtime *Pro* all-star, FoolishRob99.

In this post, Rob assessed whether the *Pro* portfolio was trading at an aggregate discount or premium to its fair value. To do this, he analyzed the theoretical fair value of the long portion of the *Pro* portfolio based on our "Fair Value Estimates," then compared the theoretical fair value of the portfolio to the actual market value.

What Is Fair Value?

Before we dive any deeper into Rob's methodology of determining the *Pro* portfolio's theoretical fair value, let us first define what "Fair Value" means. Without understanding how to interpret "Fair Value," calculating *Pro*'s theoretical fair value is of little use. Here's an anecdote from Rob's original post, which is excellent:

> *Pro includes "Fair value" prices on all its companies. That is sometimes confusing to members. The question comes up again and again: why should I buy above fair value? The answer is twofold. One, fair value isn't an absolute number, but rather the convergence of a series of possible futures. So it's inherently inaccurate. You might call it the "highest probability single value" if that means anything. Or the weighted average of values considering the likelihood of possible futures. Second, fair value advances at a discount rate, typically 10% per year. If it did not advance, fair value wouldn't be "fair" for the buyer.*

Here's how *Pro* defines "Fair Value," from the Glossary at the bottom of our "Pro Portfolio" page:

> "**Fair Value**: The price from around which we estimate investors will earn a fair annualized, long-term return. We lean conservative, and our fair value estimate will increase as the company grows."

And here are a few additional resources that help provide additional context into how we think about fair value:

- A memo from Jeff titled The Flaws of Fair Value
- A couple of board posts with further detail on fair value

Determining Pro's Fair Value

With a discussion of fair value out of the way, now we can take a look at Rob's methodology. Here it is in his words:

> *The following table takes Pro's fair value estimates along with the actual holdings, and determines what the resulting fair values of each of those positions actually are. If a stock has a FV of 30, and we have 100 shares, that position has a FV of 3,000. (100 * 30 = 3,000). We can then sum up all the position FV numbers and get a total portfolio FV, and see if we are trading at a net discount or premium to portfolio FV.*

After running his analysis, Rob determined that, at $1,437,214, the *Pro* portfolio was trading at a 2.9% discount to its theoretical fair value. He then concluded that we could expect a potential advancement in the *Pro* portfolio of $215,337 over the coming year, comprised of:

- The 2.9% advancement to fair value
- Expected dividends
- 10% annual return from increases in fair value

Since the Pro portfolio had a market value at the time of $1,886,897 (which includes cash, shorts, and options), the $215,337 expected increase in the long book could be expected to push *Pro* to an 11.4% gain by the beginning of 2015. So, how did his hypothesis perform in accordance with reality?

Well, *Pro's* ending portfolio balance on 12/31/14 was $2,321,001, a 23% gain. We did better than Rob's back-of-envelope calculations, which is due to one of two reasons (or possibly a mixture of both):

1. Our estimates of fair value were too conservative, and the fair value of our companies advanced more quickly than what was implied by our expectation of 10% annual advancement
2. The market bid up the price of our companies beyond the advancement in their true economic fair values, leading to a premium to fair value

In order to determine which of the two above reasons explains the observed reality most closely, we'd need much more data and we'd need to track *Pro*'s theoretical fair values over time and compare them to the subsequent realized returns. I plan to start doing that on a weekly basis starting now, and below is the first entry of this new and exciting data set.

Pro's Current Theoretical Fair Value

As of last week's closing prices on Friday, here is what the calculation of *Pro*'s theoretical fair value looks like:

Date	Stock	Ticker	# of Shares	Position Market Value	Position "Fair" Value	Allocation	Day Closing Price	Fair Value Estimate	Price/FVE
3/16/2018	Facebook	FB	1400	$259,126.00	$246,400.00	8.8%	$185.09	$176.00	1.05
3/16/2018	Broadridge	BR	2100	$225,288.00	$172,200.00	7.6%	$107.28	$82.00	1.31
3/16/2018	Mastercard	MA	1200	$219,060.00	$180,000.00	7.4%	$182.55	$150.00	1.22
3/16/2018	Amazon	AMZN	100	$157,168.00	$117,000.00	5.3%	$1,571.68	$1,170.00	1.34
3/16/2018	Apple	AAPL	896	$159,505.92	$148,736.00	5.4%	$178.02	$166.00	1.07
3/16/2018	Square	SQ	2800	$153,692.00	$123,200.00	5.2%	$54.89	$44.00	1.25
3/16/2018	Paycom	PAYC	1300	$142,974.00	$117,000.00	4.9%	$109.98	$90.00	1.22
3/16/2018	American Tower	AMT	924	$135,412.20	$134,904.00	4.6%	$146.55	$146.00	1.00
3/16/2018	Skyworks	SWKS	1200	$132,756.00	$126,000.00	4.5%	$110.63	$105.00	1.05
3/16/2018	Oracle	ORCL	2400	$125,448.00	$115,200.00	4.3%	$52.27	$48.00	1.09
3/16/2018	Visa	V	958	$119,299.74	$101,548.00	4.1%	$124.53	$106.00	1.17
3/16/2018	Tencent	TCEH.Y	1808	$107,163.78	$90,400.00	3.6%	$59.27	$50.00	1.19
3/16/2018	Open Text	OTEX	2800	$101,668.00	$98,000.00	3.5%	$36.31	$35.00	1.04
3/16/2018	NVR	NVR	32	$97,934.40	$88,000.00	3.3%	$3,060.45	$2,750.00	1.11
3/16/2018	Cooper Companies	COO	400	$94,276.00	$96,000.00	3.2%	$235.69	$240.00	0.98
3/16/2018	Johnson & Johnson	JNJ	724	$96,784.32	$99,188.00	3.3%	$133.68	$137.00	0.98
3/16/2018	Starbucks	SBUX	1600	$94,400.00	$83,200.00	3.2%	$59.00	$52.00	1.13
3/16/2018	CME Group	CME	500	$82,560.00	$88,500.00	2.8%	$165.12	$177.00	0.93
3/16/2018	Medtronic	MDT	1000	$81,290.00	$80,000.00	2.8%	$81.29	$80.00	1.02
3/16/2018	Verisk Analytics	VRSK	757	$79,310.89	$66,616.00	2.7%	$104.77	$88.00	1.19
3/16/2018	FactSet Research Systems	FDS	360	$77,248.80	$67,320.00	2.6%	$214.58	$187.00	1.15
3/16/2018	Gilead Sciences	GILD	900	$71,766.00	$72,000.00	2.4%	$79.74	$80.00	1.00
3/16/2018	Coherent	COHR	307	$68,049.62	$85,960.00	2.3%	$221.66	$280.00	0.79
3/16/2018	Verisign	VRSN	500	$62,960.00	$50,000.00	2.1%	$125.92	$100.00	1.26
			TOTAL	$2,945,141.67	$2,647,372.00	100.0%			1.11

Pro's long book is currently trading at an aggregate premium to its theoretical fair value of about 11.3%. This suggests a headwind to future returns, which is not surprising given the strong advancement in the stock market over the last year and a half. Jeff often mentions that he doesn't like when the market goes up too much, because in essence it is "stealing from future returns." The idea of a premium to fair value and the headwind on future returns is what he is referring to.

The *Pro* Bottom Line

By comparing *Pro*'s theoretical fair value to its current market value, we can get a sense of whether we might experience higher-than-expected or lower-than-expected performance over subsequent periods. Right now, *Pro*'s 11.3% premium to fair value suggests a headwind to future returns, although that doesn't necessarily mean that lower future returns will certainly occur.

By tracking Pro's theoretical fair value (and by tracking the fair value of the stocks that comprise the aggregate portfolio) over time and comparing the discount or premium to the subsequent realized performance, we can determine how good we are at assessing fair value, or whether we are systematically biased with our estimates. I plan to update this data set on a weekly basis and look forward to having enough data to draw historical conclusions.

And thanks to FoolishRob99 and spiggy for inspiring this Memo!

Fool on,

--Billy (TMFBillyTheKid)

Pro Catch-Up Trades and Expirations: Gilead, Square, SPY, and More

Published Mar 15, 2018 at 2:05PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Medtronic** (NYSE: MDT): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **CME Group** (NASDAQ: CME): Buy 2.5% per our recent alert.
- **OpenText** (NASDAQ: OTEX): Buy 2.9%.
- **Square** (NYSE: SQ): Buy up to 4.4% (if you're worried about volatility, start with half that size, or go up to 3%).
- **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Gilead Sciences** (NASDAQ: GILD): If you don't have a position yet (or haven't covered your shares and want to), buy at least 100 shares up to a 2.1% (or so) portfolio allocation, and simultaneously sell to open May 2018 $85 calls. Sell one call for 100 shares owned. These calls lately pay $1.50 each, for a 1.9% yield on the $79.63 share price in just more than two months. Your net debit to set up this buy/write covered call trade is about $78.13 per share, with upside to $85.
- **Home Depot** (NYSE: HD): If you've yet to join our diagonal call position, you can do so today by simultaneously buying ("buy to open") January 2020 $125 calls and selling ("sell to open") May 2018 $175 calls for a combined net debit of about $50.20 per diagonal call (that's $5,020). Invest about 1.5% of your *Pro* funds in this diagonal call position.
- **Johnson & Johnson** (NYSE: JNJ): Sell covered calls on your shares if, like us, you're comfortable capping them for upside. The May 2018 $140 calls lately pay $1.42, with the shares at $133.29. This is the minimum to accept today -- this or a few pennies less if you don't mind.
- **SPDR S&P 500** (NYSEMKT: SPY): Set up a $285/$255 synthetic short per our recent alert. If you use the same strikes as the alert, note that because SPY is higher now, the position can be implemented for about a $1.50 net credit. For a synthetic short with more breathing room and responsiveness, however, you would now probably want to set it up at least one strike price higher than the alert, selling $290 calls and buying $260 puts. This costs about a $2.10 net debit per syn short, with SPY lately at $275.61.

Upcoming Expirations:

- **Facebook** (NASDAQ: FB): Our $170/$200 protective collar *would* have expired tomorrow, March 16, but we closed it early.

Write Covered Calls on Johnson & Johnson

Published Mar 12, 2018 at 3:30PM

Is this for you? This is for *Pro* members who own at least 100 shares of Johnson & Johnson, and who wouldn't mind capping upside in return for near-term income. Those who *don't* own the stock can buy at least 100 shares to write covered calls, matching our 2.8% allocation. Those who own less than 100 shares as a full allocation can continue to hold them.

How You Participate

- **Action:** Sell to open May 2018 $140 calls on **Johnson & Johnson** (NYSE: JNJ).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover 700 of our 724 shares owned, representing about 2.8% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but **use a limit order** to split the option's current bid/ask spread. When we quoted it, that was $1.52. Later, aim for at least a 0.5% yield (option premium/current stock price) per month to expiration; with shares at $133, the minimum to accept when writing these calls is thus about $1.50.
- **Prices** (10:40 a.m. ET):
  - Stock: $133.67
  - Sell to open May 2018 $140 calls (bid/ask): $1.50/$1.55
  - $1.52 pays 1.1% ($1.52/$133.67) in 68 days
- **Alternative Trades:** You can write calls at the $135 strike if you want to trade off lower upside to your strike price for higher income now.
- **Important dates:** Johnson & Johnson will report earnings in mid-April. The next ex-dividend date is not until late May, so we'll avoid any dividend-poaching complications with this trade.

What We're Thinking

Our latest earnings update on Johnson & Johnson detailed our thinking for this position. A quick summary of our thoughts would be that JNJ's business is doing well, with a resurgent pharmaceutical division making up for slower growth in the company's other two divisions. We're pleased with the way our investment thesis is playing out, but we don't expect runaway upside from this steady, low-growth stalwart. We'd mentioned in the earnings writeup that we might consider using covered calls to add additional income to the position, so here we are.

Why This Strategy?

As the third-highest-yielding position in the *Pro* portfolio (behind Gilead and DGS), Johnson & Johnson is already an income producer for us. At current prices, the company's dividend yield should approach 2.7% once the company announces its yearly dividend increase sometime in late April. Johnson & Johnson is a Wall Street "dividend aristocrat," one of only 25 U.S.-listed stocks with a history of at least 50 consecutive years of dividend increases (this year will mark 56).

Given the healthy dividend yield and the fact that the business is a slow grower, we think covered calls should help us achieve a North Star-level return from the position. We're not too worried about losing our shares should the stock price run away from us, because we don't have much interest in chasing J&J's valuation too far above our fair-value estimate. Additionally, if we lose our shares because of these covered calls, we can turn around and write puts to target additional income and aim to reinitiate our position at lower prices.

Given the recent spike in volatility, the VIX (the "volatility index") is reaching higher levels than we've seen since initiating our J&J position in February 2017, and we think now is a good time to initiate a recurring "options for income" strategy on our position. Options premiums are modest because of the company's lower-than-average volatility, and we may have to watch out for dividend poaching around ex-dividend dates, but ultimately, we think a covered-call strategy should help us achieve our desired returns for this position over the long run.

If our shares are called in May, we'll be selling at a net price of $141.52, above our fair-value estimate and accounting for about a 20% simple return (about 18% annualized) since the position's inception . We'll manage the calls as needed with future trade alerts, and as is always true with covered calls, we may need to let our shares go if we can't roll our calls higher at a reasonable cost.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call's strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold, or we may roll our calls to a later date and/or higher strike. We'll cross any such bridge near expiration, once time value is dissipating from the calls.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions, please visit the J&J discussion board.

Submit

From Square to SVXY!

Published Mar 12, 2018 at 2:50PM

Dear *Pro* Fools,

The *Pro* portfolio finished last week at new highs, driven by many of our newer investments. We continue to see great promise in the likes of **Paycom** (NYSE: PAYC), **Tencent** (NASDAQOTH: TCEHY), **Amazon** (NASDAQ: AMZN), **Skyworks** (NASDAQ: SWKS), and our focus today: **Square** (NYSE: SQ).

Square Squared Up

Payment processor. Lender. Software provider. Our strongest performer of late, Square's shares have doubled since we bought them eight months ago. Growth has accelerated sequentially over each of the past four quarters as larger customers embrace the growing Square ecosystem. But let's step back.

In 2017, Square processed $65.3 billion in gross payment volume (GPV). Its own net revenue rose by 47% last quarter. Sellers generating more than $500,000 in annualized GPV made up 20% of Square's total GPV, up from 16% a year ago. Those selling at least $125,000 per year accounted for 47% of last quarter's GPV, another rise. This is important because larger customers not only drive more profits to Square via transactions, but they also have more money to spend on Square software and services.

The company's subscription and services businesses expanded revenue by 96% last quarter, to roughly $79 million. Ranging from invoicing to inventory to payroll software, analytics, and data (and much more), Square's services have high margins, and that's where the most long-term value will likely be created. But payment transactions are holding their own, too. Square's transaction-based profit as a percentage of customer GPV grew to 1.07% of each dollar last quarter, up from 1.04%.

Square is building an ecosystem that provides financial tools and flexibility to anyone building or running a business, and to consumers as well through its Cash App. Business customers arrive through any of a multitude of Square offerings, such as Appointments, or Loyalty, or Point of Sale (all of which are self-explanatory). Most customers add more Square products over time. These virtuous cycles are driving strong growth even as Square spends relatively little on marketing. Newcomers arrive by word of mouth and brand recognition, and the upsell cycle soon begins.

Management at Square expects 44% adjusted revenue growth in Q1, and 32% to 35% adjusted revenue growth for all of 2018. That would bring between $1.3 billion and $1.33 billion in adjusted 2018 revenue. Management estimates an EBITDA margin of 19%, with non-GAAP earnings per share of $0.43 to $0.47 this year. Even as Square spends to develop new products and grow internationally, its margins are headed higher, and GAAP profits should arrive by next year.

Just as the stock is bursting past its boundaries, the business is hard to contain in a few words, too. Square goes through pains in six paragraphs to try to describe everything it does. It's also hard to pinpoint its greatest opportunity -- because it has many, from lending to software to transactions. It's not easy to value a young, fast-growing company, so take numbers from *anyone* with a grain of salt. But we see much more opportunity ahead, and our newly increased fair-value estimate of $44 just represents a snapshot in time. The stock remains a Buy, and we have a 4.3% stake.

Half Its Former Self

ProShares recently announced that its ETF, the **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY), will adjust to track its corresponding VIX futures index at negative 0.5 times the value of the index per day. That's rather than the full negative value of the index it used to track. This is a good change for anyone, like us, who wants to see the ETF last a long time. Being short VIX futures with half as much exposure as before means it would take at least a 200% one-day jump in VIX futures to put the ETF in mortal danger -- and that has never happened before. In practical terms, it means that now if VIX futures jump by, say, 20%, SVXY will only fall by half as much.

But this also means that a price recovery, if we get one, is going to take much longer. When the VIX futures lose value, as they do on a majority of trading days, our ETF will gain only half as much as the index loses -- instead of the full amount. Still, I welcome this change. The ETF is now likely to weather giant storms much better than it did in early February.

Meanwhile, from its low near $16 in 2016, SVXY had increased to $130 by the end of 2017. Gains from here of even half that amount -- or even much less -- would still be attractive, especially if the ETF *loses* much less when volatility spikes. With this news, we may be waiting longer for any such gains, but we have less risk during market downturns and spikes in volatility. We maintain a 0.3% position, rated a Buy.

(For the curious, see the biggest VIX jumps here in CBOE's PDF; and realize that VIX futures usually move less than than VIX itself.)

In closing, it's a pleasure to spend some time with you here today. Our dialogue with you naturally continues -- with more trade alerts, more market commentary (including sequels to "Where Pro Stands"), and more earnings updates coming. Enjoy your investing!

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: March 13, 2018

Published Mar 12, 2018 at 2:16PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Square** (NYSE: SQ): Our fair-value estimate increases to $44. The stock remains a Buy at a 4.3% allocation.
- Don't miss the slew of guidance adjustments shared last week.

Pro Completed Trades (see transaction log; trades take a day to appear):

- None since last week.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Paycom, SPY, and More

Published Mar 8, 2018 at 2:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.8%.
- **Medtronic** (NYSE: MDT): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **CME Group** (NASDAQ: CME): Buy 2.5% per our new alert.
- **NVR** (NYSE: NVR): Buy 2.8%.
- **Paycom** (NYSE: PAYC): Buy up to 4.2%.
- **WisdomTree Emerging Markets Small-Cap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Facebook** (NASDAQ: FB): In case you missed the alert, we recommend selling to close your long puts in your protective collar, and closing the collar.
- **Home Depot** (NYSE: HD): If you've yet to join our diagonal call position, you can do so today by simultaneously buying ("buy to open") January 2020 $125 calls and selling ("sell to open") May 2018 $175 calls for a combined net debit of about $50.20 per diagonal call (that's $5,020). Invest about 1.7% of your *Pro* funds in this diagonal call position.
- **SPDR S&P 500** (NYSEMKT: SPY): Set up a synthetic short per our recent alert. Using the same strikes as the alert, since SPY is higher now, the net debit for the syn short is lately about $0.20.

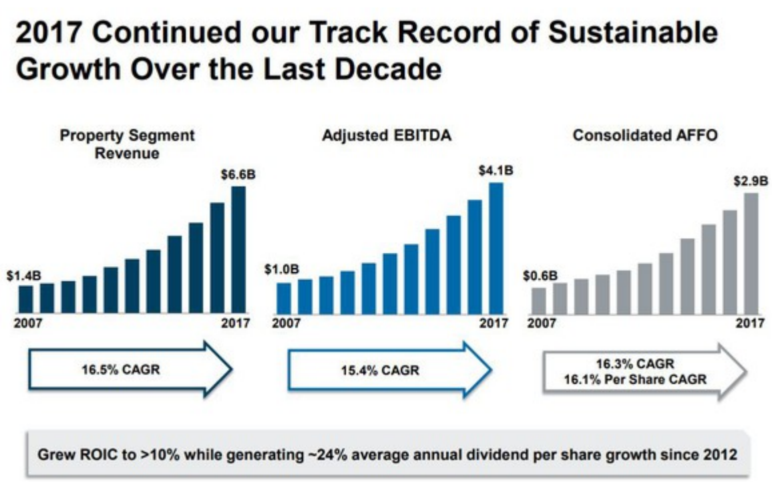
Upcoming Expirations:

- **Facebook**: Our $170/$200 protective collar *would* expire on March 16, but we closed it early.

American Tower Faces Near-Term Weakness in India

Published Mar 7, 2018 at 2:43PM

American Tower (NYSE: AMT) reported a noisy fourth quarter for 2017 as wireless carrier consolidation in India led to lower companywide profitability. Culprits included elevated levels of customer churn, one-time impairment charges, and bad debt expenses related to Indian operations. Despite the near-term weakness, 2017 capped off an outstanding 10-year period for American Tower during which the company was able to exceed its long-term strategic goals laid out in 2007. Management's goals for 2017 were to have 100,000 communications sites (they achieved 150,000-plus) and to generate $6 per share of consolidated adjusted funds from operations (AFFO) -- they reported $6.72 per share in full-year 2017.



Although international growth will be a bit slower in 2018 because of the disruption in the Indian wireless market, the U.S. business continues to improve, and the international business should rebound once the Indian market normalizes. American Tower's valuation reflects the near-term weakness in India, and the stock is currently trading at 18.5 times adjusted EBITDA guidance for full-year 2018, which is well below the company's long-term average of about 21 times adjusted EBITDA. This suggests that shares are priced attractively today.

What Happened?

CEO Jim Taiclet:

> "In 2007, American Tower initiated a long-term aspirational strategy which included a target of quadrupling both the size of our communications site portfolio and our financial performance over a 10-year time horizon. Based on our 2017 results, we have far exceeded both objectives, with over 150,000 sites versus a goal of 100,000 sites, and $6.72 per share of Consolidated AFFO versus a goal of $6.00 per share. Moreover, in 2017, we delivered growth of nearly 16% in Consolidated AFFO per Share, expanded our return on invested capital, increased our common stock dividend by more than 20%, and repurchased approximately $770 million in stock.
>
> "As we look forward to 2018, we expect strong organic tenant billings growth of over 6% in the U.S., driven by unlimited data plans, increasing mobile video consumption, announced spectrum build-outs in the 2.5 GHz and 600 MHz bands and the planned FirstNet deployment. We also expect consistent demand for tower space in Latin America, notably in Mexico and Brazil, as well as robust activity in our key markets in the EMEA region. Finally, we have incorporated into our 2018 outlook the expected impacts of the ongoing carrier consolidation process in India. We continue to have a high level of confidence that once the consolidation activity concludes, the Indian mobile industry will be positioned for major network investments to bring 4G service to the country's 1.3 billion people, providing strong growth opportunities for our extensive portfolio in India."

Get More

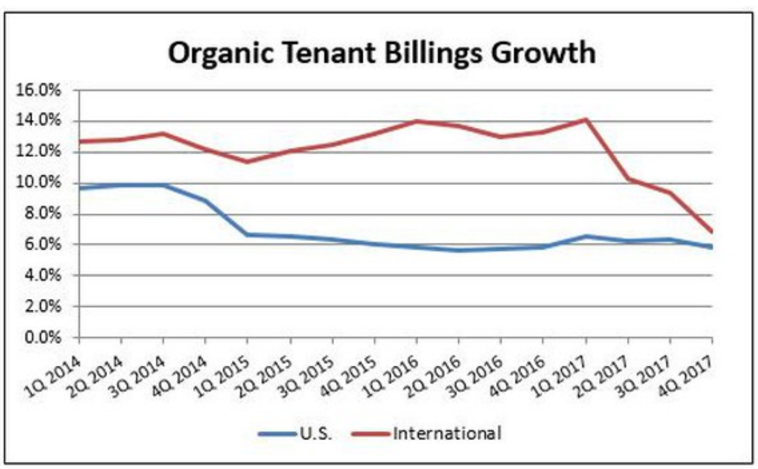
- Q4 2017 press release
- Q4 2017 supplemental materials
- Q4 2017 earnings presentation

For the fourth quarter, organic growth in tenant billings came in at 5.9% in the U.S. and 6.9% internationally, vs. 5.8% and 13.3% in the same quarter a year ago.

Internationally, there was significant disruption in the Indian market as wireless carrier consolidation resulted in a significant amount of churn (i.e., customer cancellations) in the quarter. Here is some management commentary about the current situation in India:

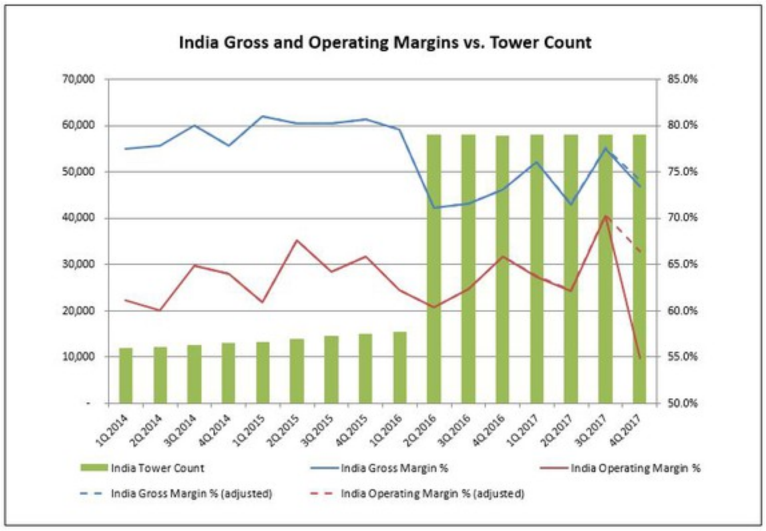
> "While we always expected a significant operator consolidation in the Indian market, Reliance Jio's bold launch of its 4G network significantly disrupted the incumbents, driving them to rapidly merge their businesses in response. Consequently, an orderly consolidation process that we expected to run over 4 or 5 years is being compressed into a much tighter time frame. As a result, we anticipate that ATC India, along with all tower operators in the market, will experience substantial churn in 2018. And this is included in our outlook. We then expect these elevated churn levels to begin to subside in 2019, and by 2020 and thereafter, that the reordered market will gradually return to more typical organic growth rates over the long run. Over the mid to long term, we believe a rational Indian wireless market, with 3 or 4 national mobile operators and 2 to 3 major tower companies, that includes ATC, will more than make up for the short-term churn impact of this consolidation process in the short term.
>
> "Consequently, we have applied our practice of acquiring quality tower portfolios during times of short-term market disruption because they're acquired at reduced asset prices. This is the logic behind our signed agreements to purchase the non-Indus Communications real estate assets of Idea and Vodafone. Over our planning period, we expect that these towers may eventually prove to be among the highest-return assets in the company given their low purchase multiple and the market's future long-term growth prospects."

As a result of the carrier consolidation, Indian organic growth came in at 2.6%, down sharply from 19.1% a year ago. Outside of India, organic growth was more typical, up 8.3% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda) and 9.9% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Paraguay, and Peru).

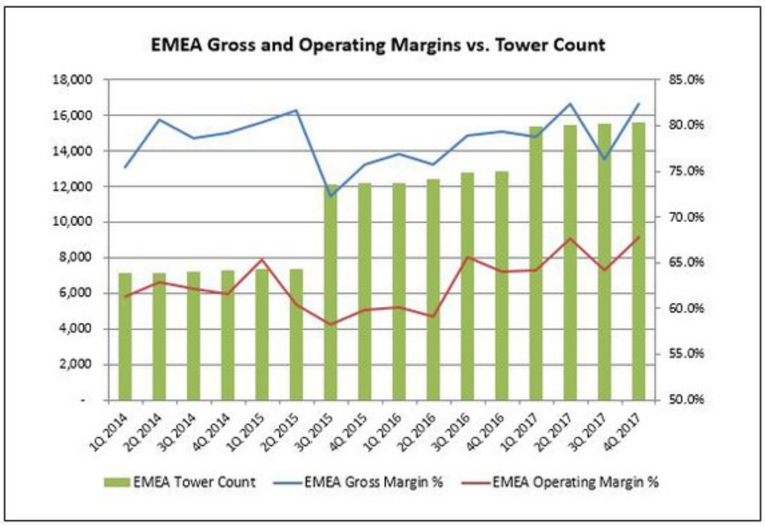


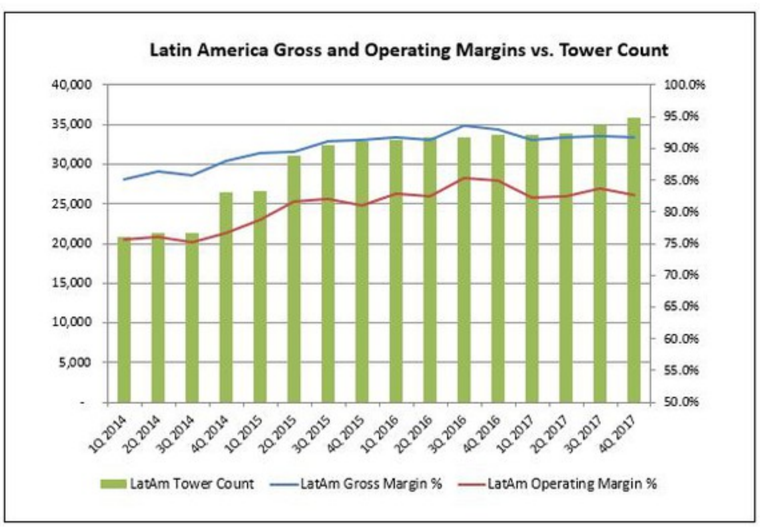
So What?

The Indian wireless carrier consolidation should continue to affect growth rates and margins in that market throughout 2018. The company booked a $209 million impairment charge and $18.7 million in bad debt expenses in the fourth quarter, all related to India carrier consolidation. The graph below shows how margins were affected in India both before and after adjusting for the one-time expenses:



In EMEA and Latin America, margin trends are positive and management expects margin expansion over time as the company continues to generate organic growth on its extensive existing portfolio of assets.



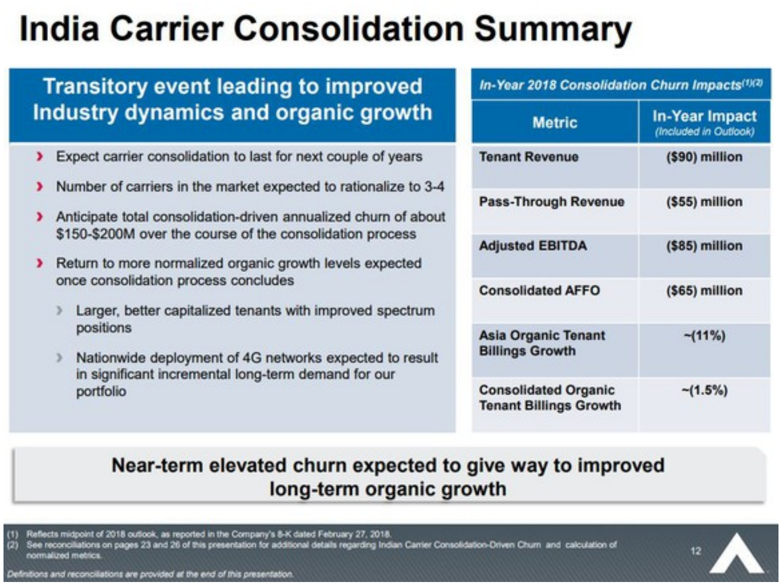


In the U.S., margin trends continue to improve. TTM gross margins increased year-over-year to 79.3% (from 78.2%), and TTM operating margins increased year-over-year to 75.1% (from 73.9%). We can see in the graph below that since the significant **Verizon** (NYSE: VZ) acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (thanks to the lower tenancy ratio on those new towers), management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets:

Continued improvement in the U.S. business is especially nice to see given the disruption in the Indian market, and given that the U.S. business still generates about 60% of companywide revenue and 75% of cash flow.

Now What?

This fourth quarter represented an atypical misstep for American Tower as unexpectedly swift carrier consolidation in India led to significant one-time impairment charges and lower organic growth rates that should persist throughout 2018. However, the Indian market turmoil allowed management to acquire new assets at reduced prices, and by 2020, management expects that the Indian market should return to more typical growth.



Aside from the Indian market, the rest of American Tower's business continues to perform well. The U.S. business is showing continued growth and margin improvement, and EMEA/Latin America are growing at a rate higher than that of the United States. Management has an outstanding track record of growth over the past decade, and we expect that to continue despite the near-term disruption in India.

Data and Guidance

- Current Price: $139.20
- Fair-value estimate (unchanged): $146
- Allocation: 3.8%, plus 0.7% in January 2019 / April 2018 $80 / $130 diagonal calls
- EV/EBITDA (TTM): 19.63

AMT remains a Best Buy Now, and fair value is unchanged at $146. We also have 0.8% in deep-in-the-money diagonal calls, which expire in April. Our April $130 short calls still have more than $1 in time value remaining, and we'll likely aim to roll those calls out and up as we near April expiration.

Fool on!

-- Billy (TMFBillyTheKid)

Close Your Protective Collar on Facebook

Published Mar 5, 2018 at 2:37PM

Is this for you? For *Pro* members who set up a protective collar on some of these shares expiring March 16, we recommend that you sell the puts to capture their value, and close the calls for pennies to uncap upside.

How You Participate

- **Action:** Close your protective collar on **Facebook** (NASDAQ: FB).
- **Trades:**
  - **Sell to close** your March 16, 2018, $175 puts.
  - **Buy to close** your March 16, 2018, $200 calls.
- **Allocation:** We had collared more than one-third of our Facebook shares. We'll close all the contracts.
- **Price Guidance:** Sell to close the puts for the current value, using a limit order (lately about $1.65, but check your current pricing). Buy to close the calls for no more than $0.03 each (you could also wait and let the calls expire March 16, assuming the stock doesn't gain more than 12% to top $200 by then).
- **Recent Prices (noon ET):**
  - March 16, 2018, $175 puts (bid/ask): $1.64/$1.67
  - March 16, 2018, $200 calls: $0.02/$0.03
  - Stock: $179
- **Scorecard Status:** Buy. Allocation is 7.5%. Fair-value estimate is $176.
- **Special Note:** We're looking at future collars for future earnings reports, though right now they're a bit expensive. We have time.

What We're Thinking

We started this collar in January with these words: "What are we thinking? We're thinking we probably don't need this protection." As it turns out, we haven't needed it -- but it *has* helped. The protective collar gave us peace of mind as Facebook fell after January's earnings and during the market swoon. And, because the collar was set up for a small credit, we can close it today -- specifically, we can sell the puts we own today -- for a profit on the strategy overall. And that's nice.

Meanwhile, Facebook's strong financials continue to grow stronger. In its latest results, the social media leader reported fourth-quarter 2017 revenue growth of 47%, to $13 billion, while income from operations rose by 61%. The company's operating margin expanded from a stunning 52% a year ago to an even higher 57% last quarter -- more than twice Google's recent operating margin. Facebook is extremely profitable even as it spends billions on data centers and new employees. For all of 2017, revenue was up 47% to $40.7 billion, and operating margins averaged 50%. Free cash flow rose 50% year-over-year to $17.5 billion, representing a world-class 43% free cash flow margin.

These incredible numbers are likely to soften this year because Facebook expects its spending to ramp up all year long, growing ever higher as the year progresses. But given how its average revenue per user is increasing in every region, healthy growth at Facebook still appears on tap this year. That's because advertising on the site is becoming more effective, so advertisers are willing to pay more per ad, and they're increasing ad budgets, too. This is likely to be the case for some time to come -- perhaps a long time.

Ad revenue is growing even as Facebook makes site changes that are materially decreasing the amount of time an average user spends on the flagship site. Facebook is focused on delivering visitors more user-generated "friends and family" content rather than third-party streaming content, hoping to increase the quality of the experience. If people make better, deeper connections on the site (rather than streaming random videos), it should lead to more long-term value for everyone.

Lately at about $179, the stock trades at 25 times expected earnings for 2018 and 40 times free cash flow. It remains a high-conviction stock at *Pro*, as it has been for many years. However, given that it's our largest position at 7.5% and this is a transitional, high-cost year for Facebook, we'll continue to consider putting protective collars on some of our stake around earnings reports if pricing is reasonable. The next earnings date will be late April or early May.

Why This Strategy?

A protective collar is friendly because it can cost little to nothing to set up (or will even pay you, as it did in our case), yet it protects you from downside. Right now, if the stock stays between our two strike prices, the options would expire unused. But given that we only have 11 days until these options expire, and Facebook is not extremely likely to fall below $175 in that time, we are recommending that you sell to close the puts to capture their value. You can also buy to close your short $200 calls for a few pennies to guarantee you keep your shares if Facebook soars above $200 in the next 11 days. Such a jump is very unlikely, but ... stranger things have happened. Some brokers don't charge a commission for closing an option at less than $0.05.

For now, we'll uncover our Facebook shares again, leaving them currently unprotected. We made several hundred bucks on this collar (as of today), although it hasn't come into play yet and probably won't. If we were to wait and do nothing, it would likely expire without value.

Alternative Trades

- **Only bought puts last time?** If you simply bought puts in January, sell to close those puts.

Pro Guidance Changes: Medtronic, Paycom, SPY, More

Published Mar 5, 2018 at 2:37PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Apple** (NASDAQ: AAPL): Fair-value estimate increases to $166. Shares remain a Buy with a 4.7% allocation.
- **CME Group** (NASDAQ: CME) arrives to the *Pro* Port as a Buy at a 2.5% allocation. Please see our alert.
- **Facebook** (NASDAQ: FB): Close your March 2018 protective collar, per our guidance in today's alert.
- **Medtronic** (NYSE: MDT): Fair-value estimate increases to $80. Shares remain a Best Buy Now at a 2.4% allocation.
- **NVR** (NYSE: NVR): Fair-value estimate increases to $2,750. Shares remain a Buy with a 2.8% allocation.
- **Paycom** (NYSE: PAYC): Fair-value estimate jumps to $90 on increasing margins and strong growth. Shares remain a Buy at a 4% allocation.
- **SPDR S&P 500** (NYSEMKT: SPY): For those who want to hedge, set up a synthetic short per our new alert. As of this afternoon, the net debit to set up this short is down to about $1.60 per syn short, considerably lower. And that's fine.
- **Verisk** (NASDAQ: VRSK): Fair-value estimate increases to $88. Shares remain a Buy with a 2.3% allocation.

- **Verisign** (NASDAQ: VRSN): Fair-value estimate increases to $100. Our covered strangle is set to expire in June.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **CME Group**: We bought 500 shares (a 2.5% allocation) at just more than $165.
- **Oracle** (NYSE: ORCL): We set up 10 contracts each of a diagonal call (a 0.6% allocation), buying to open January 2020 $30 calls and selling to open June 2018 $52.50 calls for a combined net debit of $20.33 each.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Set Up a Split-Strike Synthetic Short on SPY

Published Mar 2, 2018 at 12:44PM

Is this for you? As ever, take your time. Assess. We're not worried, just adding some extra prudence. So see if this makes sense for you. This is for any *Pro* member who *wants* a market hedge and who uses a margin account. This split-strike synthetic short will gain and lose value as the underlying index falls or rises. Those wanting to hedge in an IRA, or short SPY directly, can consider the alternative trades at the end of this report. Here's a reminder about why and how we hedge in the first place.

How You Follow Along

- **Trade:** Use a spread or two-legged order to set up a synthetic short on the **SPDR S&P 500** (NYSEMKT: SPY):
  - Sell to open January 2019 $285 calls.
  - Buy to open January 2019 $255 puts.
- **Allocation:** *Pro* is hedging 15% of its long investments (cash excluded), which for us means a hedge of approximately $433,000. So, we're setting up 17 contracts of each option, or shorting exposure of 1,700 shares at $255, which is worth $433,500. At home, for a 15% allocation, you would set up one syn short for every $173,000 or so in long exposure you carry. Said differently, set up one of each option for every $25,500-equivalent hedge you want (that's based on the $255 put strike price times 100).
- **Price (11:50 a.m. ET) and Guidance:** With the ETF at $267.24, a debit of about $4.40 is necessary (that's $440 per syn short). That price will go higher if SPY falls, and be cheaper if SPY rises. (If you want to decrease the cost of the syn short, you can buy puts at a lower strike, but they won't be as responsive.)
- **Later Guidance:** If SPY moves much in price before you act, you may want to move *both* of your strikes up or down accordingly, to continue to roughly straddle SPY's price with calls that are about 7% out of the money and puts that are about 3% to 4% out of the money. If the price changes much before *Pro* can make its trade, we'll adjust accordingly.

What We're Thinking

After a lot of noise in January and February, the S&P 500 is (lately) just about flat on the year. The severe swings in the market -- up 7.4% in a few weeks in January, then down 10%, then back up a bit -- suggest that investors are having a hard time deciphering the current economic picture. And why wouldn't they?

Tax rates are headed lower, which should boost earnings at most U.S. companies. Unemployment is low, but overall GDP is growing at about the same rate as it has for years, and wages aren't rising much. Inflation is ticking higher and faster now, and interest rates are, too. Bonds are being punished. The dollar is falling to the euro. And it currently looks like the president is likely to slap high-profile tariffs on some items (why the White House has the ability to impose tariffs unilaterally is an interesting debate for another time!). The economic landscape is shifting in multiple directions at once, and in light of that, investors are attempting to arrive at a reasonable valuation for stocks based on future growth. It's a battle between buyers and sellers.

Meanwhile, in the past few years we've bought several promising companies as we continue to position ourselves evermore for an economy that runs on data (sorry, Dunkin'!). From Paycom to Square, from Verisk and Skyworks to Tencent, we're investing in companies that are capitalizing on the cloud, mobile, data, connectivity, gaming, and more. But this also means that our net long position has grown -- from an average of 67.7% in 2016 to 81% in 2017 and now to 91% net long.

We wanted to increase our long investments, knowing that once we did, we would move to reduce our net long exposure with shorts. Our increased longs should drive our total portfolio value -- even with added shorts -- higher than we would have enjoyed without them. If the market rises, putting pressure on our syn short, we're banking on our long investments to carry us much higher overall. Meanwhile, this position gives us 7% breathing room before SPY hits our short calls, so overall we can still target North Star-type returns for the portfolio as a whole in 2018 -- as long as our 90% allocation to long investments in aggregate outperforms the drag of this 15% short, which we believe it will.

Why This Strategy

This particular position is a *split-strike* synthetic short, because the two strike prices differ. Its effect on our portfolio is similar to that of shorting SPY, but with some leeway. This syn short ends in losses if the S&P 500 goes nowhere (we lose what we paid to set it up) or if SPY rises above our short call's strike price, which would increase our loss. The syn short provides gains if SPY declines and we close it early, or if SPY declines below our long put's strike price by expiration. (There's also our cost to set it up, so that would be about a 6% decline in SPY from current prices.) If SPY remains between our two strike prices ($255 and $285), the position will be on track to expire, only costing us the initial setup price, which is about 0.3% of the portfolio.

If SPY rises, we could end up accepting short shares of SPY through our short calls (rather than closing those calls for a loss). And we might-could (a favorite phrase) write covered puts on those shares until we end the position. On the flip side, if SPY falls, we can sell our puts for a profit anytime, or turn them into short shares and stay short. We'll cross that bridge! Overall, we like this syn short because it gives us significant upside breathing room (6.8% right now) on the index before our short calls are actually in-the-money.

Of course, you don't need to set up this short if you don't want to. Only do so if it makes sense for your situation. Given *Pro*'s goals, we want to take more steps to earn profits on a decline -- profits we can then reinvest in long positions. This short is one step among several we are taking or plan to take to profit on a flat or falling market.

Alternative Trade

- **IRA-Friendly:** If you're using an IRA and can't set up a synthetic short, you can consider a bear put spread. Sell to open January 2019 $245 puts, and buy to open an equal number of January 2019 $255 puts. This will lately cost you about $2.66 per spread (again, not cheap right now, but that's all you risk, no more -- $266 per spread). Set up as many spreads as you care to risk. The position has a maximum value of $10 ($1,000) if SPY ends below $245, and the spread ends worthless if SPY stays above $255. If SPY moves much in price before you set it up, you may want to move your strikes accordingly, still aiming to pay less than $3 for a $10 spread. Just realize a spread like this needs to be closed near expiration to earn most of the profit.
- **Short SPY directly:** You could sell short SPY shares directly if you prefer, in your preferred allocation. It's an immediately responsive position, up or down. You'll need to pay out the quarterly dividend yourself. We like that our syn short gives us 6.8% upside until our short call strike, but you may not care about that.

Pro Can Help

- **Want to talk about our SPY hedge strategies?** We have a discussion board for that.

Pro Catch-Up Trades and Upcoming Expirations: Coherent, Oracle, and More

Published Mar 1, 2018 at 1:57PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.8%.
- **Oracle** (NYSE: ORCL): Buy up to 3.6%.

Continue building your portfolio with our Buys, including:

- **CME Group** (NASDAQ: CME): Buy 2.5% per our new alert.
- **NVR** (NYSE: NVR): Buy 2.8%.
- **WisdomTree Emerging Markets Small-Cap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Cooper Companies** (NYSE: COO): With a buy/write order, set up a covered call by simultaneously purchasing shares and selling one May 2018 $240 call contract for every 100 shares you purchase. Recently, this position could be set up for a net debit of roughly $221.60. Our target position size is 2.5% to 3%.
- **Gilead Sciences** (NASDAQ: GILD): Per our recent alert, sell to open May 2018 $85 calls, lately paying you about $1.77 each, or 2.2% on the recent share price of $79.26. Sell one call for every 100 shares you own and want to cover.
- **Oracle**: Per our recent alert, set up a diagonal call on Oracle with about 0.6% of your capital by simultaneously purchasing January 2020 $30 calls and selling an equal number of June 2018 $52.50 calls. Aim to do so for zero net time value. Recently, with shares at $50.30, that translates into a combined net debit to set up both sides of the diagonal of roughly $20.30 or less.

Upcoming Expirations:

- **Facebook** (NASDAQ: FB): Our $170/$200 protective collar expires on March 16. We plan to close it before then, for some value, with a trade alert.

Your Questions Answered on Facebook, Paycom, Coherent, SVXY, and More

Published Feb 28, 2018 at 2:23PM

The *Pro* team held a live video chat recently to answer members' questions. Here are some of the most popular questions and answers!

Q: Some report that Facebook (NASDAQ: FB) is losing teenagers at a rapid pace. Does this concern you?

Jeff: I've read those reports too, and we saw them ... I looked back and we saw them as early as 2012, 2013, when we first bought shares and calls, and so far it doesn't concern me. It's a very tiny part of their obviously enormous user base, and it's mostly U.S. teenagers, and a lot of them are moving to Instagram instead. I think a lot of Facebook users cycle in and out of the service, but the stickiness of it is that so many of your peers and friends are there that you'll come back to it; as of right now, it doesn't concern us, but it's something we have our eye on. Even more than that, as we talked about this morning as a team, we want to see how Facebook's changing algorithms for its news feed change traffic this year. We believe they can manage their revenue very well given the demand that they have for their advertising, as long as ad prices stay up -- and that depends on traffic being responsive to the ads.

But we may keep a collar on Facebook ... at least for the next few quarters, just because of the unknown regarding how they're managing the business. I believe, as said earlier, that they want to manage the quality of the community even more than their financials, and they'll take short-term hits to do that. Which is fine with us, but we're going to hedge. Since it's a large position, we plan to hedge a portion of it around each earnings report. That said, our current collar is running its course, it's at a small profit right now. We may just close it soon, because no earnings are on the corner and it expires in less than a month. But currently, we're not concerned about watching the teenage story.

Q: Facebook is on the defensive about Russian interference in the election. Are we still comfortable?

Jeff: We're comfortable with our position as it stands, and we're looking at putting a collar on it during our financial results for at least the next quarter or two. But it's news that we're watching closely, and we do believe Facebook wants to do right and to make the community stronger and make it all legit and weed out as much as they can. And hopefully, with time, you can almost entirely weed out fake accounts and bots and things that are destructive like that. You have to hope so. But we're watching that, and we continue to be comfortable with our stake as it is. That said, newcomers to Facebook should start with -- as we say with every position across the board -- no more than 3% to start and go from there.

Q: Given the current market volatility, should we be more or less ready to write puts?

Billy: I can jump in on that one. I think as we start to see more volatility and the VIX level goes higher, puts become more attractive to write, because the premiums are going up as the time value is affected by that volatility. I'm not sure if you're really asking this from a general perspective or from *Pro*'s perspective. In our meeting today, Jeff and JP and I discussed potentially writing some puts on some of our ideas, so we are throwing that idea around. But I think more important then current market volatility when it comes to writing puts is whether or not you want to buy the shares of the companies that you're writing puts on.

That's really the reason that you write a put, and you have to be ready to accept shares of whatever company you're writing a put on. If you don't want to buy shares, then you probably shouldn't be writing those puts. So if there are companies that you like that you're interested in buying and you want to target a lower price, now might be a good time to think about writing more puts, because we have an elevated VIX level -- much higher than it's been over the last year or two years. So you'll get paid a little bit better, but make sure that you really want to buy the stocks that you're targeting.

Jeff: It has been nice to see the VIX higher for that pro-rating purpose, and it's made us look -- as Billy has said -- at other potential income or option positions. And when we add the diagonal call on Oracle to the portfolio, we are looking at having five income-based positions: American Tower diagonal call, Home Depot diagonal, Cooper covered calls, Verizon covered strangle, and then Oracle, so five alone there, and we'll have staggered expiration dates a lot of the times.

J.P.: We may even have some more coming down the pipe, too.

Jeff: That's exactly right, so we're not stopping there. So, yes, I would be more ready to use options in general now that volatility is up a bit.

Q: Paycom (NYSE: PAYC) is the only Pro position I don't have. I've written puts a couple times, but no shares. How to proceed? Buy at this price or wait for a pullback?

Jeff: The stock is ready to buy, and it's above our fair-value estimate, which is in the process of being updated. But as a buyer, you can buy some shares. We have, I think, 3.5% -- let me make sure and check -- 3.8% now, a 3.8% position. I would say buy part of that, maybe you start with 1.5% and then wait and see what happens from there, and look to write puts when the premiums are good, or buy more on a big dip.

The stock is $97 now; it's really been a strong performer, and the good thing about that is, in a lot of cases anyway, strong performers continue to be strong performers. And Paycom has a sort of runway for its revenue and its profits that make it look like it could be a strong three- to five-year performer going forward, as well; that's our hope. It is rated Buy -- as many shares as you're comfortable with up to around 3.8%. Maybe you start with a third of that, or half, but seeing the latest earnings, we're not taking it off of Buy. It's staying at a Buy.

Q: Has your position on Coherent (NASDAQ: COHR) changed?

Jeff: It has not. The stock is rated Buy; I have posted an update. The shares fell despite record results and a record outlook for 2018, which is basically all booked already, and they're billing capacity for 2019. Shares mostly fell, it sounds like, because of concern out there about OLED screens moving aside in favor of micro LED, even though that technology is really years away from being available at a consumer level.

OLED continues to advance, and they find new ways to make it better and more efficiently; OLED is likely to stay with us for a long time to come. Why is this important? Because part of what Coherent designs and sells are laser systems that help you make OLED screens. That said, you can bet that they're working on micro LED technology lasers to help you make those next, so they should meet that demand when it arises. I'm a little surprised how concerned the market is, and that's why I'm looking to learn more about that, and learn why investors are as concerned as they seem to be with Coherent. That said, the stock does trade with volatility; it has for the past year or two, at least. Now it's at about 14 times earnings, 17 times cash flow, and we rate it a Buy. We're staying at a Buy. Our position size is 2% flat, and it's a Best Buy Now, so our stance hasn't changed; it's recommended as a 2% holding.

I should add that Coherent management itself says they see no change in the market right now regarding OLED, and they're not concerned about Apple, either. Apple is investing in micro LEDD producers as well, though, so I think it's the market overreacting right now with some concerns about Square and a possible pullback.

Q: How do you view Square (NYSE: SQ) relative to Mastercard (NYSE: MA) and Visa (NYSE: V)? Similar exposure, similar industry, but different type of business.

Jeff: What I like about Square is that they are agnostic as to how you pay -- they're just a means of payment. They're a transaction interloper, transaction middle person, basically, and whether you use Visa or Mastercard or PayPal or, they say, any future form of payment, they want to be there and be able to provide it. I view them in some sense as a little bit of diversification potentially away from MasterCard and Visa, if those two forms of payment start to lose out to some other new form of e-payment. Or PayPal -- Mastercard has a big partnership with PayPal, too. Square may benefit by being agnostic and being able to switch quickly to whatever platform is taking off, so I do like that about it. If Square were only tied to Mastercard and Visa, then I don't know that we would have bought it, because we'd have too much exposure to those two brands in that case.

Q: I bought about 2% of my portfolio's worth in SVXY (NYSEMKT: SVXY) at about $11. Do I keep it?

Jeff: That's a great question. The easy answer is, are you comfortable keeping a whole 2% in it? We had 2%, up to 3% at one point before we learned just how quickly it could lose 80%. You have to be comfortable with potentially losing all 2% overnight, because it could happen. If that doesn't feel good to you, then cut it down until you are comfortable. Shave it to 1.5%, then 1%; get to the point where you are comfortable. We only have 0.3% ourselves. Any thoughts you two would like to add?

J.P.: I would say my view on these type of vehicles -- and I guess one of the great things about working on *Pro* and for the Fool in general is that we all have slightly differing opinions -- in my view, for a lot of these of vehicles, [you can] be a little bit more tactical and methodical with your approach in terms of setup. "OK, I want to trim back to this after I've achieved a certain measure of profits, and maybe I'll cut half after I've made a certain amount, and then if it falls, I can add to it, assuming I still like it." But like you said, the overriding factor here, before you even consider anything like that -- like how much or how long do I want to hold it and stuff like that -- is, "OK, am I comfortable with risking this much?"

Because this is not a business that is compounding intrinsic value day in and day out. This is a completely different beast, and so the inherent advantages that come from buying stocks of great companies and holding them for extended periods of time are not embedded in buying something like the SVXY. So you just have to be comfortable with knowing that the risks -- the going-concern risk, the risk that this position for some reason or other goes away overnight -- are, in my opinion, exponentially higher than with something like Apple. Pick any company in the portfolio, any long position, any short position -- this one clearly has the highest risk, so you need to take that into consideration when you're deciding the allocation size. I don't know this individual's risk tolerance, their goals for this position, their goals for investing in general, and so it's really hard to give a more tailored answer than to say, "Know thyself, know what you want out of it before you decide what to do."

Jeff: It's true, J.P., and I should add that my original hope for the position is not working out ... is no longer playing out. The hope was that it could rise 100% and then 200%, and when it did decline it would decline 30% to 50%, but then it would climb again from there, so that it would over the years compound. That's why we bought this vehicle instead of shorting VXX. The hope was it'll grow over time. Now we can no longer hang our hat on that, and that's why we're we're ditching the whole hope that SVXY will add long-term value to the port. We're looking to make up for that with new positions.

J.P.: I would say also that it's worth reconsidering, what is the risk or the odds that something like this happens again? We saw billions of dollars wiped out overnight, and so you would think that the speed at which capital flows back into this type of vehicle is going to be a lot slower. So if that's the case, then maybe there is an argument for us returning to your original thesis, where the vehicle slowly grinds higher and any declines -- even though they may be sizable -- are ultimately recoverable.

That's another thing to consider when you decide whether we should hold or sell it, and so my kind of off-the-cuff guess is ... maybe we are getting back to that environment. Maybe we're going to look back here five years from now and be like, "Man, the single smartest decision we made it for the portfolio was not selling SVXY because that thing has come roaring back." You don't know, but that is something I am actually thinking is a possibility, and at least for the time being argues for holding it and maybe even adding to it.

Jeff: I'm trying to get in touch with ProShares to learn how they managed it during periods of extreme volatility like we just saw, because the reason they stayed alive is they didn't trade the futures in the aftermarket hours, which were just insanely off the charts -- that's what killed XIV. It rolled its futures and had nothing left to roll with, and ProShares held off and waited until the futures prices came back down. So if they have a lot of flexibility in rolling when they want to, like if they could even wait days to roll and let the futures come back down first, then SVXY will have staying power, because they can just sit on their old contracts and wait. They have a few months. But if they believe they need to roll each day, then the risk is higher. But the prospectus ... doesn't dictate that they need to roll each day; it leaves that unclear.

That's what we're trying to clarify. And who knows, J.P.; maybe if they have some ability to keep managing it better than just a daily roll, then maybe we'll like it more than we do right now. Final thing I'll say is that we invested 1.3% on Day One in SVXY -- the recommendation was for 1.2%, but we invested a bit more because it went up and so we wanted to match members. Keep that in mind; maybe you bring your 2% down to what we originally invested, because we never added to it after that.

Johnson & Johnson's Pharmaceutical Division Propels Growth

Published Feb 28, 2018 at 12:57PM

Fourth-Quarter and Full-Year 2017

- Press Release
- Earnings Presentation
- Supplementary Sales Data
- Sales of Key Products & Franchises
- 10-K Filing

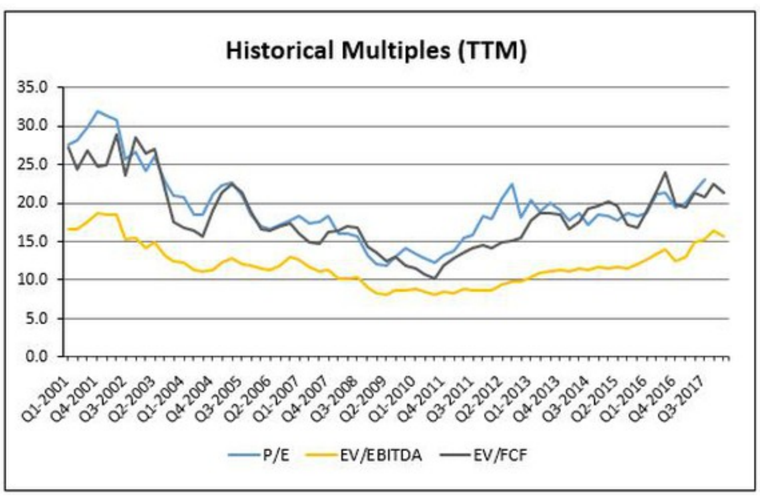
Johnson & Johnson (NYSE: JNJ) posted a good quarter and capped off a resurgent year in Q4 2017, reporting continued acceleration in revenue growth driven by the company's pharmaceutical division. J&J reported 11.5% company-wide sales growth, led by 17.6% growth in the pharmaceutical division, which accounts for 48% of total sales.

GAAP earnings for the quarter were negative, reflecting a provisional charge of $13.3 billion for the recently enacted tax legislation. On an adjusted non-GAAP basis, J&J posted 10.1% year-over-year EPS growth for Q4 and 7.6% EPS growth for full-year 2017. Management's guidance for 2018 is for 6% revenue growth and for 11% adjusted EPS growth.

While 2017 was an excellent year for revenue growth after a couple of years of stagnation, the company's GAAP earnings and margins were significantly affected by the $30 billion Actelion acquisition and tax legislation. I'm curious to see how the pharmaceutical segment continues to perform in 2018 and how the company's margins trend once the non-recurring items (acquisition costs and tax legislation) normalize. Additionally, J&J is holding a deep-dive presentation in May about the consumer and medical-device businesses, and I'm interested to hear more from management about how they plan to manage those businesses -- particularly the former, which continues to experience an eroding moat.

- **Updated guidance**: Best Buy Now (no change)
- **Recommended allocation**: 2.9%
- **Fair-value estimate**: $137 (no change)
- **Current price:** $131.27

At about $131 per share, the stock is priced at about 15 times trailing-12-month (TTM) EBITDA and about 21 times TTM free cash flow:



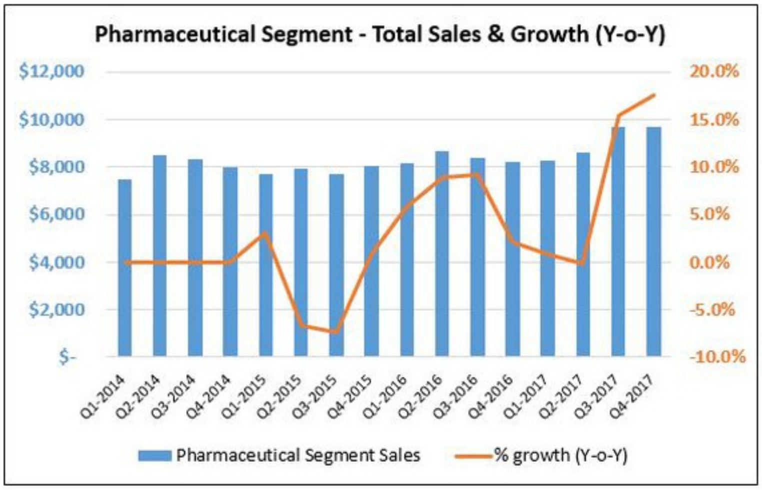
Having sold off a bit since earnings, the stock is currently about 11% below the level it was trading at before the Q4 earnings release. Based on management's guidance, J&J is priced at about 16 times next year's non-GAAP earnings, which is attractive considering that the S&P 500 is currently trading at about 25 times earnings. Additionally, J&J is set to increase its dividend next quarter, and the dividend yield will likely approach 2.7%, a level we haven't seen since early 2017 when the stock was trading around $120 per share.

Our fair-value estimate remains at $137, and Johnson & Johnson remains a Best Buy Now. Members who have yet to start or fill out their position can feel comfortable doing so at current prices, although it is important to keep expectations in check with this stock. Because of its large size and modest revenue and earnings growth, JNJ is not likely to produce outsized stock-price gains.

Since our original purchase in February 2017, the stock is up 7.8% and we've collected more than $2,000 in dividends, good for a 2.7% yield on our original investment, combining for a 10.5% total return. This is exactly the type of return we expected from J&J when we made our original investment, and we can continue to expect a growing stream of dividends and modest earnings growth to propel our investment to North Star-challenging returns over the long run. We may also consider utilizing covered calls to add additional income to the position.

Segment Performance

JNJ's pharmaceutical division continued to experience strong growth in Q4 2017, bolstering the entire company's results given that this division is the company's largest by sales volume (48% of TTM sales):



The Actelion acquisition continues to show benefits, as JNJ's pharmaceutical division posted 17.6% year-over-year growth (up 7.6% excluding acquisitions). We also continued to see strong growth from drugs in the oncology market, with Darzalex (sales up 86% this quarter) and Imbruvica (up 51%) leading the pack. The company's oncology drugs look set for continued growth and should help offset declines in other drug products that are declining (Remicade) or facing upcoming competition later this year (Stelara, Zytiga). Additionally, JNJ's pipeline is promising, with the expected regulatory approval and launch of 10 new drugs by 2021 (with two approvals expected in 2018) that each have $1 billion in peak revenue potential.

In addition to the strong growth from the pharmaceutical division, the consumer division and the medical device division posted year-over-year revenue growth of 3.1% and 8.3%, respectively. Companywide operational sales growth (ex-acquisitions) came in at 2.4% for the quarter.

Our Thesis

Johnson & Johnson is is a diversified health-care conglomerate, with more than 260 operating companies organized into three business divisions: consumer, pharmaceutical, and medical devices. At eight out of eight of our *Pro* quality criteria, J&J is a quintessential *Pro*-quality stock. While its large size means we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk from one of the safest stocks you are likely to find in the entire investment universe.

Write Covered Calls on Gilead Sciences

Published Feb 26, 2018 at 3:23PM

Is this for you? This is for *Pro* members who own at least 100 shares of Gilead Sciences, and who wouldn't mind capping upside in return for near-term income. Those who *don't* own the stock can buy at least 100 shares to write covered calls, matching our 2.2% allocation. Those who own less than 100 shares as a full allocation can continue to hold them.

How You Participate

- **Action:** Sell to open May 2018 $85 calls on **Gilead Sciences** (NASDAQ: GILD).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover all 900 shares owned, representing 2.2% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but **use a limit order** to split the option's current bid/ask spread. When we quoted it, that was $2. Later, aim for at least a 0.7% yield (option premium/current stock price) per month to expiration; with shares at $80.60, the minimum to accept when writing these calls is thus about $1.82.
- **Guidance Change:** The stock moves to Buy (and Write Covered Calls if you can) at a 2.2% allocation.
- **Prices** (11:15 a.m. ET):
  - Gilead: $80.60
  - Sell to open May 2018 $85 calls (bid/ask): $1.99/$2.01 (at your broker, click "See All" strike prices to see these)
  - $2 pays 2.4% ($2/$80.60) in 81 days.
- **Alternative Trades:** You can write a higher strike (May or June $87.50) if you want more breathing room, or a slightly lower strike if you want a higher payment.
- **New to this position?** Ideally using a covered call order, but at least 100 shares and simultaneously sell to open these calls, selling one call for every 100 shares you buy and want to cover. Lately, the net debit per share is about $78.60, with upside to $85.
- **Important dates:** Gilead will go ex-dividend for its quarterly $0.57 per share payment on March 15 and we will see earnings in late April or early May.

What We're Thinking

We've been waiting for stability in Gilead's young and giant — but shrinking — Hepatitis C franchise, and this year management suggests it's coming. Competing drugs are no longer arriving on the market, so pricing should stabilize; and patient starts are falling into a more predictable pace and pattern. "Falling" is still the right word, though.

Gilead still expects 2018 revenue to decline considerably from last year. Top brass predicts $20 to $21 billion in total 2018 sales, down from $25.7 billion in 2017, all due to Hepatitis C declines. But investors are just happy to hear the word "stability" when it comes to this franchise as 2018 advances. CEO John Milligan said this month (a little prematurely), "After years of having to be defensive about HCV revenues declining, it's very nice to be on the other side of that and talk about the positive trends going forward..." By mid-year, Gilead expects its market share in the market to be stable.

Meanwhile, Gilead continues to dominate the HIV drug market (its second-largest revenue generator), and new drug approvals promise that it will continue to treat patients more effectively than competing drugs. Still, HIV and new acquisitions in Kite Pharma and Cell Design Labs aren't enough to kick Gilead's business back into growth right now. But the shares are inexpensive enough that we're comfortable keeping them and returning them to "Buy," and we're comfortable writing covered calls (as we have done several times now) for income.

The $80.60 stock trades at 12.5 times expected 2018 earnings per share, and about 8.1 times our estimated free cash flow this year of $13 billion.

Why This Strategy?

Last year, writing covered calls helped us achieve a North Star return on Gilead. The stock yields 2.8%, and with covered calls we can work toward at least a 10% annualized return, ideally, even if the shares are rangebound. Our first covered calls on Gilead this year pay us 2.4% on the current share price in 2.7 months, while still giving us 5.4% in upside to our strike price. We'll manage the calls as needed with future trade alerts. We're also writing calls because, lacking revenue and earnings growth, it seems likely that Gilead's stock won't take off on us. But if it does, as is always true with covered calls, we may need to let our shares go if we can't roll our calls higher at a reasonable cost.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold; it's more likely right now, though, that we'd roll our calls to a later date or higher strike. We'll cross any such bridge near expiration once time value is dissipating from the calls.

Pro Guidance Changes: CME Group, Broadridge, Gilead, SVXY

Published Feb 26, 2018 at 3:23PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **CME Group** (NASDAQ: CME) arrives (returns!) to the *Pro* Port as a new Buy at a 2.5% allocation. Please see our new alert.
- **Gilead Sciences** (NASDAQ: GILD): Shares move to Buy (from Hold), at a 2.2% allocation, with the caveat that it's a Buy/Write Covered Calls position. We recommend selling May 2018 $85 calls. See the new trade alert.
- **Broadridge Financial Solutions** (NYSE: BR): Fair-value estimate increases from $79 to $82. The stock remains a Buy.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Moves to Buy (from Hold) at a 0.3% allocation, with the caveat that you have to be ready to lose this whole investment if VIX futures skyrocket in a single day (up 100% or more) and ProShares decides to roll their futures that day anyway. It's that simple (in February, they waited to roll the futures, and stayed alive as a result). So only invest what you're comfortable losing. We intend to manage/trim this position if and when it grows.

Pro Completed Trades (see transaction log; trades take a day to appear):

- We are still working to complete our recently recommended trades on **Oracle** (NYSE: ORCL) and **CME Group** (NASDAQ: CME) ourselves. We hope you got 'em done!

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Broadridge Benefits From Event-Driven Revenue

Published Feb 22, 2018 at 3:31PM

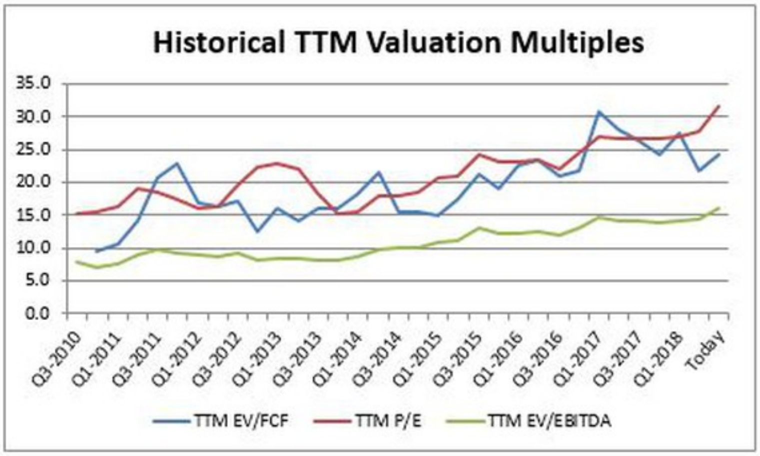
Fiscal Q2 2018

- Recurring fee revenue growth (year over year): Up 4.9% to $562 million (16% TTM growth)
- Closed sales growth (year over year): Down 30.4% to $39 million (6.4% TTM growth)
- EPS growth (year over year): Up 108% to $0.52 (28% TTM growth)

Broadridge (NYSE: BR) reported a solid fiscal second quarter for 2018, and as a result, management raised its full-year guidance for revenue, earnings per share, and free cash flow. However, the strong performance for the first half of the year can be partially attributed to record event-driven revenues that are both non-recurring and unpredictable. Additionally, closed sales for the quarter were somewhat lackluster, and the company will have to make up the sales deficit in the back half of the year. Nonetheless, recurring fee revenue continues to grow at a steady pace, and Broadridge is poised for continued growth into fiscal 2018 and beyond. Our provider of investor communications continues to improve margins and expand its core business at a consistent clip, producing significant amounts of cash flow from a capital-light asset base. Broadridge is well positioned to continue to achieve North Star-like returns over at least the next three years.

- **Updated guidance**: Buy (unchanged)
- **Recommended allocation**: 6.4%
- **Fair-value estimate**: $82 (from $79)
- **Current price:** $100

Based on management's recently raised guidance, at $100 per share, the stock is priced at about 25 times projected 2018 cash flow and 30 times projected 2018 GAAP earnings per share:



After incorporating fiscal Q2 2018 results, **our fair-value estimate increases to $82 per share (from $79)**. Although the stock is up 11% since our last guidance update about two months ago, valuation multiples have stayed in the same range because of growing earnings and cash flow. Despite the strong business performance, the current price sits more than 20% above our newly updated fair-value estimate. **Broadridge remains a Buy** on our scorecard; if you've yet to establish a full position, you may want to consider buying in halves or thirds, waiting for a narrower premium to our fair-value estimate before filling out your position.

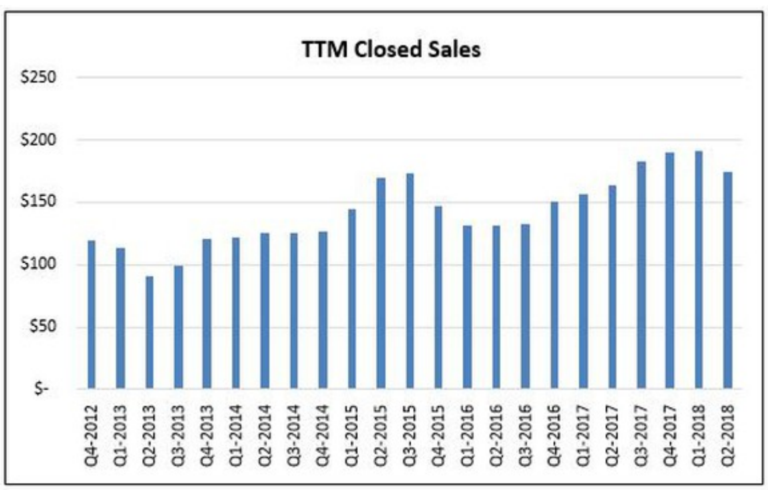
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue (augmented by tuck-in acquisitions), slight operating leverage, plenty of free cash flow, and a growing stream of dividends and share repurchases to help achieve North Star-like returns.

The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

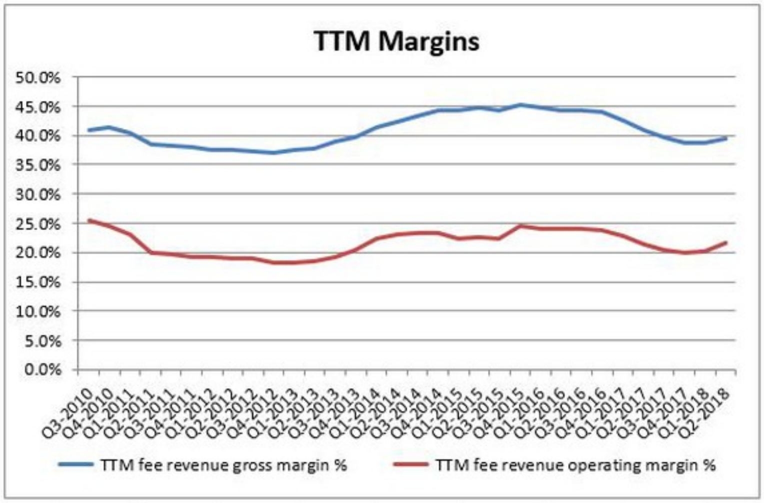
Of all the relevant metrics we follow for Broadridge, perhaps the most lackluster in Q2 2018 was closed sales. Broadridge reported $39 million in closed sales for the second quarter, down 30% from the second quarter last year. This was the first quarter since Q2 2016 that closed sales was lower than in the same quarter a year prior.



Management's guidance for closed sales for fiscal 2018 is $170 million to $210 million, and management reaffirmed that guidance in the conference call, mentioning a strong pipeline of sales. With just $62 million in closed sales for the first half of the year, the guidance implies that closed sales will be heavily back-end-loaded for the rest of fiscal 2018.

Closed sales do tend to be historically weighted more heavily toward the back half of the fiscal year, but the sales staff needs to pick it up in Q3 and Q4 to meet their annual guidance. The company beat the high end of its guidance for closed sales in fiscal 2017, and we'll see if Broadridge is able to repeat that performance in 2018.

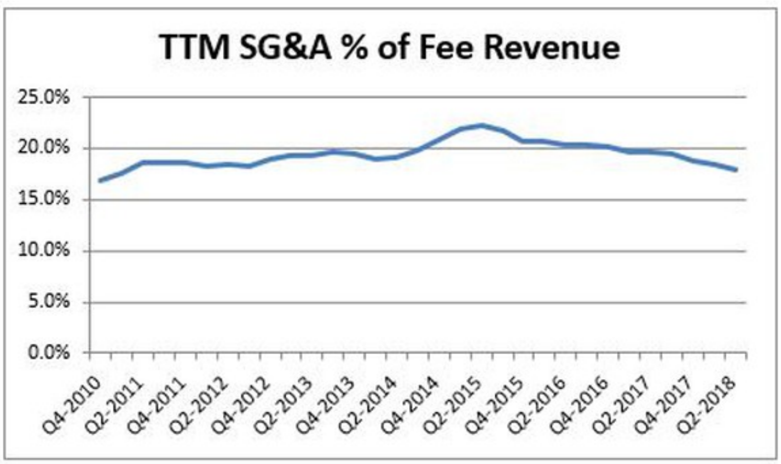
2. Fee-Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers), we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee-revenue gross margins came in at 39.5% (down from 40.9% a year ago), and TTM fee-revenue operating margins came in at 21.5% (up from from 21.3% a year ago):



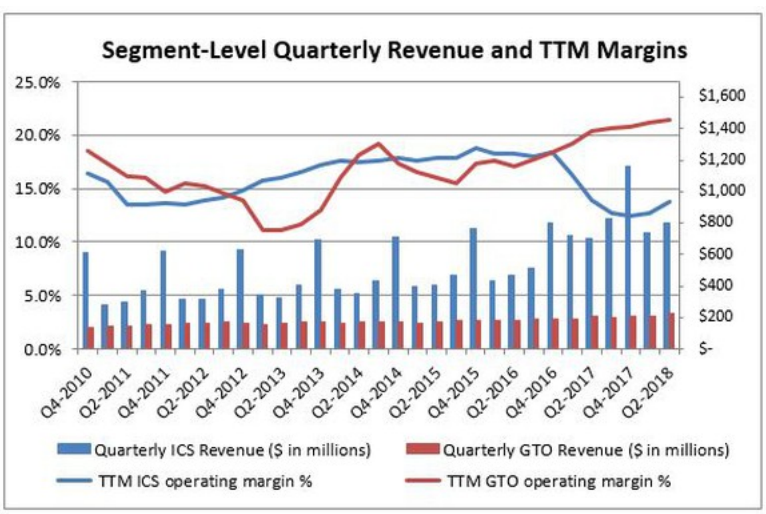
The reason for the decline in margins is the 2016 NACC acquisition. That business has a lower margin profile than Broadridge's legacy businesses, and it represents about 30% of total companywide revenue, so it drags down the margin profile overall.

However, Broadridge should be able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency, and we're seeing that play out in the financials.We can see from the graph above that both gross and operating margins have bottomed out, and the company reported expanding gross and operating margins on a quarter-over-quarter basis for the second quarter in a row.

An excellent indicator of Broadridge's ability to expand operating margins over time is the SG&A margin, which ideally will continue to drop over time as Broadridge continues to grow and improve the efficiency of its labor:



When looking at Broadridge's separate divisions, we can see that the non-NACC business continues to improve. While the Investor Communications Solutions (ICS) business has seen significantly lower (though improving) margins because of the acquisition, the Global Technology & Operations (GTO) business has shown strong margin expansion, generating a record TTM operating margin of 21.4%:



We'll want to monitor the ICS division's margins (expecting continued margin expansion as we progress through fiscal 2018 and beyond) to make sure the NACC integration is on track, and we also want to watch GTO to see whether recent margin expansion trends continue.

3. Capital Allocation: In the company's recent Investor Day presentation from December, we got a detailed update on how management plans to allocate capital between fiscal 2017 and fiscal 2020: targeting a 45% dividend payout ratio, and using up to $1.4 billion in incremental debt capacity and expected free cash flow for share repurchases and merger-and-acquisition activity.

Interestingly, we've recently seen the pace of Broadridge's share repurchases slow as the stock price has climbed over the past two quarters. After spending more than $240 million combined in Q3 and Q4 2017 on share repurchases when Broadridge's stock price was between $65 and $78 per share, the company has spent just $3 million on share repurchases in the first half of 2018 with the stock price ranging between $73 and $92.

Instead, management has preferred to let cash pile up on the balance sheet. Perhaps the company is gearing up for an acquisition, or perhaps management is being cognizant of valuation when repurchasing shares. In either case, I appreciate the non-mechanical approach to share repurchases.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring organic revenue growth (augmented by tuck-in acquisitions) to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Buy CME Group

Published Feb 22, 2018 at 12:57PM

Is this for you? This is for all *Pro* members who lack exposure to this company. Why buy it now? Beyond being a strong long-term operation, the company should benefit from more interest rate volatility and asset pricing volatility that results.

How You Participate

- **Action:** Invest 2.5% of your portfolio in **CME Group** (NASDAQ: CME) (that's $2,500 for every $100,000 you manage; for *Pro*, that's about 500 shares, or $81,000 worth).
- **Recent Price Range:** $161-$163
- **Price Guidance:** At current prices, use a limit order for less than $161.50. Later, the stock remains a Buy until we guide otherwise.
- **Fair-Value Estimate:** $177
- **Alternative Trades:**
  - Seeking a lower buy price? Sell to open any puts that appeal to you, selling one put for every $15,500 to $16,000 (or choose your strike) in stock you can afford, up to a 2.5% allocation.
  - Want upside with less capital? Set up a synthetic long. Sell to open January 2020 $160 puts and buy to open an equal number of January 2020 $160 calls, aiming to pay little time value in the process. Each synthetic long represents 100 shares exposure worth $16,000.
- **Special Considerations:** CME yields 1.7% with its quarterly dividends; it also pays a special dividend in December that has ranged from 2.2% to 3.3% a year. That's a total dividend of about 4% to 5%, making it an income stock along with business growth.

What We're Thinking

As the world's largest exchange and clearinghouse for futures contracts, **CME Group** (NASDAQ: CME) is where the world goes to manage risk. And now, after years of low volatility for interest rates and equities, that risk (when defined as volatility) is likely beginning to revert to higher levels. Should this trend continue, it should lead to more business for CME. In the U.S., interest rates are headed higher, and in Europe, rates are likely to awaken from a long slumber, too. Currencies and energy prices are showing more volatility, and weather adversity causes uncertainty in crop prices, too. All this points to more need for risk management. Enter the leader: CME.

The Business

Investors, corporations, governments, and others all flock to CME for futures contracts they use to manage pricing and exposure risk. As a mostly electronic intermediary, the company requires few physical assets to run its business, and as a result it's one of the most profitable companies in the S&P 500.

Investors use CME's exchange because of its size, liquidity, transparency, and breadth of products. The company creates trading instruments, provides a market for them, matches prices, ensures settlement, sells market data, and serves as the counter-party on most transactions in order to reduce credit risk. In 2017, 16.3 million investment contracts traded on CME's exchange in an average day. The business serves six broad needs. Here's how volume shaped up last quarter:

Product Line	Average Daily Volume (in thousands)*	Percentage of Total
Interest Rates	7,970	50%
Equities	2,632	16.5%
Foreign Exchange	941	5.9%
Energy	2,489	15.6%
Agricultural Commodities	1,278	8%
Metals	616	3.9%
Average Daily Volume	15,925	99.9% (rounding leads to this!)

*Q4 2017, ended Dec. 30. Source: Q4 earnings release.

Last year, 85% of CME's revenue was earned from transaction and clearinghouse fees; 10.7% came from market data and information services; and 4.3% came from market access, communications, and other fees.

The company's expenses are largely fixed, so its profit rises with trading volume, which has steadily climbed the last decade. CME expands its business by introducing new products, attracting more investors, and entering new markets. CME also offers *options* on futures — for those who *really* love exotic investments.

What Are "Futures"?

A futures contract is a standardized agreement between two parties to trade a specific asset or instrument at a set price (the "future" price) by a set date (the delivery date). Futures have been used for hundreds of years, initially allowing farmers to ensure a specific price for their crops. Today, companies, governments, farmers, producers and others use them to hedge any number of costs: fuel costs, metal costs (in manufacturing), food prices, currencies, interest-rate risk, and more. Like an options contract, futures contracts offer leverage, too.

What Is CME Group?

CME Group owns the Chicago Mercantile Exchange (CME), the Chicago Board of Trade (CBOT), the New York Mercantile Exchange (NYMEX), and the Commodities Exchange (COMEX). It also owns 90% of the Dow Jones' namesake market indexes (Dow Jones retains a 10% stake). CME Group was founded in 1898, and is headquartered in Chicago.

We expect U.S. trading volume to continue to grow, and CME is excited by the expansion opportunities that remain in Europe, Asia, and Latin America. In 2016 (the latest year available), only 24% of CME's trading volume occurred outside the U.S., though 50% of market data revenue was international.

Financials

CME's net income margin tops 40%, putting it among the highest of any holding in the *Pro* portfolio. Its immense marketplace provides customers with liquidity that many competitors can't match. CME owns 90% of the Dow Jones Industrial Average namesake market indexes and offers equity futures contracts on the Nasdaq and S&P indexes, some of them in exclusive deals.

In 2016 (again, the most recent year available), 82% of CME's business was conducted by exchange members who pay fees to take part. In the risk department, in that year 13% of trade and clearing revenue came from one member, and 11% from another, so it's important that CME maintains healthy relationships with its members. However, in the event that a clearing member leaves, its experience is that another one picks up the dropped volume.

The company's market value is $55 billion, its balance sheet is healthy, and shares trade at an estimated 29 times free cash flow (we await the annual 2017 10-K filing) and 24 times our estimated earnings for the year ahead. However, this is on the heels of a long period of low volatility for equities, interest rates, and currencies. January ended with record open interest (contracts that will likely be closed later) on all of CME's products, and about 18% growth in volume to new records (as of Feb. 1); and this was before the market went wonky. When trading volume picks up, CME's earnings can grow quickly.

Management affirmed confidence in its free cash flow on Feb. 7 by increasing its quarterly dividend by 6% to $0.70 per share, for a 1.7% annualized yield. Additionally, at the end of each year, CME pays a special dividend in relation to that year's earnings. It looks to dole out a large portion of its cash flow, and this extra dividend payout has averaged 2.7% since 2012, bringing the total dividend yield to above 4% annually on average. We'll take that strong yield alongside the prospect for long-term capital growth in a business that has a competitive moat and room to keep growing.

The *Pro* Bottom Line

CME qualifies as an excellent business at a good price. Volume in trading on its exchange has grown steadily over the years, and is lately hitting new records. We believe this increase will continue as volatility returns to more traditional levels on more assets. It doesn't hurt that we're entering unchartered waters, with the U.S. government adding fiscal stimulus and federal deficits despite a strong economy. That should breed uncertainty both now and when the next recession arrives. Meanwhile, we expect CME to lead its industry with new offerings (including its new cryptocurrency futures), to expand in newer markets organically, and to grow through acquisitions, all while managing its finances well for shareholders like us.

Pro Catch-Up Trades and Upcoming Expirations: Coherent, Oracle, and More

Published Feb 22, 2018 at 12:48PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.9%.
- **Oracle** (NYSE: ORCL): Buy up to 3.6%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **CME Group** (NASDAQ: CME): Buy 2.5% per our new alert.
- **NVR** (NYSE: NVR): Buy up to 3%.
- **OpenText** (NASDAQ: OTEX): Buy 2.9%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2.3%.
- **WisdomTree Emerging Markets Small-Cap Dividend** (NYSEMKT: DGS): Buy 2.1%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Cooper Companies** (NYSE: COO): With a buy/write order, set up a covered call by simultaneously purchasing shares and selling one May 2018 $240 call contract for every 100 shares you purchase. Recently, this position could be set up for a net debit of roughly $224.20. Our target position size is 2.5% to 3%.
- **Oracle**: Per our recent alert, set up a diagonal call on Oracle with about 0.6% of your capital by simultaneously purchasing January 2020 $30 calls and selling an equal number of June 2018 $52.50 calls. Aim to do so for zero net time value. Recently, with shares at $49.95, that translates into a net debit to set up both sides of the diagonal of roughly $20.

Upcoming Expirations:

- **Facebook** (NASDAQ: FB): Our $170/$200 protective collar expires on March 16. We plan to close it before then, for some value, with a trade alert.

Pro Guidance Changes and Completed Trades: Feb. 20, 2018

Published Feb 20, 2018 at 2:03PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **OpenText** (NASDAQ: OTEX): The stock moves to Buy (from Hold). We have a 2.9% stake. Fair-value estimate increases to $35.
- **Oracle** (NYSE: ORCL): We added an options strategy to our position, aiming for a 0.6% diagonal call position in addition to our 3.6% stock position. The stock remains a Best Buy Now.

Pro Completed Trades (see transaction log; trades take a day to appear):

- As per our recent dividend reinvestment alert:
  - **NVR** (NYSE: NVR): We bought 1 share, bringing our allocation to 3.1%.
  - **Tencent** (NASDAQOTH: TCEHY): We bought 58 shares, bringing our allocation to 3.1%.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Facebook, Tencent, and More

Published Feb 15, 2018 at 3:04PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Facebook** (NASDAQ: FB): Buy 3.8% (half our stake to start).
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.9%.
- **Oracle** (NYSE: ORCL): Buy up to 3.7%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **NVR** (NYSE: NVR): Buy up to 3%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy up to 3.8%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2.2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Cooper Companies** (NYSE: COO): Set up a covered call by simultaneously purchasing shares and selling one May 2018 $240 call contract for every 100 shares you purchase. Recently, this position could be set up for a net debit of roughly $223.75. The recent spike in volatility has meant that the $240 strike still meets our monthly income guidance despite the decline in the stock price. Our target position size is 2.5% to 3%.
- **Oracle**: Per our recent alert, set up a diagonal call on Oracle by simultaneously purchasing January 2020 $30 calls and selling an equal number of June 2018 $52.50 calls. *Pro* trading volume and today's stock-price increase of about 2% have resulted in a spike in the cost to set up this position; however, members should still aim to do so for zero net time value. Recently, that translates into a net debit of roughly $20.40.

Upcoming Expirations:

- None imminent.

Set Up a Diagonal Call on Oracle

Published Feb 14, 2018 at 1:34PM

Is this for you? This recommendation is for all *Pro* members who have matched our 3.6% stock allocation to **Oracle** (NYSE: ORCL) and would like to establish an additional diagonal call position to target leveraged upside and income. If you don't own stock in this Best Buy Now position already, we think you should match *Pro*'s 3.6% allocation first, then consider establishing this diagonal call position.

How You Participate

- **Trades:** Use a "diagonal call" or "calendar call" or "spread" order on Oracle to simultaneously:
  - Buy to open January 2020 $30 calls (click "view all strikes" if you don't see them) and ...
  - Sell to open an equal number of June 2018 $52.50 calls.
- **Allocation:** Invest approximately 0.6% of your *Pro* funds in the purchase of the 2020 calls. At recent prices, this most closely equates to setting up one diagonal call position for about every $320,000 you manage; for *Pro,* that's 10 contracts of each position. We'll spend about $19,700 to buy 10 calls. This is a small position by design, so be careful not to over-allocate. We already own 3.6% in the stock, and our exposure to Oracle grows to 4.2% with this long call. *Pro* members with smaller portfolios should see the Alternative Trades section at the end of this report.
- **Price Guidance:** At current prices, ideally the market makers will let you pay about an **$18.50 net debit** to set up the diagonal call (the cost of both buying the long calls and selling the short calls). Check current pricing, adjust as needed, and please **make sure you use limit orders,** aiming to split the wide bid/ask spreads, and move incrementally higher if need be; don't rush to complete this trade at any price! As prices change, continue to aim to pay no net time value to set this up (your short calls should pay for the time value present in the long calls; currently, the long calls have $1.04 in time value and the short calls pay you $1.20). Overall, ideally don't pay more than a total of $19 net to set up the diagonal call.
- **Prices** (as of noon E.T.):
  - Stock price: $48.66
  - Buy to open January 2020 $30 calls (bid/ask split): $19.70
  - Sell to open June 2018 $52.50 calls (bid): $1.20
  - Net debit: $18.50 per diagonal (or $1,850 each)
- **Alternative Guidance:** If the volume of trading among *Pro* members results in a significant impact on the options in this alert, or if the stock price changes considerably from the prices in this alert, consider looking at various other strikes for your long and short calls. Also consider looking at various other expirations for your short call, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what strikes and expirations you choose, and depending on the stock-price movements of Oracle.

What We're Thinking

Lately up 113% for us and paying a 1.6% yield, our Oracle shares have slowly (and arguably safely) more than doubled members' money despite steady criticism from Wall Street -- and that criticism is not entirely unmerited. The company has only managed to increase its revenue by 0.9% annualized over the past five years, putting it well behind faster-growing software peers. In Oracle's defense, the shift from license software sales to cloud sales has meant taking a large upfront hit, though the company later earns greater revenue and cash flow from those same customers as they pay a monthly cloud fee (which adds up). So, there should be coiled-up potential hidden in Oracle's weak-looking growth, potential that will start to unfold in the next few years.

We've been waiting for this a long time. Assuming it starts to present itself, the growth will be further fueled by expanding margins at Oracle as the costs of building the cloud get spread over more customers. The cloud is now at an annual run rate of about $6 billion in revenue for Oracle -- and growing -- out of the company's more than $30 billion in annual software sales. Meanwhile, in December, Oracle shared that its pipeline of new business is larger than it has ever been.

The Business

Last quarter, Oracle's on-premise software license revenue rose by 1% to $6.3 billion, while cloud SaaS revenue jumped 55% to $1.1 billion. Total cloud revenue grew 44% to $1.5 billion, and total revenue grew 6% to $9.6 billion. Non-GAAP earnings per share grew 14%, continuing an impressive trend of growth above 10%.

In January, Oracle launched its first autonomous database -- a "smart," self-driving system that doesn't require humans to manage or tune it. Using A.I., it promises 99.995% availability time. When asked if customers are leaving Oracle, Chairman Larry Ellison pointed out that even such big names as Amazon.com, Salesforce, and SAP are sticking around. (That said, there are rumors are that Salesforce would like to migrate off the Oracle database by 2023, and we all know Amazon is wily and likes to control its own fate.) Regardless of those big names, CEO Mark Hurd added that Oracle continues to expand its business above the market growth rate.

The roughly $48 stock trades at about 15.7 times estimated earnings one year ahead and 17.4 times trailing free cash flow, making shares appear attractive. That's assuming Oracle can continue to convert customers to its more lucrative cloud offerings, and that its long-term goal of 50% operating margins materializes.

Why This Strategy?

Oracle's stock may not soar, but if it can gain 20% by 2020 -- to about $58 -- our calls should gain nearly 50% in addition to the income we earn on them along the way. We would obviously like that boost to our overall Oracle return, and we like the opportunity to target income now that options pay better, too. If Oracle *does* soar and our diagonal call shares need to be closed, we'll still own our shares, unencumbered. Meanwhile, our risk here should be reasonable. We're comfortable increasing our exposure to Oracle marginally and leveraging our cash via call options that also serve as an income platform.

More That Matters

- **Maximum loss:** Our entire 0.6% investment if Oracle stock is less than $30 at January 2020 expiration, less premiums received from sold calls.
- **Maximum gain:** On this trade, we have upside to $52.50 for our owned call. But we hope to keep the strategy going, rolling our short calls if need be.
- **Follow-up**: By expiration, we'll seek to write new calls or roll our $52.50 calls to a later month and higher strike if the stock is above $52.50. If there aren't attractive rolling opportunities, we will consider closing the entire position.

Alternative Trades

Members for whom one contract would over-allocate their portfolios can consider a few choices:

- If you're cash-rich, at least consider buying 0.6% more in stock, bringing your stake to 4.2%. Realize you won't benefit from the leverage calls provide, although you will have a better breakeven price and no expiration.
- Consider allocating 0.6% at most to a 2020 bull call spread. The in-the-money $40/$45 bull call spread offers attractive annualized returns if the stock price remains above the $45 strike price at expiration. Lately, use a limit order of about a $3 to $3.10 net debit. This gives you room to earn at least $1.90 per share on your $3 to $3.10 investment. (Our sister service, *Motley Fool Options*, offers what we think is an excellent overview of bull call spreads here.)

Pro Can Help

- **Want to know more about this strategy?** The Options U guide to writing diagonal calls can keep you on an even keel.
- **Questions about this trade?** We keep our own database on this company on our Oracle board.

Buy (More) NVR and Tencent

Published Feb 13, 2018 at 2:18PM

Is this for you? This recommendation is for all *Pro* members who have 2017 fourth-quarter dividends to reinvest, or who have ample cash to make a small additional investment and want to match us.

How You Participate

- **Action and Allocation:** Buy 0.1% more in each **NVR Inc.** (NYSE: NVR) and **Tencent** (NASDAQOTH: TCEHY), raising these positions to a 2.9% and 3.1% allocation, respectively. At recent prices, *Pro* will buy one more share of NVR and about 58 more shares of Tencent.
- **Price Guidance:** Use a **limit order** at the prices available when you place your order. We'll buy in the next one to 30 days.
- **Recent Prices:**
  - NVR: $2,919.94
  - TCEHY: $54.40
- **Guidance:** NVR is currently rated a Buy; Tencent is a Best Buy Now.

What We're Thinking

With the recent decline in the stock market, we believe now is as good a time as any to reinvest our 2017 fourth-quarter dividends into two stocks in which we have high confidence, both of which have fallen some from recent highs. In the fourth quarter (October through December), we collected $6,069.80 in dividends, which we're splitting between the two stocks.

NVR

Although NVR's stock is still outpacing our North Star by a meaningful amount since we first purchased shares in June of last year, the start of 2018 has not been kind; the stock is down by more than 20% since setting an all-time high of $3,700 a mere 25 days ago. Although the recent market weakness is likely partially to blame here, the bigger culprit appears to be the market's apathy toward NVR's fourth-quarter results.

Because the company doesn't hold quarterly earnings calls and receives very little sell-side coverage, the stock has a habit of trading based on headline numbers. And in the case of NVR's Q4 results, those numbers -- which showed net income and EPS declining by 17% and 24%, respectively -- appeared downright abysmal. But as you know, looks can often be deceiving. A quick skim of NVR's results reveals that this decline was largely the result of the December Tax Cuts and Jobs Act, which required the company to reassess its deferred tax assets (of which it had $171 million on the balance sheet at the end of 2016), resulting in a charge of $63 million in the fourth quarter. That helped raise the company's effective tax rate to more than 52%.

	Three Months Ended December 31, 2017	
	Income Tax Expense	EPS Impact
GAAP Income Tax Expense	$136,699,000	
Less: Impact of Tax Cuts and Jobs Act	(62,702,000)	$(14.53)
Add: Impact of excess tax benefits recognized	13,960,000	$3.24
Adjusted Income Tax Expense (non-GAAP measure)	$ 87,957,000	

source: Company filings

But if we look beyond this one-time, non-cash charge, we can see that the underlying business continues to chug along. New orders and NVR's backlog of homes sold but not settled (both of which are leading indicators for revenue over the next year or so) increased by 18% and 24%, respectively, in the fourth quarter. A decrease in the average sales price (primarily the result of NVR's expansion into lower-priced geographies) continues to apply downward pressure on revenue, but the additional unit sales have enabled the company to more than offset this with operational efficiency -- gross profit and earnings before taxes for the homebuilding segment were up 12% and 16%, respectively, in the fourth quarter.

Moreover, as a company with purely domestic operations, NVR has never had the luxury of keeping profits offshore. So, going forward, NVR stands to benefit from the lowering of the effective tax rate to 21% (which is well below the 35%-plus rate NVR has reported for the past five years). And although rising interest rates will likely be a headwind for the housing industry going forward, we believe the positives (lackluster housing formation over the past decade, restricted supply, etc.) still outweigh the negatives, leaving NVR poised to deliver North Star-beating returns over the next decade. We're still waiting for the company to file its 10-K before we update our fair-value estimate (and possibly move the stock back to a Best Buy Now), but in the meantime, we're more than comfortable adding to our position.

Tencent

Like NVR, Tencent's stock has fallen by more than the market during the recent swoon after strongly outperforming in 2018. We've already devoted quite a bit of time to discussing this Chinese technology Goliath (see our original buy report, follow-up articles one, two, and three, and recent earnings coverage), but even so, we've only just begun to scratch the surface of its potential. Tencent isn't scheduled to report earnings until late March, so this buy should be viewed more as a signal of our confidence in the business than as a response to an updated fair-value estimate. And, hey, with the recent 48% spike in **Snap Inc.** (NYSE: SNAP) stock after that company reported fourth-quarter earnings, even Tencent's widely panned move to increase its stake in the Snapchat developer appears to be paying off. (Yes, it may be hard to believe, but we're partial owners of Snap through our Tencent stake.)

The Foolish Bottom Line

Only time will tell if last week's 10% index sell-off was the end of a recent market correction (making it the fastest on record outside of market crashes)or a harbinger of things to come. That's why we spend our energy on analyzing businesses, not markets. And we're confident that today's purchases will deliver more than acceptable returns over the next decade, regardless of what the rest of 2018 has in store, thanks to the underlying strength of these two businesses.

Pro Guidance Changes and Completed Trades: Feb. 12, 2018

Published Feb 12, 2018 at 3:53PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **Amazon.com** (NASDAQ: AMZN): The stock moves up to Best Buy Now (from Buy) as its financials improve and its dominance expands; our fair-value estimate (which is a much bigger guess than usual) moves up to $1,170. We have a 4.3% allocation.
- **New Buy Guidance: OpenText** (NASDAQ: OTEX): The stock moves to Buy (from Hold). We have a 3.1% stake. Fair-value estimate increases to $35.

Pro Completed Trades (see transaction log; trades take a day to appear):

- N/A

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Our Guide to Hedging Like a Pro

Published Feb 12, 2018 at 3:40PM

Fellow Fools,

In pursuit of our North Star, the *Pro* portfolio explores every corner of the market: We go long, we go short, we use options. That flexibility and creativity helps us find upside, but it also means that if we're not careful, we can be exposed to risk from every corner of the market, too.

We mitigate this by carefully using hedges. A hedge is a position that reduces a portfolio's overall exposure to risk, and over the course of *Pro*'s history, we've hedged in several different ways. In every case, we begin by deciding what exactly we want to accomplish with our next hedge. As we drill down on how exactly to rein in our exposure to risk, we focus on:

1. **Target selection.** What kind of potential decline are we trying to guard against -- a black swan, or a more moderate, run-of-the-mill slump? What are the risk factors that make us want to hedge, and which vehicle should we choose? Would an index do the best job of isolating those risks and protecting us against them, or do we want to target individual stocks?
2. **Size.** How much of the portfolio do we want to hedge out? Will this be the only position we'll use to do it, or will we have other approaches to reducing our long exposure in place as well?
3. **Time frame.** How long do we want the hedge to last? Do we prefer a set-and-forget type strategy, or one that requires maintenance?

Developing answers for each of these criteria has traditionally been a good way of narrowing down our possible hedging strategies to a select few. From there, if there are still two or more hedges we like equally, we'll consider pricing to try to break the tie. Here, we're considering the potential trade-off between the costs -- both direct (option premiums or losses on shorts) and indirect (missed upside from holding cash) -- and the potential benefits, given the current market environment and our portfolio positioning.

We'd love if there were a simple checklist to apply to every hedge, one that would both simplify the process and ensure we achieve our desired results every time. Sadly, it doesn't work that way. Hedging, like all of investing, is both an art and a science, one that requires constant learning and evolution for long-term success. That said, there are some hedging maxims we always keep in mind when picking a strategy:

- **Be miserly.** It's possible that at a given point in time, paying up for a hedge might be the right thing to do -- but the odds are heavily stacked against you in the long run if you do so repeatedly. (Just look at all the failing hedge funds.)
- **The goal of hedging is twofold.** In order for *Pro* to continue to achieve its lofty goals over a full market cycle, our hedges must do more than just reduce volatility; they will also need to provide us with enough capital that we can be aggressive during significant market declines.
- **Do no harm (or at least as little as possible).** Since 1896, the market has risen 78 years out of 119, or 66% of the time. This means you need to pay just as much attention to the risks of your hedge as you do to the potential benefits, since odds are you won't end up needing it. In most cases, a hedge will be a drag on your returns.

And now for the details behind our favorite approaches to hedging. Many of these strategies use options, so look for links to the relevant section of *Motley Fool Options*' Options U if you need a quick refresher.

Cash

- **How it works**
  - Arguably the most straightforward hedging strategy, cash works as a hedge by reducing a portfolio's long exposure. For example, a portfolio that has a 20% weighting in cash (and is thus only 80% long), all else equal, exhibits only 80% of the volatility of a similar portfolio that's fully invested.
  - Maximum gain: Interest earned on the cash
  - Maximum loss: You typically lose to inflation

- **Advantages**
  - Simplicity. Time spent constructing and monitoring more complex hedges is time *not* spent looking for the next long position that could double or triple in five to 10 years. Using cash to hedge your portfolio requires only a small initial investment in time and essentially zero maintenance.
  - Flexibility. Besides protecting a portfolio from untimely declines, one of the major reasons we hedge is as a source of funds: money you can use to take advantage of said declines by purchasing shares of your favorite companies at a discount. Some hedging strategies can be difficult to unwind at a moment's notice, meaning you could miss a buying opportunity, but that's not the issue with cash, which can be immediately deployed.
- **Drawbacks**
  - Missed upside. During bull markets, holding cash comes with a meaningful opportunity cost. Although you're not explicitly paying for a hedge out of pocket, you *are* missing additional upside on the cash you don't have invested. Compounded over multiple years, those missed gains add up. Consider two $100 portfolios: one that is fully invested and one that is only 80% invested, with the remaining 20% in cash. Assuming an average market return of 9% over various investment horizons (as well as a 1.5% annualized return on your cash), you can see how the cost of holding excess cash really adds up the further out in time you go.

	Portfolio A	Portoflio B	
year	100% long	80% long & 20% cash	difference in portfolio returns
1	9%	8%	1%
2	19%	16%	3%
3	30%	25%	5%
4	41%	34%	7%
5	54%	45%	9%
10	137%	113%	24%
15	264%	216%	48%
20	460%	375%	85%

- **When to use**
  - For investors seeking a straightforward approach to reducing volatility who are less concerned with missing out on upside, cash works as a standalone hedging strategy.
  - It also works as a great compliment to other hedges, especially those that are options-based and cannot be closed until close to expiration.

- **What to target**
  - Your primary considerations here are: By how much do you want to reduce the volatility of your portfolio? and What role will cash take in your overall hedging approach? *Pro* typically targets a net long exposure (long-shorts and hedges) of 70% to 80%, with cash being only part of our overall strategy for volatility reduction. Historically, we've targeted about 15% in cash (resulting in a reduction in volatility of 15%, *ceteris paribus*), though we've taken this number as low as 6.4% and as high as 22.8%. In an ideal world, our cash position will act as a counterbalance for the portfolio. As markets fall, our cash balance will fall, too, as we take advantage of depressed stock prices. But as markets climb higher, our cash holdings will likely rise as we sell out of overvalued securities (or investments where the thesis has run its course) and wait for better opportunities.

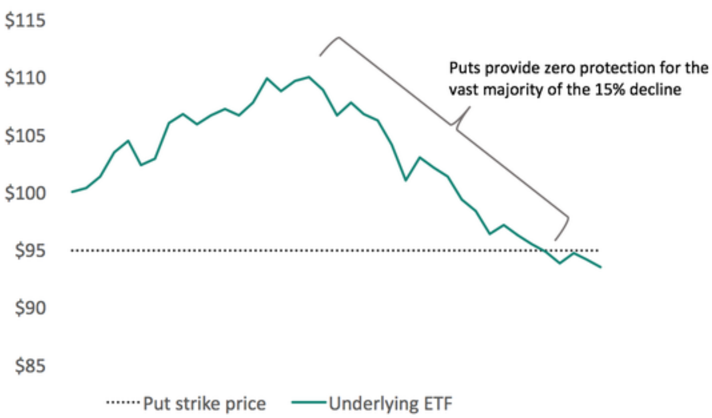
Shorting an ETF

- **How it works**
  - Another straightforward approach, this is when you to sell short the ETF of a relevant index (e.g., the **SPDR S&P 500 ETF Trust** (NYSEMKT: SPY) or the **PowerShares QQQ Trust** (NASDAQ: QQQ)). For example, if you had a $1,000,000 portfolio and wanted to hedge out 20% in order to reduce your net long exposure to 80%, you would short $200,000 in your desired index ETF.
  - Maximum gain: Achieved if the ETF falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to the amount the ETF can rise during the period you hold your short position open
- **Advantages**
  - Simplicity. Pick your ETF and your desired short weighting, then sell borrowed shares into the market at the current price.
  - Reactive. With a direct index short like this, if the underlying ETF falls by 2% the day after you set up the short, you can close your hedge and capture that gain immediately if you so desire. Many hedges, especially those that combine multiple options, are not nearly as immediately reactive.
  - Potential for outperformance over cash. An investor who targeted a net long position of 80% in a long-plus-cash portfolio would need to hold 80% of that portfolio in stocks. But in a long/short portfolio, this goal can be achieved with a greater weighting in stocks, as long as the short position results in a net of 80% long (e.g., 90% long and 10% short, 100% long and 20% short, 120% long and 40% short). If the "extra" long holdings (say, 20% in the case of a portfolio that's 100% long, 20% short) over the long-plus-cash portfolio outperform the ETF underlying the short, the long/short portfolio will outperform the long-plus-cash portfolio.
  - Liquid. In relation to being reactive (covered above), these positions can be put on and taken off at a moment's notice, which means you can take advantage of declines by reinvesting hedging profits as soon as you want.
- **Drawbacks**
  - Losses if the market rises. Unlike cash, shorting an ETF has a direct cost associated with a rising market. (Remember, when you short something, your payoff diagram is reversed: You make money when the underlying instrument declines in value and *lose* money when it rises.) The higher the market climbs, the greater your loss on the short, and potentially the larger a percentage of your portfolio the short becomes.
  - Shorting fees. Although they tend to be modest on larger ETFs, these fees do add up and weigh on returns if the short is held for long enough.
- **When to use**
  - When you're looking for a straightforward, highly reactive hedge, you're OK with paying a fee to borrow shares, and you don't mind that the hedge will act as an anchor on the portfolio if the market rises.
- **What to target**
  - As with cash, your primary consideration here is your desired target net long weighting for your portfolio as a whole, and what role you want this particular strategy to play.
  - Given how common this approach is, prices don't fluctuate much, so pricing discipline and discovery aren't much of a concern. The issue is more whether you're willing to pay up to use the hedge.

Buying Puts

[Options U link]

- **How it works**
  - For an up-front payment, puts protect the portfolio (or a position in it) from all downside below the strike price.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: The premium paid to purchase the puts
- **Advantages**
  - Simplicity. This is arguably the most straightforward options-based approach to hedging.
  - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active. You only risk losing what you paid for the puts.
  - Accessible. This is a strategy that most investors will be able to set up in their accounts even if they have limited options-trading permission.
  - Reactive. This single-legged strategy will show profits if the underlying instrument falls by a large enough degree prior to expiration, in which case you don't need to wait until close to expiration to close.
- **Drawbacks**
  - Cost. Cost-wise, buying puts is essentially the opposite of using cash to hedge: You're not at risk of missing upside should the market rise, but you *are* required to make a payment in order to set up the hedge. Depending on the market environment, you could end up spending a significant percentage of your assets (say 3%-5%) per year for strike prices that are only reasonably out of the money -- meaning the strategy really starts to drag on portfolio performance if used for long enough. It's not impossible to imagine a situation in which the gains you receive when your hedge finally pays off — which will probably require multiple rounds of buying puts, unless you get really lucky with your timing — fail to even offset the cost you've incurred to buy those puts time and again, meaning you're actually worse off for hedging despite witnessing a decline in the market. At *Pro*, we guard against this by trying to find various ways to finance our put purchases, such as writing puts on longs we like to pay for the protective puts we buy.
  - Timing matters a lot. For the most part, puts only start paying off once they are in-the-money, so you run the risk that your hedge might be largely irrelevant by the time the market finally declines. For example, if you buy puts that are 5% out-of-the-money, but the market rises 10% before falling 15%, your hedge would only be reactive for the final 1.4% of the decline.

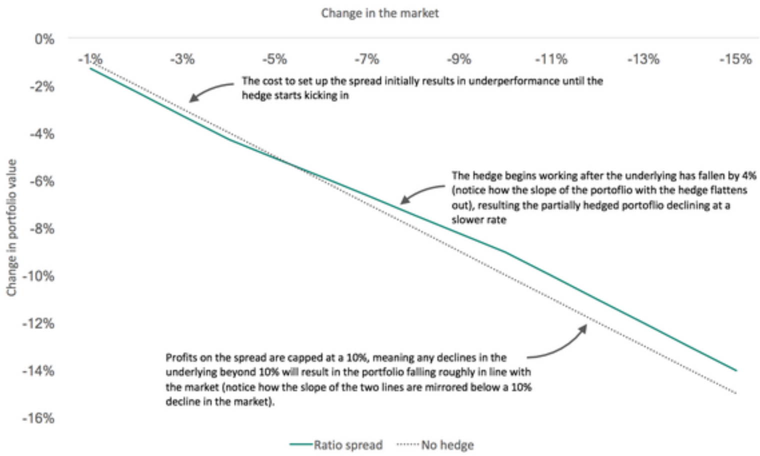


- **When to use**
  - When option prices are cheap (i.e., they favor the buyer) and your concerns about missing upside outweigh your dislike of paying to set up a hedge.
- **What to target**
  - There are two approaches you can take when looking to hedge by buying puts. The first is to target an intermediate length of time (typically 11 months or less) you'd like the hedge to be in place, then look to purchase puts, knowing it's likely you'll lose the entire premium you've paid if you hold them until expiration. When *Pro* takes this approach on an individual stock, we typically target puts that are somewhere around 10% out-of-the-money and pay no more than 5%-6% of the holding's value per year, with hopes that we'll sell the puts and get at least some of that back. The second approach is to purchase long-dated puts (typically expiring in a year or longer) and plan to roll them to a higher strike price if necessary to keep them closer to the underlying ETF's current price (and therefore more reactive as a hedge). In this case we target put strikes typically 10% to 15% out-of-the-money, and still aim to pay no more than about 6% per year of the position's value, initially, with hopes of recouping some of that when we sell, whether we roll up or not.

Bear Put Spread

[Options U link]

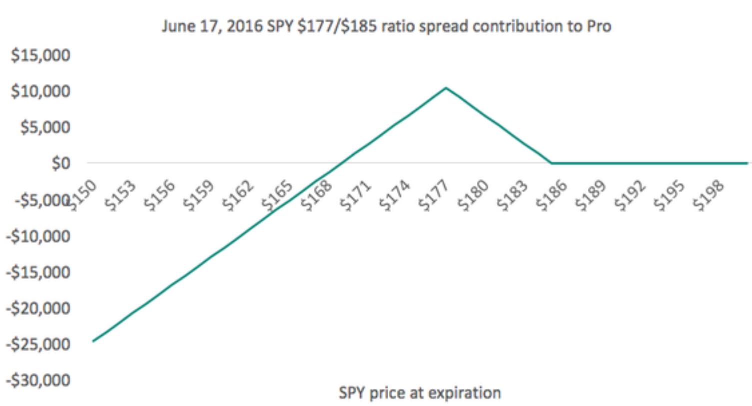
- **How it works**
  - With this options-based hedge, you purchase a put on an index or stock while financing some of the cost by simultaneously writing (selling) a lower-strike put with the same expiration date.
  - Maximum gain: Achieved if the underlying falls at least to the lower strike price of the written put
  - Maximum loss: The net premium paid to set up the spread
- **Advantages**
  - Cost, relative to just purchasing puts. Because you're selling puts with a lower strike price, you're able to meaningfully reduce the cost of setting up the hedge. This serves to minimize the drag on the portfolio if the market does not decline, while also raising your breakeven price and increasing the odds that your hedge makes money if the underlying instrument *does* go down.
  - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active.
- **Drawbacks**
  - Cost. Although a bear put spread is cheaper than buying puts outright, you're still making an up-front payment for something that may never actually benefit you.
  - The amount of downside you can capture is limited. Selling puts helps reduce the cost, but it also caps the maximum profit you can make from a given spread.
    - To see these two drawbacks in action, let's say you set up a 20% hedge using a spread that starts making money when the underlying ETF falls by 4% and has a maximum gain at a 10% decline. Such a spread would leave you worse off in any market situation that's *better* than a 4% decline, because you had to pay to set up the strategy -- but once the hedge did kick in, your portfolio's value would decline at a slower pace than without it. However, that's only true until the decline reaches 10%. After that, you won't receive any additional protection.



- **When to use**
  - As with buying puts, you can set up a bear put spread if you desire a hedge that doesn't result in any missed upside (just the cost of your spread). But because your maximum gain on the hedge is capped, you should generally limit its use to situations where you're not overly bearish.
- **What to target**
  - Although you can set up a spread of any size and duration, typically we target a spread that is roughly 3% to 5% out-of-the-money, with about a $10 difference between strike prices. The cost for this type of hedge will largely depend on its duration, but a four-month position should cost about $2-$5 in most market environments. Your maximum profit in this example is $10 per spread, or at least a double, which is what we target since we risk a 100% loss of capital along the way. We generally target large ETFs including SPY, IWM, and QQQ, though you can also hedge individual stocks.

Ratio Spread

- **How it works**
  - A two-part, options-based hedge, a ratio spread requires the investor to sell twice as many puts as they purchase for a given expiration date. The written put's strike price must be lower than the purchased put's strike price. (For example, you might write 20 January 2018 $175 puts while simultaneously purchasing 10 January 2018 $190 puts.) At worst, the spread is set up for a very small debit; breakeven, or even a slight credit, can at times be achieved. It provides protection starting at the strike price of the purchased put, but if the underlying instrument falls far enough below the strike of the written put, the spread becomes a liability that also shows a loss.
  - Maximum gain: Achieved if the underlying falls to the strike price of the written put, but not below
  - Maximum loss: Achieved if the underlying falls to zero
- **Advantages**
  - Cost. Because you can set it up for little to nothing out of pocket, a ratio spread overcomes one of the most common drawbacks to hedging, which is that the long-term costs might outweigh any gains achieved when the market finally does fall.
  - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active.
- **Drawbacks**
  - Cash necessity. Since written puts are a potential obligation, you need buying power or free cash to keep this position open, and that's cash that isn't invested elsewhere in most cases.
  - Downside protection is limited. That's the tradeoff for not spending any money out of pocket: A ratio spread's maximum gain is captured if the underlying falls exactly to the written put's strike price, but if it continues to fall beyond that, the protection the hedge provides starts to lessen. If it declines enough, you eventually arrive at breakeven, which can be calculated thusly: Written put strike price — (purchase put strike price — written put strike price). Below this price, the hedge is actually a liability.



- **When to use**
  - Ideal for situations when you are bullish but looking to hedge for small to moderate corrections.
  - When pricing is favorable (see below).
- **What to target**
  - There are a lot of moving parts here, but generally speaking, here's what to aim for:
    - Set up the position for a slight net credit or breakeven (a small debit is the worst-case scenario for this type of hedge, and that's not bad) while also achieving all of the criteria listed below. If pricing is unfavorable, consider an alternative hedge.
    - Your purchased put's price should be about 3% to 5% less than the current price of the underlying ETF.

    - Your written put's price should provide an acceptable gap between the purchased put's price and your maximum profit. (The smaller the gap, the greater the risk your ratio spread becomes a liability.) For shorter ratio spreads of three months or so, this can be as small as 5%, if that makes the spread between the maximum profit and the current price of the underlying instrument at about 10% (so, you earn your max profit if the index falls 10%). For ratio spreads of nine months or more, the gap between maximum profit and the current price of the underlying ETF should be 15% or more.
    - Expiration dates can be tailored as needed. We have previously targeted spreads from as short as three months to as long as one year.

Synthetic Short

Options U link

- **How it works**
  - This is an options-based approach that mirrors the performance of directly shorting an ETF by selling an at-the-money call in order to finance the purchase of an at-the-money put.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to the amount the ETF can rise during the period you are short it. (This is calculated as the current price of the underlying less the short call's strike price.)
- **Advantages**
  - Reactive. As with purchased puts, this strategy should show a profit even if the underlying immediately falls after the strategy is set up (because the puts will start gaining value while the calls lose it).
  - Fewer fee events. By using options to short an index ETF, you avoid paying shorting fees on the ETF, and you don't need to pay out any dividend payments the index pays, either.
- **Drawbacks**
  - Losses if the market rises. You will not only miss out on upside above the written call's strike price, you'll also begin to see losses on the hedge in a rising market.
  - Costs. Setting up two options may cost more commissions than would just shorting the ETF directly for short periods of time.
- **When to use**
  - When looking for an alternative approach to directly shorting an ETF.
- **What to target**
  - Depending on the position of your strike price in relation to the underlying instrument, you should be able to set this position up for little to no cost. Generally speaking, you should use the single strike price on both the calls and puts that is closest to the current ETF share price, while adjusting both options up or down a strike or two (while still using the same strike on both option) if you want to avoid paying to set this up.
  - As with cash and directly shorting an ETF, the primary consideration here is your desired target net long weighting for the entire portfolio. Consider the role you want this particular strategy to play within that context.

Split-Strike Synthetic Short

- **How it works**
  - Essentially a more conservative, options-based alternative to shorting an ETF. With this strategy, you purchase an out-of-the-money put while simultaneously selling an out-of-the-money call. Both have the same expiration date, and the call typically offsets the cost of the put.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to how much the ETF can rise during the period you are short it. (That's calculated as the current price of the underlying instrument less the short call's strike price.)
- **Advantages**
  - This strategy is more conservative than directly shorting an ETF. Because you're shorting an out-of-the-money call, your hedge has some headroom before it starts to guarantee you a loss on the short calls at expiration. Essentially, you're trading the ability to profit from small declines for more wiggle room on your short should the market rise.
  - Reactive. This strategy will, however, show a profit if the underlying instrument immediately falls after setting up the strategy, because the puts will start gaining value while the calls lose it.
  - Cost. By selling calls, you're typically able to offset a large portion of the cost (and sometimes all) of the purchased puts.
- **Drawbacks**
  - Losses if the market rises enough. You see a loss on this hedge if the ETF ends above the written call's strike price.
- **When to use**
  - If you're looking for an approach that's similar to directly shorting an ETF, but more conservative.
- **What to target**
  - As with most of the options-based approaches, there is a lot of flexibility here depending on how aggressive -- or defensive -- you want to be. More aggressive approaches start capturing declines sooner but risk showing losses with smaller increases in the underlying instrument, while more conservative strategies don't show losses as quickly but require the underlying instrument to fall further before showing gains. We generally like to target a small net debit in order to purchase puts closer to the current price of the underlying instrument (for example, we might purchase puts that are 5% out-of-the-money and sell calls that are 7% out-of-the-money).
  - There's a lot of flexibility possible with expiration dates, too. You can go short-term (three to four months) with the goal of just holding the position until expiration, or longer-term (nine months to a year) with the intention of being more active and periodically rolling the position higher or lower if need be.

Buying a short ETF

- **How it works**
  - A friendly trade for those with restrictions on their accounts, this establishes a short position by buying shares in an inverse ETF (e.g., the ProShares Short S&P 500 (NYSEMKT: SH).)
  - Maximum gain: Achieved if the underlying falls to zero (so, for example, the ProShares Short S&P 500 achieves its maximum gain if the S&P 500 falls to zero).
  - Maximum loss: Limited to your initial investment.
- **Advantages**
  - Ease of use. Since you're buying shares, you don't need permission to short or trade high-level options, although some short ETFs have extra requirements for ownership.
  - Reactive. This strategy should show a profit if the underlying instrument falls immediately after you set it up.
  - Imperfect tracking. We'll discuss this in greater detail in the "drawbacks" section, but these instruments deliver their inverse performance on a daily basis -- an imperfect measure and one that can at times work in your favor.

- **Drawbacks**
  - Losses if the market rises. If this happens, the ETF will decline in value.
  - Imperfect tracking. These ETFs seek to replicate the inverse of the daily performance of an index, but their long-term results will almost always differ from the true inverse of that performance. For example, over the past five years (as of Feb. 12, 2018), the S&P 500 has risen by 72.40%. Over that time, arguably the most well-known S&P 500 index, the Spider S&P 500 (SPY), has risen by 72.02%. But the corresponding short ETF, the ProShares Short S&P 500, has only declined by 51.71%. This discrepancy is most pronounced over long stretches of time, but it can occur over shorter stretches, as well. (In those cases, it's usually less extreme and can even work in your favor.)
  - Cash outlay. Since you're buying shares, this form of hedging reduces your cash balance on day one.
- **When to use it**
  - When restrictions on your account prevent you from participating in other strategies.
- **What to target**
  - As with cash, the primary consideration here is what you want the target net long weighting for your portfolio to be, and what role you want this particular strategy to play within it.

Hedging an Individual Stock in Your Portfolio

- **How it works**
  - When you have a large position in a single stock that you'd like to hedge (instead of hedging the entire portfolio), you can reduce volatility by hedging out that single stock using any one of the strategies listed above.
  - Maximum gain: Depends on the strategy
  - Maximum loss: Depends on the strategy
- **Advantages**
  - Pinpoint accuracy. Foolish investors tend to have stocks that aren't perfectly correlated with a single ETF, meaning an ETF-based hedge doesn't completely remove company-specific risk from the portfolio. By targeting a specific stock, you're able to exercise greater control over the business risk you hedge against.
- **Drawbacks**
  - Market risk. The odds are higher that a single stock won't correlate with the market than that an entire portfolio will go rogue, meaning you run the risk of hedging out a stock that continues to crush its performance while the market (and your overall portfolio) tanks.
- **When to use**
  - When you're primarily concerned about a single stock, but aren't ready to sell your shares just yet (perhaps you just want to hedge through earnings).
- **What to target**
  - Depends on the strategy selected.

Thoughts? Questions? Don't hedge your bets! We're here for you on the Hedging discussion board.

Where Pro Stands, Part 1

Published Feb 9, 2018 at 5:24PM

Dear *Pro* Fools,

As I update this on Friday after the market close, the S&P 500 is down 8.7% from its intra-day high reached on January 26, and down 2% year-to-date. Our North Star is up nearly 1% year-to-date. The *Pro* portfolio is down 3.3% in that time, much of that because of one small position that blew up. We have catching up to do, and we know the path we want to take to do so.

First, though, it's instructive to look back a bit. The major market indexes now trade at the same level they were at in late November, about 70 days ago. During all of last year (and the years before that), we largely refrained from systematic shorting and hedging because the market environment seemed so highly positive.

That means we have likely saved many thousands of dollars by *not* actively shorting and hedging the market with responsive shorts. For example, we contemplated synthetic shorts on the market indexes several times over the past year, and we kept passing on them. We also considered paying out for insurance by purchasing puts, but ultimately chose not to. The strategy would have cost us at least 3% a year to cover about 20% of the portfolio -- expensive, and (so far) not worth it. The market is still at a higher price than it was each time we considered hedging in 2017.

Also, as you know, we've always worked to configure a portfolio that generates our upside goals without investing all of our cash. When your portfolio only averages about 73% net long, as ours has, and you want to keep pace with your North Star (and incidentally a strong stock market), you need to calibrate some extra risk into your portfolio to get there. Since inception, we have earned 191% of the North Star's steady return, and about 106% of the S&P 500's total return -- despite only being 73% net long on average since 2012 (and even less before then). We could only accomplish this by avoiding large misses -- and by investing in some risk, including **Facebook** (NASDAQ: FB) before it was loved, **Mastercard** (NYSE: MA) when it looked expensive, and others.

Part of the reason we had a strong 2017 was the risk we took by owning the **ProShares Short VIX Short-Term VIX Futures ETF** (NYSEMKT: SVXY). This position added a substantial 2% in value to the portfolio last year. We made the conscious decision to give ourselves additional exposure to upside with this *small* position, which brought us outsized returns in a rising market but only risked 1.3% of our assets when we set it up. And it worked just as hoped: Despite being one of our smallest positions to start 2017, SVXY brought in the second-highest unrealized gains in the port, second only to Facebook. En route, it increased about 200% last year. But we missed our chance to sell some.

Now, SVXY sets us back. (The stock was down by an incredible two-thirds on Tuesday ; we hope to share more about what happened to it in after-hours trading last Monday as we learn more about the bizarre VIX futures trading that took place then.) In losing nearly 3% of our portfolio's value (2% of which were its unearned returns), we lost two years' worth of 1% annual portfolio gains, and we're left needing to earn 3% back to return to plan. We plan to do so by taking bullish positions in great *Pro*-quality companies -- buying more stock, using call options, and writing more options as long as they continue to pay more.

In other words, we're no longer relying on SVXY to give us the extra boost it once did in a strong market. (We obviously can't rely on it for that now, even in a rising market.) We've always relied most on our long-term buy-and-hold businesses to increase in value over time, and now we're looking to invest additional funds in our favorites, both old and new, to ideally get us back on track.

As we increase our long exposure to stocks and options, our plan is to expand our hedging, as well. We still want to maintain reasonable net long exposure (70% to 80%), because that's part of our roadmap.

Now, about hedging ...

Because SVXY helped us keep a bit more cash out of the market, it played a small role in dissuading us from hedging more often (because we had ample cash). And that saved us some money the past few years. We might have lost more than 1.3% of the portfolio on steady insurance and hedging -- insurance can easily cost several percentage points of a portfolio each year, and being short the index as it rises can cost just as much or more. That said, we typically seek to hedge market declines of 7% or more, and now we're back to looking at the same hedges we considered last summer -- when the market was still lower than it is now. So that's good.

More on potential hedges soon. For now, some thoughts on some positions in our portfolio on Hold. We always want each position in the portfolio to have a purpose, and here are updates on those whose purpose we're considering.

- **Gilead Sciences** (NASDAQ: GILD): In a market that has many stocks at assertive valuation multiples, it's nice to own some that are inexpensive. We'll decide soon whether we're moving Gilead to Buy again and keeping it as a buy/write covered-call position, writing calls against it for income as we did last year. Expect our update by the end of this month, after we go through this week's earnings and updated outlook.
- **OpenText** (NASDAQ: OTEX): OpenText is also an inexpensive-looking company in an industry (software) that's mostly expensive. After a strong quarter, we're moving the stock back to Buy and committing to it, in theory, for at least the next three years again. That said, we could of course sell it anytime for something we like better, as is true of everything we own. But for now, we like it again at this price after recent strong results.
- **SVXY:** It's now only an 0.2% position, so we plan to keep it and see what we can learn from it -- see how it plays out over time. As soon as we believe there's no longer an imminent or likely risk that it will go to zero, we'll move it back to Buy, but only for members who are comfortable risking 0.2% (even then, it could still go to zero!). We believe we can learn more by continuing to follow it than we could by selling it; the capital at risk is slight now, and over many years, could it recover? (That said, one reason we might sell it someday is to offset gains we take in any particular year. Or, if it does seem like it's plummeting to worthlessness, we may choose to get out first.)

All of our other stocks are rated Buy or Best Buy Now, and with the downturn hitting everything this week, all are trading at more attractive valuations than they were a week ago. Take a look.

Now About That Market

When the latest *Barron's* Roundtable, chock-full of investment experts, was blue-sky bullish in January, I joked that it was time to be worried. But the speed and depth of this market decline surprised me, too. We have lower taxes and higher earnings to look forward to this year; earnings are already coming in strong, with more to come. The S&P 500 trades at about 17 times expected earnings (one year ahead), too -- not a crazy number.

With good reason, many are suggesting that this decline is because interest rates on bonds have gone up, and it's true that higher "risk-free" interest rates usually bring lower stock valuations, although stocks don't *always* fall when rates rise (and interest rates are likely to remain historically low even after slight increases). Further, I don't believe this market decline is *all* about interest rates, because financial stocks have been falling as badly as everything else. If this were about interest rates jumping, financial stocks would stand to benefit -- they'd be a safety net for investors, and their prices would rise. But that's not what we've seen.

Most likely, interest rates sparked concerns, but this is a decline that was just waiting to happen either way. Too much speculative money moved into the market, looking for a quick return, and now that money is fleeing because the market is falling. Sellers are unloading stock to stronger hands, and eventually the decline will subside. This story is as old as time (or as old as markets, anyway).

There are other things to worry about -- there always are. The dollar is getting weaker. The U.S. deficit this year might top $1 trillion, double last year's, and we're selling more debt even as buying interest overseas may be waning (driving rates higher). Higher rates also makes our debt more expensive to carry. And we're stimulating the economy with tax cuts and extra spending even though the economy is already growing. Usually, you want to save stimulus for the next downturn. So, this is uncharted territory. But overall, we know that owning excellent, world-leading companies at fair prices is the first and largest step toward building your portfolio's value over time.

Until next time: enjoy your weekend. Keep your long-term perspective. As always, be grateful for what you have, life and health being top of the list. Meanwhile, we'll keep working to improve our investing.

In closing, my colleague and friend Jim Gillies wrote an excellent column about the market today -- be sure to check that out.

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: Coherent, Facebook, and More

Published Feb 8, 2018 at 1:14PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2%.
- **Facebook** (NASDAQ: FB): Buy 3.9% (half our stake to start).
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.9%.
- **Oracle** (NYSE: ORCL): Buy up to 3.6%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 3%.

Continue building your portfolio with our Buys, including:

- **NVR** (NYSE: NVR): Buy up to 2.8%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy up to 3.8%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Cooper Companies** (NYSE: COO): Set up a covered call by simultaneously purchasing shares and selling one May 2018 $240 call contract for every 100 shares you purchase. As of this morning, this position could be set up for a net debit of roughly $220. The recent spike in volatility has resulted in the $240 strike still meeting our monthly income guidance despite the decline in the stock price; however, more conservative Fools who favor income over upside can consider selling the May 2018 $230 calls instead. Our target position size is 2.5% to 3%.

Upcoming Expirations:

- None imminent.

Pro Video Chat, February 2018

Published Feb 7, 2018 at 2:41PM

The *Pro* team will be holding **a live video chat on this page at 2 p.m. Eastern on Wednesday, Feb. 21**! We'll be using Slido to communicate with members during the chat; to join in, visit slido.com and enter code **#ProChatFeb**. We recommend opening Slido in another browser tab (or on a mobile device) so you can see both the video and the Slido questions at once. See you soon!

Transcript

Jeff: ... With our members, you. We appreciate you being here. I'm joined at table by JP Bennett.

J.P. Bennett: Happy to be here, Jeff.

Jeff: And through Skype, we have Billy Kipersztok down in Florida. Hey, Billy.

Billy K.: Jeff, J.P, hey. How you guys doing?

J.P. Bennett: Great.

Jeff: We're doing great. We just had a Pro meeting among the three of us this morning as well so if we seem like we're getting along well, it's because we are. We just finished a one hour meeting to talk about the Pro portfolio. We hope you're doing well too. Please, as you enjoy the lovely visuals and audios of this video itself, also go to slido.com. Enter ProChatFeb. We're lazy today, so we just shortened. ProChatFeb, F-E-B. There you can ask your questions and Slido vote up other questions that your fellow members ask, and we will answer them generally in order of popularity. But we might also go more quickly this time, depending on the volume of questions and just each of us will go around the table and select one from the list and go right through them that way.

Either way, we hope to answer all the questions or as many as we possibly can with answers that are indeed helpful to you. That's our whole point. So, ProChatFeb, and we'll get started with your questions in just a minute. As a short preamble before that, I'll say that the Pro portfolio as of 11:30 this morning, two hours ago, was up 2.2% year to date right in line with the SMP at 2.2% and, coincidentally, right in line basically with the North Star as well, which is up around 2%. Inflation is ticking higher, which is gonna make our North Star get above 10% a year, maybe 11%, maybe push towards 12 soon, and we'll do what we can to invest in the spirit of our North Star and grow our money with reasonable risk. Anything you want to talk about, JP or Billy before we get started?

J.P. Bennett: I would say just as a precursor, because I haven't done any of my quarterly earnings write ups that by and large it seems like what we're seeing from our Pro companies is pretty positive I know. I just went through Verisk this morning so it's kind of top of mind for me but I was pleasantly surprised or impressed with what I saw not just that because they have a new CFO, I was super impressed with the changes they're making in terms of their disclosure and how they're going to present their business going forward to kind of clear up some of ... I don't want to say confusion but just the lack of clarity and uncertainty that was surrounding things because if you think they are a subscription, largely subscription based business so you would think it would be really easy to predict what they're going to do quarter in quarter out and the changes would be more on a yearly basis or multi-year basis.

But there were some pretty significant kind of I'm going to use air quotes here for those of people who aren't looking at me you know misses in terms of what they did versus sell side estimates and that kind of had to deal with the way they disclose their business or the way they presented their financials. So what did they do? They got a new CFO, they went around talked to a bunch of their biggest shareholders and said, "What do we need to do to be kind of a more shareholder friendly company in terms of disclosures and how we present the business," and I'm really optimistic not just in terms of where the business could be going but also in terms of the better understanding we're able to achieve with the business going forward. Then you look at even some of the businesses that sold off like NVR because of the one time tax hit and maybe some of the concerns regarding rising rates but the underlying business seems good.

I think the local housing market where they're situated seems like it could the current dynamics could last for a little bit longer and so I don't know about you guys but so far I'm pretty pleased with what we saw from the Pro companies.

Billy K.: Yeah, I would agree with that JP and I think we're starting to see some sort of economic expansion here in the United States and globally as well and I'm curious to see how that plays out for our companies over the coming year as well as the impact of the tax reform for a lot of our US based companies I think. Jeff was talking about this earlier the market maybe underestimating the impact that tax reform has on the earnings for these companies so even as we have some volatility early in the year, it looks like the economy and the businesses that we own are doing well so we'll see what happens.

Jeff: I would agree. I'm pleasantly surprised by earnings so far and we're starting to see some headwinds, I'm sorry some tailwinds from the tax reform, the money that's going to come back overseas back to the States is likely to benefit shareholders most of all.

J.P. Bennett: Yeah, don't get me started on that one.

Jeff: And the thing that we are talking about, the Pro team, you should know is this environment of higher inflation, interest rates headed higher, still you have stimulus in the economy which is very unusual during a time of an expanding economy, is growing deficits which is also very unusual so although things look good right now and perhaps stronger this year over time month by month the year may get stronger, longer term, we have some concerns about how it all plays out in the end but we remain or I remain ... We don't want to think about the market short term but I remain bullishly oriented. I think this year you have more tailwinds than headwinds and it's probably a bit more likely that stocks will rise this year than not although nobody knows but-

J.P. Bennett: Hedging your bets.

Jeff: We are working to hedge our bets. I like what we've seen so far, we have some new potential buyers right around the corner in the Pro portfolio but on top of that we're looking to get more invested in some really high quality names that we'd love so that we're also then going to put on more hedges and possibly shorts to balance out the portfolio in both directions as best we can. That's what we're looking at right now; inflation, interest rates and strong earnings growth as well so let's go to your questions on slido.com, again that's ProChatFeb, if you want to go into slido.com and ask questions, Karen is asking our latest thoughts on SVXY, the ProShares short term futures on VIX and I can share hopefully within just a minute or two our thoughts on that.

Big picture right now it's at 0.3% position so it's our smallest position. It's down about 67% so it's down a lot from where we bought it and down for members even more who bought it later and that's after seeing it more than double. To have a go from about a 3% position to 0.3, obviously a big hit just in the last few weeks on the portfolio and yet cold comfort maybe but true facts the portfolio is up as much as the market this year, we're still in our positive territory so that's good.

J.P. Bennett: Diversification.

Jeff: Yeah, diversification pays off and again in keeping this position small but we missed our chance to reduce our position even though we had planned to, that's no excuse we didn't execute in time. We still would have held probably a one to one and a half percent position instead of 2.7%, so our latest thoughts on it though is now that it's this small that we want to keep it and see how it plays out. ProShares was able to keep SVXY going despite the futures rising more than 100% in one day but we now know for certain that there is a risk that if the VIX doubles or more, this like XIV which is gone now could disappear. We always knew it could fall very rapidly if you read our original report we said it could be worthless very quickly or close to worthless but now we know for certain that it could be worthless if the VIX were to double or more so we need to keep the position small but we are keeping it and doing so we do plan to move it back to buy and tell members only to buy 0.3% or less and be ready to lose that money because it could happen.

But what we hope will happen, more likely to happen is that over time it will appreciate and we'll gradually trim it, and trim it and manage it and eventually exit it perhaps years down the road but eventually exit because it's not ... we'll find other ways to invest in volatility or against volatility. We don't want to hold an instrument in prop or indefinitely that can go to zero on a whim so we're going to manage it and keep it small but we are keeping it and we want to see what will learn from it. We talked about it this morning too among us some and we do think there's a fair amount of evidence that this was an unusual event given that so many people had invested in short volatility that when the VIX finally did spike those trades had to unwind and it resulted in these exacerbated movements in the futures market that fed on themselves and basically killed the very instruments that were betting against them.

We may not see that again for years unless people slowly go back and SVXY or things like it and use them to short volatility again but these have become so big, these few ETFs that they accounted for about 25% estimated of the VIX futures trading on the Chicago Board of Options Exchange itself so there was a lot of volume in there and it unwound in an ugly fashion even when the market didn't fall that much. It was definitely surprising and definitely unfortunate.

J.P. Bennett: We saw or at least I saw as early as 2016 there were some people that were kind of pointing out how the dynamics were changing. You look at it from a 10,000 20,000 foot view and you think okay, the SVXY is based on the VIX so the VIX determines SVXY but because like you said they were tracking so much money and the positions they were having to take were so large, the dynamic was actually starting to reverse and you could basically based on whether they needed to be, all of the VIX based instruments, needed to be net long or net short a particular month. You could kind of predict what was going to happen to the VIX and so this is kind of ... I don't want black swan but it was definitely unforeseen because even back then it's like all right this is a new dynamic, you need to understand this when you're investing in those products and I guess we kind of understood that there were these risks but you cannot really anticipate how exactly they put, you can't really simulate this in advance it's all about proper risk management like you said.

Unfortunately, we had basically decided a couple of days prior, it's hit that mark or we're going to trim some of it. We need to at least pull out all the money we put in so we're basically using quote unquote house money and it's just one of those things where sometimes timing just doesn't work out for you. We had some great timing with some of our buys the past couple years and this one just wasn't in our favor but that's investing. We are not that perfect but we're not going to.

Jeff: Yeah, it's true JP and a reminder to those who weren't here when we first bought SVXY three years ago I believe, almost, maybe.

J.P. Bennett: Man time flies.

Jeff: It does. It fell 58% right off the bat on us so we've been at this size of a loss before and we didn't add to it.

J.P. Bennett: So you're saying it's going to come back.

Jeff: No I'm not saying ... We want to learn still. It was a new position we want to learn rather than add to it and we're in the same position now. We don't plan to add to it we want to learn what seeing this huge dislocation.

J.P. Bennett: What happens now.

Jeff: Let's see what happens next but thankfully it's again a small position. It was never so large that it could harm us indefinitely and as we talked about this morning every although it may be impossible for you to know this I should share more potentially if I can every time we've taken a hit whether it was American Airlines, call options or SVXY now or even when we lost Intel and I didn't really want to I was bummed about that, I've turned that negative energy into something positive into-

J.P. Bennett: I does kind of motivate you, right?

Jeff: Yeah, motivates you to find a really great buy like Paycom or Skyworks replaced Intel and this is motivated us to look at a few other companies that make it in the portfolio very soon and then in the long run we'll make a lot more money I believe because of that than we would have otherwise so in some ways we've been too smooth and too easy going. We should have more mistakes because they do motivate us to then do even better in the next leg of our performance so SVXY, amazing experience. Right after we bought it we saw it fall about 58% when the VIX I have to go back and look it up I meant to this morning but ran out of time, I think the VIX nearly doubled so that gave some what turned out to be false comfort like okay of the VIX can soar and SVXY only falls 20% in the day or 30% and it comes back.

To see it fall 80% was impossible to foresee at least in one day I guess you could say and. It's a new experience but we have been in this hole before I'm not saying JP It will climb back but over a long we may slowly-

J.P. Bennett: That was just a joke.

Jeff: I know, I don't think any of us believe that because that took two years or so of very low volatility which can continue, which can happen again but we're not banking on it and thankfully SVXY has now no real bearing on our future performance. I used to put some weight on it thinking in this is a small position but it will gain 100 or 200% in a good market over a few years time and add a few percent of the to the portfolio which is real and those are real returns and it did that exactly and now we don't count on that at all so we're going to make up for that in other ways with better longs with real companies and with more options with companies themselves I should say. Let's get to more of your questions that was a lot on that one stock, one ETF.

J.P. Bennett: I'm going to assume that there are a lot of questions in here.

Jeff: I'm sure, so SVXY we're keeping it where it is at, 0.3% buy no more than that. Hold it only if you're comfortable with potentially losing all that money overnight you have to know that it could be gone tomorrow if the VIX doubled again so we're okay with that we want to learn from this now and see what happens next with it. I feel at this position sizing we're not being irresponsible with the money as long as you know the risks that are involved and act accordingly for yourself so we're holding it for now. Anonymous is asking, "Some reports that Facebook is losing teenagers at a rapid pace. Does this concern you?"

I've read those reports too and we saw them ... I looked back and we saw them as early as 2012, 2013 when we first bought shares and calls and so far it doesn't concern me. It's a very tiny base part of their obviously enormous user base and it's mostly US teenagers and a lot of them are moving to Instagram instead. I think a lot of Facebook users cycle in and out of the service but the stickiness of it is that so many of your peers and friends are there that you'll come back to it but as of right now it doesn't concern us but it's something we have our eye on. Even more than that as we talked about this morning as a team is we want to see how Facebook's changing algorithms for its news feed change traffic this year, we believe they can manage their revenue very well given the demand that they have for their advertising as long as ad prices stay up and that depends on traffic being responsive to the ads.

But we may keep a collar on Facebook over each other earnings quarter at least for the next few quarters just because of the unknown regarding how they're managing the business. I believe as said earlier that they want to manage the quality of the community even more than their financials and they'll take short term hits to do that which is fine with us but we're going to hedge. Since it's a large position we plan to hedge a portion of it around each earnings report. That said our current collar is running its course, it's a small profit right now and we may just close it soon because no earnings are on the corner and it expires in less than a month but currently not concerned about watching the teenage story. Who wants to talk about current market volatility. Should we be more or less ready to write puts?

Billy K.: I can jump in on that one. I think as we start to see more volatility and the VIX level goes higher puts become more attractive to write because the premiums are going up as the time value is affected by that volatility. I'm not sure if you're really asking this from a general perspective or from Pro's perspective. In our meeting today Jeff and JP and I discussed potentially writing some puts on some of our ideas so we are throwing that idea around but I think more important then current market volatility when it comes to writing puts is whether or not you want to buy the shares of the companies that you're writing puts on.

That's really the reason that you write a put and you have to be ready to accept shares of whatever company you're writing a put on and if you don't want to buy shares then you probably shouldn't be writing those puts so if there are companies that you like that you're interested in buying and you want to target a lower price now might be a good time to think about writing more puts because we have an elevated VIX level and much higher than it's been over the last year or two years and so you'll get paid a little bit better but make sure that you really want to buy the stocks that you're targeting.

Jeff: It has been nice to see the VIX higher for that prorating purpose and it's made us look as Billy has said at other potential income or option positions period and when we add Oracle the diagonal call to the portfolio, we are looking at having five income base positions; American Tower, Diagonal Call, Home Depot, Diagonal Cooper Covered Calls, Verizon covered Strangle, and then Oracle so five alone there and we'll have staggered expiration dates a lot of the times.

J.P. Bennett: We may even have some more coming down the pipe too.

Jeff: That's exactly right so we're not we're not stopping there. So, yes I would be more ready to use options in general now that volatility is its up a bit. Member is asking, "Paycom is the only Pro position I don't have, I've written puts a couple times but no shares how to proceed. Buy at this price or wait for a pullback." The stock is ready to buy and it's above our fair value estimate which is in the process of being updated but as a buyer you can buy some shares. We have I think at 3.5%, let me make sure and check 3.8 now, 3.8% position. I would say buy part of that, maybe you start with 1.5% and then wait and see what happens from there and look to right puts when the premiums are good or buy more on a big dip.

The stock is 97 now it's really been a strong performer and the good thing about that is in a lot of cases anyway strong performers continue to be strong performers and Paycom has a sort of runway for its revenue and its profits that it looks like could be a strong three to five year performer going forward as well that's our hope. It is rated buy as many shares as you're comfortable with up to around 3.8%, maybe you start with a third of that or half but seeing the latest earnings we're not taking it off of buy. It's staying at a buy.

JA has kind statement of support to the team here for the feedback provided on SVXY early this month. Thank you for that very much it's very kind. These challenging times when they arrive are times when we especially want to be available to you and process our own understanding and mistakes as quickly as we can so that we can then share with you what we're thinking. It never gets easier when you have a big mistake just because you've had several in your life and in investing I should say mostly in investing thankfully so far it's. It's still a challenge to process it quickly and share with you our team the Pro team, all of us what we think we're going to do next and why and what the situation is. We know you all have real money invested with us and any money is real money is what I mean to say and. Thank you for the positive feedback and we'll keep trying to be as available and expedient and yet useful in our thinking as we can.

SVXY is going to go down as one of those things that we will look back on as a lesson like the American Airlines call options for a long time to come and hopefully we'll learn from it and again as I said earlier I think ultimately make greater profits because of it. I was going to throw one more thing on there but I'm going to write a memo soon about our losers and look back at all our losers and what we gained from those so thank you JA that's appreciated. Let's go to a question that someone else can speak to and then I'll talk about Coherent in a few minutes. More strangles ... I think general it's good see you Jen. We just covered that, we are looking at more options in this more volatile market so I will archive your question Jen about Skyworks. I'll say to Skyworks I don't want to cover it right now I think the stock is too ... Well I'll look at the options well out of the money but the valuation is appealing on Skyworks it's a buy.

I'm not sure I want to cover it again we finally got our money made back on that covered call situation. Is there anything one of you want to talk about please jump in and then I'll cover Coherent and square and what not.

Billy K.: I can tackle this question from Lone about IYR and real estate. I'm going to assume Lone that you own the IYR as an alternative possibly to the short of SRS that we have which is still a position we have in our portfolio. A 0.2% allocation it's on hold because we can't recommend it to members as it's very difficult to short now but IYR is a real estate elite index fund basically and it tracks the elite sector and interestingly actually the largest holding in IYR is Pro holding American Tower and that's a 6% position and IYR and IYR also has significant exposure to the other tower companies as well and that would be Crown Castle and SBAC and together they make up more than 12% of this IYR.

What we've seen this year in 2018 is that even in the beginning of the year before the volatility and that big market crash in February when all of the indices aside from real estate were up strongly S&P 500 at its peak this year was up 7%, NASDAQ was up 9%, Dow Jones up 7% but the Reindex in the REIT industry has been doing poorly this year and right now year to date in just 2018 it's down 11% and that's likely almost certainly due to the fears of rising interest rates which we touched on a little bit in the beginning of the chat here. This is something that we've talked about and we've discussed as a risk factor for American Tower for many years as we've been covering it in 2013 and other years when the Fed's kind of tapering tantrum happened and the REIT sector was hit with some volatility.

Any time there is a speculation that interest rates are going to rise, the tendency is for a REIT pricing to fall and that's because REITs provide a yield generally because they're required to pay out a portion of their earnings and that yield when right rates are rising becomes more competitive for people to buy alternatives to REITs when you're looking for income whether that be bonds or anything else that might provide a yield. In our case and what we're thinking about how it affects the companies in our portfolio specifically with respect to American Tower, I've touched on this a lot in the discussion boards, interest rates really don't make a big impact on the company's cash flows and the company's earnings. It may affect just a little bit as far as their cost of debt, America tower does use quite a bit of debt in funding their business and the cost of that would go up but it doesn't make a very big impact.

This is all to say that the impact that we see to the reach sector in response to REIT rising is really kind of a knee jerk market reaction and a lot of times the REIT sector has a tendency to really trade all together and all the stocks are very highly correlated but in reality the forces that are driving the success of the individual businesses that make up the REIT index is kind of more varied and interest rates are not really the biggest factor when it comes to whether or not those businesses are going to be successful. To answer your question more succinctly I've been kind of rambling a bit there but real estate right now is kind of challenged and as rates continue to rise you might see more pressure in the real estate sector but what that means is that there may be more opportunity for you to dive into that real estate sector and find the specific companies that you like where maybe the market is throwing the baby out with the bathwater.

Specifically in our case for Pro, American Tower is a good indication of that as the REIT sector has come down significantly in price, American Tower now is more attractively priced and it's been in quite some time and we're seeing valuation levels American Tower that corresponds most closely to other times of low multiples for that stock. That's my long winded answer to your question, Lone.

Jeff: It's a great question and SRS in the last five years is down 60% so the short has performed, IYR is up including dividends roughly about 30, 37% but a lot of that is the dividend itself with a four percent yield. We didn't plan to keep the short this long per se but IYR we've always viewed as a very long term investment if you're going to make it and you're doing it largely for the yield and hopefully to get a North Star return overall but so far it hasn't quite done that the last five years at 30% returns or hasn't done it by a long shot actually 30 versus 50%. I guess Lone, it depends on how well it fits into your portfolio and if you like owning it or not as Billy said our SRS is such a small stake now and the ETF itself is so small that nobody can really short it anymore. It might hover us to just close that out, take away any confusion with new members but for now it's a 0.2% position. JP Do you have any questions you would like to answer?

J.P. Bennett: They only thing is a lot of questions that I have a little bit further down ... they're kind of geared towards the stocks that I cover are quite a ways down and I don't want to skimp out on the ones that have 10, 12.

Jeff: I can jump onto those then. I'll talk about ... I can talk about Coherent and square and we can all talk about Facebook and FAZ as well so let's tackle the top five. We have about half an hour remaining already so we can try to cover all these questions in that time if I'm quick. Our position on Coherent has not changed. The stock is rated by, I have posted an update on the board and in full life well when you quote the stock itself you'll get our update on it too on the page and it's still a buy. The shares fell despite record results and a record outlook for 2018 which is basically all booked already and they're billing capacity for 2019. Shares mostly fell it sounds like because of concern out there about OLED screens moving aside for micro LED, in favor of micro LED even though that technology is really years away from being available at a consumer level.

Said, OLED continues to advance and they find new ways to make it better and more efficiently and OLED is slightly likely to stay with us for a long time to come. Why is this important? Coherent part of what they design and sell are laser systems that helps you make OLED screens. That said, you can bet that they're working on micro LED technology lasers to help you make those next so they should meet that demand when it arises and I'm a little surprised how concerned the market is and that's why I'm looking to learn more about that and learn why investors are as concerned as they seem to be with Coherent. That said the stock does trade with volatility and it has for the past year or two at least and now it's at about 14 times earnings, 17 times for cash flow, and we rate it a buy and we're staying at a buy and our position size is, you can see on the page 2% flat and it's a best buy now so our stance hasn't changed and it's recommended as a 2% holding.

I should add Coherent itself says they see no change in the market right now regarding OLED and they're not concerned about Apple either. Apple is investing in micro LEDD producers as well though so I think it's the market overreacting right now. Some concerns about Square and a possible pullback. Nobody knows what it will do of course Square will announce earnings February 27th, so in six days if you're waiting to add the position you could wait and see how those earnings go and then you'll have more knowledge obviously and you can make your investment based on that. Whether or not you get a lower or higher price, nobody knows time will tell. We rate the stock a buy and I'm not ... as long as the financials keep tracking the way they have been I'm not concerned about the business itself, the valuation is a little ahead of our estimate which is a difficult estimate to arrive at given the youth of this business and that it's just turning profitable.

It's going to be a more speculative more volatile position than most that we hold but the business is on a great track right now it appears in the financials are getting there as well. So, a lot of promise and looking ahead three to five years three years we're hopeful that it will continue to create value for us so you can wait on earnings on the 27th or not, Billy, yes.

Billy K.: I was going to ask you a question Jeff I'm curious to hear your answer to this and how do you view Square relative to MasterCard and Visa. Similar exposure, similar industry but different type of business.

Jeff: What I like about Square is that they are agnostic as to how you pay they're just a means of payment. They're a transaction interloper transaction middle person basically and whether you use Visa or MasterCard or PayPal or they say any future form of payment they want to be there and be able to provide it. I view them in some sense as a little bit of diversification potentially away from MasterCard and Visa if those two forms of payment start to lose out to some other new form of E-payment or PayPal which MasterCard has a big partnership with PayPal too then square may benefit by being agnostic and being able to switch quickly to whatever platform is taking off so I do like that about it Billy. If Square were only tied to MasterCard and Visa then I don't know that we would have bought it because we'd have too much exposure to those two brands in that case.

Billy K.: Thank you.

Jeff: Of course Billy, thank you. Great question. Facebook, anonymous is asking, "Facebook is on the defensive about Russian interference in the election, are we still comfortable?" We're comfortable with our position as it stands and yet we're looking at putting a collar on it during our financial results for at least the next quarter or two but it's news that we're watching closely and we do believe Facebook wants to do right and to make the community stronger and make it all legit and weed out as much as they can and hopefully with time you can almost entirely weed out fake accounts and bots and things that are destructive like that. You have to hope so but we're watching that and we continue to be comfortable with our stake as it is that said newcomers to Facebook should start with as we say every position across the board no more than 3% to start and go from there.

All right and I'll say briefly about FAZ. If you're short FAZ, you could stay short well pro re up that position potentially. We're looking at several new positions right now and how those play out may dictate whether we set up a synthetic short on FAZ or not but I'm still short myself and don't plan to close it anytime soon the original thesis still stands so members can stay short FAZ if they're comfortable and happy to do so.

Billy K.: And also especially now after the recent spike of volatility you may want to not consider closing it because your short position is now ... you have a higher obligation to repay because of that volatility so if you were considering closing it wait for that volatility to die down.

Jeff: Good news on Gilead fulls anonymous is asking about it I'm sure and many of you have the same question. In the quarter just reported Gilead said that they expect the hepatitis market to stabilize this year. It had been fall in the last couple of years and revenue for it had fallen sharply due to new competition pricing declines and even volume declines so they expect it to stabilize by the second half of this year and be stable from there on out. There are no, at least in the intermediate term, there are no new competing drugs on the market, pricing has stabilized and even customer flow is stabilizing. The market was happy to hear that with Gilead and now we have to see a few quarters if it holds true and last Gilead did very well with their forecast for hepatitis C so that's promising.

The stock has rebounded a bit because of it and our current plan, I don't know if I should pre-announce it but we've talked about this morning, I've said it before on the boards I think I know I did and the recent where Pro stands part one column two I said our plan is to move it to a buy and turn it into an official buy right position where we're going to write covered calls on it and manage those as well as we can to earn income as well as keep some upside in the shares. That is short on the list and should happen fairly soon so expect to see that soon down the road. It will become our sixth active income position again targeting some upside as well ideally so hopefully we'll see stable results from Gilead this year as they expect.

Chris has a great question as well that is a tough one to answer she or he bought around 2% of their portfolios worth in SVXY around 11 do they now keep it? It's a great question. The easy answer is are you comfortable keeping a whole 2% in it. We had 2% up to 3% at one point before we learned just how quickly it could lose 80%. You have to be comfortable with potentially losing all 2% overnight because it could happen. If that doesn't feel good to you then cut it down until you are comfortable. Shave it to 1.5% then 1%, get to the point where you are comfortable. We only have 0.3% ourselves. Any thoughts you two would like to add?

J.P. Bennett: I would say my view on these type of vehicles and I guess one of the great things for working on Pro and just not a fool in general is that we all have slightly differing opinions. It's encouraged to be modest enough and have different opinions about different stocks and things like that in my view for a lot of these of vehicles especially something SVXY is to be a little bit more kind of tactical and methodical with your approach to it in terms of set up okay I want to trim back to this after I've achieved a certain measure of profits and maybe I'll cut half after I've made a certain amount and then if it falls I can add to assuming I still like it but like you said the overriding factor here before you even consider anything like that like how much or how long do I want to hold it and do stuff like that is, "Okay, am I comfortable with risking this much." because this is not a business that is compounding intrinsic value day in and day out.

This is a completely different beast and so the inherent advantages that come from buying great stocks and holding them or buying stocks of great companies and excuse me for that and holding them for extended period of time is not embedded in buying something like the SVXY and so you just have to be comfortable with knowing that the risks, the going concern risk, the risk that this position for some reason or other goes away overnight is in my opinion exponentially higher than something like Apple. Pick any company in the purport for their right any long position, any short position, this one clearly has the highest risk and so you need to take that into consideration when you're deciding the allocation size.

I don't believe having a percentage of your portfolio kind of like what we're doing right, we're not completely selling because we think okay at this point you know it makes sense and to keep at least some of it in the portfolio buying it after it's gone and absolutely you know walloped and you know that at least for right now it's still going to continue to exist that's not a bad move. That's potentially a very smart move but it all comes on the position sizing and I don't know this individual's risk tolerance, their goals for this position, their goals for investing in general and so it's really hard to give a more tailored answer than to say, "Know thyself, know what you want out of it before you decide what to do."

Jeff: It's true JP and I should add to that that my original hope for the position is not working out ... is no longer playing out. The hope was that it could rise 100% and then 200% and when it did decline it would decline 30 to 50% but then it would climb again from there so that it would over the years compound. That's why we bought this vehicle instead of shorting VXX .

J.P. Bennett: Yeah, there's definitely added advantage to doing it this way.

Jeff: Yeah, the hope was it'll grow over time. Now that we can no longer hang our hat on that and that's why we're we're ditching the whole hope that SVXY will add long term value to the port and we're looking to make up for that with new positions and set in companies that will own that can indeed compound because that's our hold back here. We want to compound our results I hope was SVXY could add to that even when it periodically declined 50% but if it can decline 80, 90%, that is just out the window that's not going to compound for us.

J.P. Bennett: I would say one other thing to consider and I haven't spent as much time because there are so many other things as earnings are doing some like that are going on that again we're giving more time to simply because of how small this is. Now it's worth reconsidering what is the risk or the odds that something like this happens again? We saw billions of dollars wiped out overnight and so you would think that the speed at which capital flows back into this type of vehicle is going to be a lot slower and so if that's the case then maybe there is an argument for us returning to your original where it slowly grinds higher and any declines even though they may be sizable or ultimately recoverable. T

hat's another thing to consider when you decide whether or not we should hold or sell it and so my kind of off the cuff guess based on not having done a ton of research on kind of the lay of the land currently is that we may be pivoting back I almost think about in terms of like bubbles or market cycles right there is clearly ... you could tell, you look at Twitter you look anywhere you could tell that kind of the volatility trade, I don't know if I want to say long in the tooth but everybody was cutting in especially the retail investor was really getting in on this and so it was definitely a quote unquote yeah, their time amusing of course this call. It was a crowded trade and everybody is piling in and as we know housing, tulips, tech, those type of environments, there are repercussions and there are ... you have consequences for that and what you've see well I can't speak of tulips because I don't know what happened after the first place but you look after housing and tech and stuff like that right there was growth that resumed after the market settled and things readjusted.

So, maybe we are getting back to that environment. Maybe we're going to look back here five years from now and be like, "Man, the single smartest decision we made it for the portfolio was not selling SVXY because that thing has come roaring back." You don't know but that is something I am actually thinking is a possibility and at least for the time being argues for holding it and maybe even adding to it. I don't know I'm not going to say did it win in one way or another but maybe we'll come to that conclusion after a month of studying and getting a better lay of the land currently.

Jeff: One thing I'm trying to get in touch with ProShares to learn how they managed it during periods of extreme volatility like we just saw because the reason they stayed alive is they didn't trade the futures in the after market hours which were just insanely off the charts and that's what killed XIV. It rolled its futures and had nothing left to roll with and ProShares held off and waited until the futures prices came back down so if they have a lot of flexibility in rolling when they want to, like if they could even wait days to roll and let the futures come back down first then SVXY will have staying power because they can just sit on their old contracts and wait they have a few months. But if they believe they need to roll each day then the risk is higher but the prospectus says they ... doesn't dictate that they need to roll each day it leaves that unclear.

That's what we're trying to clarify and who knows JP, maybe if they have some ability to keep managing it better than just a daily roll then maybe we'll like it more than we do right now. Final thing I'll say to Chris is that we invested 1.3% on day one in SVXY the report was for 1.2% but we invested a bit more because it went up and so we want to match members. Keep that in mind maybe you bring your 2% down to what we originally invested because we never added to it after that. Okay guys, we have 15 minutes left,

J.P. Bennett: Lightning round.

Jeff: Let's do lightning round so we'll try to answer every question I think we maybe can but if our answers are brief it's because of lack of time solely. Karen is asking which holdings do we think will be most affected by rising interest rates and that's positive and negative. Any thoughts to share there from either of you?

J.P. Bennett: Just quickly I would say a lot of them. The obvious examples are like NVR and housing and American Tower being a REIT and things like that but I would say a lot of the company is just in terms of pricing where there be inputs or outputs or stuff like that but this kind of gets back and hopefully I'll be able to kill two birds with one stone because I think I saw another question further down the Q talking about, "Hey, how are you guys going to adjust to this, are there any change you're going to be?" One of the things, one of the hallmarks that has been in Pro since day one, one thing I hear you say day in and day out is we want companies with pricing power. We want companies when inflation and interest rates and all those things kind of kick up it doesn't affect their business because they're able to pass through price increases with without skipping B and so the negatives are completely offset and so hopefully the goal here is that the positive dynamics behind the companies that we have invested in are going to more than offset any negatives from rising interest rates or inflation or things like that

So the answer is you know either directly or indirectly all of them but I believe or I have conviction at least that those companies will be able to kind of just continue on compounding value.

Jeff: And periods of rising interest rates don't always ultimately result in a poor stock market. Typically, the stock market does appreciate during periods of inflation and modestly rising rates. When rates soar of course stock market usually does badly. We're also looking at companies that benefit from more volatile interest rates as new potential buys. Mikey, hello Mikey is asking, "What juice do the options give the Pro port and how do you make a decision to add an option trade or not within the parameters of the North Star?"

An Update on SVXY

Published Feb 6, 2018 at 5:02PM

Dear *Pro* Fools,

Pro has always wanted to push boundaries. Our very first position in 2008 was investing in Japanese yen using a young ETF. Not long after, we used options to take positions (both long and short) on volatility via the "fear index" -- the CBOE Volatility index, or VIX -- and on brand-new VIX vehicles. All along the way, however, our core focus has been on building a strong portfolio of companies that should compound in value and carry us to success. That is still our central mission, and it's still what carries us.

Would *Pro* be *Pro* without its other, more unique positions, though? I haven't thought so. I've always believed part of the allure of *Pro* has been our willingness to go where others haven't or don't -- to sell short (an act of rebellion by itself), to wade in and buy call options instead of stocks, to set up hedges on market indexes that actually earn us money even when stocks rise. But in investing as in life, when you try new things, you're going to learn new lessons.

Remember: Many of us have been working on buying winning companies for decades, so we're fairly good at that. In *Pro*, we haven't sold a core company at a loss for years. (In fact, have we ever? I'll have to look and see. We have sold speculative stocks for a loss, but we went into those saying they were speculative.) Alongside those winners, with some new ETFs and new strategies, we've certainly had big losers.

But if we took away the losers from our approach, our winners would look different, too. Again as in life, we are what we do. Your good points and your ... less great attributes, your flaws and your virtues, they all play together to make you *you*; one side doesn't come without the other. At *Pro*, the bulk of our effort -- perhaps 90% -- is in finding great companies to drive our results. And historically about 5% goes toward finding unique, new opportunities you won't see elsewhere that may or may not work out, but that certainly expand our experience. The other 5% is dedicated to remaining humble -- and to minimizing our exposure to unknown risks in new ventures.

SVXY Update

- **Summary: ProShares VIX Short-Term Futures** (NYSEMKT: SVXY) moves to Hold.
- **Reason:** We need to reassess the staying power of the ETF following today's extreme drop in price. Any stock or ETF can go to zero, but this one is more prone to it, and all investments are about risk vs. reward. Is SVXY worth it? We need to decide again.
- **Risk and You:** While it was a 1.3% position when we bought it (and grew to about 3%), our risk is smaller than ever now: SVXY is only 0.3% of the portfolio today. Don't be anxious about that (for one thing, it does you and your body no good). Even today, as SVXY lost a majority of its value, the *Pro* portfolio is *up* on the day. For 2018 so far, we're down a mere 0.4%, and we can still work to chase our North Star this year, of course.

Background

For several reasons, in late 2014, we invested 1.3% in the ProShares VIX Short-Term Futures ETF. We wanted the benefits of being short volatility over the long term, without the risk of being called out of short shares. We also wanted a position that limited our initial risk to the amount of our small initial investment, 1.3%. And we wanted a position that could grow unhindered over time. Finally, we planned to manage it accordingly. The last factor is where we missed the mark.

By January of this year, SVXY had grown by more than 200% for us -- at its peak, it became about a 3.1% position in the portfolio. The *Pro* team recently met and discussed cutting that position basically in half. JP wanted to. Billy agreed. I said we'd do it. That was our intent, and it was next on our list of trade alerts to write. Of course, the fact that we talked about SVXY regularly but had incredibly bad luck in our final timing does not excuse the 68% loss on our investment (as of this writing). We missed a chance to sell some at a gain.

Yesterday was historic -- the largest one-day jump in the VIX ever recorded, from 17.3 to 37.3, or more than 100%. If you're a fund that shorts VIX futures, and you need to close your positions daily to reset them, you're potentially closing with zero value left. You may need to liquidate, as the **VelocityShares Daily Inverse VIX ETN** (NASDAQ: XIV) is now set to do later this month. Our holding, SVXY, is set up as an ETF, not an exchange-traded note, and it should have more staying power (part of the reason we chose it). But it isn't invulnerable. More leaps in the 100% range for the VIX could spell its end. It's not that likely. But it's possible. It always will be.

There's plenty of time to discuss the merits of investing in vehicles like this at all. I think that if we do so in small amounts, and with full explanations -- our original buy report noted that SVXY could lose all of its value very quickly -- there's still a place in *Pro* for such experiences and opportunities. We'll only get good at it if we keep at it. But it's imperative that members keep allocations small. Even now, the most anyone here should be down (if you matched us at the top of SVXY) is about 2.8% of your portfolio -- a large but recoverable amount. We lost that, too, from SVXY's peak. We'll build it back. That's what we're here for.

What matters now with SVXY, though, is what we do next. With our allocation risk now slight (0.3% of the port), we need to calmly and rationally assess what we want to do next with our stake. We have several choices:

- **Keep our shares.** They don't risk us much now, and over time, as long as volatility isn't this intense again, they should slowly recover. If we're still worried, we can consider buying puts to protect them, though that gets costly over time.
- **Sell our shares.** If volatility leaps by about 100% again in one day (until yesterday, that had never happened before), the ETF could indeed end without value. Liquidation is always a risk when shorting, and we know that risk. We could just exit now.
- **Add to our shares.** This would require high confidence that SVXY is here to stay and will operate as it should. And once we've recovered some gains, we should cut the position expediently this time.
- **Sell some shares.** Should we cut our 0.3% stake down to 0.15% and keep that much to see if it recovers and what we can learn? It's not much, but 0.3% is still real money. We might want to take some out.

As we consider these choices, and perhaps others, we've put the ETF on Hold. I believe our decision will boil down to SVXY's likely staying power, and our desire to risk our remaining capital in it -- or not.

If SVXY likely has greater staying power than currently feared, we'd be wise to stay in it and let it slowly recover. Although the instrument only started trading in 2011, data that simulates SVXY's behavior over the previous two decades shows 80% drawdowns followed by eventual recovery. One reason we bought SVXY, and used other VIX vehicles in the past, is that it isn't levered, which helps us here. And as an ETF, it should be able to continue operating. That said, though, if a VIX spike of 100% occurs again, even SVXY could be vulnerable.

In closing (for now), it's clear that any position of this sort needs to be reasonably sized. We've been saying that since 2009. But should positions like this be in the *Pro* port at all? Should we instead just focus on owning companies, traditional shorting and hedging, and standard use of options? That's something we'll have to decide together, with some time to discuss it. We have plenty of room to keep improving, and we always want to. In the short term, our SVXY position is small enough that we have some time to decide what to next. But you should still know that it could go even lower -- it could even go to nothing. We have to be comfortable with that for as long as we hold it. That's always been true. It's true of every stock on the market, but more true here, as today shows us.

To discuss SVXY, please visit its board.

Best,

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Feb. 5, 2018

Published Feb 5, 2018 at 2:11PM

Pro Guidance Changes (past two weeks; see any related trade alerts or earnings coverage):

- **Amazon.com** (NASDAQ: AMZN): The stock moves up to Best Buy Now as its financials improve and its dominance expands; our fair-value estimate (which is a much bigger guess than usual) moves up to $1,170. We have a 4.3% allocation.
- **Facebook** (NASDAQ: FB): Fair-value estimate increases to $176. The stock remains a Buy. We have a 7.9% allocation, with one-third currently collared (optional).
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $150. The stock remains a Buy. We have a 6.1% allocation.
- **OpenText** (NASDAQ: OTEX): Fair-value estimate increases to $35. The stock remains on Hold as we consider whether we're eager to keep it for at least three years or replace it with something else. This quarter was a step in the direction of keeping it.
- **Square** (NYSE: SQ): The stock moves from Best Buy Now down to Buy after appreciation and as we await earnings due Feb. 27.
- **Visa** (NYSE: V): Fair-value estimate increases to $106. The stock remains a Buy. We have a 3.4% position.

Pro Completed Trades (past two weeks; see transaction log; trades take a day to appear):

- **Facebook** (NASDAQ: FB): We set up a protective collar on about 30% of our shares, selling five March 16, 2018, $200 calls, and using the proceeds to buy five of the same-dated $170 puts (we adjusted down from $175 on price changes). We did this for a net credit of $0.43. Everyone with a collar can leave it in place. Those without one can decide whether they want to set one up now, post-earnings. You can still set ours up for a credit. The immediate uncertainty of earnings is now gone.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Lessons From the Rearview Mirror

Published Feb 5, 2018 at 1:50PM

Dear *Pro* Fools,

I'm convinced that if aliens landed on Earth and observed us, they would believe half of us were crazy. For years now, so many investors have been obsessed with the "risk" of a "correction" -- meaning a decline of 10% or more. And yet, when some downside finally appears, they seem surprised and upset by it, rather than prepared to acknowledge this as a natural part of investing. The S&P 500 has doubled since February 2012. People have been talking about corrections the whole time. If we now see a drop of 10% or even 20%, investors will still be far ahead of where they likely assumed they would be, let alone ahead of those who stayed on the sidelines. And those who use a "dip" to finally buy stocks would still be paying much higher prices than they would have earlier. But I digress.

We're not here to look ahead today. I will remind you, though, that bear markets almost always coincide with recessions, so unless a recession is around the corner, the market's current volatility is probably just a normal fluctuation rather than the start of a new bear market. We showed you how often market downdrafts occur in an October 2017 Memo called "Recessions and Declines: Face Your Fears." Drops are natural. We work to minimize their impact in *Pro*, especially when they grow to 7% and larger. We also have cash we can employ. Meanwhile, it's good to see volatility rising and options finally starting to pay more. If this persists, it will help us make more income.

Rather than keep prognosticating about the future, though, today we're going to look back at the past once more. Last week, we reviewed our 2017 performance. Today, let's discuss some lessons and reminders drawn from last year.

2017 Lessons

We had a successful 2017, with the portfolio up 21.5% -- despite some losers that reminded us of truths we had to relearn.

Even Companies You've Known for Years Can Disappoint

I've followed **AmTrust Financial Services** (NASDAQ: AFSI) since it went public in 2006 at an adjusted $3.24 per share. At its peak in October 2015, it was up more than tenfold. From the beginning, I watched AmTrust build its business by entering new markets, offering new lines of insurance, and making acquisitions. Knowing the company from Day One was a definite advantage, one that gave me confidence to stay with it when short-seller attacks first materialized about 2008 or so (after it had doubled for the first time). It went on to rise much more in the ensuing years, even as attacks escalated.

Though AmTrust is one of *Pro*'s largest realized gains, we missed out on selling most of our shares at much higher prices than we finally accepted. (We did sell some portions along the way for more.) Warnings emanated from short sellers and in the press,but none of those I watched for came to fruition. At times warning signs showed in the numbers, but I was used to seeing those numbers improve. Combined, a history of success at AmTrust perhaps made me more confident than I might have been. I thought 11 years of hard-fought results wouldn't turn foul.

But AmTrust did prove to have material weaknesses in its reporting, big ones: Results were overstated, and the business wasn't as profitable as it had said. The new valuation made the choice to sell easy. *Pro* still earned a strong return, but newer members lost money. And a lesson was relearned: Even companies you've followed for years, from Day One, can surprise and disappoint you. We like to trust our oldest friends unconditionally, but we can't treat companies the same way. That's because the people running companies vary and change, as does their temptation to cut corners. To be clear: We never slacked on AmTrust. To the contrary, we spent more time analyzing it than any other company we've owned. And yet, we missed selling before a large drop, perhaps because I was partly too optimistic. There's another lesson in that, but it cuts both ways: Sometimes being optimistic will cost you a higher sales price. But overall, being optimistic has led to our success as investors.

Bottom line: Any company can surprise or disappoint you. All get a steady critical eye from us.

Lack of Recurring Revenue Is Always a Risk

We bought **Gilead Sciences** (NASDAQ: GILD) nearly four years ago, and as it turns out, we were late to the game. True, the stock was trading at just 11 times expected earnings, and its massive Hepatitis C drug had launched mere weeks before our buy recommendation -- $21 billion in brand-new sales (a tripling) would unfold in the next two years. And yet we were late! The stock had already risen sharply even before all this new revenue arrived. We thought Wall Street was still underestimating the Hep C market opportunity, and it was; Gilead's revenue from selling its cure for Hep C exceeded early expectations. But that revenue started to waver by 2016, as patients were slower to enroll and drug prices were slashed in light of competition. The market was, in a sense, already anticipating this slowdown when we arrived on the scene in 2014.

Wall Street values recurring revenue far, far more highly than it does one-time revenue. We know this. Gilead's Hep C revenue peaked so fast that it only briefly served as a boon to the stock after the drug launched. Ironically, had the Hep C market grown more slowly and revenue kept growing with it, the stock likely would have done better, longer. But here we are, four years later, with a nearly flat stock that's on Hold. The stock is now at 9.2 times earnings, and we're seeking to write covered calls again to aim to earn our North Star this year.

Fellow biotech giant **Celgene** (NASDAQ: CELG) has also seen its stock falter. When key products (in this case drugs) lose earnings power, it's hard for a business to compensate. Companies that lack naturally recurring revenue (software subscriptions, insurance premiums, transaction-based fees) face an uphill battle to compound growth. We usually buy recurring-revenue businesses. When we don't, we know our risks are higher. Pharmaceuticals/biotech drugs face this risk.

What You Read May Eventually Influence You

Last year was the year, according to the media, that old-timey retail all but died. Those headlines and sentiments were everywhere. After weeks or months of reading about this, the idea seemed to permeate Fool analysts' chatter around the office, too. The next victims, the media story went, included auto-parts retailers. Autonomous cars, ride-sharing, electric cars, **Amazon.com** (NASDAQ: AMZN) -- all would conspire to shrink old-school auto-parts businesses, including **AutoZone** (NYSE: AZO) and *Pro* stock **O'Reilly Automotive** (NASDAQ: ORLY).

And those stocks indeed started sliding as same-store sales began to slip. We set up a protective collar to potentially sell our shares of O'Reilly at $220, and eventually did so. (Members without puts unfortunately sold much lower.) Again, we earned a strong, market-beating return on our investment, but newer members lost money. Across the Fool, most auto-parts retailers were sold from other Fool services. Today, O'Reilly's stock is $255; we're still cautious on its multiyear prospects, but the best-run retailers are not, in fact, dead -- or even dying -- yet.

When a drum is beating incessantly, you're prone to eventually start moving to its rhythm. Whether you're drawn into buying Bitcoin at $19,000, or selling a stock when the doomsday drumbeat is loudest -- as we've done a handful of times, with less-than-ideal results -- it's hard to escape others' influence. This is especially likely to happen with stocks in which you lack 100% confidence to begin with. You need to be as mindful as possible that the decision you're making is your own, not someone else's. We were at least somewhat influenced by the constant chatter -- if we didn't read the news and constant opinions in this case, I wonder if we would still own O'Reilly today? Perhaps not. We wanted to reposition the portfolio. But even so, we'll keep this lesson in mind during future media flareups around our stocks -- for example, as we've done when naysayers attack **Apple** (NASDAQ: AAPL) periodically. (No, we don't think "peak cell phone" means the end of Apple's dominance.)

Just be aware, we are all susceptible to undue, external influence. It helps to check back on why you bought a stock to begin with, and see if those reasons remain in place today.

Winners Often Keep Winning

The SEC requires mutual funds to state that "past performance is not indicative of future results." That's a sensible reminder for fund investors, but it flies in the face of reality when it comes to those who are the very best at what they do. The top investors -- Warren Buffett is the obvious example -- have had strong results for decades. And the very best companies have shown that past results *are* indicative of future results, because they go on winning. In fact, David Gardner likes to say that past results are often a great indicator of future results. In the best cases, that's true, as it was last year with **Facebook** (NASDAQ: FB) and **Broadridge** (NYSE: BR), **MasterCard** (NYSE: MA) and **Apple** (NASDAQ: AAPL), all among our Most Valuable Players last year -- *again*. As AmTrust reminds us, we must stay diligent, but we should also expect decent odds that many of our industry-leading winners will remain on top.

Shorting Is Difficult for This Reason

Risk vs. reward is *one large reason* why shorting is so difficult. When you short a stock, rewards are typically modest, while your risk is always much higher . That's why it's important not to give your shorts a long leash: When a company you've shorted may be improving, you must seriously consider closing -- or face growing consequences. We closed our **Gogo** (NASDAQ: GOGO) short at a small loss because the outlook for the business improved (briefly, it turned out); the stock is back down now. We closed **GoPro** (NASDAQ: GPRO) for the same reason: Management projected profits after a stronger quarter. We closed for a tiny gain as the shares jumped. Best to be safe, right? The stock has been cut in half since then; GoPro's turnaround is failing. Our short would have worked.

Shorting will always be difficult because you want to keep from playing chicken with a position. As soon as any business results look counter to your thesis, you typically don't want to wait around to see whether the early improvement will continue. So, you often close to be safe. However, next your thesis might play out without you. That's how shorting often goes when you're disciplined about capping your risk. To be safe, you close on an updraft of better results. That's just discipline. But then later, the company often falters again. Missing that stings.

Meanwhile, **Shake Shack's** (NYSE: SHAK) business is facing more meaningful headwinds than before, yet the stock has risen. So far, we're waiting it out, and even considering adding to the position. Unlike the two companies mentioned above, the financials here have not improved, and thus we feel we can wait; and yet, proving again how difficult shorting is, the stock is rising while we do so.

You Need to Be You

Finally, 2017 served as a good reminder that you need to be *you*! When you invest, it's an expression of yourself, and of your knowledge and comfort level. We're all different. I wanted to put **Square** (NYSE: SQ) into the portfolio. JP wanted to buy **NVR** (NYSE: NVR). Billy added **Johnson & Johnson** (NYSE: JNJ). They're three very different investments, all doing well so far, and all reflections of ourselves in various ways. You need to be you when you invest. As a team, we at *Pro* work well together. Being the best "you" means incorporating the gifts of others into what you do, too.

Please post any comments or questions on the Memo Musings board. And thank you for being a *Pro* Fool with us!

Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: Facebook and More

Published Feb 1, 2018 at 1:09PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2.3%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 2.9%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 3%.

Continue building your portfolio with our Buys, including:

- **Facebook** (NASDAQ: FB): Buy at least half of our 7.9% stake if you haven't bought yet.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **None.** Do NOT set up the protective collar on Facebook if you haven't yet. For those who have, of course, we'll manage it through official trade alerts.

Hedges:

- N/A

Upcoming Expirations:

- None imminent.

Set Up a Protective Collar on Some of Your Facebook Position

Published Jan 30, 2018 at 12:31PM

Is this for you? Any *Pro* members who own at least 200 shares of this stock, and who want to protect against downside, should consider this recommendation for some of their shares.

How You Participate

- **Action:** Set up a protective collar on **Facebook** (NASDAQ: FB).
- **Trade:** Simultaneously ...
  - **Sell to open** March 16, 2018 $200 calls.
  - **Buy to open** March 16, 2018 $175 puts.
- **Allocation:** Set up one protective collar (one of each option) for every 100 shares you want to protect. *Pro* will collar 500 of our 1,400 shares, setting up five collars. This protects 36% of our position, leaving 64% of our shares -- a 5% allocation -- uncovered, while collaring the other 2.7% that we own.
- **Price Guidance:** Use a **limit order** and initially aim to set this up for **small credit**. Prices will fluctuate as the stock moves, with the trade getting less expensive to execute if shares rise, and more expensive if the stock declines. Initially, always aim for no cost or a credit. **If prices change a lot**, it's a judgement call on your part depending on how much you want to spend; you should also consider using different strikes, rolling up or down accordingly to target no cost or credit. We will use different strikes if we need to by the time we make our trade.
- **Recent Prices (Noon ET):**
  - Sell to open March 16, 2018 $200 calls (splitting bid/ask): $3.90
  - Buy to open March 16, 2018 $175 puts: $3.60
  - Net credit: $0.30 per collar (use a **limit order**)
  - Stock: $187.60
- **Scorecard Status:** Buy. Allocation is 7.7%. Fair-value estimate is $168. We are putting a collar on 500 of our 1,400 shares, or 35.7% of our holding.
- **Special Note:** Facebook announces earnings tomorrow, Wednesday, Jan. 31, after market close, so we plan to execute our trade before that time.

What We're Thinking

We're we thinking? We're thinking we probably don't need this protection. But that's why it's called a hedge -- you're hedging an investment that you *believe* will do just fine, but that could (as always) disappoint you. In this case, we're hedging a portion of our Facebook shares (about 35% of our holding), partly because after a 600% gain it is our largest position, and partly because the company is facing a transitional year.

Management plans to spend enormous sums of money in 2018 hiring people and investing in better content controls; at the same time, Facebook is reconfiguring its "news feed" to show more content from friends and family, and less from news creators. This *may* affect advertising revenue, at least in the short term. Also weighing in our decision to be cautious is our belief in Mark Zuckerberg. Yes, our belief.

I believe Mark Zuckerberg cares more about the quality of the Facebook experience, and its reputation, than he does about near-term profits. We like this. We even believe this will eventually lead to greater long-term profits for the business. But Wall Street is rarely patient during performance hiccups if and when they occur, and Zuckerberg is not afraid to incur them for the greater good of Facebook.

We also recently bought **Tencent Holdings** (NASDAQOTH: TCEHY), a social media giant in China. It's a similar business, even if its advertisers differ. But it means we have a large investment in social media (10.7% to be exact, between these two), so a hedge on some of it makes still more sense. We have a 3% allocation to Tencent.

Returning to Facebook: Lately at $187, the stock trades at a reasonable 29 times expected earnings for the year ahead, and 47 times free cash flow. This isn't expensive for this business right now. So, once again, we don't believe we'll need this protection. But that's precisely why it's a hedge: It exists just in case. We're protecting some of our largest position against the possibility of surprise downside.

Why This Strategy?

A protective collar is friendly because it can cost little to nothing to set up (or even pay you, as in this case), yet it protects you from crazy downside. Plus, it gives the stock you cover with calls some upside before reaching the strike price of your short call. In this case, we have about 6.6% upside in the shares we're covering, and we have downside protection on these shares starting about 6.7% below the current share price. This collar could protect us into mid-March if we keep it open. Namely, it gets us through tomorrow night's earnings report and a possible update on 2018 guidance.

What happens next? If the stock stays between our strike prices, nothing. The options expire unused. If the stock falls below our long put's $175 strike price, we can sell our puts at a profit, or sell our 2.7% allocation in stock at the strike price. We would decide that at the time. Finally, if the stock rises above our short call's $200 strike price, we could let our covered shares be sold at $200, or we could close or roll the calls if we want to keep our shares (we would likely need to pay to do so). But again, most of our position continues to enjoy uncapped upside and the accompanying downside risk.

Alternative Trades

- **Own fewer than 100 shares and want protection?** You shouldn't sell a call option if you own fewer than 100 shares (because the call represents 100 shares), but if your Facebook stake is still a large enough part of your port that you want to protect it, you can buy a put option and have more protection than you need. The March 16, 2018 $175 put is lately about $3.60, so it's $360 for one put, and the stock needs to fall 6.7% just to hit your strike. You can buy this insurance if the cost is worth it to you; but you may be better off keeping your position unprotected. We still plan to be in Facebook for the long haul.
- **Own 100 shares?** You could collar all of it, but realize that's not our intention here; we're only collaring about one-third of our holdings. But it's your choice whether you want to collar all or none of your shares.
- **Just own Facebook calls or a syn long?** You can effectively collar a portion of those positions, too, if you wish. But make sure you want to go through the trouble of it.
- **Not using options?** Make sure that you're comfortable with the size of your Facebook position, and adjust if needed. The stock remains a Buy, though, and we don't plan to sell any shares unless the Facebook story changes. This hedge is a "just in case." If the story does change, we'll of course issue a trade alert with new guidance.

Pro's 2017 Results, Reviewed!

Published Jan 29, 2018 at 1:44PM

Dear *Pro* Fools,

We hope that you're feeling prosperous in every way as 2018 welcomes us. And welcome us it has, with the S&P 500 already up more than 7% to start the year, fueled by worldwide GDP growth, higher earnings, lower taxes, and -- shall we say -- some animal spirits.

We don't like to make market prognostications, because we don't like to look foolish (small f), and it's not at all necessary for successful investing. But on our weekly radio show and podcast, *Motley Fool Money*, I nonetheless made a reckless prediction in December that the stock market would gain 21% *again* in 2018. Maybe that fun, silly prediction will bear fruit? I almost hope not, though, because that gain would just be stealing from future returns.

Anyhoo! Before we contemplate the future, let's revisit the past year.

2017 Redux: $574,955 Appreciation

The *Pro* portfolio appreciated by $178,000 in 2015 and again in 2016, and last year, we tacked on another $575,000 in a 21.5% gain. We started the year about 79% net long, averaged 81%, and are currently at 86%. So our exposure to the market grew over the year, and it's currently at the highest level since our inception. We have 15% in cash.

Below, check out our five-year annual returns and our three-year annualized gains. Over the past three years, we averaged 73.8% net long, yet we're well ahead of our North Star and the major market index.

Interestingly (to a nerd like me), we can see inflation ticking up via our North Star measure, which increased by 8.2% in 2015 and 9.5% last year. That's a meaningful jump; we keep our eye on inflation.

Vehicle	2017 Return	2016 Return	2015 Return	2014 Return	2013 Return	3-Year Annualized Return
Pro	21.5%	7.3%	7.5%	17.5%	35.1%	12.3%
North Star	9.5%	9.3%	8.2%	8.5%	8.7%	8.8%
S&P 500	21.8%	12%	1.4%	13.7%	32.4%	11.3%
MSCI World	20.1%	5.3%	(2.7%)	2.9%	24.1%	6.5%

Pro Average Net Long 81%	67.7%	72.8%	74.7%	74.6%	73.8% Three-year Average Net Long

The largest contributors to our jump in 2017 were **Facebook** (NASDAQ: FB), which gained $86,000 for us; **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY) was second, gaining more than $67,000 in value; **MasterCard** (NYSE: MA) grew $57,000 and **Broadridge** (NYSE: BR) $51,000. A little position, the ProShares ETF cited above gained more than 200% to make it our second-largest dollar contributor. **Apple** (NASDAQ: AAPL) and **Paycom** (NYSE: PAYC) were four and five in our dollar winners.

But our six brand new buys last year, combined, were the real winners, scoring us unrealized capital gains of $127,737, even though they were added as the year progressed. **Amazon.com** (NASDAQ: AMZN), **Coherent** (NASDAQ: COHR), **Johnson & Johnson** (NYSE: JNJ), **NVR** (NYSE: NVR), **Square** (NYSE: SQ) and **Tencent Holdings** (NASDAQOTH: TCEHY), all new, all nicely in the green.

Our biggest money losers in 2017 were two we sold during the year, **AmTrust Financial Services** (NASDAQ: AFSI) and **O'Reilly Automotive** (NASDAQ: ORLY). The first lost more than $74,000 in value for us last year before we sold (options offset that loss by a small amount), and O'Reilly lost more than $40,000 in port value before it was sold via $220 puts. O'Reilly has bounced back from that price, but our new buys are doing even better, and we're still concerned about long-term consumer retail habits.

Net Realized Capital Gains: $305,734

We were not tax-efficient in 2017 -- just as we said we wouldn't be when the year started. We wanted to position the portfolio better for the new realities we're seeing unfold in the world, and that adjustment continues today. It means we sold some long-term holdings. We booked big gains by selling AmTrust, **Gentex** (NASDAQ: GNTX), O'Reilly, **Papa John's** (NASDAQ: PZZA), **Parexel** (NASDAQ: PRXL), and **TD Ameritrade** (NASDAQ: AMTD). We had no meaningful losers to offset this. I guess that's a "problem" we'll accept.

Dividends: $27,561

Our dividends held steady despite us selling some dividend payers, including TD Ameritrade and AmTrust (formerly our largest payer), and buying more "growthy" companies that don't pay dividends, including Amazon.com and Square. Increased dividends at our dividend payers helped, and we added Johnson & Johnson.

When you look below, remember that our dividends are down since 2015 because we sold other big payers including **The Buckle** (NYSE: BKE), **Tupperware** (NYSE: TUP), and **Wells Fargo** (NYSE: WFC). On the whole, with those sells we avoided the Buckle's undoing (sorry -- that's a bad pun, but I had to take the opportunity!).

Year	Dividends Received
2017	$27,561
2016	$27,192
2015	$32,304
2014	$25,387

Our largest absolute payers in 2016 were **American Tower** (NYSE: AMT), Apple, Broadridge, and **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) -- and J&J.

For the first time last year, we reinvested our dividends quarterly starting in April. This definitely helped our returns so far, as we bought more shares of **FactSet Research** (NYSE: FDS) (quite a jump lately, eh? Unexpected!), and WisdomTree; more Coherent and **Verisk** (NASDAQ: VRSK); and more American Tower and Johnson & Johnson. All of those additional buys are making money, as is the additional purchase we made of **Visa** (NYSE: V) in March.

We'll continue to reinvest our dividends quarterly this year, assuming we like our opportunities. Our dividends last year represented just more than a 1% yield on our starting port value for the year, though; if we want to increase this, it will need to be a conscious effort. Right now, we seek dynamic companies more than we do greater dividends.

Option Income: $15,474

Despite a very low CBOE VIX (the volatility index measure) all year long -- which drove our SVXY position up big -- we made some option income. Not a lot. But some.

Year	Option Income
2017	$15,474
2016	$21,492
2015	$16,774
2014	$7,491

Three rounds of covered calls on **Gilead Sciences** (NASDAQ: GILD) and strangles on **Verisign** (NASDAQ: VRSN) and **Skyworks Solutions** (NASDAQ: SWKS) led the way, along with a strangle on **Expeditors** (NASDAQ: EXPD) that ended last January. We also wrote puts on Gentex and diagonal calls on American Tower, among others.

Combining this income with our dividend income, we earned a 1.6% yield on the portfolio's starting value last year, despite having a good amount of cash. We would like this yield to typically be above 2% (in volatile times, very much so), but the low-VIX environment makes that tough without taking chances we don't want (or need!) to take right now.

Short Stocks: ($912) in Realized Losses and ($1,036) in Fees

We paid more than $1,000 in shorting interest fees last year, and realized a net loss on our shorts of more than $900. That damage was minimal in the rising stock market. Much of our short losses were realized in the **Domino's** (NYSE: DPZ) paired trade short, and **Gogo** (NASDAQ: GOGO) was closed at a loss, too, offset by gains earned in shorting **Caesar's** (NASDAQ: CZR), **CurrencyShares Euro Trust** (NYSEMKT: FXE), and **GoPro** (NASDAQ: GPRO).

Last year, I criticized myself for not acting on some of our shorts sooner than we did, but hoping it would work out anyway. Alas, that ended up costing us some. That said, we backed off from placing several shorts last year that have subsequently gained ground -- so we were wrong on those shorts, but right to hold off.

Takeaway: Our shorts were nearly a wash in a very strong market.

Hedges: ($41)

We set up two put ratio spreads on the **PowerShares QQQ Trust** (NASDAQ: QQQ), one of which just expired. At our original pricing in the alerts, we would have ended with a small credit for our hedges (huzzah!), but we had to pay small debits for our trades. We're not complaining -- again, we lost almost nothing on hedges last year in a strong market.

Year	**Hedge Gain (Loss)**
2017	($41)
2016	$7,950
2015	$811
2014	($34,673)

In 2014, we had direct shorts of **SPDR S&P 500** (NYSEMKT: SPY), and naturally we lost on those as the market climbed. In 2015, we wanted to improve on that approach and stuck to ratio spreads. That has helped us greatly over the past three years, keeping hedging costs down and bringing in gains in an up market. Now we are looking to evolve to other hedging approaches. Watch for a new hedging guide from us on its way to you soon.

Active, but With Moderate Long-Term Turnover

Staying steady, we issued 43 trade alerts in *Pro* last year, or nearly four per month. (We also issued 108 alerts in *Options*, making *Pro* and *Options* the most active services at the Fool. That was up from 84 alerts in *Options* the year prior. I knew it felt busy over there!)

Year	***Pro* Trade Alerts**
2017	43
2016	45
2015	43
2014	34
2013	42
2012	55

We want to keep our stock turnover low, so much of our activity is related to options, but last year we sold more long stocks than usual (six), and closed a lot of shorts early in the year. That proved smart given how the market increased, but some of our shorts that we closed still fell.

We ended the year with 23 core company investments, the same as 2016 and up from 21 in 2015. We also hold two ETFs.

Our top 10 positions currently represent 46.3% of the portfolio's value (up from 44.5% last year, and 42% in 2015). Winners often keep winning.

Biggest Lessons and Improving Again

Last year started with a lot of question marks, and with volatility in some of our top holdings. Making those sell decisions wasn't easy, but they were part and parcel of moving into companies that we believe will have tailwinds and advantages for years to come. We also sensed risk to our shorts, and closed a lot of them early. By mid-year, we were feeling better, and we focused on putting still more new companies into the portfolio; those are so far doing very well.

We can't ignore the strong market for driving prices higher. We believe we're good at recognizing companies with advantages that will hopefully carry the day through harder years, too, but right now many stocks are rising. That said, the average fund that could be long or short returned less than 10% last year according to Morningstar, and has returned only 5.5% annualized over the past three years (6.5% over the past five). We've about doubled that, and topped the S&P 500, too, by taking a stand and being mostly long -- even at just 73.8% long on average -- while hedging with minimal cost.

Now our minds are on reasonably protecting what we're building while still allowing our portfolio to grow -- we believe that good business growth is still in the cards over the next three years and beyond. This is *Pro*'s 10th year in business! But we still feel that we have a lot to achieve -- in fact, we think most of it is still ahead of us. And we need to keep evolving while still sticking to the disciplines that we know work.

Please post any comments or questions on the Memo Musings board. In closing today, thank you for being a *Pro* Fool with us! We enjoyed spending last year with you, and we thank you! Now we look forward to this year with you...

Fool on!

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Jan. 29, 2018

Published Jan 29, 2018 at 1:07PM

Pro Guidance Changes (past two weeks; see any related trade alerts or earnings coverage):

- **The Cooper Companies** (NYSE: COO): A new addition, the stock starts at a Buy on our scorecard, with a covered-call position as well.

Pro Completed Trades (past two weeks; see transaction log; trades take a day to appear):

- **The Cooper Companies:** We bought 400 shares and sold to open four May 2018 $240 calls.
- **Powershares QQQ Trust** (NASDAQ: QQQ): Our January 2018 ratio put spread expired unused.
- **Skyworks Solutions** (NASDAQ: SWKS): Our January 2018 $105 covered calls expired as income.
- **Verisign** (NASDAQ: VRSN): We rolled our January 2018 $105 calls to June 2018 $115 calls, and we sold to open new June 2018 $110 puts, recreating our covered strangle. Our January 2018 $100 puts expired as income.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Coherent, Skyworks, and More

Published Jan 25, 2018 at 2:39PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Coherent** (NASDAQ: COHR): Buy 2.5%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 3%.

Continue building your portfolio with our Buys, including:

- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.4%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2.1%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **The Cooper Companies** (NYSE: COO): Set up a covered call by selling one May $240 call for every 100 shares you purchase, per our recent alert. As of this morning this position could be set up for a net debit of $228.60, or a 5% return in 3.8 months. The recommended allocation size is 2.5%-3%, with more information on position sizing located in the "alternative trades" section of the report.

Hedges:

- N/A

Options expirations:

- None imminent.

It's All Relative

Published Jan 22, 2018 at 2:21PM

Fellow Fools,

- Is paying $700 per square foot for a given home a good deal?
- How good is my favorite football team?
- Is Apple undervalued?

How would you go about answering these questions? For many, the process would begin, and in some cases end, by attempting to assess the relative value of the item in question. How much have comparable homes sold for in that neighborhood recently? What is the current standing of my team in its division? How does Apple's valuation compare to the S&P 500 and similar tech companies?

Our brains seem to be predisposed to making comparisons, and assessing the intrinsic value of something can range from extremely difficult to just about impossible (do you know the objective intrinsic value of a Granny Smith apple? Me neither). So the fact that we reach for relative value when making decisions shouldn't come as much of a surprise. But while it's not inherently wrong, there are times when this can end up doing more harm than good.

Let's say you and five friends enter a contest in which a random group is chosen to win an undisclosed sum of money, with the prize to be arbitrarily distributed amongst the winners. Upon receiving your prize envelope in the mail one morning, you're ecstatic to open it and see a check for $10,000. "Free money! This is the best day ever!" you say to the dog. But shortly afterward, you get a call from one of your friends. You learn that they all won more than $50,000, with your best friend since grade school having won $100,000. You should have been overjoyed about winning a sizable sum of money for doing nothing more than writing your name on a piece of paper, but that night you lie awake in your bed, unable to shake the thought that you deserved more and life is a cruel, cruel mistress.

This story may be unrealistic, but when it comes to investing, the outcome is anything but. The longer a bull market lasts, the more you hear about people who've managed to generate impressive, and in some cases life-changing, returns over the span of a few years. Regardless of how respectable your own progress might be, the more you hear about other people being *more* successful, the greater the odds you'll find yourself dissatisfied with your own portfolio -- perhaps even so much so that you'll change your process to more closely mirror those who've seen such triumphs.

Just like with relative valuation, there's nothing inherently bad about attempting to learn from other successful investors. But as with most things in life, there's a catch. For the vast majority of us, investing is about tangible goals: having a comfortable retirement, putting our kids through college, buying a home, achieving financial independence, leaving our children and grandchildren with funds to pursue their dreams. For us, investing is *not* about keeping up with the Joneses down the street who got into Bitcoin early or leveraged their stock portfolio to the max in early 2009. Many of the success stories you'll hear about during extended bull markets were only made possible by the excessive risk-taking these markets tend to encourage. And for some investors, given their personal circumstances, this is exactly the right way to invest. But it's not the right way for everyone. It certainly isn't for *Pro*, and if your goals are similar to ours, it may not be for you.

In addition to potentially leaving you dissatisfied, focusing on other investors' results can make your decision-making process myopic as you spend too much time chasing similar results (and we all know the dangers of chasing historical returns). Instead, focus on your performance in relation to what *you* need to meet your goals. For *Pro*, this means any action needs to be considered in the context of whether it increases our odds of doubling our real purchasing power every 10 years, while also generating positive returns over every rolling three-year period. That is our measuring stick, our guiding light, our North Star. And while only 81% of our portfolio, on average, was in long stocks over the course of 2017, we managed to increase our lead over the North Star by a meaningful amount. That lead might be even larger if we'd been more aggressive, but we wouldn't change our approach. If the market hadn't been kind to investors in 2017, being overly aggressive could have undone all of our progress over the preceding few years.

If you haven't done so recently, the start of a new year is as good a time as any to take a moment to review your investing process and ensure you have a correct frame of reference for evaluating your performance. Investors hear a lot about thesis drift, but using the wrong reference points can bring process drift, with excessive risk-taking along for the ride. It can become ever more difficult to stay disciplined during an extended bull market, but that's often when the payoff for doing so is the biggest. Our goal is to beat the North Star, not the Joneses, and we need to ensure that we remain focused on doing exactly that.

Enjoy your week, Fools.

Pro Guidance Changes and Completed Trades: Jan. 22, 2018

Published Jan 22, 2018 at 11:46AM

Pro Guidance Changes (past two weeks; see any related trade alerts or earnings coverage):

- **The Cooper Companies** (NYSE: COO): A new addition, the stock starts at a Buy on our scorecard, with a covered-call position as well.
- **Oracle** (NYSE: ORCL): The stock moved to Best Buy Now from Buy. We have a 3.5% stake.

Pro Completed Trades (past two weeks; see transaction log; trades take a day to appear):

- **The Cooper Companies:** We bought 400 shares and sold to open four May 2018 $240 calls.
- **Powershares QQQ Trust** (NASDAQ: QQQ): Our January 2018 ratio put spread expired unused.
- **Skyworks Solutions** (NASDAQ: SWKS): Our January 2018 $105 covered calls expired as income.
- **Verisign** (NASDAQ: VRSN): We rolled our January 2018 $105 calls to June 2018 $115 calls, and we sold to open new June 2018 $110 puts, recreating our covered strangle. Our January 2018 $100 puts expired as income.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: The Cooper Companies, Oracle, Square, and More

Published Jan 18, 2018 at 2:28PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **Oracle** (NYSE: ORCL): Buy 3.5%.
- **Square** (NYSE: SQ): Buy 3.3%.

Continue building your portfolio with our Buys, including:

- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **American Tower:** If you've yet to join our diagonal call position, you can do so today by simultaneously buying ("buy to open") January 2020 $95 calls and selling ("sell to open") April 2018 $140 calls for a combined net debit of about $40.85 per diagonal call (that's $4,085). Invest about 0.7% of your *Pro* funds in this diagonal call position.
- **The Cooper Companies** (NYSE: COO): Set up a covered call, following our new trade alert.

Hedges:

- N/A

Options expirations (Jan. 19):

- **PowerShares QQQ Trust** (NASDAQ: QQQ): Our ratio put spread, put in place as a hedge, is on track to expire unused. We need do nothing.
- **Skyworks Solutions** (NASDAQ: SWKS): At current prices, our $105 covered calls are on track to expire as income, although the stock is challenging our strike price as we approach expiration. Keep an eye on Skyworks' stock price tomorrow -- we may need to take action if the stock price rises above our $105 strike price, since we want to keep our shares. We will need to "buy to close" the calls tomorrow (still earning most of the profit) if the stock price rises above $105 before the market close; we will alert you if this happens.
- **Verisign** (NASDAQ: VRSN): We are rolling our covered strangle up and out to June with this recent trade alert. Our January $100 puts are set to expire as income tomorrow.

Write Covered Calls on The Cooper Companies

Published Jan 17, 2018 at 3:03PM

Is this for you? This is for *Pro* members looking for a position that can bring them income with upside, and who have a large enough portfolio to remain properly diversified after buying at least 100 shares. For alternative trades, please see the end of the report.

How You Participate

- **Action:** Complete a "buy-write" order by simultaneously:
  - Buying shares of **The Cooper Companies** (NYSE: COO), and ...
  - Writing ("sell to open") May 2018 $240 calls.
- **Allocation:** Write ("sell to open") one call for every 100 shares you purchase, in order to establish a new 2.5% to 3% position. Here's the math for *Pro*:
  - *Pro* portfolio value: $3,401,000
  - Value of a 2.5% position: $3,401,000 x 0.025 = $85,025
  - Number of shares to be purchased, rounding to the nearest 100: $85,025/$235 = 362, rounded up to 400 shares, resulting in a 2.8% position size.
- **Price Guidance: It is imperative that you use a limit order, given the wide bid-ask spread for the May calls**. Fools should aim for a minimum yield of 1% (option premium/current price of the stock) per month to expiration; with shares at $235.14, the minimum to accept is currently is $9.50. We have a little over 4 months till expiration, so patience and limit orders are our friend here. If you don't utilize limit orders you will likely fill at a price well below this.
- **Prices** (12:40 p.m. ET):
  - Cooper Companies: $235.14
  - Sell to open May 2018 $240 calls (bid/ask): $10.30/$10.90
  - $10.60 pays 4.5% ($10.60/$235.14) in 121 days.

Why Write Covered Calls on Cooper Companies?

- Myopia, or nearsightedness, is already common. We believe it's guaranteed to become even more prevalent, in part because of environmental factors and in part because of increasingly frequent behaviors that people appear unwilling to change.
- We believe Cooper Companies, currently the third-largest contact-lens manufacturer in the world, is the best way to gain exposure to this seemingly unstoppable phenomenon, thanks to its competitive positioning within the industry.
- The contact-lens industry is attractive in its own right. Combining what we see there with Cooper's current valuation, we believe the risk/reward tradeoff from starting a position today is heavily in our favor.

What We're Thinking

They really didn't see it coming: In 2012, researchers in East and Southeast Asia were caught by surprise at the results of their study on myopia in young adults. Their data showed a likely frequency of between 80% and 90%,meaning hundreds of millions of nearsighted people in need of glasses, contacts, or corrective surgery. Worse yet, although that high rate may not (yet) be matched anywhere else in the world, this isn't just an Eastern Hemisphere phenomenon. It's currently estimated that more than 40% of all U.S. citizens are myopic, and global data suggests that about 50% of the population, or almost 5 billion people, will have the condition by 2050.

Prevalence of Myopia Estimated for Each Global Burden of Disease Region between 2000 and 2050

	2000	2010	2020	2030	2040	2050
Andean Latin America	15.2%	20.5%	28.1%	36.2%	44.0%	50.7%
Asia-Pacific, high income	46.1%	48.8%	53.4%	58.0%	62.5%	66.4%
Australasia	19.7%	27.3%	36.0%	43.8%	50.2%	55.1%

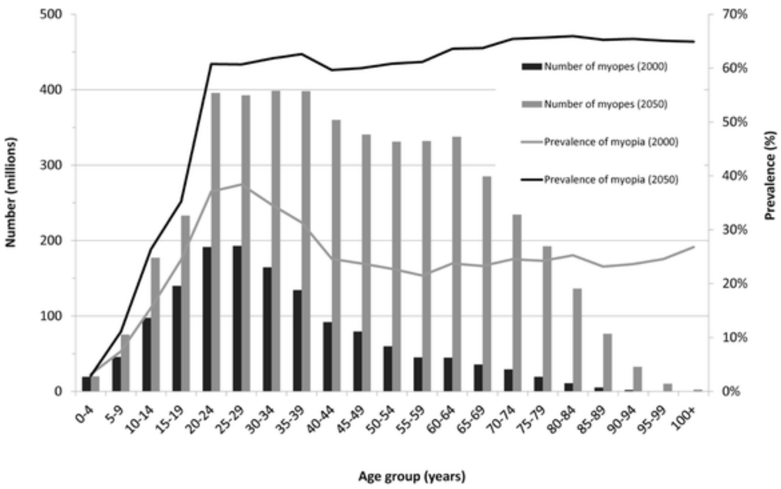
Global	22.9%	28.3%	33.9%	39.9%	45.2%	49.8%

Source: Holden BA, Fricke TR, Wilson DA, et al. (2016) *Global prevalence of myopia and high myopia and temporal trends from 2000 through 2050*.

There are some optimists out there who think this trend is reversible, but we're clear-eyed realists here at *Pro*: We think the squints are here to stay. Myopia was once thought to be largely genetic, but recent research suggests that lifestyle choices -- including spending time indoors and on electronic devices -- contribute meaningfully to the proliferation of poor eyesight around the globe, especially for young people.

Changes in the global economy over the past 20 years have resulted in people spending more time inside for both work and pleasure. (And we weren't all lumberjacks to start with: A U.S. Environmental Protection Agency study found Americans were already spending 87% of our time indoors by the mid-1990s.) And you need only to look around any public setting to see countless people with their eyeballs glued to their electronic screens. A recent 2016 survey found that 50% of teens self-reported as being "addicted" to their smartphones, likely underestimating the true rate of addiction by a meaningful margin given what we know about psychological biases.

Worse yet, as in East Asia, many regions report the highest rate of myopia among the younger generations. That means only one thing is necessary for the rate of myopia to rise: the passage of time. As the years go by, older people with better eyesight are replaced by younger ones with a higher rate of myopia, as can be seen in the following chart.



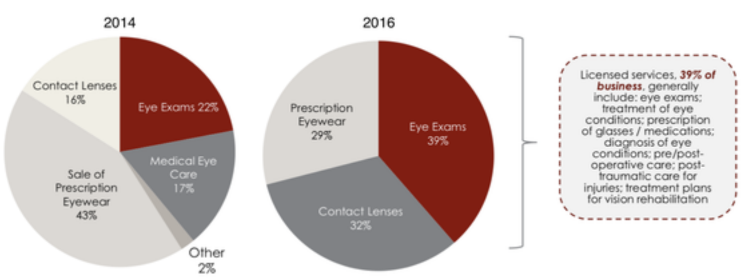
Source: Holden BA, Fricke TR, Wilson DA, et al. (2016) *Global prevalence of myopia and high myopia and temporal trends from 2000 through 2050*.

This is exactly the type of backdrop we like when writing covered calls — a slow and steady trend that seems immune to changes in the economy or stock market. And with Cooper Companies, we believe we've found something even better: a company within an attractive niche market, poised not just to ride this tailwind but to outmaneuver its competitors and continue to take share. Let's take a look at a few industry- and company-specific reasons we like Cooper in particular.

The Contact-Lens Industry

- Contact lenses are largely **recession-resistant**; yearly sales numbers go up by 4% to 6% on average, with growth only decelerating slightly, to 3%, during the worst of the global financial crisis in 2008 and 2009. Market sentiment many change during bear markets, but odds are Cooper's business will continue to compound its intrinsic value thanks to a steadily growing end market.
- With four top players controlling more than 95% of the market, this is a **classic oligopoly** -- one that has avoided pricing wars and enabled the largest players to earn excess profits. There is fear that the industry's shift away from unilateral pricing policies (which prohibited their lenses from being sold for less than a specific price, like what you see with iPhones), could spell the end of the golden age of contact-lens manufacturers. We believe this fear is misplaced, and even if it isn't, we believe Cooper is poised to profit regardless -- read on.
- Contact-lens customers are loyal; the average wearer sticks with a given brand for seven years. The big four's manufacturing advantages and customer relationships, and the slow rate of adoption of new lenses even from established brands, make for an industry where the **threat of new entrants is quite low**.
- Technological advances, and clever marketing, have resulted in a steady uptake in the adoption rates of **daily disposable lenses**, which bring anywhere from a 400% to 600% increase in annual revenue for manufacturers. Globally, only about 28% of wearers use daily lenses, and the U.S. in particular is still several-plus years away from hitting the saturation point. This shift is one reason contacts are becoming an increasingly important source of revenue for optometrists here in the U.S., expanding from 16% at the start of 2014 to 32% as of the end of 2016.

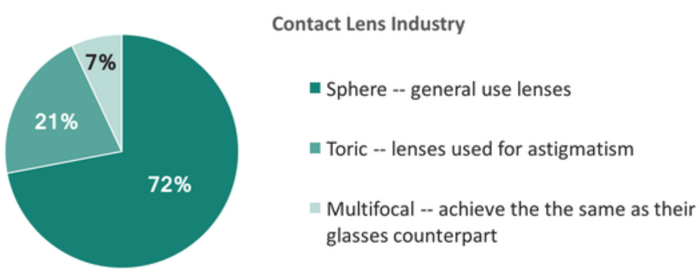
Optometrist Services Segmentation



Source: Harris Williams & Co (2015) *Vision Industry Overview*; Harris Williams & Co (2015) *Vision Industry Update*

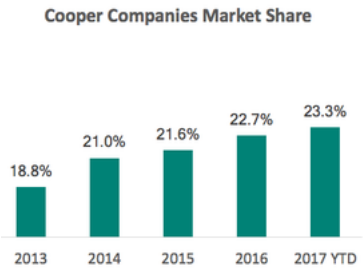
Cooper Companies In Particular

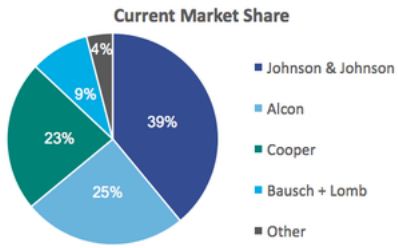
- The contact-lens market consists of three basic categories: sphere, toric, and multifocal.



Source: Cooper Companies

- Cooper is the **current market leader** in toric and multifocal lenses, which combined to account for 41% of Cooper's vision based revenue in the past quarter. Both are expected to grow at above-market rates (8% and 9%, respectively) over the next five years. Better yet (for investors, anyway), toric and multifocal lenses are 50% and 100% more expensive, respectively, than the basic spheres.
- A strong product portfolio and a smart reduction in acquisitions have helped Cooper consistently **gain share on its rivals**, many of which are part of bigger companies that are likely to be distracted by other business units.





Source: Cooper Companies

- As an example, consider silicone hydrogel, commonly considered the best material for lenses. While Cooper got off to a slow start in the space, management later invested heavily to not just catch up to its rivals but in many respects surpass them. Cooper is currently the only manufacturer offering two price tiers of daily silicone hydrogels, and the only one offering daily disposable silicone hydrogel toric and multifocal lenses. Although we've recently seen some competitors take steps to refocus on the contact-lens market and stop ceding share, we believe Cooper's strong product portfolio, accelerated investments in its sales force (despite gaining share in recent years, Cooper had lacked salespeople compared with its competitors), and customer stickiness have positioned it to **continue to take share** in the coming years.
- In addition to online retailers, independent eye-care providers (ECPs) also contend with retail chains including Visionworks, Costco Optical, Walmart Vision Center, and Lenscrafters. Independents still count for the majority of patient visits, but the chains have managed to capture an outsized slice of the revenue pie. This has forced smaller ECPs to attempt to find ways to differentiate their services, and **private-label contact lenses** are one approach. About 30% of current lens revenue comes from private-label offerings at Cooper, which was the first large manufacturer to fully embrace private labels and continues to offer the largest selection. This has helped forge strong relationships with many ECPs and boost sales of Cooper products.
- But that's not to say Cooper is choosing independent ECPs over big retailers in this battle. Take a peek at a box of Costco or Walmart **store-brand contact lenses** and there's a good chance you'll see Cooper listed as the manufacturer of those, as well. Management is pretty tight-lipped about its private-label business, but they did disclose that in 2016, margins there were actually in line with their branded offerings -- perhaps surprising, given mega-retailers' reputation for being ruthless with retailers.

Risks

Now that I've sold you on the contact-lens industry and Cooper's dominance therein, I should probably mention that Cooper Vision will only account for 75% of the company's revenue next year. The rest will come from a health-care business that is focused on providing products and services that focus on women's health, fertility, and diagnostics. Although we expect it to continue to deliver acceptable returns on invested capital, we believe the risk of a misstep is much higher in this line of business, especially since Cooper has relied heavily on acquisitions here for growth.

With the FDA having classified contacts as Class II or Class III devices since the 1970s, regulations have actually benefited the largest contact lenses manufacturers by helping dissuade new entrants. Recently; however, the call for contacts to be treated more like a commodity has become louder. Ultimately, we believe the risk is low in the intermediate term given the uniqueness of soft lenses (though they've garnered a reputation for being commodity-esque, soft lenses are all unique in terms of their polymer characteristics, ionicity, oxygen permeability, base curves, radii, thickness, moduli, and edge profiles), but any changes to the classification of contact lenses would likely be a hit to Cooper.

The *Pro* Bottom Line

Ultimately, we believe that Cooper's clear runway for steady growth for the foreseeable future makes it an ideal candidate for covered calls, and the supplemental income from those options should help our position outpace the North Star for as long as we keep it in the portfolio. And with the stock currently valued at less than 20 times forward earnings and 25 times our 2018 estimate for free cash flow, we believe the risk of permanently losing money with this position is low.

Alternative Trades

- **Want to write puts?** Currently you can write the May 2018 $230 puts for $9.7, or a 4.2% yield in 121 days.
- **Worried about remaining properly diversified?** At most, we believe you can dedicate 5% of your portfolio to this covered-call position, meaning you can follow along with this covered call as long as your portfolio is worth at least $470,000. If that's not the case for you, consider just buying 2.5% worth of shares. We believe Cooper Companies has a fighting chance to more than keep up with the North Star, but we're looking to have our cake and eat it too by generating both income *and* capital gains.

More That Matters

- **Maximum gain:** The stock's upside is capped at our written call's strike price.
- **Maximum risk:** The full stock value, minus call premiums received.
- **Follow-up:** With our calls set to expire in May, we're going to sit and watch the paint dry with this position before considering our options closer to expiration.

Pro Can Help

- **Blurry vision?** You're probably going to want to get that checked out, but if you have any Cooper-related questions, please head on over to our new Cooper Companies discussion board.

The Global Gaming Giant, Part 1

Published Jan 16, 2018 at 4:08PM

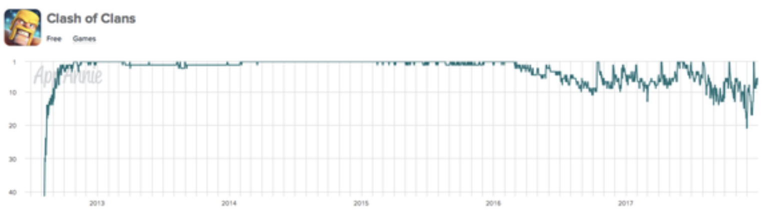
Deep Dive on Tencent: In our surveys and member communications, longer-tenured *Pro* Fools often express a desire for more educational content. So we're trying something new with our recommendation on **Tencent** (NASDAQOTH: TCEHY). Our initial alert laid out the thesis for our investment as usual and provided you with all the info you need to buy along with us. Subsequent additional pieces like this are meant to give you deeper insights into why we're investing in China for the first time in *Pro*'s history. Thoughts? We're here for you on the Memo Musings board!

The makers of the popular mobile game *Candy Crush* may have chosen to name their company "King," but there's little doubt that when it comes to video games, Tencent is the only company that can truly lay claim to the throne. In the first half of 2017, Tencent's lead over second-place Sony actually widened to more than $3.7 *billion* as Tencent's mobile gaming business continued its torrid growth (up 84% this past quarter to more than $2.75 billion).

I haven't always been glued to my phone, investment-wise. In fact, I was bearish on the mobile/social gaming industry when I first started at the Fool. Having seen several lightning-in-a-bottle mobile-game developers disappear -- and, of course, Zynga's spectacular fall from grace in 2012 -- I was convinced that the only place for this industry in *Pro* was on the short side. But when I began doing research for short ideas in earnest, I realized that my long-held opinions were in need of an update. Not only does the current industry bear little resemblance to the Wild West environment of its formative years, but a few companies appear to have cracked the code to achieving long-term success in this flourishing industry.

Long Live the King

Those bearish on Tencent like to note that countless new games are released every day, thanks to low barriers to entry. They say the mobile gaming industry is simply too volatile and too risky for a long-term investor. However, take a look at the following chart.

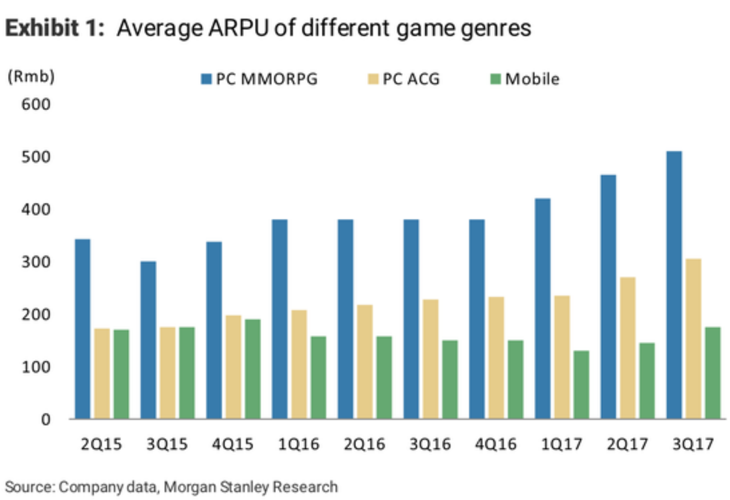


Source: App Annie

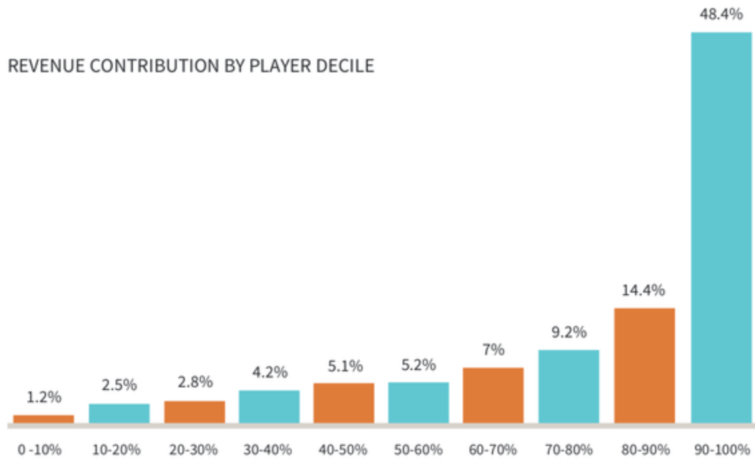
What we have here is the U.S. App Store ranking, based on gross revenue, of *Clash of Clans* (developed by Tencent-owned Supercell). Released all the way back in 2012, the app is currently ranked No. 6 for all apps in the iOS App Store and No. 2 in the Google Play store. This type of longevity is unheard of in console gaming and rare in almost any form of entertainment (quick, name any movie that spent *five years* at the top of the box office). As the industry has matured, the largest players' accrued advantages — bigger balance sheets, current player bases, access to desirable IP, distribution and marketing, etc. — have meant the mirroring of a pattern we know from console gaming, where for every one game that seemingly comes out of nowhere, we see 25 blockbusters created by top developers and/or based on proven IP. *Clash of Clans* is a poster child for this new reality in mobile gaming, one where a single hit game can have a lifespan measured in years, not weeks or months.

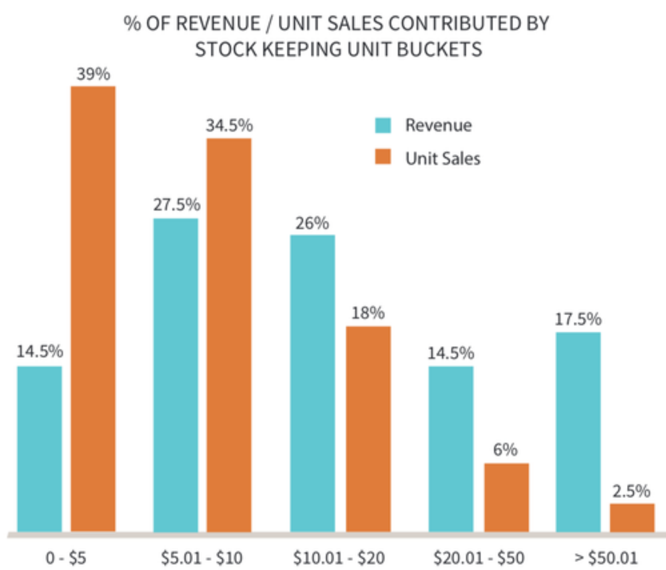
But those advantages alone don't fully explain the longevity of games like *Clash of Clans*. To really understand, you have to look at the games themselves, which arguably resemble a psychological experiment as much as they do a traditional video game. That's because consumers and the industry alike have developed a strong preference for the "freemium" (otherwise knowns as "free to play," or "F2P") business model, where games are downloaded and played for free with the option to purchase various things (cosmetic enhancements, in-game advantages, a lack of advertising) from within. In fact, only two of the current top-100-grossing gaming apps in the iOS store require you to pay to download. In general, there are two keys to success with a freemium game:

1. **You need to attract a large player base**. Publishing an F2P game is a bit like trying to find a needle in a haystack, with the needle being players who will actually spend money. A 2016 study that analyzed monetization data from 20 million mobile gamers found that only 1.9% of them actually made in-app purchases. This large percentage of people who refuse to pay is why most companies' mobile game ARPU (average revenue per user [gamer]) is lower than for other formats, such



as PC.
However, it is important to realize that a lower ARPU isn't necessarily indicative of a bad business model. The low to nonexistent marginal costs of mobile gaming give developers a great incentive to make their haystack (player base) as big as possible in hopes of finding more needles (paying players).
2. **You need to keep players coming back for more.** One of the most attractive aspects of the freemium business model for game developers is that it's a form of price discrimination: Users get to decide how much they pay. Putting the power in the consumers' hands might not sound like a smart business decision (imagine if Starbucks gave you the option to pay whatever you wanted for your favorite drink every morning), but it's one of the biggest reasons F2P games can be so lucrative. You see, some gamers have shown a willingness to spend far more than any rational developer would dream of charging for their game, more than making up for the ones who don't pay at all. Various studies have found that the top 10% of spenders tend to account for 45% to 60% of an app's total revenue (after accounting for other revenue sources, like advertising) and upwards of 75% of in-app purchases. Known as "whales" within the industry, the big spenders will often spend thousands, or in some cases millions, on a F2P game. Needless to say, the longer you can keep these gamers around, the better.



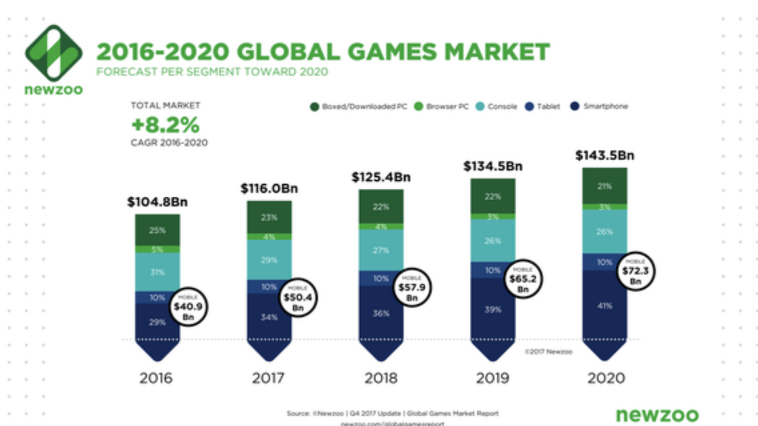


Source: swrve

But with 115 new iOS mobile gaming apps coming online *every day* in 2016 -- and low switching costs -- achieving both of these goals is extremely difficult. Developers need to create games that hook players from the start and then keep them constantly coming back. This is where the various psychological tactics come into play. Although this topic extends far beyond the scope of this Memo, the skeptic in me believes it's safe to say that many developers frequently make design choices that deliberately blur the line between fun and addiction. For those interested in reading more, here's a primer on some of the tactics used by developers. It's fascinating stuff.

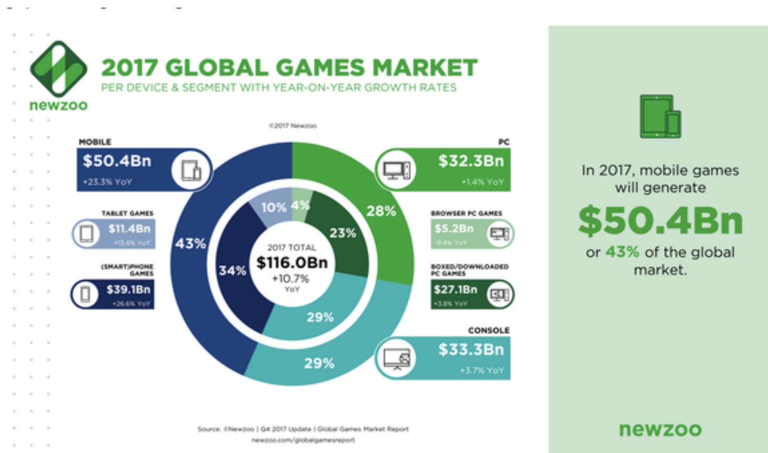
From Downloads to Dollars

Few forms of entertainment can match both the size and growth rate of video games, which generated more than 3 times the revenue of movie tickets in 2016 and are expected to see a revenue boost of 10.7%, to $116 billion, in 2017. And if you include revenues from console gaming hardware ($10 billion) and PC gaming systems and peripherals ($23 billion), gaming is actually a bigger global business than sports (which includes media rights sales, sponsorships, merchandise, and ticketing).



Source: newzoo

As with Tencent, mobile is currently leading the way for the industry as a whole. At $50.4 billion, mobile gaming currently accounts for 43% of the global gaming market, and it's likely to become the single largest contributor within the next three years. This is quite amazing when you realize that less than a decade ago, mobile gaming accounted for just 4% of total gaming revenue in the U.S. and many other countries.



Source: newzoo

But there's a lot more to like about the economics here than just robust growth. Tencent doesn't provide too many granular details, but by looking at other companies, we can get an idea of the numbers behind its biggest hits. *Candy Crush* parent King generated more than $1.9 billion in free cash flow and reported net income margins and returns on invested capital in excess of 25% and 38%, respectively, for the three years following *Candy Crush*'s launch (and before King was acquired by Activision Blizzard). And in 2016, Supercell (which Tencent now owns) reported $2.2 billion in revenue and $792 million in net income, good for a profit margin of more than 35%. With only 213 employees, that means Supercell and its four App Store offerings generated more than $10 million in revenue and almost $4 million in profits per employee in 2016, which was more than Facebook ($559,000), Apple ($394,000), Alphabet ($270,000), Microsoft ($147,000), or Fannie Mae (the Fortune 500 company with the highest profit per employee, at $1.8 million).

Most of the large pure-play video game companies are currently valued at between 6 and 7.2 times their revenue. With a strong stable of games already out and a promising pipeline for the the year ahead, we believe Tencent can generate somewhere between $18 billion and $20 billion in gaming revenue in 2018 (at current exchange rates). That translates to a valuation of $108 billion to $144 billion for the gaming business, or roughly a quarter of Tencent's current market cap. However, as we've said on multiple occasions, we believe the whole is worth more than the sum of the parts for this company, and the gaming division doesn't exist by itself. So in our next deep-dive piece on Tencent, we'll examine why Tencent has been so successful in mobile gaming, what we expect from the gaming business going forward, and what we believe the company as a whole is worth.

Enjoy your week, Fools.

--JP (TMFYossarian)

Roll Your Calls and Write New Puts on Verisign

Published Jan 11, 2018 at 3:21PM

Is this for you? This recommendation is for investors already participating in our **Verisign** (NASDAQ: VRSN) covered strangle strategy. If you lack any position, consider the Alternative Trades at the end of this report to get on board.

How You Participate

- **Assuming you own shares and strangled them as we did ...**
- **Actions:**
  - Buy to close your January 2018 $105 calls. (We're leaving our January $100 puts alone to expire next week; you could also buy to close them if the extra exposure worries you.)
  - Sell to open June $115 calls.
  - Sell to open June $110 puts.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares you own and every additional 100 shares you could buy. *Pro* has a 1.7% stake -- 500 shares -- and the strangle could potentially double that stake.
- **Price guidance:** As I write this, you would use a **limit order** and aim to roll your strangle for a **net credit of $3.15**. The stock looks likely to close above $105 by expiration Friday next week, so we need to get the trade completed before then or we'll lose our shares. We're sending the alert now because we want members to have plenty of time to act, and because most of the time value is gone from our short $105 calls. Please use a limit order, and pay as little time value as possible, to close your $105 calls. Lately, you would pay about $7.35 to $7.40, or $0.10 to $0.15 in time value.
- **Prices** (2:30 p.m. ET):
  - Stock: $112.22
  - Sell to open June $115 calls, bid/ask: $5.40/$5.60
  - Sell to open June $110 puts, bid/ask: $4.95/$5.15
  - Buy to close January $105 calls, bid/ask: $7.20/$7.50
  - Bid/ask split: Sell to open at $10.55; buy to close at $7.40. Combined **limit order** for $3.15. Inch it downward, toward $3, if that doesn't take.

What We're Thinking

Today's trade alert marks the fourth time we've rolled our covered strangle on Verisign, a global leader in Internet domain-name registry services that's mission-critical to keeping the Web up and running, since initiating the position at the end of 2016. Just keeping this position alive proved somewhat of a challenge in 2017, with the stock rising almost 50%, but we've actually managed to extract a respectable amount of income to date to go along with our capital gains. We're looking to bring in even more of both with today's roll, but please keep in mind that because they're thinly traded otherwise, Verisign's options prices can be widely affected by the volume *Pro* brings. Please use a limit order and adjust as needed.

In our previous rolling alert, we noted that we'd be happy to purchase shares at the strike price of our $100 put, which is about where we expected our fair-value estimate to close out the year. Assuming Verisign's fourth-quarter results (due out Feb. 8) are in line with our expectations, that estimate will remain accurate. That said, the stock continues to benefit from the expansion of its valuation multiple, and we as options investors find ourselves in a situation where the underlying stock price is above both our short call's strike price and our fair-value estimate.

After considering our options, we've decided to roll our position "up and out" yet again. Baring an unforeseen acceleration in the business, our 2018 **year-end** fair value for Verisign will be slightly higher than $115. This means that we can be comfortable rolling our strangle above our current fair-value estimate, because we believe our net start price for our new written puts will be below the stock's intrinsic value by year end. (This is not standard practice for us; we consider Verisign to be a unique case given the extreme stability of the business.) That said, it also means we're front-loading the position this year, looking to capture most, if not all, of our annual capital gains right out of the gate. Should the stock continue to run higher in the coming months, our plan is to either:

1. Roll the position out (not up and out, as before) to collect additional income.
2. Close down our options strategy and continue to hold the shares.
3. Let our shares get called away if we can't find an attractive rolling option and repurchasing our short calls is too costly.

Though we'd love to keep this strategy in the portfolio for years to come, No. 3 may well be the only rational choice if the market continues marching higher. We want members to be aware of this ahead of time.

The relationship of the stock price to our fair-value estimate is also why we're opting to go with June as our expiration date over March. We're not keen on paying to roll our covered strangle upward and write new puts above our current fair-value estimate when we don't have plans to chase the stock higher should it continue appreciating.

Alternative Trades

- **New to this position?** If you can afford a potential $22,200 or so in shares, buy 100 shares today and then "sell to open" the same June 2018 $110/$115 covered strangle described above (sell one call for every 100 shares now owned, and sell one put for every additional 100 shares you could buy). Using a limit order, you could lately collect about $10.55 per share in combined credits to write both options; demand a minimum of $10.55 for now.
- **New and only want to write puts?** Sell to open March 2018 $110 or June $110 puts, lately for about $3 and $5 (or a bit higher), respectively.
- **Have you previously only written covered calls?** You'll need to roll those calls, assuming you want to keep the position going. Roll them by buying to close them and selling to open the June 2016 $115 calls, lately for a net debit of about $2. That price will change as the stock moves, but you'll need to get this trade completed before next Friday or your shares will be called away. As always, sell one call for every 100 shares you own and wish to cover.
- **New and only want to write covered calls?** Use a buy/write order to buy shares in 100-round lots and simultaneously sell to open June 2018 $115 calls, selling one call for every 100 shares you buy. Lately this can be set up for a net debit of about $106.70, with initial upside of 7.7% to $115.

Pro Catch-Up Trades and Upcoming Expirations: American Tower, Coherent, and More

Published Jan 11, 2018 at 2:23PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **Coherent** (NASDAQ: COHR): Buy 2.7%.
- **Oracle** (NYSE: ORCL): Buy 3.5%.

Continue building your portfolio with our Buys, including:

- **Broadridge Financial Solutions** (NYSE: BR): Buy half of our 5.8% position to start.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.6%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **American Tower:** If you've yet to join our diagonal call position, you can do so today by simultaneously buying ("buy to open") January 2020 $95 calls and selling ("sell to open") April 2018 $140 calls for a combined net debit of about $40.50 per diagonal call (that's $4,050). Invest about 0.7% of your *Pro* funds in this diagonal call position.

Hedges:

- N/A

Options expirations (Jan. 19):

- **PowerShares QQQ Trust** (NASDAQ: QQQ): Our ratio put spread hedge is on track to expire, unused.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $105 covered calls are on track to expire as income. We may close them a bit early to be sure (depends on the stock price); if so, we'll of course issue a trade alert.
- **Verisign** (NASDAQ: VRSN): We currently need to roll the short $105 calls on our covered strangle; you should receive a trade alert from us soon.

Pro Guidance Changes and Completed Trades: Jan. 8, 2018

Published Jan 8, 2018 at 3:58PM

Pro Guidance Changes (past week; see any related trade alerts or earnings coverage):

- **Oracle** (NYSE: ORCL): The stock moves to Best Buy Now from Buy. We have a 3.5% stake.

Pro Completed Trades (past week; see transaction log; trades take a day to appear):

- N/A

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Deliberate, Patient, Optimistic

Published Jan 8, 2018 at 3:53PM

Dear Pro Member:

Welcome to 2018! We hope the new year finds you happy, feeling good, and enjoying each day.

How are we? Thank you for asking! We're great. We're here, ready for earnings season to start, assessing what we want to buy and short next, and considering other changes to make to the portfolio. Last year was only the *beginning* of our transition to owning *more* companies that we believe will have multiple tailwinds coupled with growing profitability for years to come.

Now, about our promised 2017 review: Our broker, Interactive Brokers, does not have our 2017 year-end statement ready yet, so it's not practical to review our performance in detail today, but that should occur sometime next week. But the portfolio gained 21.5% last year, well ahead of our North Star's 9.5%, and nearly tied with the S&P 500's 21.8% -- yet our portfolio averaged only 81% net long last year, so our results exceeded what could reasonably be expected (especially in a year of some notable losers).

Our North Star seeks steady results with much less volatility, rather than home runs. That said, our long-term track record of exceeding the market's total return while being only 73.5% net long on average is something we definitely aspire to continue.

Last year again rewarded investing Fools like us who follow a steady approach to *staying* invested. Our results were driven by strong gains from **Facebook** (NASDAQ: FB) and **Broadridge Financial Solutions** (NYSE: BR), from **Paycom Software** (NYSE: PAYC) and all of our new buys -- **Amazon.com** (NASDAQ: AMZN), **NVR** (NYSE: NVR), **Square** (NYSE: SQ), **Johnson & Johnson** (NYSE: JNJ), **Coherent** (NASDAQ: COHR), and already **Tencent Holdings** (NASDAQOTH: TCEHY). Plus, **Proshares Short VIX Short-Term Futures** (NYSEMKT: SVXY) climbed from $45 to $128, growing from a 1% stake to lately 3.2%. That last one helped make up for the fact that options prices are low in this time of low volatility, so we're writing relatively few options.

As we look ahead, our approach and mood are best described as "deliberate, patient, and optimistic." We don't feel *rushed* to buy or short anything. We like our portfolio. We are patiently considering new positions and strategies. We look forward to earnings and to the insights provided. We're optimistic over the coming years.

As for this year, nobody knows. But it's being reported this morning that investor bullishness has climbed to a seven-year high. Sometimes high-water marks like this can mean stocks are due to retreat or rest, because if you're bullish, you're likely already invested, so where will the new buyers come from?

But this year we also have lower tax rates on the way, most notably a much lower corporate tax rate and incentives to bring hundreds of billions of dollars currently overseas back to the U.S. That is going to fuel more share buybacks. This alone can't keep the stock market up, but is one factor to keep in mind.

What happens in the near term shouldn't matter much to any Foolish investor anyway. We want to earn steady returns, and we know that sudden, large gains in the market basically steal away from future returns. We would rather have steady results, while accepting that setbacks will occur regularly.

To continue our progress in 2018 and beyond, our strategy remains boringly the same. We're focused on buying more companies with competitive advantages and bright management that portend years of growth ahead; shorting companies that are in decline or stocks that look far overpriced; hedging market indexes against any decline; using options for enhanced exposure and income; and enjoying and reinvesting dividends.

And that's all I'll say as I keep refreshing our Interactive Brokers page for our year-end statement. We'll be back soon with our 2017 review. Fool on!

Pro Catch-Up Trades and Upcoming Expirations: Amazon, Tencent, and More

Published Jan 4, 2018 at 2:13PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Oracle** (NYSE: ORCL): Newly moves to Best Buy Now. Buy 3.5%.
- **Square** (NYSE: SQ): Buy up to 3.2%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.9%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.6%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Hedges:

- N/A

Options expirations (Jan. 19):

- **PowerShares QQQ Trust** (NASDAQ: QQQ): Our ratio put spread put in place as a hedge is on track to expire, unused.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $105 covered calls are on track to expire as income. We may close them a bit early; if so, we'll of course issue a trade alert.
- **Verisign** (NASDAQ: VRSN): We'll currently need to roll the short $105 calls on our covered strangle. We plan to do so soon, with a trade alert to you.

Roll Your Diagonal Calls on Home Depot

Published Dec 21, 2017 at 1:10PM

Is this for you? This is for all *Pro* members who wrote January 2018 $170 diagonal calls on **Home Depot** (NYSE: HD) as per our alert in October. If you have yet to establish a diagonal call position on Home Depot, or if you established a different alternate position, please see the Alternative Trades section below.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all Jan. 19, 2018, $170 written calls.
  - "Sell to open" the same number of May 18, 2018, $175 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all nine of our calls.
- **Recent Prices** (1 p.m. ET):
  - Stock: $188.39
  - Buy to close Jan. 19, 2018, $170 calls (bid/ask): $18.45/$18.85 (midpoint $18.65)
  - Sell to open May 18, 2018, $175 calls (bid/ask): $16.90/$17.40 (midpoint $17.15)
  - Net debit to roll: Approximately $1.50 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls and to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $1.50 net debit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. The January short calls still have about 30 days until expiration (and more than $0.20 of time value left), so you have some time to complete this trade. As we approach January expiration, the remaining time value on the short call will erode, but realize that if Home Depot's stock continues to rise, rolling at attractive prices may become more difficult.

What We're Thinking

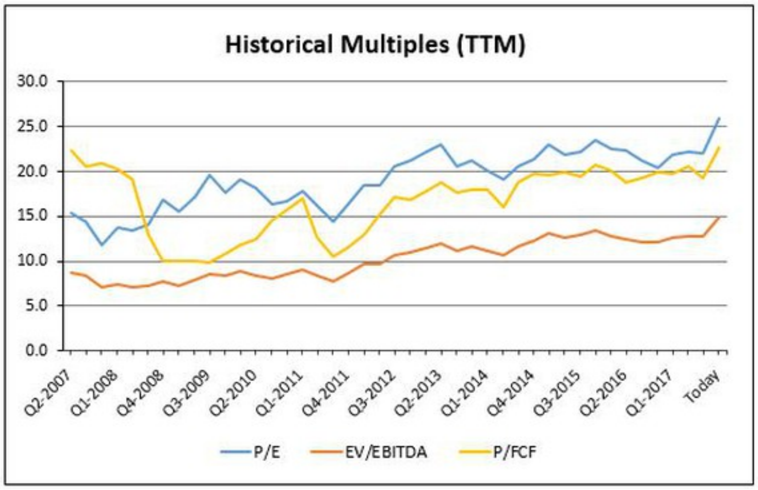
In late October, we decided to initiate a diagonal call position on Home Depot in order to target leveraged exposure to the well-run home improvement retailer. With a 13% simple return since inception if we were to close the diagonal call today, the position has so far been a success -- perhaps too much of one, in fact, as the stock has risen well above our short call and is forcing us to pay a debit to roll to keep the strategy going.

Since October, Home Depot has reported third-quarter 2017 earnings and held its 2017 Investor and Analyst Conference, outlining its long-term financial targets. Quarterly results were strong, continuing the company's momentum with 8% net revenue growth, 7.7% U.S. comparable-store sales growth, 15% earnings-per-share growth, and expanding trailing-12-month operating margins (14.5%, up from 14% in the same quarter last year). Financial targets for the longer term, through fiscal 2020, include compounded annual sales growth of 4.5% to 6%, operating margins of 14.4% to 15%, and a near-doubling of the company's investment spending, with a focus on reinvesting in the existing store base, IT and online features, and supply-chain initiatives.

In addition to Home Depot's strong business results and guidance, housing data has also been upbeat. The NAHB Housing Market index reached a level of 74 in December, the strongest reading of builder confidence since July 1999:

In addition to high levels of builder confidence, the most recent data from private residential construction (up 7.2% year-over-year), new single-family home sales (up 18.7% year-over-year), and housing starts (up 13.7% year-over-year) all suggest continued momentum in housing into 2018. As a result, the market has bid up Home

Depot shares and the company's valuation multiples have significantly expanded since we initiated our position:



Sources: S&P Global Market Intelligence, company fillings, author's calculations

Despite the rising multiples, if housing and economic momentum remain strong, Home Depot's stock should continue to do well. Given our assessment of the company's fair value and business momentum, we're content to pay to roll our diagonal calls out and up in order to capture further upside and keep the diagonal call position going. In exchange for $1.50 or so in incremental investment, we gain $5 in additional upside to our position (a 233% return on incremental capital in about four months), and we extend our expiration out to May, with the flexibility to potentially continue the position as market and business conditions dictate. As we approach May expiration, we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write January 2017 $170 covered calls?** If you wrote covered calls, you can make the same rolling trade as *Pro*, rolling your January 2018 $170 calls up and out to May 2018 $175 calls.
- **New to the position and have yet to set up a diagonal call?** Do so by simultaneously buying ("buy to open") January 2020 $120 calls and selling ("sell to open") May 2018 $185 calls for a net debit of about $59.50 per diagonal call (this price may change). Invest 1.7% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $350,000 or so you manage), and keep in mind that this position is "off-reservation" from *Pro*, so if you're not comfortable managing a position on your own, this choice might not be the best one for you.
- **Have a different position not addressed here?** Check in on the Home Depot discussion board and we will do our best to answer your questions.

Pro Can Help

- **Questions?** Ask away on the Home Depot board.

Pro Catch-Up Trades and Upcoming Expirations: Oracle, Square, and More

Published Dec 21, 2017 at 12:56PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 4%.
- **Medtronic** (NYSE: MDT): Buy 2.5%.
- **Square** (NYSE: SQ): Buy up to 3.1%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.7%.

Continue building your portfolio with our Buys, including:

- **Oracle** (NYSE: ORCL): Buy 3.5%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.5%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 1.9%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.6%.

Options:

- See today's trade alert on **Home Depot** (NYSE: HD).

Hedges:

- N/A

Options expirations (January 2018):

- **PowerShares QQQ Trust** (NASDAQ: QQQ): Our ratio put spread as a hedge is on track to expire, unused.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $105 covered calls are on track to expire as full income. We may close them early in early 2018 to capture much of the gain and have our shares uncovered for a recovery -- we're not closing the short calls now because that would book a large tax gain this year.
- **Verisign** (NASDAQ: VRSN): We'll currently need to roll the short $105 calls on our covered strangle.

A Strong Year Nears Its End

Published Dec 18, 2017 at 4:31PM

Greetings, Fools,

Sure, the stock market is up sharply this year, and the *Pro* portfolio is up more than the S&P 500. But it has still been a challenging year. We suffered hits on **AmTrust Financial Services** (NASDAQ: AFSI) and **O'Reilly Automotive** (NASDAQ: ORLY), both of which we sold (O'Reilly through a protective collar). We also decided to sell **Papa John's International** (NASDAQ: PZZA), happily at much higher prices than today's, and we also sold **TD Ameritrade** (NASDAQ: AMTD), among others.

Deciding to sell is rarely easy, but it's an especially taxing decision in a bull market. Stocks are rising, so who wants to swim the other way? But we wanted to position the portfolio for what we believe will be a better future, so we sold several holdings, and we soon bought positions in **Square** (NYSE: SQ), **Coherent** (NASDAQ: COHR), **NVR** (NYSE: NVR), **Johnson & Johnson** (NYSE: JNJ), and, more recently, **Tencent** (NASDAQOTH: TCEHY). We had bought **Amazon.com** (NASDAQ: AMZN) to start the year, too.

These are just a fraction of the investment decisions we made this year (both long and short, buying and selling). This was being done against a backdrop that I find discouraging. Living in Washington, D.C., I'm accustomed to political bickering in my backyard, but it seems as if we've been on a long slide backward when it comes to civility and rational discourse among politicians. Congress's moniker as "the Greatest Deliberative Body in the World" has become a joke on its face. Bills are being pushed through with less than zero deliberation -- without even knowing what's in them.

We've probably all watched what's happened in D.C. this year. It has likely consumed a fair amount of attention from many of us. I couldn't end the year without mentioning that it affects us here in *Pro*, too -- in this context, by testing our investing resolve and process. We only want to own superior businesses that can withstand storms of any nature and wind up larger three years from now (and beyond). Early in 2017, we reassessed all of our positions and sold ones we thought might be less than superior.

AmTrust's accounting issues called into question its return on equity and book value. TD Ameritrade had to lower its commissions again, and probably will again later (it's weathering this dynamic well so far -- in a bull market). O'Reilly faces risks with changing consumer shopping habits and, eventually beyond that, cars with fewer parts. Papa John's grew expensive and faces increasing competition in food delivery. (Politics later helped bring its stock lower, too.) We like the switches we made -- the sells and the new buys.

What's *less* fortunate is how strong the stock market has been this year. Big up years like this inevitably take away from future returns by pulling them forward. If the market drifts for a few years after this, or declines some, we need to see that as fair payment for the strong gains we've seen this year and in the many years preceding it. At *Pro*, we'll seek to ride out fallow periods with much more option income, with shorts and hedges (some of which we can take on quickly and in large size), and by owning companies that still grow. And we may now be nearing the point where we're ready to short and hedge more; as more of our stocks start to trade at earnings and free cash flow multiples closer to 30 than 20, the clarion call of hedging to get defensive sounds ever louder.

As for broader U.S. and worldwide trends: The lower corporate taxes that might be coming can't hurt companies' bottom lines, but investors have likely priced that news into stocks already. Expanding GDP around the world is a definite plus -- may it continue. Earnings growth this year is finally less than anemic for many U.S. companies. Interest rates are still low and will remain very low in Europe and elsewhere for years to come. Against this backdrop, we have millennials -- the largest generation ever, surpassing baby boomers -- reaching the ages where it's typical to start families and buy homes (in other words, spend a lot). And boomers are retiring.

Review of 2017 Coming

But before we try to look ahead, we'll soon look back. In early 2018, we'll review *Pro's* 2017 performance and see where our gains came from. We've had some laggards, and we've had some positions carry more than their weight. We've avoided big losers in shorts except one -- **Shake Shack** (NYSE: SHAK) -- but we're not done shorting. We've just waited in this environment. Before that review, though, we bid you a wonderful holiday break. Between Dec. 24 and Jan. 1, The Motley Fool does not publish except in cases of trading emergencies, so *Pro* plans to go quiet starting next week. Enjoy your break! And we look forward to seeing you very soon in 2018.

Meanwhile, everyone here at *Pro* and at The Motley Fool **thanks you again** for your continued trust in us. We're a fun place, and we get to wake up every day thinking of ways to invest smarter, and to serve you better. We're grateful for that opportunity that you bestow upon us.

As always, to share any thoughts, please visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Dec. 18, 2017

Published Dec 18, 2017 at 4:06PM

Pro Guidance Changes (from past two weeks; see any related trade alerts or earnings coverage):

- **Broadridge** (NYSE: BR): Fair-value estimate increases to $79. The stock moves from Best Buy Now to Buy on valuation.

Pro Completed Trades (past week; see transaction log; trades take a day to appear):

- **American Tower** (NYSE: AMT): We bought 24 more shares at $143.53, bringing our stake to 4%.
- **Johnson & Johnson** (NYSE: JNJ): We bought 24 more shares at $140.82, bringing our stake to 3.1%.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: American Tower, Johnson & Johnson, and More

Published Dec 14, 2017 at 2:01PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 4.1%.

Broadridge Updates Its 3-Year Growth Objectives

Published Dec 12, 2017 at 3:12PM

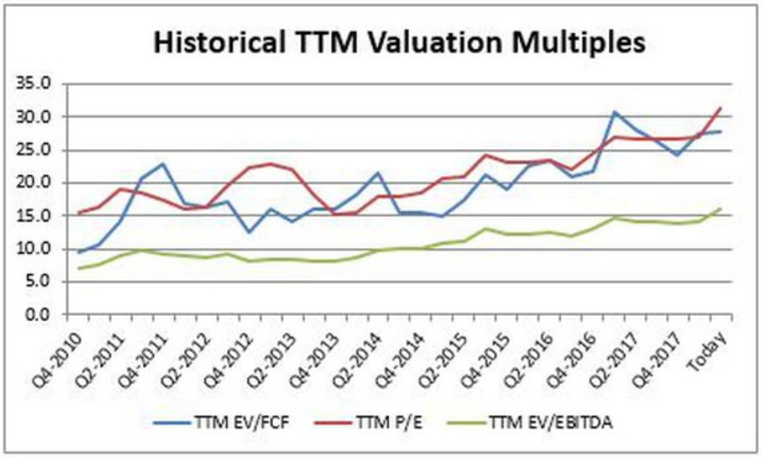
Fiscal Q1 2018

- Recurring fee revenue growth (year over year): Up 6% to $548 million
- Closed sales growth (year over year): +6% to $23 million
- EPS growth (year over year): +52% to $0.42

Now that **Broadridge** (NYSE: BR) has fully lapped its significant acquisition of DST's North American Customer Communications (NACC) business, the company is poised for continued growth into Fiscal 2018 and beyond. Our provider of investor communications continues to expand at a steady pace and produce significant amounts of cash flow from a capital-light asset base. Companywide margins are improving after a temporary depression due to the NACC acquisition, and margins should expand over time as the acquisition is integrated and operational synergies are achieved. Management has released their Fiscal 2017-Fiscal 2020 expectations, with 7%-9% annual growth in recurring fee revenue, about 50 basis points of operating margin expansion per year, and 9%-13% annual earnings-per-share growth over the next three years. We believe these expectations are reasonable and Broadridge is well positioned to continue to achieve North Star-like returns over at least the next three years.

- **Updated guidance**: Buy (from Best Buy Now)
- **Recommended allocation**: 5.8%
- **Fair-value estimate**: $79 (from $77)
- **Current price:** $89.80

Based on management's guidance, at $89.80 per share, the stock is priced at about 28 times projected 2018 cash flow and 28 times projected 2018 GAAP earnings per share. Both of these valuation metrics are elevated relative to the company's history:



After incorporating Fiscal Q1 2018 results and updating our valuation to account for the company's new three year growth objectives, **our fair-value estimate increases to $79 per share (from $77)**. The stock is up 10% since our last guidance update about two months ago, valuation multiples have expanded (as you can see in the graph above), and the current price sits nearly 14% above our newly updated fair-value estimate. As such, **we're moving Broadridge back to Buy (from Best Buy Now)** on our scorecard.

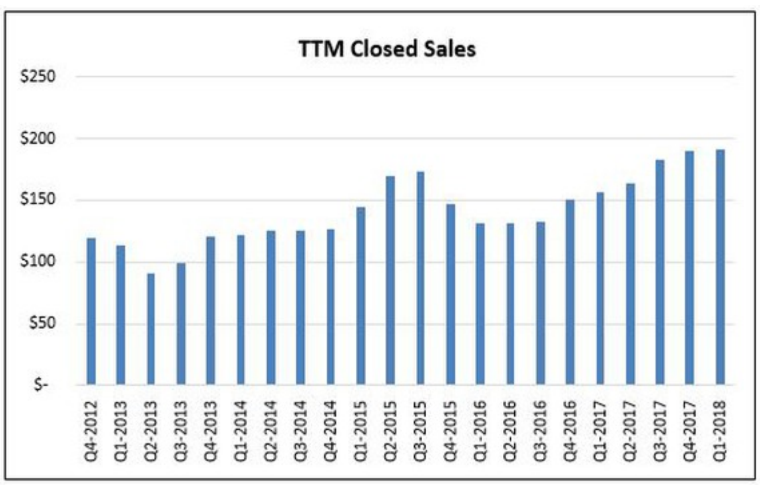
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue (augmented by tuck-in acquisitions), slight operating leverage, plenty of free cash flow, and a growing stream of dividends and share repurchases to help achieve North Star-like returns.

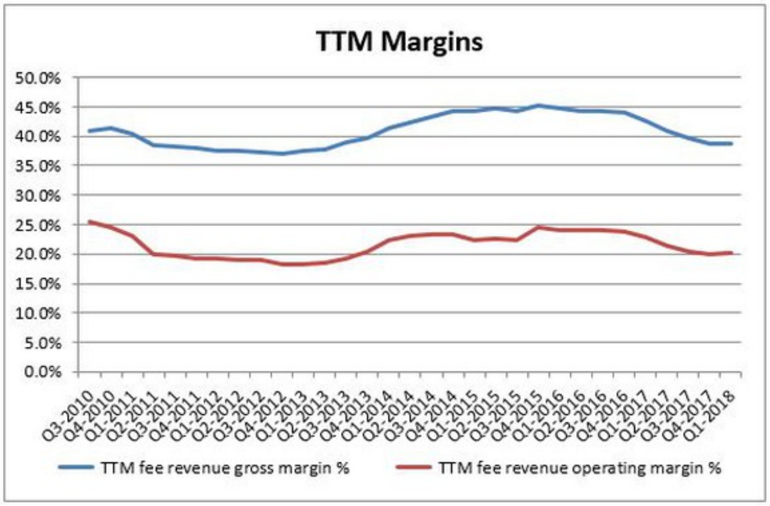
The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

Broadridge started Fiscal 2018 with $23 million in closed sales for the first quarter, up 4.5% from last year. Management's guidance for closed sales for Fiscal 2018 is $170 million to $210 million, and closed sales for the first quarter puts Broadridge on track to meet guidance (closed sales is historically weighted more heavily toward the back half of the fiscal year). The company beat the high end of its guidance for closed sales in Fiscal 2017, and we'll see if the company is able to repeat that performance in 2018.

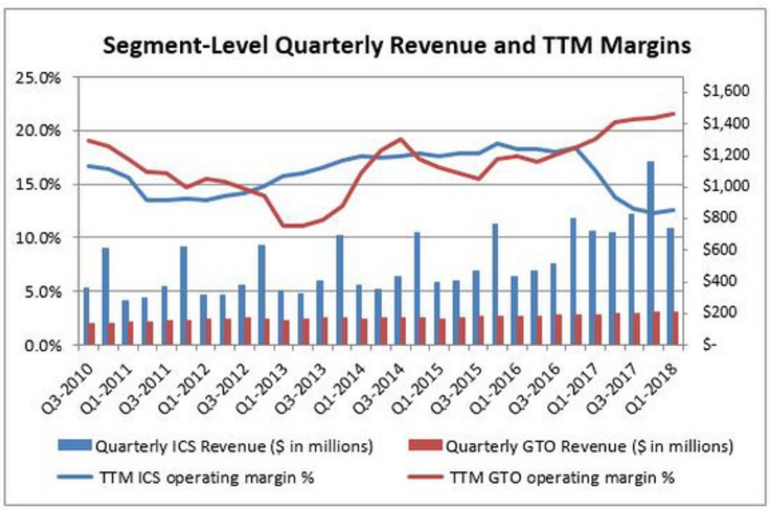


2) Fee Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 38.7% (down significantly from 42.5% a year ago), and TTM fee revenue operating margins came in at 20.2% (down from from 22.9% a year ago):



The reason for the decline in margins is the 2016 NACC acquisition. That business has a lower margin profile than Broadridge's legacy businesses, and it represents about 30% of total companywide revenue, so it drags down the margin profile overall. However, Broadridge should be able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency. I mentioned last quarter that now that we've fully lapped the acquisition, we should hopefully start to see margin expansion as we progress through Fiscal 2018, and that's what we started to see this quarter as TTM margins bottomed out and the company experienced expanding operating margins on a quarter-over-quarter basis (20.2% in Q1-2018 vs. 19.9% in Q4-2017).

When looking at Broadridge's separate divisions, we can see that the non-NACC business is doing quite well. While the Investor Communications Solutions (ICS) business has seen significantly lower (though improving) margins because of the acquisition, the Global Technology Operations (GTO) business has shown strong margin expansion, generating a record TTM operating margin of 21.6%:



We'll want to monitor the ICS division's margins (expecting longer-term margin expansion as we progress through fiscal 2018 and beyond) to make sure the NACC integration is on track, and we also want to watch GTO to see whether recent margin expansion trends continue.

3. Capital Allocation: In Broadridge's last Investor Day presentation in 2014, the company outlined plans for Fiscal 2015 to Fiscal 2017 to target a 45% dividend payout ratio, to increase levels of share repurchases, and to target $400-$600 million in tuck-in acquisitions to drive growth. Now that Fiscal 2017 is in the books, we can see that the company achieved its objectives:

- Total dividends of $3.60 per share between 2015-2017 vs. $7.59 in earnings per share, a 47% dividend payout ratio
- 12 acquisitions with a total spend of about $800 million
- $764 million spent on share repurchases (vs. $420 million the three years prior), reducing the share count by 4.1%

With the company's recent Investor Day presentation from last week, we got a detailed update on how management plans to allocate capital between Fiscal 2017 and Fiscal 2020: targeting a 45% dividend payout ratio, and using up to $1.4 billion in incremental debt capacity and expected free cash flow for share repurchases and merger & acquisition activity. Based on these capital allocation plans, we expect to see further share repurchases and tuck-in acquisitions over the next three years to help augment Broadridge's relatively slow organic growth.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring organic revenue growth (augmented by tuck-in acquisitions) to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Pro Guidance Changes and Completed Trades: Dec. 11, 2017

Published Dec 11, 2017 at 3:34PM

Pro Guidance Changes (from past two weeks; see any related trade alerts or earnings coverage):

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $146. The stock remains a Best Buy Now.

Pro Completed Trades (past week; see transaction log; trades take a day to appear):

- **American Tower**: We bought 24 more shares at $143.53, bringing our stake to 4%.
- **Johnson & Johnson** (NYSE: JNJ): We bought 24 more shares at $140.82, bringing our stake to 3.1%.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Coherent, Skyworks, and More

Published Dec 7, 2017 at 1:18PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.7%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **Medtronic** (NYSE: MDT): Buy 2.5%.
- **Square** (NYSE: SQ): Buy up to 3.4%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.6%.

Continue building your portfolio with our Buys, including:

- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.6%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS).

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.6%, but as said last week, too, realize that this company is hitting new 52-week highs, and that momentum may continue for a while, so be comfortable with that or wait and see. We are considering adding to our short once it settles down.

Options:

- N/A

Hedges:

- N/A

Options expirations:

- None until January.

Buy (More) American Tower and Johnson & Johnson

Published Dec 4, 2017 at 3:03PM

Is this for you? This recommendation is for all *Pro* members who have year-to-date dividends to reinvest, or who have ample cash to make a small additional investment and want to match us.

How You Participate

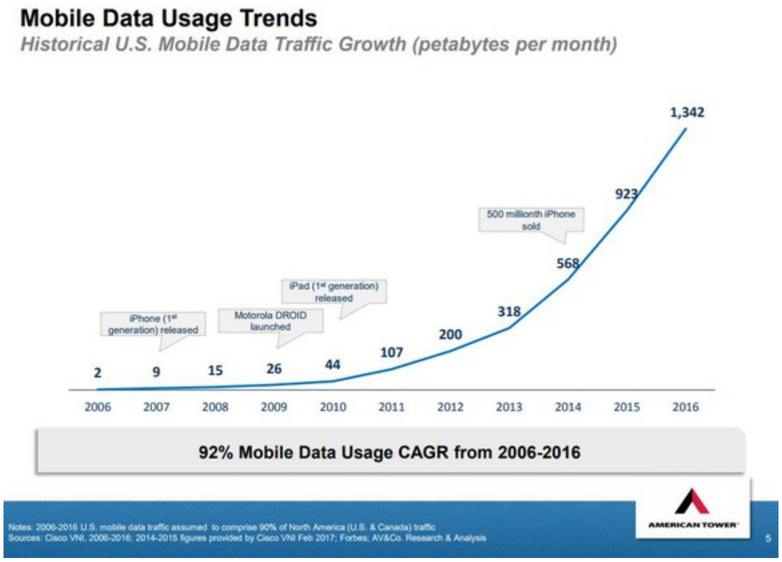
- **Action and Allocation:** Buy 0.1% more in **American Tower** (NYSE: AMT) and 0.1% more in **Johnson & Johnson** (NYSE: JNJ), raising these positions to a 4% and 3.2% allocation, respectively. At recent prices, *Pro* will buy about 24 more shares of American Tower and about 24 more shares of Johnson & Johnson.
- **Price Guidance:** Use a **limit order** at the prices available when you place your order. We'll buy in the next one to 30 days.
- **Price Ranges (Dec. 4):**
  - AMT: $140.03-$144.39
  - JNJ: $139.30-$141.50
- **Guidance:** Both are rated Best Buy Now; American Tower's fair-value estimate is $146, and Johnson & Johnson's is $137.

What We're Thinking

This is now the third quarter in which we're reinvesting our dividends when we see incremental purchases we're happy to make. This is always assuming we'll still be comfortable with our cash balance post-investment, which in this case we will; we have plenty of cash today at about 16% (ex-shorts), and we can afford to invest the net dividends we've collected since our last reinvestment in April. In the third quarter (July, August, September), we collected $6,616 total in net new dividends that we're now going to reinvest. This time around, we're targeting two stocks that have experienced fair-value increases post-earnings. Here's what we're thinking.

American Tower

Since its inclusion in the *Pro* portfolio in 2013, American Tower has been one of our most consistent companies, generating business performance that aligns with our investing thesis and valuation expectations. One needs only to read our quarterly updates over the past three to four years to to see that the business has been phenomenally consistent with its strategy, growth plans, and execution. We saw much of the same in third-quarter 2017, with American Tower reporting organic growth of 6.3% in the U.S. and 9.3% internationally. Notably, the company's U.S. growth was supported by the widespread adoption of unlimited data plans among subscribers of all four national mobile operators, which clearly indicates U.S. consumer demand for increased data consumption. This should directly benefit American Tower as the wireless carriers continue to invest in their networks to meet that demand for data:



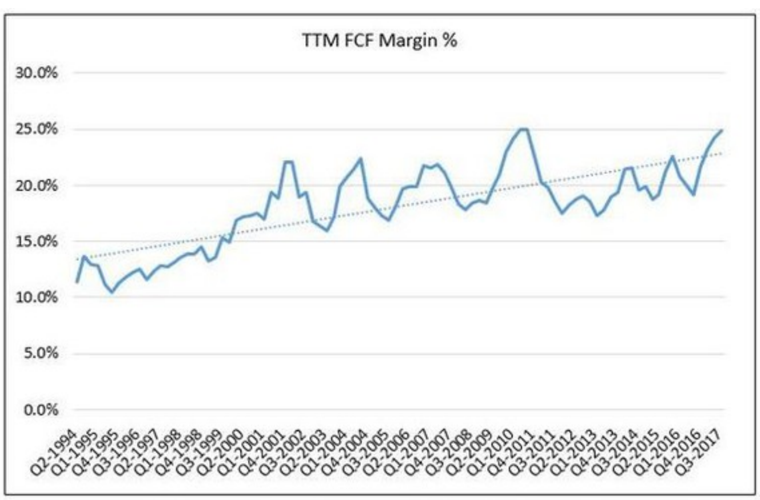
Margins are increasing in American Tower's U.S. business as it continues to integrate and lease up lower-margin towers acquired in 2015 from Verizon. Management has also maintained its focus on expanding internationally (e.g., a recent acquisition of 20,000 sites in India), which we like because international growth should be higher than U.S. growth over the short, medium, *and* long terms. We have a favorable view of the leadership team, led by 56-year-old CEO Jim Taiclet, who has been with the company since 2001 and has been named to the *Harvard Business Review*'s list of "The 100 Best-Performing CEOs in the World" for six consecutive years. We expect that the company will continue to invest selectively overseas and slowly increase margins both within the U.S. and abroad. In the meantime, we will continue to benefit from dividends and capital appreciation as sales and cash flow keep growing consistently over time. The stock is rated Best Buy Now, and we recently increased our fair-value estimate to $146 per share.

Johnson & Johnson

This is our first addition to this position, which was initiated in February and has returned roughly 15% (not including dividends) so far in less than 10 months, well outpacing our North Star over that short time frame. Our original write-up and investment thesis on Johnson & Johnson focused on how well the company fit our eight-point *Pro* Quality Checklist, and at 8 out of 8 qualities, JNJ is a quintessential *Pro*-quality stock. Since February, the business has performed well, which in part explains the stock-price appreciation we've experienced.

Accelerating revenue growth in the third quarter was driven by the company's $30 billion acquisition of Actelion and its suite of pulmonary hypertension drugs. The company beat analyst expectations on sales and earnings, and management raised 2017 guidance in response to the strong performance. Sales growth in the quarter was the highest reported since the fourth quarter of 2007, and the pharmaceutical division benefited from the Actelion drug portfolio and from promising growth of some newer drugs (Darzalex and Imbruvica) in the oncology market. This division continues to be a potential source of upside, with JNJ's strong pipeline set to help offset declines in older drug products over the medium to long term.

Management is also doing a good job managing expenses; the company's free cash flow margin is rising, meaning more dollars are available to distribute back to shareholders via ongoing stock buybacks and dividends:



We expect to continue to benefit from JNJ's healthy 2.4% dividend yield, modest earnings growth, and consistent stock buybacks. The stock is rated Best Buy Now, and we recently increased our fair-value estimate to $137. JNJ is one of the safest stocks in the *Pro* portfolio, and while we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk.

The Foolish Bottom Line

As we reinvest each quarter to take advantage of the long-term benefits doing so will provide, we plan to pay at least a bit of heed to the fact that much is unknowable. Though what we're doing isn't "auto-reinvestment," in some senses we want it to be *like* that. We don't want to overthink it -- we want to think just enough. Nudge these two positions up by about 0.1% each if you have dividends you want to reinvest or more than ample cash and want to follow along. Helping to make this economically feasible, our trading commissions at Interactive Brokers are very low. Hopefully, given the commission wars going on, yours are, too. Fool on!

The Last Time We Were Here

Published Dec 4, 2017 at 2:55PM

Fellow Fools,

Thirty-six percent.

That's the premium the S&P 500 was fetching on a P/E basis this past Friday, compared with its July 2007 peak. A little more than ten years ago, that peak was the beginning of a 57% slide over the next year and a half. So if we're more than a third above that now, it's probably safe to say that now is the right time to batten down the hatches and completely hedge out the *Pro* portfolio, right?

Patterns. Patterns Everywhere

Burton Malkiel, the economist most famous for his work on "random walks" and the efficient market hypothesis, once showed a stock chart to one of his friends who practiced technical analysis. The friend's response was enthusiastic, to put it mildly:

> [He] practically jumped out of his skin. "What is this company?" he exclaimed. "We've got to buy immediately. This pattern's a classic. There's no question the stock will be up 15 points next week."

The only problem? There was no underlying stock. The chart had been produced by Malkiel's students simply by flipping a coin; if it landed on heads, they'd mark the stock as rising by half a point, and tails was the reverse.

Pattern recognition makes a lot of sense from an evolutionary perspective ("The last time I tried to get a drink out of this river, that hippo over there tried to maul me, so I think I'll go a little farther downstream before I try that again"). And it provides modern humans with a ton of everyday utility, too, helping us to learn faster, reducing mental strain, and freeing up cognitive capacity so we can deal with simultaneous stimuli. However, when it comes to investing, I'd argue that pattern recognition may in fact do more harm than good.

And that's not just with respect to technical analysis. Sure, pattern recognition can help identify common traits among successful investments, streamlining the process for finding new ideas. But this can lead investors to place too much importance on one or two factors while turning a blind eye to critical differences. It also helps explain why so many investors love backtesting and drawing conclusions based on comparing the current state of affairs with various points in history.

Mining for Headlines

And that's the reason for today's Memo. Recently, I've noticed a resurgence in commentaries featuring lines like the one I led with above: "We're now at levels not seen since right before the XXX bear market!" These pieces frequently end with the author suggesting that some type of meaningful decline is imminent, but I've always found this logic to be puzzling, given the sample size.

Think about it: Since 1980, we've seen a whopping total of four bear markets in the S&P 500. Would you be willing to fly in a new kind of commercial plane if it had only been through four hours of test flights? (Currently, the requirement is 4,000-5,000.) Would you be willing to try a new medicine with potentially harmful side effects if its clinical trials only required four participants before receiving approval? Would you claim to know the political leanings of a country as large as the U.S. after sampling four citizens? Extenuating circumstances (you're a daredevil, you're ill and not currently being treated) aside, I'm willing to bet your answers to those questions would range from "no" to "are you out of your mind?!" So why would you make investment decisions based on a handful of valuation data points from the past? That's especially important because the number of variables that are *different* between now and a given historical reference point vastly outweighs the number that are similar. Commentaries with these comparisons make for great headlines, but statistically speaking, they simply don't hold up.

Comparing a single data point (today's P/E) with one or two reference points in the past makes for a great headline, but without context, it says almost nothing about whether the current market is under-, fairly, or overvalued. It's tempting to want the market's fair value to adhere to some kind of simple rule -- say, a P/E less than 17 means something is undervalued, between 17 and 20 means fairly valued, and higher than 20 means overvalued. But in reality, fair value is based on the interplay of a myriad of factors, including the U.S economy, the global economy, labor participation and productivity, index composition, company profitability and growth runways, dividend yields and reinvestment rates, buybacks, interest rates, bond yields, fiscal policy, the industries of the constituents of the index, fund flows, preference for active vs. passive investments, retail investor sentiment, institutional investor sentiment, government investments in equities, and monetary policy ... just to name a few.

Pro's Take

The point of today's Memo isn't to predict smooth market sailing for the foreseeable future. In the current environment, both bulls and bears can make coherent and convincing arguments for either stance. To us, this means *Pro* should adopt a somewhat cautious approach, while of course remaining optimistic about the long-term opportunities in investing in best-of-breed businesses trading at fair valuations.

Rather, we hope that today's Memo will serve as a reminder to never let yourself be swayed by a headline or single data point. Because truth be told, the last time the market was trading at a valuation similar to last Friday's wasn't right before the last bear market that began over 10 years ago. The S&P 500 has actually been trading in a valuation range similar to today's since late April of 2016. That means that any investor who was swayed by articles calling for a market decline the first time we returned to the current valuation range, more than 19 months ago, has completely missed out on the 26% rally in the market -- a rally that has been especially kind to winning *Pro* businesses including Amazon, American Tower, Apple, NVR, Paycom and Visa.

Have a great week, Fools.

-- JP (TMFYossarian)

Hedges:

- N/A

Options expirations:

- None until January.

What's Your Exposure?

Published Nov 27, 2017 at 1:54PM

Greetings, Fools,

We hope you had an excellent weekend! For today's Memo, I'll get right to the point: market exposure.

When we talk about our returns, it makes the most sense to talk about them in relation to how "net" invested we are in stocks. As a long/short portfolio, *Pro* can always be as long or as short as we wish, and we can change our market exposure all but instantly if we like. For example, by selling short a giant stake in the **SPDR S&P 500 Depository Receipts** (NYSEMKT: SPY), we could offset all of our other exposure to long stocks, basically turning market-neutral in a day. Will we ever do that? I would be surprised if we *didn't* at some point. Sometimes you want to be neutral, but without selling anything you own.

Since our inception, though, we've taken a much more bullish approach. We found it ironic that hedge funds at large were remaining market-neutral *after* the epic 2008-2009 meltdown, at a time when it made much more sense to us to steadily invest in beaten-down stocks. So we did. And for all these years, every quarter, if not all the time, we've been considering *shorting* more stocks, too, though in the end we've rarely been compelled to short or hedge all that much. Judging by market history, that'll change someday.

Instead, we've sought to be about 70% net long and still earn strong returns -- ideally our North Star (inflation plus 7% per year) or more. The rising stock market has put us far past our North Star, but we've also been able to do much better than the S&P 500 index despite our much more conservative exposure. If we're 70% net long and the market rises 100%, you should expect us to rise only about 70% -- unless we're above-average stock pickers.

Fortunately, we've risen more than 100%, in this example, and more than the market since inception. In fact, with only about 74% net exposure, we've actually earned about 115% of the market's total return.

Below is our average, historic market exposure since January 2012 -- so over nearly six years. Unfortunately, I didn't track these numbers until then, and our change of brokers midstream makes recreating our past a more arduous task than we have time for at the moment. Suffice it to say that in our early years, from 2009 through 2011, we were *less* invested than we were in 2012 and beyond -- we were still building then. By 2012, we finally became more than 90% invested (long) on average, and 70% net long.

Year	Average Net Long exposure	Average Long Exposure	Average Short Exposure
2012	70.1%	90.9%	21.2%
2013	71.1%	84.3%	11.4%
2014	74.6%	86.1%	10.9%
2015	74.7%	86.9%	17.6%
2016	67.7%	81%	14.6%
2017 YTD	81%	84.6%	4.7%
Average	**73.5%**	**85.6%**	**13.4%**

Over this history, our average gross exposure (longs plus shorts) has been 99.8% (again, by design). But it's our net long exposure that tells us how invested (or exposed) we were in long stocks, and that has averaged 73.5%. Including positions that were hedged out by in-the-money covered calls, that drops to an average of 71%.

By the way, it may appear that we have not hedged or shorted much at all in 2017, but do note that we've been carrying a put ratio spread all this time. Sized at about 15% of the portfolio to begin with, this position would bring our short exposure much higher if the market were to fall significantly. Stocks have risen so much, however, that our option strikes are far out-of-the money, so we don't count the position as short exposure until that changes. That position expires in January.

Overall, it gives us great pleasure and some Foolish pride to earn these returns for you, our members, while keeping our exposure, and thus risk, lower than average. That should help us in downturns, too.

To discuss, please visit the Memo Musings board.

Fool on!

Pro Guidance Changes and Completed Trades: Nov. 27, 2017

Published Nov 27, 2017 at 11:47AM

Pro Guidance Changes (from past two weeks; see any related trade alerts or earnings coverage):

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $146. The stock remains a Best Buy Now.
- **FactSet Research** (NYSE: FDS): Fair-value estimate increases to $187. The stock remains a Buy.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $128; the stock remains a Buy.
- **OpenText** (NASDAQ: OTEX): Our fair-value estimate increases to $33, but the stock moves to Hold for now. Confidence has ebbed that we'll keep our investment at least another three years, although we still hope to have reason to.
- **Paycom** (NYSE: PAYC): Fair-value estimate increases to $61. The company remains a Buy, despite trading well above that.
- **Shake Shack** (NYSE: SHAK): The stock remains a Short, and our fair-value estimate is set to $26.
- **Square** (NYSE: SQ): Our fair-value estimate increases to $36. The company for now remains a Best Buy Now despite being above that price.
- **Visa** (NYSE: V): Our fair-value estimate increases to $100. The company remains a Buy.

Pro Completed Trades (past week; see transaction log; trades take a day to appear):

- N/A

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Big Gets Even Bigger in Tencent's Third Quarter

Published Nov 22, 2017 at 3:44PM

Third-Quarter Results Quick Take

- **Firing on all cylinders:** Tencent is easily beating analyst estimates on both the top and bottom lines.
- **Everybody's doing it:** Monthly active users (MAU) for WeChat increased by 16% year over year to 980 million, and the number of advertisers using the WeChat "moments" platform increased 30% over the previous quarter. Social advertising revenue rose 63%.
- **Do you think this is a game?** Both mobile and PC games delivered strong growth (up 84% and 27%, respectively) and cash flow, though the latter's player base saw a slight decline because of the continued migration toward mobile gaming.
- **It killed the radio star:** The company's video platform now leads its field in mobile daily active users and subscriptions.
- **Tencent's investments are also paying off in the public markets:** The company was an early investor in two of China's hottest IPOs in recent memory, as well as in Chinese search engine **Sogou** (NYSE: SOGO), which completed its IPO on the NYSE earlier this month.

As we keep pointing out, our latest recommendation, Chinese app behemoth **Tencent** (NASDAQOTH: TCEHY), may be one of the biggest public companies in the world, but that doesn't mean the "law of large numbers" makes a slowdown in its performance inevitable from here. In the most recent quarter, Tencent reported its fastest quarterly revenue growth since the second quarter of 2010. It also managed to soundly beat analyst estimates for net income with a year-over-year increase of 69%, despite having invested heavily in content.

WeChat, We Advertise, We Profit

I won't spend much time on WeChat's results -- if you're curious, we've got all the detail you need in [a deep dive called "What's WeChat Worth?"](). But I do want to call out the continued strength in advertising, with Tencent reporting a strong increase in both revenue (63%) and the number of advertisers on WeChat Moments (30%; Moments is a platform similar to Facebook's contextual ads). And with 1.36 billion mobile phone users in China at the end of June 2017, WeChat's reported 980 million users translate to a penetration rate higher than 70%. As impressive as that sounds, eMarketer actually predicts that WeChat's user share in mobile messaging apps and smartphones will finish the year even higher, at 85% and 79%, respectively.

Gaming Joins the Major Leagues

Online gaming revenue was up 48% in the quarter, to $4 billion, as Tencent continued to capitalize on the secular growth story that is mobile gaming. Thanks to strong performance from Tencent's latest blockbuster, *Honour of Kings*, mobile gaming revenue increased by 84% to account for 55% of total gaming revenue. Big news was made earlier this month, however, when competitor NetEase was able to end *Honour of Kings*' year-long run as the top iOS game in China (though it still remains the top-grossing app). The rapid ascension of NetEase's new game (the title of which is loosely translated as "Survival in the Wilderness") was made possible by a recent global surge in the popularity of the survival genre, but don't think Tencent is just sitting idly by. The company recently released its own take on the genre via an update of its popular *CrossFire* franchise, which actually helped Tencent retake its spot atop the iOS rankings (at least as I type this). It's also secured exclusive Chinese rights to the game that's primarily responsible for the aforementioned global surge in survival-game popularity -- and purchased a 5% stake in its developer.

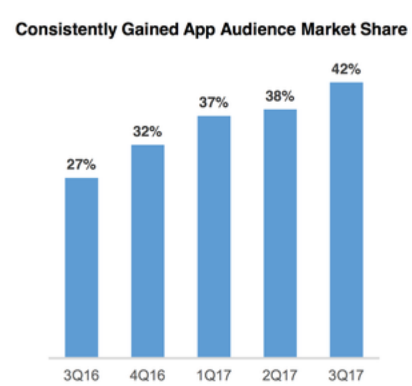
On the PC gaming front, while users in general continued their move to mobile, average revenue per user (ARPU) increased across most of Tencent's titles to bring a year-over-year increase of 27%. Tencent also hosted the seventh *League of Legends* world championship this fall; yep, that's an e-sports championship played live. Management initially invested in e-sports as a way to expose its games to more people as well as increase engagement with current fans -- in other words, to increase a game's lifespan, popularity, and ARPU. That's all well and good, but there may soon come a day when e-sports themselves provide a boost to Tencent's bottom line. A recent survey by Limelight Networks found that millennials were more interested in watching e-sports than traditional sports, and although we don't have the official viewership/attendance figures, the following picture from the championship, held in China's Bird's Nest Stadium (the same one built for the 2008 Summer Olympics), speaks volumes for just how far e-sports have come:

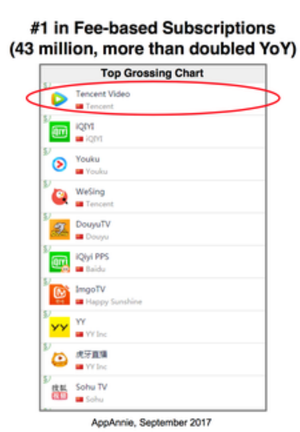
Source: lolesports

Here in North America, 2018 will mark a transformative year for professional *League of Legends* players. The game's developer, Riot, has switched its league structure from a relegation system (think European soccer league) to a permanent partnership system (think NFL or MLB), a move that should attract bigger names and bigger investments. And although you might not recognize [the names of the teams that have been accepted]() (and required to pay $10 million to $13 million to join), you'll recognize the investors -- the owners of the Golden State Warriors, the Cleveland Cavaliers, the Milwaukee Bucks, the Texas Rangers, the New York Yankees, and the Houston Rockets, among others. Oh, a little company called Disney, too.

Netflix + YouTube = Tencent Video?

While the video industry will continue to generate losses for at least the near future, Tencent continues to invest heavily in the space because management believes it's one of the best ways to keep users inside the Tencent ecosystem (it's behind only social in terms of time spent). In the third quarter, video revenue growth eclipsed 100%, driven by both advertising and a doubling of the subscriber base to 43 million. In fact, Tencent Video is the top-grossing app in the entertainment category, and management thinks it's tops in market share now, too, based on average daily active mobile users.





source: Tencent Q3 2017 results presentation

Like Netflix and other U.S. companies, Tencent has recently been investing heavily in original and exclusive content in order to attract and retain users. During the earnings call, the company's president, Martin Lau, provided an update for the company's approach to content, including drama, variety shows, animation, movies, documentaries, and more. He noted that drama is the most popular and revenue-generating genre and that Tencent has been entering into partnerships to create anime based on Chinese online literature IP. Ultimately, I envision Tencent becoming somewhat of the Chinese equivalent of Disney: a company that is able to repackage IP for multiple business units. For example, Tencent owns China Literature, which is ranked No. 1 for online titles that were adapted into major domestic entertainment products, including:

Metric	**Market Share**
Top 20 domestic adapted films in terms of box office	65%
Top 20 domestic adapted TV series in terms of ratings	75%
Top 20 domestic adapted Web series in terms of viewership	70%
Top 20 domestic adapted online games in terms of cumulative downloads	75%
Top 20 domestic adapted animated works in terms of search rankings on Baidu	80%

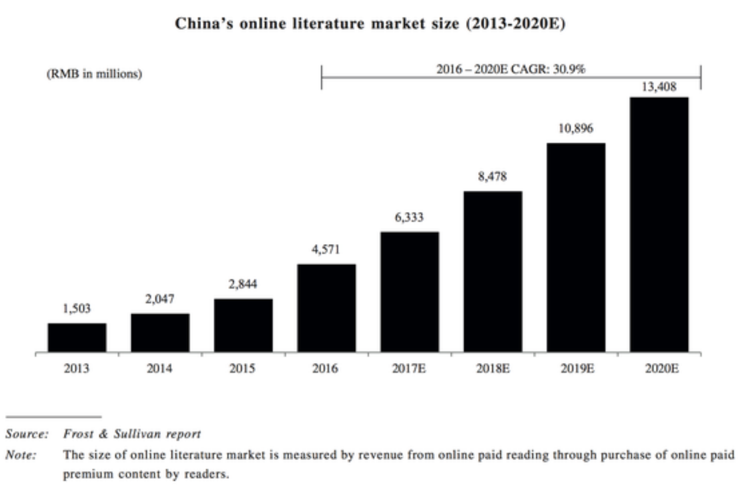
Tencent also made waves with recently announced plans to spend $1.5 billion to set up a revenue-sharing agreement with creators of "open media" (Tencent's term for YouTube-style content). The company will also spend an additional $1.5 billion for additional resources including start-up spaces and IP protection. The latter is especially important given that Chinese open-media producers aren't generally afforded the same level of protection as their Western counterparts (or producers of traditional content such as film, music, and games), so they often earn far less.

Going forward, we should expect video to remain an anchor on company margins as Tencent continues to invest in exclusivity and original content to help drive user and revenue growth. Is this the right call? We believe so. The company's other business units are more than able to pick up the slack, and these investments increase the odds that WeChat will remain the dominant app in China for years to come.

E-Books, Automobiles, and Search, Oh My!

What do China's leading online literature platform, its largest online car retailer, and its No. 2 mobile search engine have in common? They've all recently participated in successful IPOs -- and all three count Tencent among their strategic investors.

Hong Kong-listed China Literature's recent IPO was 625 times oversubscribed (that's the equivalent of 1 in every 20 Hong Kong citizens!), resulting in an 86% first-day gain for the company, in which Tencent still has a 62% stake. I won't deny that this sounds a little bubbly, but there's hope that the thriving, profitable business will eventually grow into its valuation. (Full disclosure, though: We're nonetheless applying a discount to Tencent's stake when valuing the business.) China Literature delivered an 11% net income margin for the first half of 2017 and appears poised to continue to benefit from a rapid rise in the popularity of online literature. The company has more than 9.6 million literary works (good for 72% market share) and over 191 million monthly active users, and an influx of new readers, some fleeing copyright clampdowns in other areas, has resulted in some impressive growth for the industry. The annualized rate for 2013 to 2016 was 45%, and most are expecting this to continue for the foreseeable future:



Source: China Literature prospectus

Yixin Group's IPO was a less impressive (relatively speaking!) 560 times oversubscribed; the stock was up 32% at one point during its first day of trading, although it did give up much of those gains in the following days. As China's largest online auto retail platform with roughly 19% market share, Yixin is using technology to shake up an industry that has been around for generations. China has been far quicker than the U.S. to embrace online car buying; for the first half of 2017, sales volume increased by 88% to 160,000 and aggregate value increased by 94% to a little less than $2.5 billion. Tencent still owns roughly a fifth of the company, as well as providing backup for Yixin on accounts, user traffic, risk management, and more. There are plans to integrate online payments platform Tenpay into the mix, as well.

Not to be outdone, Sogu -- China's second-largest mobile search engine in terms of market share and its No. 4 Internet company in terms of monthly active users (511 million as of September) -- began trading on the NYSE earlier this month. Baidu is still the Chinese equivalent of Google when it comes to search, but we think Sogou's relationship with Tencent leaves it better positioned for the future than the U.S. bridesmaid, Microsoft's Bing. That's because Sogou, unlike Bing, has actually been grabbing some market share in mobile search as of late, with its piece of the pie growing by 206 basis points to 17.8% for the six months that ended in September. Tencent's stake in the $5.3 billion company is currently valued at a little north of $2 billion.

Pro's Take

Treat yourself to a slice of pumpkin pie, Fool (or whatever your Thanksgiving dessert of choice may be): *Pro*'s first investment in China is up almost 25% since we bought shares less than a month ago. Odds are we won't be writing a novella every time Tencent reports from now on, but we wanted to give you just a taste of how many moving pieces the Tencent juggernaut has (and we didn't even cover them all!). Overall, we're pleased with the results, and we believe management is continuing to demonstrate that they think like Foolish long-term shareholders by willingly sacrificing some short-term profits in exchange for long-term value creation.

Questions? Thoughts? Bring them to the Tencent discussion board, and Fool on!

Pro Catch-Up Trades and Upcoming Expirations: Medtronic, Tencent, and More

Published Nov 22, 2017 at 1:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Johnson & Johnson** (NYSE: JNJ): Buy 2.9%.
- **Medtronic** (NYSE: MDT): Buy 2.5%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.9% (see our new trade alert).

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.4%.
- **Facebook** (NASDAQ: FB): Buy 4% to start (we have 7.8% total).
- **Oracle** (NYSE: ORCL): Buy 3.5%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Home Depot** (NYSE: HD): Set up a diagonal call; buy to open January 2020 $110 calls, and sell to open an equal number of January 2018 $175 calls.

Hedges:

- N/A

Options expirations:

- None until January.

Pro Guidance Changes and Completed Trades: Nov. 20, 2017

Published Nov 20, 2017 at 3:10PM

Pro Guidance Changes (see any related trade alerts or earnings coverage):

- **FactSet Research** (NYSE: FDS): Fair-value estimate increases to $187. The stock remains a Buy.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $128; the stock remains a Buy.
- **OpenText** (NASDAQ: OTEX): Our fair-value estimate increases to $33, but the stock moves to Hold for now. Confidence has ebbed that we'll keep our investment at least another three years, although we still hope to have reason to.
- **Paycom** (NYSE: PAYC): Fair-value estimate increases to $61. The company remains a Buy, despite trading well above that.
- **Shake Shake** (NYSE: SHAK): The stock remains a Short, and our fair-value estimate is set to $26.
- **Square** (NYSE: SQ): Our fair-value estimate increases to $36. The company for now remains a Best Buy Now despite being above that price.
- **Visa** (NYSE: V): Our fair-value estimate increases to $100. The company remains a Buy.

Pro Completed Trades (past week; see transaction log; trades take a day to appear):

- N/A

American Tower Continues to Ride the Mobile Data Wave

Published Nov 20, 2017 at 1:30PM

American Tower (NYSE: AMT) notched another strong quarter, continuing the company's multi-year momentum and posting solid organic growth and improved margins across its growing global asset base. Management also recently announced another acquisition of approximately 20,000 sites in India; in general, the company continues to steadily expand internationally, where growth is stronger than in the U.S. and where most future growth will occur.

The company remains a Best Buy Now, with an **updated fair-value estimate of $146 per share** and an allocation of 4% (and a diagonal call allocation of 0.8%) in the *Pro* portfolio.

What Happened?

CEO Jim Taiclet:

> "Our strong third quarter performance was driven by robust organic tenant billings growth of 6.3% in the U.S. and 9.3% internationally. Notably, in the U.S., our organic growth was supported by the widespread adoption of unlimited data plans among subscribers of all four national mobile operators. According to independent industry analysts, subscribers who switch to these unlimited plans consume up to two times more mobile data on a daily basis.

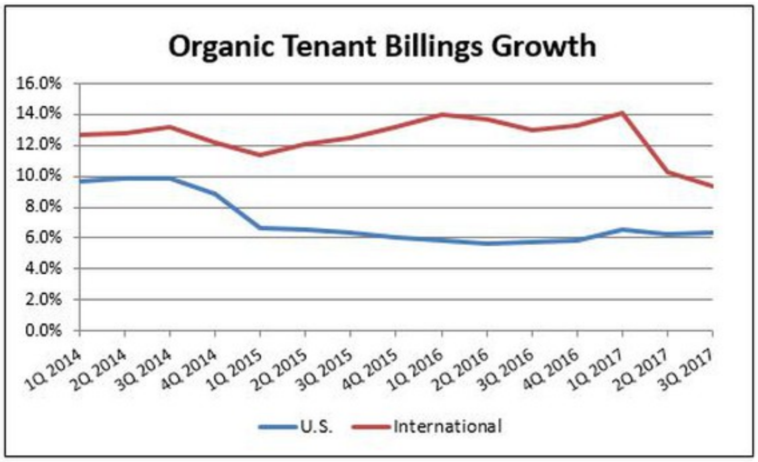
Consequently, we expect that annual mobile data usage in the U.S. will continue to expand by an average of at least 25-30%, and will grow even more rapidly in our international markets over our next five year planning period. As a result, we anticipate ongoing aggregate U.S. wireless capital investments on the order of $30 billion per year, complemented by material network investments in our international markets. We expect these global trends to drive substantial demand for tower space and support solid long-term AFFO per Share growth for American Tower."

Get More

- Q3 2017 press release
- Q3 2017 supplemental materials
- Q3 2017 earnings presentation

Organic tenant billings (growth attributable to tenant co-locations, lease amendments, and price escalations, net of cancellations) came in at 6.3% in the U.S. and 9.3% internationally (vs. 5.7% and 13% in the same quarter a year ago).

International organic growth was broad-based across all regions, up 8.4% in Asia (i.e., India); 9.1% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda); and 10.2% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Paraguay, and Peru).

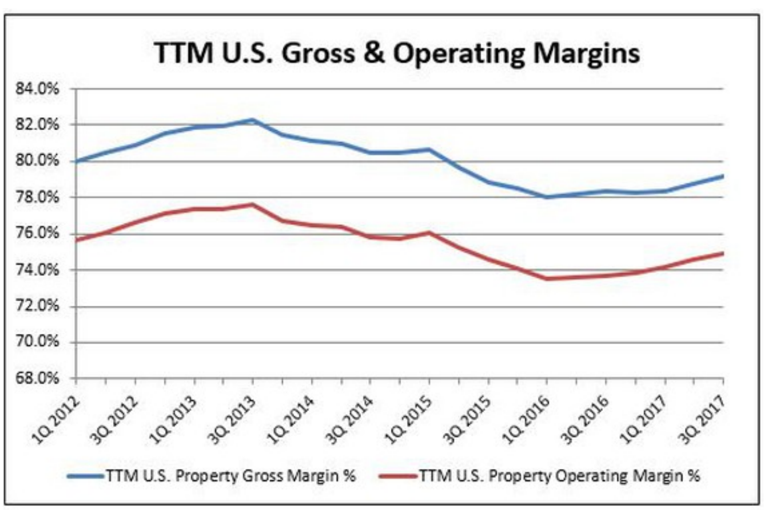


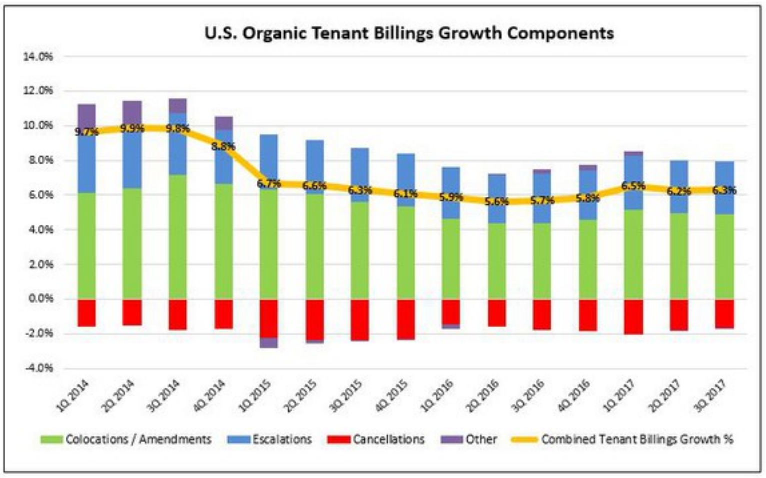
So What?

The deceleration in international organic tenant billings growth continued, although this slowdown was expected and is in line with management's outlook. International growth should settle at about 2% to 4% above the rate of U.S. growth over the medium to long term as wireless operators in American Tower's international markets continue to invest in improving their wireless infrastructure.

Margins increased in the quarter thanks to the strong organic growth, cost controls, and the continued integration and lease-up of more than 70,000 low-tenancy sites built, leased, or acquired since the end of 2014. Management expects a broad margin expansion trend as the company continues to generate organic growth on its extensive existing portfolio of assets.

U.S. gross margins increased year over year to 79.2% (from 77.4%), and U.S. operating margins increased year-over-year to 74.7% (from 73.2%), reflecting those trends. This next graph shows U.S. gross and operating margins on a trailing-12-month (TTM) basis, which smooths out the lumpiness of individual quarters and shows the longer-term trend in margins. We can see that since the significant Verizon (NYSE: VZ) acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (thanks to the lower tenancy ratio on those new towers), management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets:



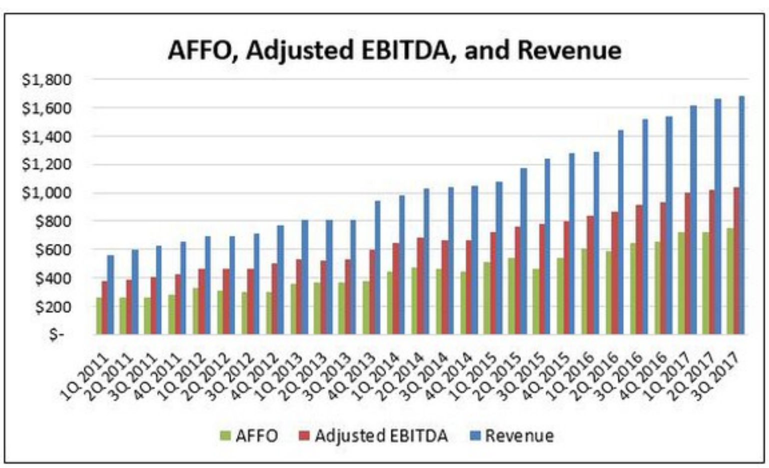


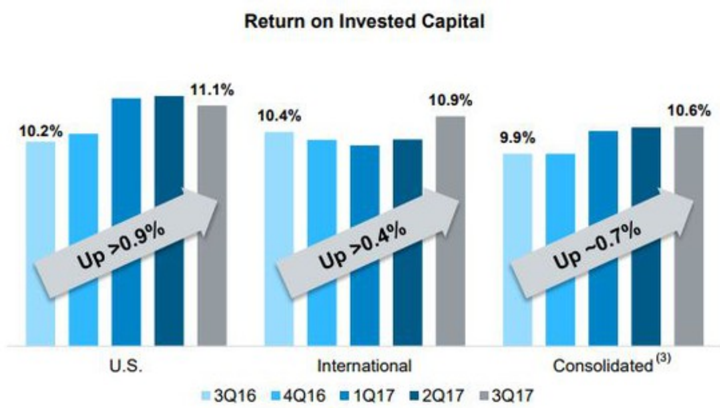
Internationally, margins increased sequentially (gross margins up to 83.9% from 82.4% a year ago; operating margins up to 74.9% from 72.6% a year ago) as the company continues to integrate its recently acquired assets:

As for debt, the company continues to de-lever and ended the quarter with a net leverage ratio of 4.4, the lowest the leverage ratio has been since the third quarter of 2013. Yearly distribution growth continues to track in line with management's 20% long-term growth target, coming in at 20% growth (at $0.66 per share, a 1.8% forward yield on the current share price). Twenty percent annual distribution growth continues to look like a more than reasonable target for 2017 and beyond.

Now What?

This quarter's report confirms that our investment thesis -- that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time -- is continuing to play out. The company's impressive operating history, excellent management, and strong competitive position in a growing industry give me confidence that American Tower will continue to increase revenue and cash flow at high rates for a long time, providing strong returns on capital (ROIC). The company's portfolio of nearly 150,000 sites worldwide positions it to benefit from secular mobile data demand trends on five continents, and acquisitions and incremental leasing activity should continue to drive revenue, cash flow, and ROIC higher over the long term:





Data and Guidance

- Current Price: $146.26
- Fair-value estimate (**updated**): $146
- Allocation: 4%, plus 0.8% in January 2019 / April 2018 $80 / $130 diagonal calls
- EV/EBITDA (TTM): 20.9

AMT remains a Best Buy Now, with an updated fair-value estimate of $146 per share and an allocation of 4%. We also have 0.8% in deep-in-the-money diagonal calls, which we recently rolled out and up to April 2018.

Even as the stock has gained 37% year to date, the company continues to generate shareholder value, and our fair-value estimate continues to rise along with the stock price. If you've yet to start a position, now is as good a time as any to match us.

Fool on!

What's WeChat Worth?

Published Nov 20, 2017 at 1:11PM

Deep Dive on Tencent: In our surveys and member communications, longer-tenured *Pro* Fools often express a desire for more educational content. So we're trying something new with our recommendation on **Tencent** (NASDAQOTH: TCEHY). Our initial alert laid out the thesis for our investment as usual and provided you with all the info you need to buy along with us. Subsequent additional pieces like this are meant to give you deeper insights into why we're investing in China for the first time in *Pro*'s history. Thoughts? We're here for you on the Memo Musings board!

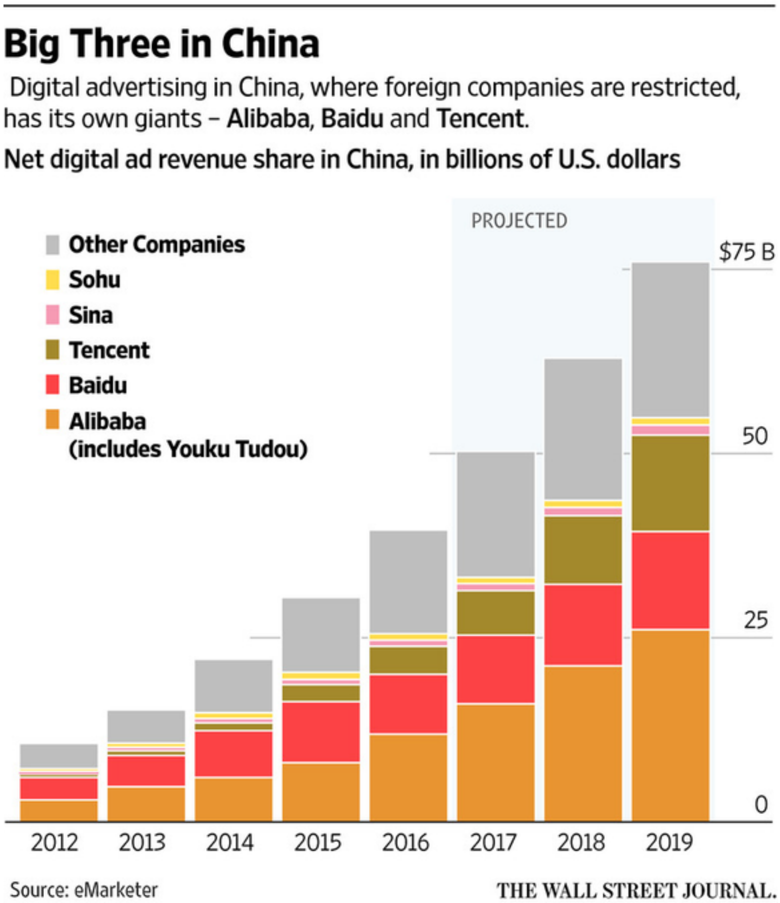
Conventional wisdom would have you believe that given its market cap of roughly $500 billion, there's no way Chinese Internet company Tencent could be undervalued. However, as with Apple, Amazon, Google, and Facebook, we believe the lack of a historical counterpart makes the market myopic on this one. Because one of the easiest and most common ways to understand and value businesses is to look at historical examples, we think investors tend to under-appreciate both the durability and the growth runway of these innovative behemoths. Today, then, we're beginning our discussion of what we believe Tencent could ultimately be worth by taking a look at the first of the many monetization opportunities for its behemoth instant-messaging app, WeChat: advertising.

Before we start, please note that although we'll look at divisions of the business in an attempt to make things easier to understand, Tencent is a great example of a whole that's truly more valuable than the sum of its parts. This is because each division serves to reinforce the value proposition of the others. For example, having a hit mobile game linked to the user's WeChat account simultaneously reinforces the value of both the mobile game and WeChat -- WeChat drives more players to the game and keeps them playing for longer, and the game keeps users in "WeChat's world" for longer.

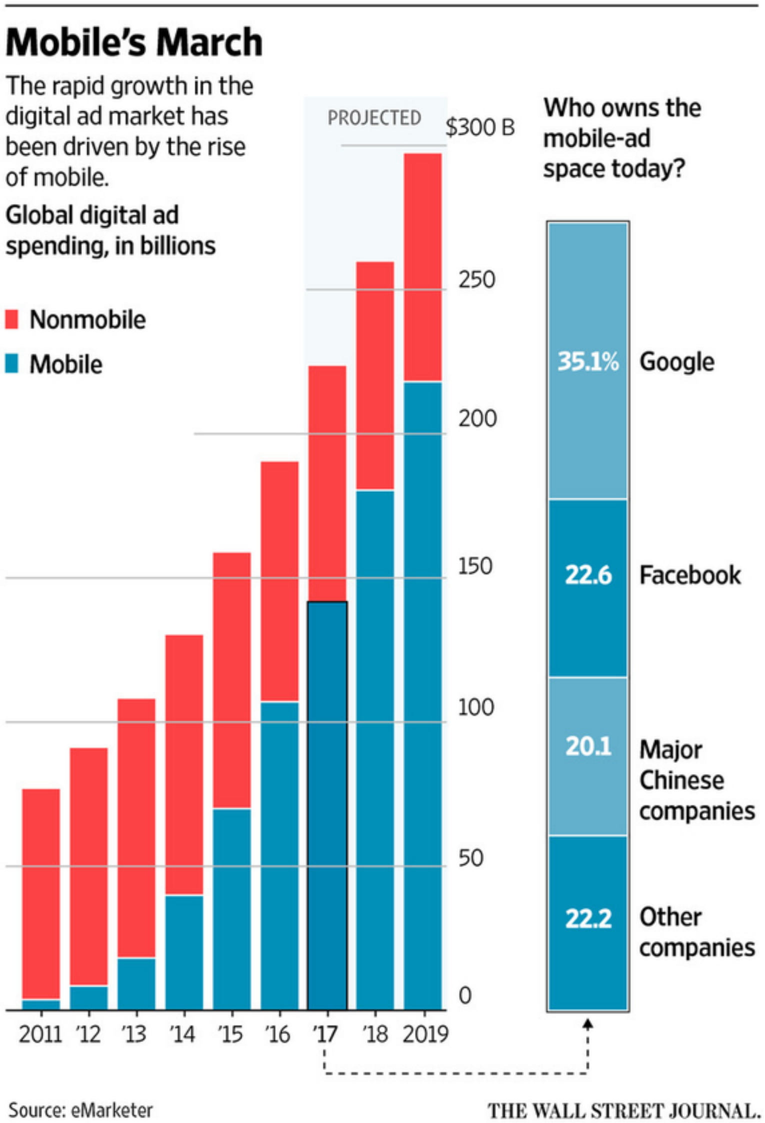
The U.S., Everywhere Else, and China: One of These Is Not Like the Other

Nobody likes ads. Everyone I know tries to avoid them whenever possible. Yet as an industry, the advertising juggernaut continues to power forward, with an 18% global increase in spending forecast for 2017 to $229 billion, according to researcher eMarketer. Unsurprisingly, Google and Facebook are the dominant players in the space, commanding an estimated 49% of digital ad expenditures. Here in the U.S., the dynamic duo is even more dominant, capturing 63% of the $83 billion digital market.

The U.S. market's maturity means it's expected to grow more slowly than the global market (relatively speaking -- low- to mid-teens growth isn't mature by conventional standards). In China, digital ad spending continues to flourish, with an expected leap of 27% this year to just more than $50 billion, followed by another 50% over the next two years to finish 2019 above $76 billion. As much as Google and Facebook would love to get a piece of this rapidly growing pie, government restrictions keep these two out of the country, enabling China's big three — Baidu, Alibaba, and Tencent, or BAT — to establish a stranglehold on their home market.



The big three currently hold 62% of China's digital ad market, and we think industry shifts could give them another 800 basis points of market share over the next two years -- and that's a conservative estimate. Of the three, we agree with most industry experts that Tencent will gain the most share, because we think mobile will continue to be the primary worldwide driver behind ongoing rapid growth in the global digital ad market. That's especially true in China, where forecasts show mobile accounting for close to 82% of digital ad spending (and almost 60% of total media ad spending) by 2021 as advertisers respond to consumers' love of the platform.



Tencent generated $3.9 billion in revenue from online advertising in 2016, up 44% year-over-year. While WeChat and its other products offer a clear value proposition for advertisers, Tencent has been slow to ramp up its ad sales, meaning it's only got about 14% market share in mobile advertising despite making up about 55% of all mobile internet traffic in China (WeChat alone is nearly 30%). Focusing on user experience first is definitely Foolish if your goal is ultimately to create an ecosystem that users can't imagine living without, even if it means sacrificing short-term results. But just how far away are we from what Tencent could ultimately achieve?

Economics 101: Revenue = Volume x Price

Comparing Tencent with Facebook certainly isn't apples-to-apples, given the differences in the products they offer and the countries in which they operate. But we do think it's telling that during the second quarter of 2017, Facebook's global average revenue per user (ARPU) was 5.5 times larger than Tencent's by our estimate. (Its North American ARPU was 23 times larger.) Even a small convergence between the two companies would result in a meaningful bump for Tencent, and we think that's ultimately inevitable given Facebook's head start on inventory. For some context: Tencent has only recently begun to test displaying two ads per day in certain cities. If the company did this with every user, WeChat would deliver about 2 billion impressions per day. That's not even a third of the number Facebook delivered ... in *2012* (on both an absolute and per-user basis)!

When it comes to pricing, though, things aren't as straightforward. Facebook ads can be purchased on both a cost-per-click (CPC) and a cost-per-1,000-impressions (CPM) basis; with the former, you pay for a set number of clicks on your ad, and with the latter you pay for a set number of people to see it. In the second half of last year, advertisers paid roughly $0.28 and $7.20 on a CPC and CPM basis, respectively. Tencent, meanwhile, currently offers WeChat advertisers two options: traditional banner ads or "moments" ads, which are very similar to the contextual ads in a Facebook timeline. Banner ads are lower-priced because they perform worse, at a CPC and CPM of $0.075 and between $1.60 and $2.20 (depending on city) respectively. Moments ads, though, are currently in strong demand, partly because of Tencent's reluctance to show too many of them. This lets Tencent charge a premium for these ads, however fancy they are and wherever they're shown:

Estimated Ad CPM, Q2 2017

City size	Text & picture	Video
Core city	$21.25	$26
Large city	$14.25	$17
Other	$7.00	$9

source: WalktheChat, author calculations

Core cities: Beijing, Shanghai. **Large cities**: Guanzhou, Chengdu, Shenzhen, Hangzhou, Wuhan, Suzhou, Chongqing, Nanjing, Tianjin, Xi'an, Guiyang, Changsha, Qingdao, Ningbo, Zhengzhou, Dalian, Xiamen, Jinan, Harbin, Fuzhou.

These prices are much higher than Facebook's averages, which to us demonstrates how much demand there is for these ads relative to the supply. Because of this, we don't think we'll see a simple, linear relationship between the number of ads shown and the price Tencent is able to charge. As outsiders, we don't have enough information to know precisely where equilibrium is here, but we're willing to bet pricing will continue to, at worst, hold steady until the number of ads has increased significantly.

While it was the last of the big three to move into artificial intelligence (AI), Tencent's recent aggressive moves into the AI arms race led Quartz to refer to it recently as "the sleeping giant in global AI." Tencent has poached the former head of Baidu's Big Data Lab and formed an alliance with several top minds in the space, including the "father" of Google's self-driving car, Sebastian Thrun. The scale of the data Tencent can gather is also essentially unmatched, at 600-plus possible data points per user and counting. If these AI plays work out, they'll ultimately benefit both the advertisers (better targeting, context, and effectiveness) and WeChat users (more relevant, less intrusive ads).

That's Billions With a Capital B

Ultimately, we believe Tencent's advertising revenue could eclipse $10 billion by the end of 2019. We think the company could very well overtake Baidu over the next five years (and we're not alone here). It's worth looking again at Facebook, which first reported trailing-12-month revenue of more than $10 billion in July 2014. The market valued that business at slightly less than $200 billion at the time; that's about 42% of Tencent's current valuation at today's exchange rate. Tencent's advertising business doesn't have Facebook's global reach, so it stands to reason that a discount is warranted. But we can't just slap a 30% discount on that $200 billion and call it a day, because with the benefit of hindsight, it looks like Facebook was massively undervalued at the time -- it's beaten the market by almost 110% since then.

In fact, assuming Facebook's riskiness justified a 20% discount (roughly double the market's return and almost assuredly overly punitive), the business should have been worth more than *$280* billion in July 2014. That would mean it was undervalued by 40% at the time -- 35% if you use our current fair-value estimate as a starting point. Based on assumptions we think are conservative, including revenue that decelerates much faster than Facebook's did and 2019 growth less than half the rate of Facebook's from a similar starting point, we think Tencent's advertising business (including non-WeChat sources but excluding video) should be worth north of $250 billion. That's 44% to 53% of the valuation Tencent will need to achieve if we're to hit our North Star by 2019, for a part of the business that currently only makes up 17% of revenue.

What's the rest of Tencent worth? Why in the world did Tencent invest even more in Snap? What is Snap? Will JP ever return to having normal-colored hair? All of these questions and more will be answered in our next deep dive on Tencent, so stay tuned!

Earnings Roundup: Coherent, MasterCard, Paycom, and Square

Published Nov 20, 2017 at 12:59PM

Greetings, Fools, and happy Thanksgiving week!

We have so much to be grateful for, including the fact that we're all reading this right now. People who are able to save and invest are among the most fortunate on the planet when it comes to finances. It is estimated that more than 70% of the world's population still lives on $10 or less per day, and despite what we hear, it remains difficult to move up into a middle income bracket. So people like us who are able to invest are fortunate even when stocks go nowhere.

And our *Pro* portfolio has gained 21.3% this year (as of Friday), topping the S&P 500 by several percentage points and doubling our North Star even as we maintain a 15% cash balance. The Foolish approach to investing in superior businesses -- and holding them -- continues to deliver. We are grateful that you've put your trust in us here at *Pro*, and we carry that gratitude with us daily. We hope you and your family have an excellent holiday this week!

But hold on. Before you run off to season the turkey, we have *more* earnings coverage for you. Let's cover the quarterly vibe on four more *Pro* holdings, three of which have yet to pass the year mark in our portfolio.

Coherent (NASDAQ: COHR)

- Buy
- 3% allocation

Investors pay up for predictability, and laser machine maker Coherent is delivering. As a result, the stock is performing as we estimated, rising 24% since our May recommendation to reach (and pass) our initial fair-value estimate of $280. Record sales, gross margins, and earnings per share for both the fourth quarter and the full year put the company on track to slice out a record 2018, too. In fact, its newly expanded capacity is already almost fully booked for the next year, and growth will come from full use of that capacity, more expensive tool installation, and an increase in service revenue. This past quarter, products and services accounted for 26% of sales, up 79% over last year. Total fourth-quarter revenue was $490.3 million, nearly double year-ago numbers (thanks largely to the Rofin acquisition) and up a healthy 6% sequentially.

Across the board, Coherent sees strong demand. Semiconductor manufacturing demand for laser products is at record levels, with orders growing more than 10%; Internet of Things devices are driving greater service demand for installed laser systems; and all sorts of industries -- materials processing, battery welding for electric vehicles and energy storage systems, battery packs in general, consumer packaging, additive manufacturing, consumer electronics, and many more -- increasingly depend on lasers. Coherent is addressing companies' needs early in the planning stages, adding clarity to the picture of its long-term demand. Management feels strongly positioned for another "record-setting year in fiscal 2018."

Last quarter, microelectronics accounted for 54% of revenue, materials processing 30%, original equipment manufacturer (OEM) components and instrumentation 11%, and scientific and government business 5%. Total backlog sits at $1.3 billion, or nearly a year's worth of sales. At a recent $302, the stock trades at 19.9 times expected earnings for the year ahead. Our $280 fair-value estimate stands for now but will likely be increased in early 2018, as we near the one-year anniversary of our holding. For what it's worth, competitor **IPG Photonics** (NASDAQ: IPGP) fetches 30 times forward earnings estimates.

MasterCard (NYSE: MA)

- Buy
- 5.5% allocation
- Fair-value estimate increases to $128

The No. 2 credit card processor increased its net revenue by 17% and earnings per share by 23% last quarter, citing -- as did **Visa** (NYSE: V) -- a generally positive economy around the world, especially in Asia and Europe. MasterCard is seeing greater than 10% volume and transaction growth in most of its markets.

Areas of continued focus include security (after the Equifax breach), digital or mobile transactions (including the growth of MasterPass), blockchain (MasterCard uses it and is integrating it with banks), Fast ACH technology (making money transfers instant), and behavioral biometrics and artificial intelligence (leading to more data sales to customers). MasterCard also expanded its close partnership with **PayPal** (NASDAQ: PYPL) into a worldwide reach.

Lately $149, the stock trades at 29 times expected earnings for the year ahead and 31 times trailing free cash flow. There's no question it fetches a premium. Our fair-value estimate is 13% lower, at $128, and puts the stock at 20 times expected *2019* earnings. If MasterCard didn't have such an exceptional business model, we might question recommending it at this level, but we know well enough how the company could continue to outperform expectations. We want to own it for the long haul as long as the business keeps growing.

Paycom (NYSE: PAYC)

- Buy
- 3.3% allocation
- Fair-value estimate increases to $61

The human-resources cloud-software provider has been in our portfolio for nearly one year (our recommendation went out Nov. 30, 2016), and it's already gained a heady 95% as of this morning. Though we (unfortunately, so far!) never added to our original stake, the stock price has soared to make this our 10th largest position. Sales were up 31% last quarter to $101 million, and 98% of that was recurring revenue. Total adjusted administrative expenses were only up 20.7%, to $59.3 million, showing the leverage in the business. The company's adjusted gross margin is a whopping 84%. Earnings per share rose by 93%.

For the year ending in December, management increased their revenue guidance to about $431 million, a 31% rise. We should expect that growth rate to slow next year, but it should remain healthy as the company continues to open new offices. Of its 45 current locations, nine are still maturing (getting ready to truly produce, a process that takes about two years). New offices will continue to roll out.

This quarter's conference call lacked real revelations; the business is simply growing as it adds new customers and cross-sells more services, and the stock continues to be priced at a premium given the recurring, high-margin nature of the revenue. Lately at about $80, shares trade at 54 times expected earnings for the year ahead. Compared with the earnings growth rate, that multiple has logic, but it's still a premium price.

It's important to remember that Paycom is in its early growth phase; it's just now investing in new corporate headquarters and continues to open offices around the country, so its cash flow will look relatively depressed these days. As investments start to produce, the business should show its additional earnings power. Meanwhile, cloud software leaders including **Salesforce** (NYSE: CRM) and **Workday** (NASDAQ: WDAY) continue to fetch big premiums, too, at 59 times and 123 times forward earnings, respectively. Wall Street recognizes the powerful annuity stream offered by leading cloud software businesses, and the long runway for growth.

As it stands, we hope to have great reasons to keep our Paycom shares for years as the company continues to grow.

Square (NYSE: SQ)

- Best Buy Now
- 3.9% allocation
- Fair-value estimate increases to $36

In earnings announced Nov. 8, Square's adjusted revenue was up 45% year-over-year, and its sales growth rate again accelerated compared with the previous quarter. The reason: Outperformance across the board. Even more importantly, as CFO Sarah Friar said, "more and more virtual loops" are being created in the business, meaning more customers are using more and more of Square's services -- and adoption of one leads to the addition of others. Besides processing credit transactions, services include loans, payroll, human resources management, data analysis, and more.

This ecosystem is getting another boost from Square Register, the company's new hardware offering. Aimed at larger merchants, Square Register combines proprietary hardware, software, and payments into one product that doesn't require a third-party mobile phone or tablet. It's ready to use out of the box, and customers can use it quickly and without help. It's a big feather in Square's quiver of omnichannel solutions for commerce. Relatedly, subscription and services-based revenue was up 84% year-over-year, and large sellers who generate more than $500,000 in annualized payment volume rose by 64%. Even so, Square's profit level held steady at 1.05% of gross payment volume. And total gross payment volume rose 31% to $17.4 billion in the quarter.

For the second time since we've owned Square, management increased its guidance for the year; they now see 2017 net revenue of $2.18 billion to $2.19 billion, and EBITDA of about $133.5 million, with a massive 7-percentage-point improvement in margins. Despite that jump, management projects continued margin improvements of about five points a year.

From Square Cash (person-to-person transactions), to Square Capital (Square loans to small businesses), to payroll-as-a-service, to Square Marketing (customer relationship management software) and more, Square is many businesses in one: in its own words, a "comprehensive e-commerce platform." It's not easy to value what the whole company could be worth, but there's promise in its many potentially high-margin businesses. In fact, Square has already generated more than $100 million in free cash flow over the past 12 months, and it's just getting started in most of its business lines.

The stock has been a Best Buy Now since our trade alert was issued in July. As of this morning, shares are up 74% for us since then. Our fair-value estimate is rising because margins have risen more than expected, as has the top line. But keep in mind that this remains a speculative investment. The stock trades at more than 100 times expected earnings for a year ahead, but I actually believe the whole company would be worth much more to a buyer than our $36 value estimate suggests. As with Paycom, we hope to have good reasons to keep our stock a long time as the company grows. We expect price volatility in the meantime.

In Summary ...

Many leading stocks trade at premium prices today, a common occurrence in a bull market. In a bear market, leaders will still usually be priced well above lesser companies. With economic growth revisiting much of the world, and with earnings growing, these prices are arguably merited (the market says so!) -- for now. But we have to expect drops along the way. Our three-year outlook mitigates much of the near-term concern, and as long as we believe a superior business we own can at least earn our North Star with reasonable risk, we can stand pat. If and when the market begins to worry us more, we'll look at quick hedges and other protective or defensive strategies.

To discuss any of these companies, please visit its board!

Thank you again for being a Fool with us! We appreciate it even more so this week as we pause to do nothing ... but be grateful. (Want to share good tidings with fellow investor/members? Please visit the Social Banter board!)

Fool on!

Earnings Roundup: Gilead, OpenText, Shake Shack, and Visa

Published Nov 16, 2017 at 2:39PM

Greetings, Fools!

Every quarter, we're granted another snapshot of how our companies are performing. With this information, we can incrementally add to our knowledge and shine our flashlight a little further into what the future may hold. It's that kind of long-term-minded insight that may make us decide to add to, or perhaps reduce, some positions. It takes us several weeks to comb through results from all two dozen of our companies, but it's worth it. Today, we've got updates on several more. Meanwhile, our portfolio as a whole continues to outperform.

Gilead Sciences (NASDAQ: GILD)

- Hold (don't buy or sell)
- 2% allocation

Shares of the biotech leader are at $71.53 as I write this, meaning they've been perfectly flat over the year to date. Thus, all of our returns here have come from the 2.9% dividend yield, plus the $3,716 we made in 2017 by writing three rounds of covered calls (all of which expired as 100% income) -- at current prices, that brought in another 5.7% in returns. At this share price, then, our 2017 return on Gilead will be 8.6% including the December dividend. We're shy of the 10% or so North Star return we sought, though any tick higher in the share price could get us there. But we got lucky with the timing of our covered calls, and this is still a disappointing return compared with this year's strong market.

At this price, the stock trades at 8 times earnings, 10 times forward estimated earnings, and a mere 5.8 times estimated EBITDA. It's cheap. But the business isn't growing, and this year's big acquisition of Kite Pharma won't change that anytime soon. Worse, the business could shrink again in 2018. Total product sales declined 14% last quarter, with Hep C sales in the U.S. down 31% year-over-year. And the full impact of new Hep C drug pricing and Gilead's market-share losses will start to be felt in the next quarter and roll into 2018.

That's the headline, and that revelation alone has us considering a sale of our shares by year's end. We need to make that decision in the context of the whole portfolio and other opportunities we see. But right now, it appears that Gilead may face some challenges again in 2018. The company continues to rake in strong free cash flow, but without growth, shares may remain cheap. To Gilead's credit, its 2017 Hep C revenue is right in-line with the guidance management gave in February. But it's telling that this hasn't been enough to drive the stock higher. We'll decide what we're doing next with Gilead soon.

OpenText (NASDAQ: OTEX)

- Hold (changed from Buy, because confidence is currently ebbing that we'll keep it three years or longer; that could, of course, change)
- 2.9% allocation
- Fair-value estimate increases to $33

Trading at $33, our content-services and managed-services software vendor fetches 17 times free cash flow and 13 times expected earnings over the next 12 months. The stock is up about 8% year-to-date, including modest dividends, so it has been a laggard -- though not a loser. Total revenue was up 30% to $641 million in the most recent quarter, and annual recurring revenue accounted for 76% of that. Customer renewal rates on software subscriptions topped 90% again, and adjusted earnings per share rose by 26%. Operating margins are at 31%, trending toward goals of 34% to 38% in 2020.

OpenText made about $300 million in acquisitions during the quarter, including $221 million for Guidance, which puts the company in a new market for information security. The pace of acquisitions has brought net debt from just $95 million in 2013 to nearly $2.4 billion now, and with annual interest payments now $121 million, we're closely watching the balance sheet. These acquisitions need to earn a strong return, or they'll end up destroying value. With more than $350 million in annual free cash flow, the debt can be serviced, but the recent rash of expensive acquisitions needs to prove worthy.

Also, OpenText potentially owes the IRS $590 million as a years-long dispute continues to drag out. The company does not believe the IRS is correct.

For the current quarter now under way, management foresees revenue growth of 5% to 9%. The company is taking **Oracle**'s (NYSE: ORCL) approach of selling both in the cloud and on premises. It has acquired itself a chair at the head of the table in its industry, but now we need to make sure the whole entity can move forward and perform while continuing to expand. We have a fairly small position at 2.9%.

Shake Shack (NYSE: SHAK)

- Sell short
- 0.5% allocation
- Fair-value estimate set at $26

Same-store sales declined again at the small burger chain, dropping 1.6%. The underlying reality is a bit uglier, with a 3.8% drop in traffic offset by a 2.2% increase in pricing mix. In my opinion, the chain is too young to be posting declines in traffic of this size already -- something competitors like Chipotle rarely did early on. Management blames its small store base that's focused in New York City, but if your brand is growing in relevance with society, your traffic will grow rather than decline. Shake Shack is likely starting to face the headwinds of the crowded (and getting tired?) mid-scale hamburger restaurant boom.

Shake Shack is *definitely* facing the headwinds of more expensive labor, as new laws increase wages around the country. Those costs are expected to accelerate in 2018, along with other investments, to the extent that the stock is more expensive on forward earnings estimates than on past results -- and that's despite aggressive plans to open 32 to 35 new domestic owned Shacks in 2018, representing unit growth of 36% to 40%, its fastest pace in a long time.

The $38 stock trades at 62 times trailing earnings and 73 times expected earnings for the year ahead. Unsurprisingly, free cash flow is negligible as management invests in new locations, but the company does have $77 million in net cash. In other words, financially it's fine, but lackluster earnings growth leaves a lot to be desired at this valuation. Any little trip in results could send shares to the kitchen floor, and perfect execution may only provide modest aid. We're keeping our short open for now, and are considering adding to our small exposure.

Visa (NYSE: V)

- Buy
- 3.3% allocation
- Fair-value estimate increases to $100

With its share price lately at $110, Visa trades at 27 times estimated earnings for the year ahead and 33.5 times trailing free cash flow. Its purchase of Visa Europe and big customer wins including Costco and USAA drove strong growth over the past year, which ended in October, but the company highlighted that "economic growth around the world has been strong," too. Visa's full-year net revenue and earnings per share both jumped by 22%, to $18.4 billion and $3.48 respectively. Payment volume continued to increase by more than 10% globally, and healthy cross-border volume was driven by increased travel.

Visa is renewing multiple contracts as we speak, which means client incentives (rewards to keep doing business with Visa) will increase substantially in the first half of 2018. This leads management to estimate 2018 net revenue growth of less than 10% ("high single digits"), with revenue growth starting below that level in early 2018 and growing to "low double digits" (higher than 10%) in the second half, with the highest growth in the fourth quarter of next year. The outlook for earnings-per-share growth next year is "at the high end of mid-teens" -- so, perhaps 16% or so.

Visa should generate more than $9 billion in free cash flow next year, and management expects to deploy it in buybacks, dividends, and reinvestment. In the past year, the company returned more than $7 billion to shareholders, including a recent purchase of $1.7 billion of stock at $102.54. Diluted share count is down 10% since 2012. Even with so many buybacks, there's no question that Visa is adequately investing in growth prospects and will continue to do so. Payment competition in China from the likes of our own **Tencent** (NASDAQOTH: TCEHY) was mentioned in the call. Visa is keeping a close eye there, and its Visa Direct continues to develop. Data processing for clients is also a fast-growing, lucrative business that may add to its moat.

Our fair-value estimate on Visa ticks up from $97 to $100. The stock remains a Buy.

Pro Catch-Up Trades and Upcoming Expirations: JNJ, Medtronic, Tencent, and More

Published Nov 16, 2017 at 12:18PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often about 3%).

- **Johnson & Johnson** (NYSE: JNJ): Buy 3%.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.8% (see our new trade alert).

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.5%.
- **Facebook** (NASDAQ: FB): Buy 4% to start (we have 7.8% total).
- **Oracle** (NYSE: ORCL): Buy 3.7%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Home Depot** (NYSE: HD): Set up a diagonal call, following our trade alert.

Hedges:

- N/A

Options expirations (November):

- **Skyworks Solutions** (NASDAQ: SWKS): Our Nov. 17 $92.50 puts are on track to expire as full income this Friday. No action required as long as shares stay above our strike price.

Pro Guidance Changes and Completed Trades: Facebook, JNJ, and More

Published Nov 13, 2017 at 2:09PM

Pro Guidance Changes (past two weeks; see any related trade alerts):

- **Apple** (NASDAQ: AAPL): We've increased our fair value to $155; the stock remains a Buy.
- **Facebook** (NASDAQ: FB): Our fair-value estimate increases to $168. The stock remains a Buy.
- **Johnson & Johnson** (NYSE: JNJ): The stock moved to Best Buy Now, and its fair value estimate increased to $137.
- **NVR** (NYSE: NVR): We've increased our fair-value estimate to $2,650; the stock remains a Buy.
- **Skyworks Solutions** (NASDAQ: SWKS): Our fair-value estimate increases to $105. Shares remain a Buy.
- **Verisk** (NASDAQ: VRSK): After strong price appreciation in reaction to the company's third-quarter results, we're moving the stock back to Buy from Best Buy Now.

Pro Completed Trades (last two weeks; see transaction log; trades take a day to appear):

- **Home Depot** (NYSE: HD): We set up a diagonal call by buying to open nine January 2020 $110 calls and selling to open the same number of January 2018 $170 calls for a net debit of $53.90. This starts a 1.5% cash value position in Home Depot calls.

- **Skyworks Solutions** (NASDAQ: SWKS): We rolled all of our November 2017 $95 covered calls to January 2018 $105 calls, gaining $10 in upside for a net debit of $6.10.
- **Tencent Holdings** (NASDAQOTH: TCEHY): We bought 1,750 shares at $44.82, for a 2.5% stake in this new Best Buy Now.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Facebook, Skyworks Shine Bright

Published Nov 13, 2017 at 1:58PM

Greetings, Fools,

Another quarter of earnings is wrapping up, and we'll have most of the rest of our coverage to you in the coming days. The general story: healthy growth. The U.S. economy is growing, as are economies around the world, and most of our companies have customers internationally -- perhaps none more so than Facebook. Let's start there.

Facebook (NASDAQ: FB)

- Buy
- 7.7% allocation
- Start at 3%

I must begin by quoting the conference call's opening, from CEO Mark Zuckerberg:

> "Our community continues to grow, now with nearly 2.1 billion people using Facebook every month and nearly 1.4 billion using it daily. Instagram also hit a big milestone this quarter, now with 500 million daily actives. And we saw good results in the business where total revenue grew 47% year-over-year, and we had our first-ever quarter with more than $10 billion in revenue. But none of that matters if our services are used in a way that doesn't bring people closer together or the foundation of our society is undermined by foreign interference ... What they did is wrong, and we're not going to stand for it."

He goes on to add, "I am dead serious about this. I've directed our teams to invest so much in security on top of other investments we're making that it will significantly impact our profitability going forward. And I wanted our investors to hear that directly from me."

Calling Russia out for using Facebook to sow distrust and discord, the company is going to double the 10,000 people it has working on security, change how it discloses advertisers, and work on new laws with Congress, among other investments. It believes these moves will make the community much stronger, and benefit Facebook in the long run. It's not hyperbole to say that bad parties could fundamentally put Facebook's future at risk, so these investments are all but necessary, as well as value-based.

Management expects expenses to grow by 35% to 40% this year (down from an initial 40% to 45%), then by another 45% to 60% in 2018. That's a large jump during a time when revenue will likely only grow in the 20% to 30% range. However, I'm skeptical that Facebook will be able to spend that much money that quickly. The company is spending $7 billion on capital expenditures in 2017, and expects that to about double in 2018, alongside new investments in people.

On the revenue side, Facebook has about 6 million active advertisers (mostly smaller businesses), and mobile ad revenue was up 57% this quarter to $8.9 billion. Video is a driving force of growth, as are higher ad prices. Ad impressions were up only 10% as inventory growth continues to slow, but the average ad price rose by an impressive 35% as marketers are willing to pay more for slots. This dynamic may continue in 2018, especially if ads continue to become more effective and inventory growth continues to wane (as it should). I suspect we'll see healthy top-line growth offsetting a fair amount of the company's increased spending. Sporting a 50.1% operating margin last quarter, Facebook can afford to give up some margin as it invests in its future.

In other ventures, Messenger is used by more than 20 million businesses, and artificial intelligence is a growing presence; Marketplace is used by 550 million people to buy or sell items; and Workplace is now used by more than 30,000 companies. Facebook continues to push forward on virtual reality, with a new $199 Oculus Go headset shipping next year.

The $178 stock trades at approximately 45 times free cash flow, 34 times trailing earnings, and 28 times the average earnings estimated for a year ahead. Earnings per share jumped 77% in the last quarter. That growth will of course slow as expenses grow, but Facebook should still have years of expansion ahead of it. Social media captures a sliver of total advertising dollars, and other mediums are struggling to enlarge their audiences. That being the case, analysts appear too pessimistic about next year, now estimating only 11% earnings-per-share growth for Facebook in 2018. We'll take the over on that. **Our fair-value estimate climbs to $168**, or 25 times a still-conservative 2018 earnings estimate.

Skyworks Solutions (NASDAQ: SWKS)

- Buy
- 4.1% allocation

Another excellent quarter of growth for the mobile connectivity leader saw revenue up 18% to $985 million as earnings per share rose 24% to $1.82. For the year just ended, operating cash flow jumped 35% to $1.5 billion on revenue of $3.7 billion, up 11%. Earnings per share were up 16%, and operating margins rose yet again (and continue to move higher).

That total revenue line tells you Skyworks is still a relatively small company, despite selling massive amounts of product to **Apple** (NASDAQ: AAPL) and other smartphone giants. Even better, the company's design win pipeline continues to expand. From Samsung to Bosch, Sonos to Amazon, Cisco Systems to DirecTV, drones to virtual reality, smartwatches to GPS devices, Skyworks just scored new wins, and management sees the connected economy gaining "significant momentum."

Connected homes, AI, wearables, autonomous cars -- are all expected to drive global media data usage up fivefold between 2017 and 2021, and that estimate may be conservative. There's a digital traffic jam looming, one that will need to be solved by rolling out 5G technology -- another major opportunity for Skyworks that will play out over years. Speeds in 5G can be up to 100 times faster than 4G, with almost no latency; this will drive countless new applications. Today, the broad Internet of Things market is about 26% of revenue at Skyworks, with smartphones making up the bulk.

For the next quarter, management expects revenue to grow about 15% and earnings per share to hit $1.91, up 19%. At about $110 each, shares trade at 20.5 times trailing free cash flow and earnings, and 15.5 times expected earnings for the year ahead. **Our fair-value estimate moves up to $105**, or about 13 times expected earnings for next year. Again, we seek to be conservative. We currently have $105 covered calls on our stock (only recommended to those who have been managing this strategy for a long time), but we plan to eventually wrap up that strategy.

To discuss these compelling companies, please visit the Facebook or Skyworks boards. Our next earnings coverage, included in updates coming this week and next, will feature Shake Shack, Gilead, OpenText, Paycom, Coherent, Square, Visa, and others -- arriving to your inbox when ready.

Thank you for being here and for putting your trust in us! We appreciate it every day. Fool on!

Pro Catch-Up Trades and Upcoming Expirations: Nov. 8, 2017

Published Nov 8, 2017 at 12:59PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often around 3%).

- **Johnson & Johnson** (NYSE: JNJ): Buy 3%.
- **Medtronic** (NYSE: MDT): Buy 2.4%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.7% (see our new trade alert).

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.5%.
- **Oracle** (NYSE: ORCL): Buy 3.8%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2.2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Options:

- **Home Depot** (NYSE: HD): Set up a diagonal call, following our new trade alert.
- **Skyworks Solutions** (NASDAQ: SWKS): If you haven't yet, you can still roll your November 2017 $95 calls up to January 2018 $105 calls (buy to close the $95 calls, and sell to open the same number of January 2018 $105 calls). Today, lately, this can be done for a net debit of about $7. Aim to pay as little time value to close the $95 calls as possible.

Hedges:

- N/A

Next options expirations (November):

- **Skyworks Solutions**: Our Nov. 17, 2017, $92.50 puts are on track to expire as income. No action required as long as shares stay above our strike price.

Johnson & Johnson Moves to Best Buy Now

Published Nov 8, 2017 at 11:35AM

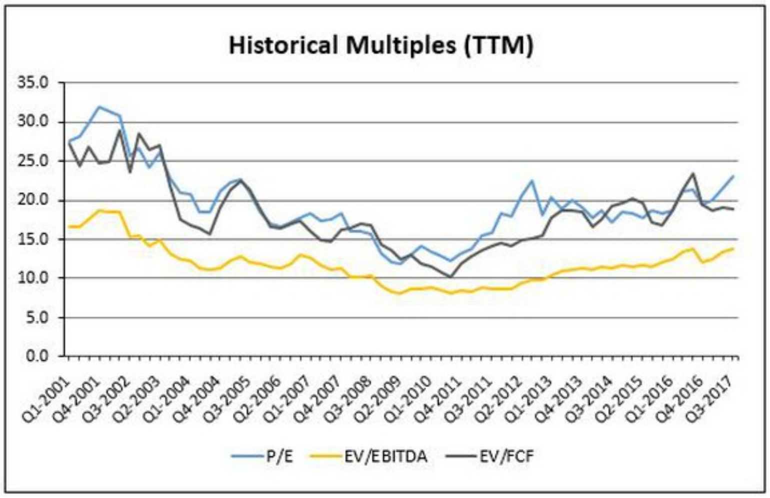
Third Quarter 2017

- Press Release
- Earnings Presentation
- Supplementary Sales Data
- Sales of Key Products & Franchises
- 10-Q Filing

Johnson & Johnson (NYSE: JNJ) reported a strong third quarter in 2017, demonstrating accelerating revenue growth driven by the company's $30 billion acquisition of Actelion (and its suite of pulmonary hypertension drugs). J&J reported 10.3% company-wide sales growth, led by 15.4% growth in the pharmaceutical division, which accounts for 47% of total sales. The company beat analyst expectations on sales and earnings, and management raised 2017 guidance in response to the strong performance. The market was pleased with the company's report, bidding shares up 3.4% on the day of the earnings release.

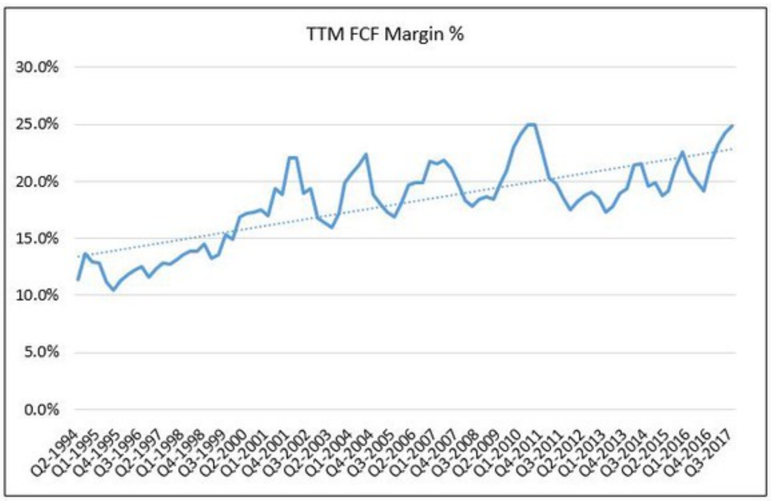
- **Updated guidance**: Best Buy Now (from Buy)
- **Recommended allocation**: 3%
- **Fair-value estimate**: $137 (from $123)
- **Current price:** $140

At $140 per share, the stock is priced at about 24 times trailing-12-month (TTM) GAAP earnings and about 16 times TTM EBITDA. Both of these valuation metrics are elevated relative to the company's recent history:



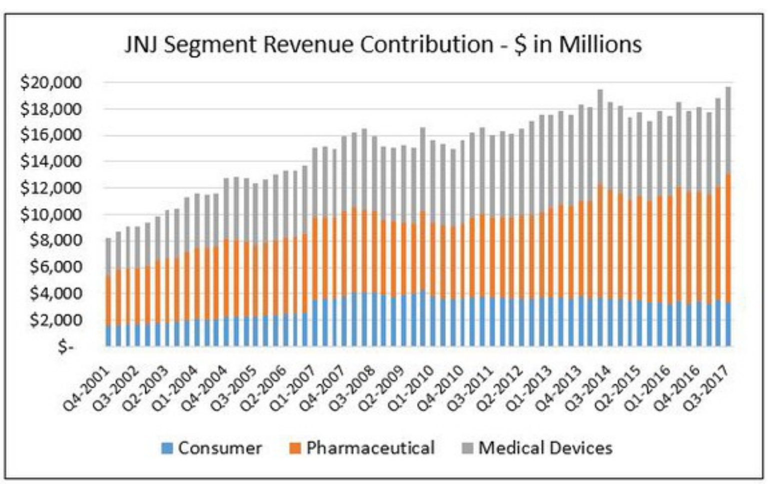
To support the expanded valuation multiples, Johnson & Johnson's business is benefiting from positive momentum as the company's Actelion acquisition is boosting the pharmaceutical division's growth, leading to strong overall sales growth (+10.3% year-over-year net sales growth in Q3 2017, the highest reported growth since Q4 2007). Upside in the company's pharmaceutical division is one of the key aspects to our investment thesis for J&J, so it's nice to see positive results from this division early along in the position's history. We'll keep an close eye on the pharmaceutical division over time as it is likely to be an important driver of J&J's long-term growth.

And as sales are increasing, the company's free cash flow margin is rising, meaning more dollars are available to distribute back to shareholders via the company's ongoing stock buybacks and dividends:

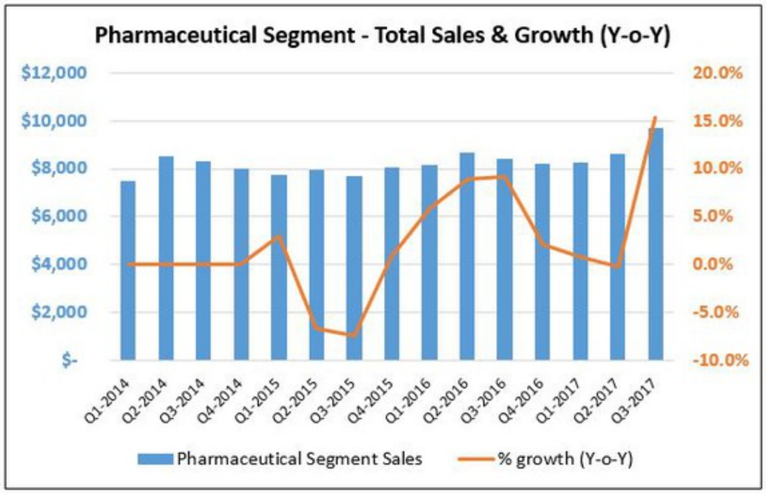


After incorporating Q3 2017 results and updating our valuation assumptions, **our fair-value estimate increases to $137 per share (from $123), and Johnson & Johnson moves to Best Buy Now (from Buy) on our scorecard.** Members who have yet to start or fill out their position can feel comfortable doing so at current prices.

Segment Performance: JNJ's three business segments are (1) consumer [currently 18% of total sales] , (2) pharmaceutical [47%], and (3) medical devices [35%]. Here is a graph that breaks out how much each segment contributes to overall revenue, and how that breakout has changed over time:



As mentioned above, the company's pharmaceutical division experienced strong growth in Q3 2017, bolstering the entire company's results given that the pharmaceutical division is the largest segment by sales volume (47% of TTM sales):



Thanks in part to the company's Actelion acquisition, JNJ's pharmaceutical division posted 15.4% year-over-year growth (+7% growth excluding acquisitions). Although JNJ will be facing generic competition for some of its major drug brands over the next few years, I am encouraged by the strong growth of some drugs in the oncology market, including Darzalex (whose sales are up 95% this quarter) and Imbruvica (47%). The pharmaceutical division continues to be a potential source of upside as new sales from JNJ's strong pipeline should help offset declines in older drug products over the medium to long term.

In addition to the strong growth from the pharmaceutical division, the consumer division and the medical device division posted year-over-year revenue growth of 2.9% and 7.1%, respectively. Companywide operational sales growth (i.e. ex-acquisitions) came in at 3.8% for the quarter.

Our Thesis

Johnson & Johnson is is a diversified health-care conglomerate, with more than 250 operating companies organized into three business segments: consumer, pharmaceutical, and medical devices. At eight out of eight of our *Pro* quality criteria, J&J is a quintessential *Pro*-quality stock, and it is one we expect to hold for the long term. While its large size means we don't expect runaway growth and upside, we do expect to earn North Star-challenging returns with low downside risk from one of the safest stocks you are likely to find in the entire investment universe.

Earnings From Apple, NVR, Starbucks, and More

Published Nov 6, 2017 at 2:54PM

Fellow Fools,

With earnings season in full swing, here's where we stand on five essential *Pro* holdings.

Apple (NASDAQ: AAPL)

Can an almost $900 billion company be misunderstood -- even undervalued? With its Q4 2017 results and Q1 2018 guidance, Apple tried once again to convince investors that the answer is "yes." Revenue growth accelerated to 12% thanks to strong growth in the services division (up 24%, excluding a one-time gain) and demand for the iPhone 8 and 8 Plus -- the latter of which, as CEO Tim Cook mentioned, has had the best start of any iPhone Plus model ever. Mac growth rose 25%, and the Apple Watch saw unit growth of 50%. (The latter number included yours truly, even though I was never previously a fan of wearing watches. I'm also now a subscriber to Apple Music.) Looking forward, Apple's guidance suggests that strong iPhone X demand will result in the largest first-quarter revenue increase in three years (after adjusting for the extra week in Q1 2017) and margins more or less in line with recent averages. We continue to believe that Apple has years of modest, steady growth ahead of it, and we're updating our fair value to $155, or 17 times earnings. The stock remains a Buy.

NVR (NYSE: NVR)

Management at homebuilder NVR doesn't hold quarterly earnings calls (though they'll take your call if you ask), so a short press release and 10-Q is all the automatic insight into the business investors get each quarter. So far, we're pleased with what we've seen from NVR since it was added to the portfolio, and with the stock up 13% over the past two days in reaction to third-quarter results (and nearly 35% since we first purchased shares less than five months ago), it's clear the market likes it, too.

Management's focus on local dominance and efficient production means this best-in-breed business posts impressive results during strong and weak markets alike. Excluding the excess tax benefit from adopting a new accounting standard, EPS was up 27%, thanks to a 35% increase in homebuilding income. That, in turn, was largely driven by a 6% increase in settlements, as well as an increase in the average settlement price. The company's cancellation rate for new orders has also declined nicely, to 13% from 18% in the third quarter of 2016. Looking forward, robust growth in both new orders (up 21%) and backlog (up 16%) suggests that investors should expect more strong results from NVR in at least the near term, as long as pricing holds up.

Valuation multiples can be deceiving for cyclical companies like NVR, since they say nothing about where we are in the cycle. I still believe there's at least some room to run in the housing market as long as the overall economy holds up, but NVR simply isn't as cheap as it was six to 12 months ago, despite the impressive financial performance. So we've lowered the stock to a Buy from Best Buy Now on the scorecard, even as we *increase* our fair-value estimate by $100, to $2,650. That's OK -- with the stock having already delivered roughly four years' worth of North Star returns, we think it deserves a bit of a break!

Starbucks (NASDAQ: SBUX)

Talk about a caffeine crash! The coffee giant's stock fell by 5% or so on fourth-quarter results after market close on Thursday, but on Friday morning the price actually popped by more than 2%. The initial decline likely had two causes: management's lowering of long-term guidance, and results that came in near the bottom of analyst estimates for the quarter. We've long called Starbucks' long-term targets "aggressive," so the former move didn't come as a surprise to us, given an industry that's now much weaker than when those targets were first published. However -- and this is worth emphasizing -- we've continued to hold our shares despite our skepticism because we believe in the stock's ability to deliver North Star-like returns even if management fails to achieve its own lofty goals.

This is especially true with respect to comparable-store sales, or comps. We expected these to settle at 3.5% to 4%, a forecast that may have once seemed bearish but now falls squarely within Starbucks' newly lowered 3%-5% target range. Lower comps leave a smaller margin for error when it comes to new store openings, and commentary on that front was sparse, though management did once again note that new U.S. locations aren't cannibalizing existing stores' sales and mentioned their 2018 net new store target of 2,300 stores (a 4.5% increase). We'll be watching closely to see whether Starbucks is reconsidering its total addressable market (TAM); any meaningful decline would require us to reconsider our thesis.

Overall fourth-quarter results were essentially in line with what we've come to expect given brick-and-mortar retail struggles. China continues to be a bright spot, with fourth-quarter comps up 8% against 3% in the Americas (after adjusting for the impact of recent hurricanes) and 2% worldwide. Combined with a global net store increase of 603 and solid results in the channel development division, revenue was up a net 8% after adjusting for the extra week in 2016. Margins remain pressured by increased store and partner investments and an ongoing shift in product mix; the latter can be attributed to the continued growth of Starbucks' food offerings, which contributed 2 points to American comps for the third consecutive quarter and now account for 21% of sales (management's 2021 target is 25%). Starbucks Rewards membership rose by 11% in the U.S., while member spending was up 8% in the fourth quarter, well above the overall U.S. rate. Though they account for only 18% of unique customers coming through Starbucks stores, Rewards members contributed about 36% of fourth-quarter revenue, so we're glad to see their spending continue to increase even if the newest members aren't always the most diehard Starbucks customers. It'll soon be time for our annual review; in the interim, the stock remains a Buy and our fair value is unchanged at $52.

Verisign (NASDAQ: VRSN)

Verisign's third-quarter results were exactly what we've come to expect from the company, with modest revenue growth translating into high-single-digit EPS growth thanks to increased operating leverage and share repurchases. In fact, the only notable thing from the company's earnings call was how quickly it was over -- only one analyst bothered to call in and ask a question. Third-quarter domain-name registrations (8.9 million) and renewal rates (expected to finish up 130 basis points to 74.3%) continue to trend in a positive direction, giving us confidence that the global leader in domain-name registry services will continue to create shareholder value going forward. The stock currently sits near the upper bound of our estimate of fair value, but given the quality of the business, we have every intention of rolling our January covered strangle at some point if the market permits.

Verisk (NASDAQ: VRSK)

After its first two quarters were received poorly by the market, Verisk looks back on track with solid Q3 results. Organic growth in the data analytics provider's insurance division finally reaccelerated to 9% (7% excluding the one-time benefit from recent hurricane activity), and most signs indicate that subpar growth is finally in the past. Recent acquisition Wood Mackenzie, where organic growth was 3.3%, continues to show signs of strength in a market (energy, metals, and mining) that appears to have stabilized at last; in fact, recent strength in new subscriptions suggests even better results on the horizon once most of the subscriptions signed during the worst of the recent energy bear market are gone. And new partnerships with Argus all but guarantee that Verisk's financial services division will reaccelerate in Q4 and beyond.

Verisk remains active on the capital-allocation front -- by my count, the company acquired 15 businesses for an aggregate purchase price of $583 million in just this past quarter alone. Although the argument for purchasing each is compelling, it remains to be seen whether the multiples Verisk paid are justified. In fact, while I acknowledge that acquisitions are frequently the best way for Verisk to enter a subset of its core markets, I currently believe they're one of the biggest risks to Verisk shareholders -- specifically, that the core business is *so* strong that management feels emboldened to destroy value by becoming too aggressive with what it buys. That being said, if you believe -- as we do -- that WoodMac will return to a growth rate higher than that of the consolidated Verisk at some point in the next few years, the odds are favorable that shares can once again return to their market-beating ways. For those keeping track, the recent pop in the stock means that Verisk has caught back up with the market and is now outpacing the North Star since we first bought shares. We're moving the stock back to a Buy from a Best Buy Now.

That's it for now, but we'll likely have more updates on various *Pro* holdings later this week. Enjoy the rest of your day, Fools!

-- JP (TMFYossarian)

Pro Guidance Changes and Completed Trades: Apple, Verisk, and More

Published Nov 6, 2017 at 12:39PM

Pro Guidance Changes (see any related trade alerts):

- **Apple** (NASDAQ: AAPL): We've increased our fair value to $155; the stock remains a Buy.
- **NVR** (NYSE: NVR): We've increased our fair value to $2,650; the stock remains a Buy.
- **Verisk** (NASDAQ: VRSK): After strong price appreciation in reaction to the company's third-quarter results, we're moving the stock back to Buy from Best Buy Now.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Home Depot** (NYSE: HD): We set up a diagonal call by buying to open nine January 2020 $110 calls and selling to open the same number of January 2018 $170 calls for a net debit of $53.90. This starts a 1.5% cash value position in Home Depot calls.

- **Skyworks Solutions** (NASDAQ: SWKS): We rolled all of our November 2017 $95 covered calls to January 2018 $105 calls, gaining $10 in upside for a net debit of $6.10.
- **Tencent Holdings** (NASDAQOTH: TCEHY): We bought 1,750 shares at $44.82, for a 2.5% stake in this new Best Buy Now.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Nov. 2, 2017

Published Nov 2, 2017 at 12:02PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often around 3%).

- **Medtronic** (NYSE: MDT): Buy 2.5%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.5% (see our new trade alert).

Continue building your portfolio with our Buys, including:

- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **Oracle** (NYSE: ORCL): Buy 3.8%.

Shorts:

- N/A

Options:

- **Home Depot** (NYSE: HD): Set up a diagonal call, following our new trade alert.
- **Skyworks Solutions** (NASDAQ: SWKS): Roll your November 2017 $95 calls up to January 2018 $105 calls (buy to close the $95 calls, and sell to open the same number of January 2018 $105 calls). Today, lately, it appears this can be done for a net debit of about $6 and change. Aim to pay as little time value to close the $95 calls as possible.

Hedges:

- N/A

Next options expirations (November):

- **Skyworks Solutions**: Our November 2017 covered strangle ($92.50 puts, $95 calls) will expire on the 17th. We're leaving the puts alone to expire, and rolling the $95 calls to January 2018 $105 calls.

Roll Your Covered Calls on Skyworks Solutions

Published Oct 31, 2017 at 1:28PM

Is this for you? This recommendation is for *Pro* members who have written November 2017 covered calls on **Skyworks Solutions** (NASDAQ: SWKS). Those who have not yet written covered calls should leave Skyworks stock uncovered and just go on owning it; we're playing catch-up here, rolling our in-the-money calls higher. The stock remains a Buy at a 4.3% allocation. (Members following the *Motley Fool Options* put-writing trades in that service should be careful not to grow your exposure beyond a reasonable allocation.)

How You Participate

- **Trade:** Use a rolling order on Skyworks options to:
  - Buy to close all November 2017 $95 calls, and ...
  - Sell to open the same number of January 2018 $105 calls.
  - Note: We are leaving our November $92.50 puts from our previous strangle alone to expire as income, although you can buy to close them for lately $0.15 if you prefer.
- **Allocation:** *Pro* will continue to write calls on all 1,200 shares owned.
- **Recent Prices (12 p.m. ET):**
  - Stock: $113.80
  - Buy to close November 2017 $95 calls (bid/ask): $18.90/$20.30 = $19.60
  - Sell to open January 2018 $105 calls: $11.80/$12.20 = $12
  - Net debit to roll: Approximately $7.60
  - Upside gained on stock: $10 per share, and a 31.6% return on incremental investment
- **Price Guidance:** Prices will change, but lately use a limit order and aim for a $7.60 or lower net debit to roll. No matter what, aim to pay minimal time value to close the $95 calls.
- **Stock Guidance:** Buy 4.3%. As mentioned above, don't use options on this stock today if you don't have them in place already.
- **Fair-Value Estimate:** Remains $100, but will be updated after earnings.
- **Note:** Earnings are due Nov. 6 after the market closes. We aim to roll before then to give our stock more upside breathing room ... just in case.

What We're Thinking

Shares of Skyworks Solutions have soared to new highs this week, greatly diminishing the time value that was safely lingering in our short calls until now. As the company gets ready to announce earnings Nov. 6, there's no reason to expect anything but a healthy, growing business poised for a strong 2018. The only impediment to that -- and it is possible! -- is if **Apple**'s (NASDAQ: AAPL) new iPhones disappoint. Apple remains a major customer, accounting for about 40% of Skyworks's revenue, so we watch this relationship intently.

Right now, it's all systems go, with Skyworks and Apple working closely on analog semiconductor designs and solutions for Apple products. Beyond Apple, Skyworks has a fast-growing Internet of Things business (lately about 25% of sales) and sells to just about all major phone makers in the world. China remains a giant tailwind, too, as that country slowly catches up to newer-generation cell technology.

Lately at about $114, the stock trades for about 16 times expected earnings for the year ahead and 20 trailing times free cash flow, making it appear reasonable. We got caught with covered calls at the wrong time, and have been playing catch-up the past year by writing covered strangles. We've collected healthy credits on our written puts in the past, but this time we're just rolling our calls. We have ample exposure to Apple and Skyworks already, and the cost of rolling our calls is largely absorbed by the income earned on the puts we wrote that expire Nov. 17. For now, we're just going to manage our covered calls and see if we can continue to catch up.

Alternative Trades

- **Wrote other calls expiring in November?** In most cases, rolling those now per this alert will make sense for you, too. Roll up by a $10 strike price increment, or any amount that pleases you. Ask on the Skyworks board if you have questions.

More That Matters

- **Maximum gain:** The stock's upside is capped at our written call's strike price.
- **Maximum risk:** The full stock value, minus call premiums received.
- **Follow-up:** We'll continue to manage our covered calls, rolling for upside or more credit as needed, as long as we like the prices. We plan to keep the stock for the long term as long as the business and valuation seem to merit it, and to start and end our covered-call strategy opportunely, too. Yes, we're breaking our own rules here a bit -- out of necessity, it seems to us.

Options Can Help

The Rise of the Everything App

Published Oct 30, 2017 at 4:21PM

Deep Dive on Tencent: In our surveys and member communications, longer-tenured *Pro* Fools often express a desire for more educational content. So we're trying something new with our recommendation on **Tencent** (NASDAQOTH: TCEHY). Our initial alert laid out the thesis for our investment as usual and provided you with all the info you need to buy along with us. Subsequent additional pieces like this are meant to give you deeper insights into why we're investing in China for the first time in *Pro*'s history. Thoughts? We're here for you on the Memo Musings board!

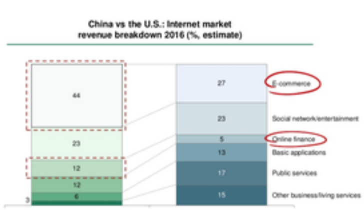
What propels a product like Tencent's WeChat from just another app to one so dominant it accounts for 30% of internet traffic in its home country? Hall of fame Yankees pitcher Lefty Gomez often quipped that he'd "rather be lucky than good," and although the notion of relying on luck for success runs counter to the prevailing American mythos that hard work is all it takes, the truth is that being at the right place at the right time can be key to countless companies' fates. So, in an attempt to lay the groundwork for our upcoming discussion on the future of WeChat, today we'll look at what Tencent did right and why the timing was perfect for an app like WeChat to come along.

Right Place, Right Time

Would WeChat have been just as successful if it had launched in the U.S. instead of China? Of course, we can't know for sure. But given how different the internet landscape in these two countries was in 2011, we believe the answer is no. The U.S. was already a developed nation by the time the internet, and subsequently mobile technology, started to play a meaningful role in the global economy -- but China was (and still is) not there yet. Unsurprisingly, this meant the U.S. could cement its place at the vanguard of the industry early on while China played catchup.

But it's not always a bad thing to be a little late to the party. Because most industries in the U.S. were fully mature, with processes already entrenched, by the time the internet rose to prominence, many were slow to adopt new technologies and improvements. On the other hand, China -- a developing nation with larger economic inefficiencies and pain points -- presented a fertile landscape ripe for disruption by the internet and mobile computing, populated by users eager to adopt newer technologies to improve their quality of life. And when this was combined with supportive government policies, China found itself with the perfect blueprint for skipping over many inefficient, outdated technologies and practices to catch up with those it once trailed.

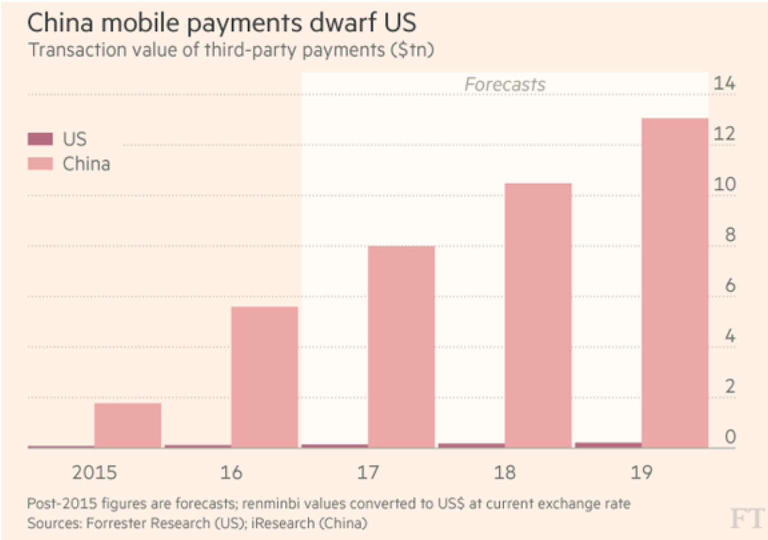
To see how powerful this combination of factors can truly be, consider retail and mobile payments. In 2005, there was 63 times more retail floor space per thousand people in the U.S. than in China. (The business-to-consumer e-commerce market was still in its infancy in China at that time, at just $0.3 billion.) And independent channels (think small corner stores) accounted for 53% of grocery sales, vs. just 18% in the U.S. Although this isn't an apples to apples comparison, these statistics suggest that the industry was both inefficient and not fully meeting all of its customers' needs. Or in other words, it was ripe for disruption from the online channel, which is exactly what we saw:



Source: The Boston Consulting Group (2017), *Decoding the Chinese Internet, A White Paper on China's Internet Economy*

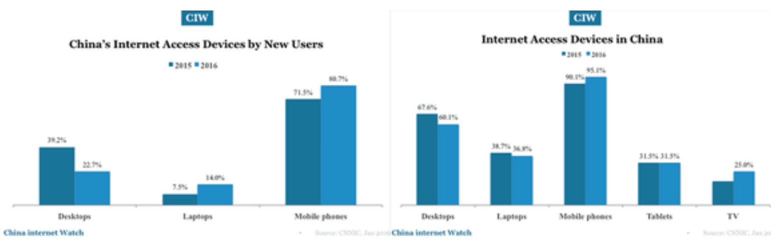
In the U.S., where debit and credit cards had been in wide use for years, people accustomed to the convenience of not having to carry cash could afford to ignore the incentives of adopting a new technology like mobile payments. But compare that to China, where in 2011 the average citizen had just 0.2 cards (vs. 1.7 in the United States), and where even someone who did have a credit card couldn't necessarily use it everywhere -- there were just 36 point-of-sale terminals per 10,000 people in China that year, vs. 287 in the United States. Enter mobile payments, in which transactions can be completed simply by scanning a QR code with your smartphone.

In a recent study of Chinese consumers jointly published by Tencent, 84% of the 6,500 respondents said they wouldn't mind going cashless. And even if Tencent's involvement causes you to question the validity of that finding (which you always should, when a company is involved in a study that reports favorable findings!), the industry statistics speak for themselves: Chinese mobile payments reached $8.6 trillion in 2016 and accounted for 74 percent of all online payments, with 42 percent of in-store purchases made with non-cash options.



Source: Financial Times (2017), *China mobile payments dwarf those in US as fintech booms, research shows; difference between the $8.6 trillion for 2016 noted above and the 2016 figure in the chart is likely due to the chart using older data*.

So the timing was right for Tencent technologically, but it was also serendipitous from a user-base perspective. The average internet user in China is 14 years younger than her U.S. counterpart, according to The Boston Consulting Group, and younger generations are generally more open to new technologies. And remember how we mentioned leapfrogging? Many Chinese internet users made their first foray online by way of a mobile device, completely skipping over the desktop.



Source: China Internet Watch (2017), *Whitepaper: China Internet Statistics 2017*

This "mobile first" mentality also means many Chinese people use multiple mobile devices, making WeChat's ability to easily create a digital identity that is shared across devices even more desirable. And it's helped WeChat quickly become accepted as the preferred method of communication in the workplace -- a recent survey of 20,000 professionals found that almost 90% liked WeChat best, dwarfing email (77.4% reported not using that at all), phones, and other forms of communication. Chinese internet users are also far more open to relying on just a few apps, with about 60% of installed apps being used two times or less (that number is about a third in the United States). Lastly, we'd also be remiss if we didn't mention the fact that Facebook and other popular Western social-media apps are blocked by the Chinese government , creating a void that needed to be captured by a native company. It certainly doesn't hurt to have some of the biggest threats to your business stuck on the outside looking in.

Catching Lightning in a Bottle, Again ... and Again ... and Again

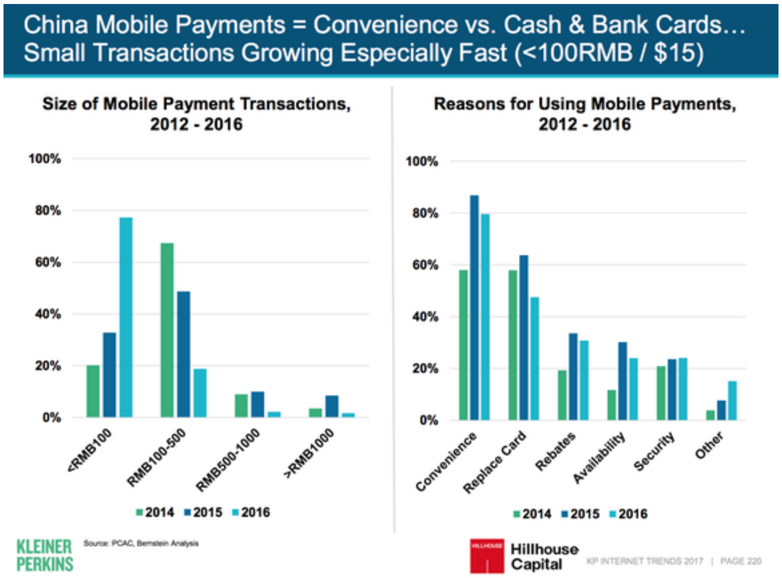
Tencent has:

- the dominant desktop app
- the dominant mobile messaging apps
- the largest video game business in the world
- the largest social networking services app (Qzone)
- the top news services when ranked by daily active users
- the top mobile video service when ranked by views
- the top music streaming platform
- the top online content library and publishing platform
- the top mobile browser
- the top app store

So it's probably safe to say that its success isn't just the byproduct of fortunate timing. But what specifically did the company do that enabled WeChat to become so pervasive in its users' lives? Here are three savvy decisions that will also tie into future discussions on WeChat and its monetization potential.

- **Keep it simple:** The dominant messaging apps of the time, including Tencent's own QQ, were both cluttered and gaudy, leading some users to assume that WeChat was actually developed by a Western company because of its Apple-esque minimalist design. Besides helping with the "cool" factor, these design choices resulted in an app that simply worked better on mobile.
- **Today messaging, tomorrow the world:** WeChat's initial value proposition to consumers was both straightforward and obvious: In a country where mobile use was skyrocketing but mobile messaging remained expensive, WeChat let you communicate for free. But this was just the first phase of Tencent's master plan. It's standard in the West to use different apps for different tasks, but in China, apps are multitaskers. By slowly rolling out additional features, Tencent was able to keep users in the app for longer, creating a powerful network effect: Increased user engagement attracted other users and businesses/developers to the platform, which in turn attracts more users, repeat ad infinitum.
- **Payments:** In the buy report, we mentioned Tencent's mobile payment offering, TenPay, and how it's quickly gaining share at the expense of the once-dominant AliPay. A single marketing tactic has propelled much of this growth: In 2014, Tencent created a viral sensation with its "gamification" of the Lunar New Year tradition of gifting hongbao (red envelopes with money inside). The craze is still going strong -- last year, there were 33 red packets given for every living being in

China. By requiring people to link their bank accounts to give or receive, Tencent was able to overcome the largest mobile-payments hurdle and accelerate adoption of TenPay. And with their Tencent digital wallets suddenly full of money, people began using TenPay to make daily purchases online and in stores (because if you've got the money, you might as well spend it).



Source: Mary Meeker (2017), *Internet Trends 2017 -- Code Conference*

Ultimately, we believe it was the combination of smart decisions on Tencent's part and a environment that was ready to embrace an "everything app" that enabled WeChat to become so dominant. In our next follow-up article, we'll take a look at what this means for the future of WeChat. Bring your thoughts about the company to the Tencent board, and Fool on!

Pro Guidance Changes and Completed Trades: Oct. 30, 2017

Published Oct 30, 2017 at 3:37PM

Pro Guidance Changes (see any related trade alerts):

- None.

Pro Completed Trades (see transaction log; trades take a day to appear):

- **Tencent Holdings** (NASDAQOTH: TCEHY): We bought 1,750 shares at $44.82, for a 2.5% stake in this new Best Buy Now.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Oct. 26, 2017

Published Oct 26, 2017 at 2:26PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often around 3%).

- **American Tower** (NYSE: AMT): Buy up to 4%.
- **Medtronic** (NYSE: MDT): Buy 2.6%.
- **Tencent Holdings** (NASDAQOTH: TCEHY): Buy 2.5% (see new trade alert).
- **Verisk** (NASDAQ: VRSK): Buy 2.1%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.5%.
- **MasterCard** (NYSE: MA): Buy 3% to start (building to 5% or more later).
- **OpenText** (NASDAQ: OTEX): Buy 3.1%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Short 0.5%.

Options:

- **Home Depot** (NYSE: HD): Set up a diagonal call, following our new trade alert. (Make sure you don't have a similar position already from *Motley Fool Options*.)

Hedges:

- N/A

Next options expirations (November):

- **Skyworks Solutions** (NASDAQ: SWKS): Our November 2017 $92.50 put/$95 call covered strangle will expire on the 17th of next month. With shares lately above $104, we're likely to roll our calls higher, or close them for a partial profit of late. We'll see soon, depending on how pricing goes.

Set Up a Diagonal Call on Home Depot

Published Oct 25, 2017 at 1:23PM

Is this for you? This recommendation is for all *Pro* members who would like to establish a diagonal call position on **Home Depot** (NYSE: HD) to target leveraged upside and income with moderate risk.

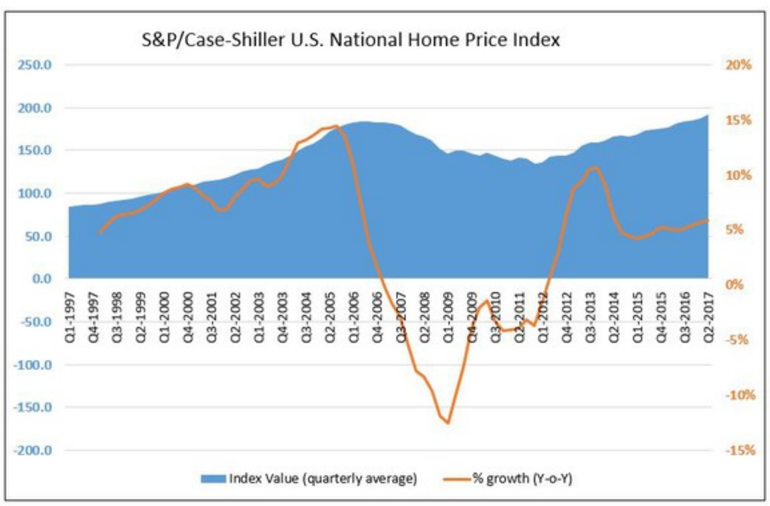
How You Participate

- **Actions:**
  - Buy to open January 2020 $110 calls and ...
  - Sell to open an equal number of January 2018 $170 calls.
- **Allocation:** Invest approximately 1.5% of your *Pro* funds in the net purchase of these diagonal calls (the aggregate cost of both buying the long calls and selling the short calls). At recent prices, this most closely equates to setting up one diagonal call position for about every $350,000 you manage; for *Pro,* that's about nine contracts.
- **Price Guidance:** As with all options transactions, limit orders are **required**. The 2020 options are thinly traded and bid/ask spreads are wide. Aim to pay a net debit no higher than $54.50. Lower is always better, and don't be afraid to wait for your price.
- **Prices** (1 p.m. 10/25/17):
  - Stock: $165.70
  - January 2020 $110 calls (bid/ask): $55.10/$60.00
  - January 2018 $170 calls (bid/ask): $2.96/$3.15

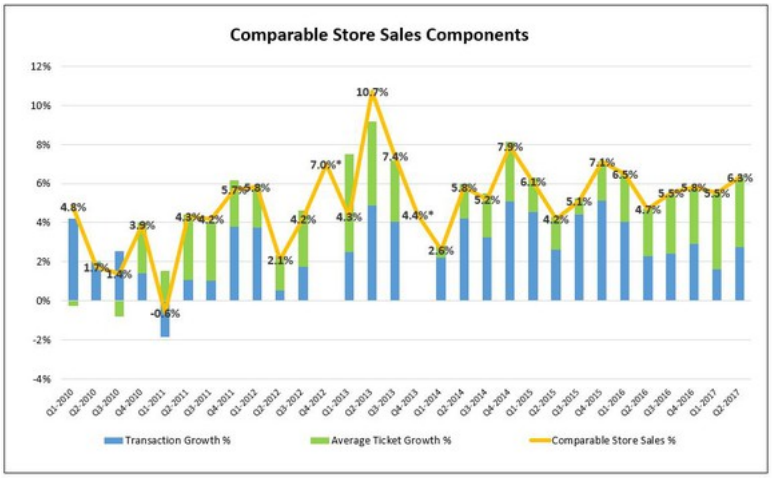
What We're Thinking

Home Depot (NYSE: HD) is the world's largest home-improvement specialty retailer (and the sixth-largest global retailer in general), with nearly 2,300 warehouse-format stores throughout the United States, Canada, and Mexico. The company provides building materials, home improvement products, and lawn and garden products as well as a range of related services. Home Depot has been wonderfully managed since emerging from the 2007-2008 credit crisis, and the company remains primed to benefit from a broad, long-running, slow improvement in housing.

If you've been in the market for a home in the last few years, you probably know that the U.S. housing market is doing quite well. Although we haven't reached the peak levels seen during inflation of the housing bubble (probably because the subprime mortgage loan market isn't as -- ahem -- robust as it used to be), all housing metrics (private residential fixed investment, housing starts, new houses sold, and existing home sales) have rebounded well off their recessionary lows. And home price appreciation remains strong, with the most recent reading of the Case-Shiller U.S. National Home Price Index in July indicating year-over-year growth of 5.8%, the highest rate since the second quarter of 2014:



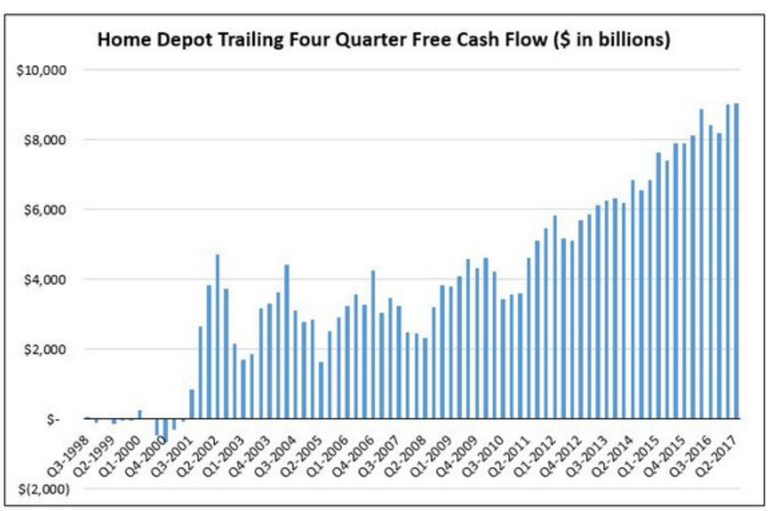
As has been the case since the end of the credit crisis, a steady labor market, low housing inventories, historically low interest rates, and positive long-term demographic trends all support the likelihood of continued home-price appreciation, which helps stimulate new construction and housing investment activity. All of these trends in housing have found their way through to Home Depot's sales performance, as management has done an excellent job generating balanced growth in both the number of transactions and average ticket size. A diagonal call on Home Depot is a means of capitalizing on these continuing trends:



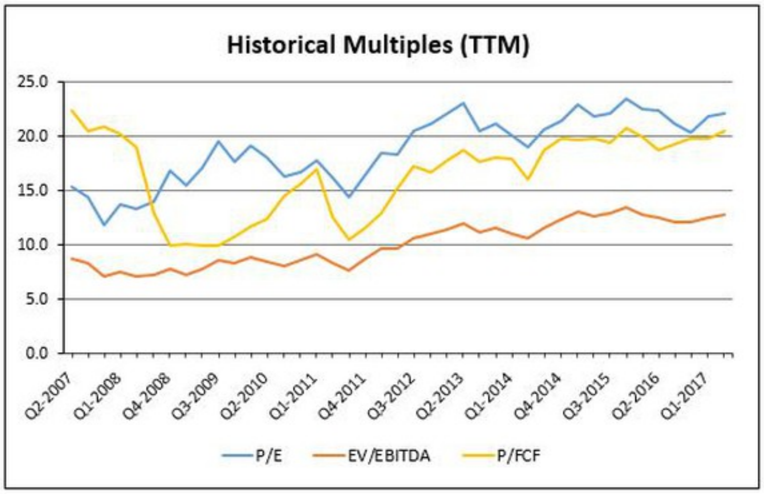
Note: Fourth-quarter 2012 and 2013 transaction growth percent and ticket growth percent are omitted due to an additional week in the fiscal year that impacted year-over-year comparisons.

There are several reasons Home Depot is so well-positioned to capture profitable growth. The U.S. home improvement retailing market is essentially a duopoly, with Home Depot controlling about half the market while **Lowe's** (NYSE: LOW) commands about a third. These two industry giants have strong competitive advantages over smaller players in distribution, sourcing, and advertising, thanks to their scale. Home improvement retailers are also uniquely unlikely to be "Amazoned" -- they're somewhat insulated from e-commerce competition because a lot of their products aren't cost-effective to ship (say, new hardwood or tile flooring) and because they stock products people need immediately for construction jobs, home repair, and so on.

These competitive advantages can be seen in Home Depot's margins, returns on capital, and free cash flow over time. These metrics are currently sitting at all-time highs, and it's reasonable to think they'll expand further (so long as the housing market continues its steady growth), especially as the company increases its sales faster than its expenses and continues to optimize its supply-chain efficiency:



All in all, Home Depot is a well-run free-cash-flow machine, and the company is very well-positioned to benefit from continued improvement in the U.S. housing market. And although valuation multiples are higher than they've been in the past ...



... we think that positive industry dynamics and the company's strong and improving financial metrics justify the multiple expansion. We peg fair value somewhere in the range of $150 to $170 per share, and assuming the housing market remains robust over the medium term, as we expect it will, our Home Depot diagonal should result in healthy profits for us by the time we close our position.

Why This Strategy?

At the beginning of this year, I wrote a Memo detailing four strategies we hoped to use in 2017 to help us on our quest to continue to challenge our North Star (inflation + 7%). The four strategies are:

1. New Long Stocks With Potential for Strong Growth
2. Intelligent Leverage Strategies
3. Protect Against Downside
4. Target Monthly Income Whenever We Can

We've done a pretty good job of executing on some of these strategies so far in 2017, adding five new stocks (Amazon, Johnson & Johnson, Coherent, NVR, Square, and now Tencent), all of which (except the brand-new Tencent) have experienced healthy appreciation since our purchases (up 19%, 17%, 6%, 32%, and 24%, respectively), and all of which appear poised for continued growth in business metrics.

We've also done a good job protecting against downside by using protective collars on some of our positions (O'Reilly and AmTrust), continuing to employ hedges (such as our QQQ hedge), and selling stocks that we feel less confident will generate strong growth over the next three to five years (including Parexel, TD Ameritrade, Papa John's, Valmont Industries, AmTrust, O'Reilly, and Gentex).

And we've done an OK job targeting monthly income by continuing our covered strangle position on Verisign and writing covered calls on Gilead Sciences.

Where we may have lagged in 2017 is in employing new leverage strategies. This Home Depot diagonal helps us with our objective of using intelligent leverage, plus it contributes to our goal of targeting monthly income whenever we can. We are risking just 1.5% percent of our capital to gain about 4.8% look-through exposure to a well-run, competitively advantaged business. We also create an opportunity for further income, assuming we can write more short calls against our long call in the future.

Additionally, Home Depot allows us to gain some measured exposure to retail (a category we've intentionally avoided because of the threat of Amazon) and increase our exposure to the housing market, which we initially targeted with our purchase of NVR. Over time, if the diagonal call strategy plays along, we may end up turning our long calls into stock, allowing us to benefit over the long run from a strong, competitively advantaged, *Pro*-like business.

More That Matters

- **Maximum gain:** If Home Depot closes at the written strike price ($170) in January 2018, our estimated return on invested capital at that time will be about 13.5%. Don't get too excited, though, Fools: This would have another two years to run (and possibly more), so measuring profits or losses after three months is misleading.
- **Maximum risk:** Equal to our originating net debit of $54.50.
- **Follow-up**: When our written calls expire in January, our owned January 2020 calls should retain significant value. At that time, we'll either roll our written calls out and/or up (if the stock price is higher than our $170 strike), or write new calls to reestablish the diagonal following worthless expiration of our January 2018 calls.

Alternative Trades

- **Want to establish your diagonal with more potential upside or, conversely, a lower cost?** Adjust accordingly:
  - **A more conservative choice** would be to move up the strike on the written call, leaving more upside room for the stock to rise. The January 2018 $175 calls look OK to us, or you could choose a later expiration date (February or March 2018) in order to earn higher premiums at higher strike prices.
  - **A more aggressive choice** would be to move up the strike on the purchased call. You could substitute the January 2020 $120 call for a net debit of less than $45.72, but realize the trade-offs -- you're buying less room for Home Depot to fall in a pessimistic market.
  - **You could use covered calls** instead, selling one January 2018 $170 call for every 100 shares you can afford to purchase and wish to cover for income. Aim for a stock allocation of 2%-3% of your *Pro* capital if you choose to use covered calls instead of a diagonal call.

Options Can Help

- **Want to know more about this strategy?** You can do it. We can help ... with our guide to diagonal calls.
- **Questions about this trade?** Bring them to our newly constructed Home Depot discussion board.

Buy Tencent

Published Oct 25, 2017 at 12:03PM

Is this for you? This is for all *Pro* members who are comfortable investing in one of the most dominant public companies in China. We have our usual long-term outlook: a minimum of three years, and ideally much longer.

How You Participate

- **Action:** Buy 2.5% in **Tencent Holdings** (NASDAQOTH: TCEHY)
- **Price Guidance:** Please use a **limit order!** Today, ideally pay less than $45.50. Later, the stock will remain a Best Buy Now until we change that status with an update.
- **Current Price:** $45.04
- **Guidance:** Best Buy Now
- **Fair-Value Estimate:** $50

Our $0.02 and More: In our surveys and member communications, longer-tenured *Pro* Fools often express a desire for more educational content. So we're trying something new with our recommendation on Tencent. Today's initial alert lays out the thesis for our investment as usual, and it should provide you with all the info you need to buy along with us. But in the coming days, we'll be sending additional content that takes a deeper dive into the valuation, our expectations, and more. Stay tuned!

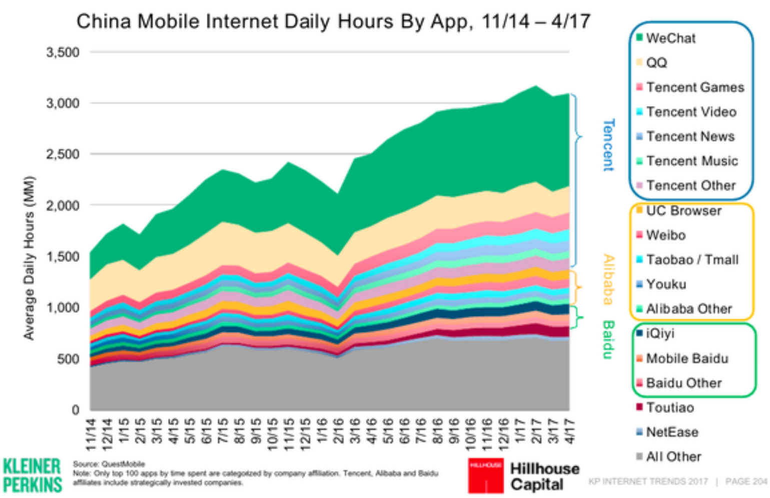
- Follow-up part 1: The Rise of the Everything App
- Follow-up part 2: What's WeChat Worth?
- Follow-up part 3: The Global Gaming Giant, Part 1

It's WeChat's World

Technology is with us from the moment we wake up until we drift off to sleep, making our lives more convenient and keeping us entertained and (hopefully) productive. Here in the West, we've become accustomed to relying on different applications for most daily tasks, but ask anyone who's spent time in China about this approach and they might say it's like stepping back in time. You see, in China, a single app — Weixin (WeChat) — that started out as nothing more than a smartphone messaging platform has since embedded itself into the daily lives of almost a *billion* internet users, enabling them to complete countless tasks in one digital place.

Tencent originally got a taste of success when it released its desktop instant-messaging (IM) service, QQ, in 1999. Despite cries of unoriginality, the app quickly gained a rabid user base, and by the late aughts, it had solidified its dominance with an estimated 76.2% of the Chinese IM software market. But co-founder and current CEO Pony Ma recognized early on that China's future was in mobile computing, not the desktop. His solution was to start an internal competition among several teams to create an app to address this perceived inevitability, and WeChat (which was initially developed by a team of just 11 employees) ultimately won out.

From there, the app has been a blockbuster success, dominating China's social-media landscape with 963 million users as of June 30. A recent study found that, of the roughly 3.1 billion hours Chinese people spend on mobile each day, WeChat captures about 900 million -- or almost 30% of all mobile internet traffic. More than 50% of users spent at least two hours with the app every day, and a third spent more than four. (Collectively, users spend 1.7 *billion* hours a day on Tencent apps -- more than they spend on all other apps combined.)



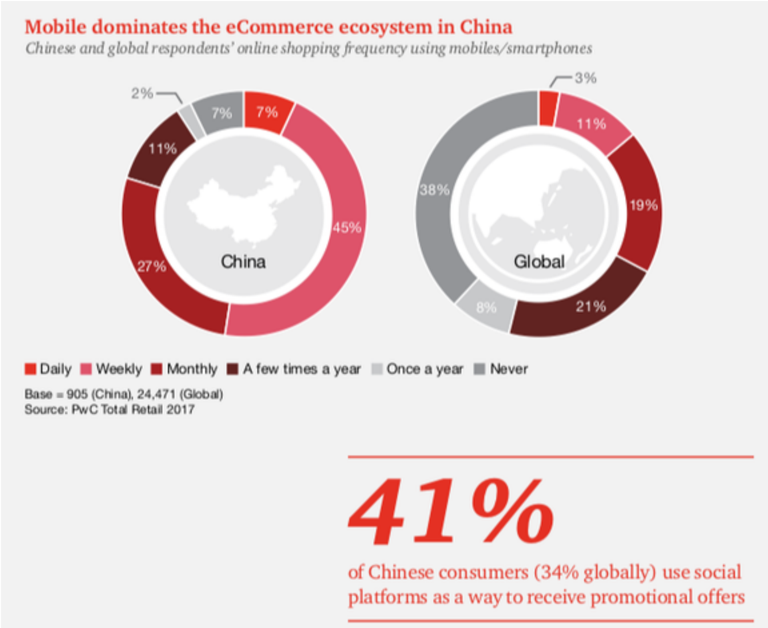
Source: Mary Meeker, Internet Trends 2017

One big reason for this success is that Tencent didn't just make an excellent smartphone messaging app and stop there; instead, it pushed to turn WeChat into a pseudo-operating system like iOS or Android. Need to talk to a friend, hail a cab, read the news, order a new shirt, pay for coffee, pay your water bill, play a video game, watch a video, listen to music, buy movie tickets, monitor your workout, or send someone money, just to name a few? All these things can be done without leaving the WeChat app. The end result has been a network effect and competitive positioning to make even WeChat's most successful Western counterparts envious.

In one of our forthcoming follow-up pieces on Tencent, we'll focus on the monetization of WeChat. For now, let's just say the potential is as impressive as we've seen in quite some time. We're excited about advertising -- some forecasts show the rapidly growing mobile market accounting for 60% of total media ad expenditures and more than 80% of digital ad spending in China by 2021. Chinese users' heavy reliance on just a few select apps ultimately reinforces the competitive positioning of the established market leaders and leads us to believe that advertisers will spend ever more money to get their messages onto the dominant platforms. If so, then it stands to reason that Tencent will disproportionately benefit from this trend.

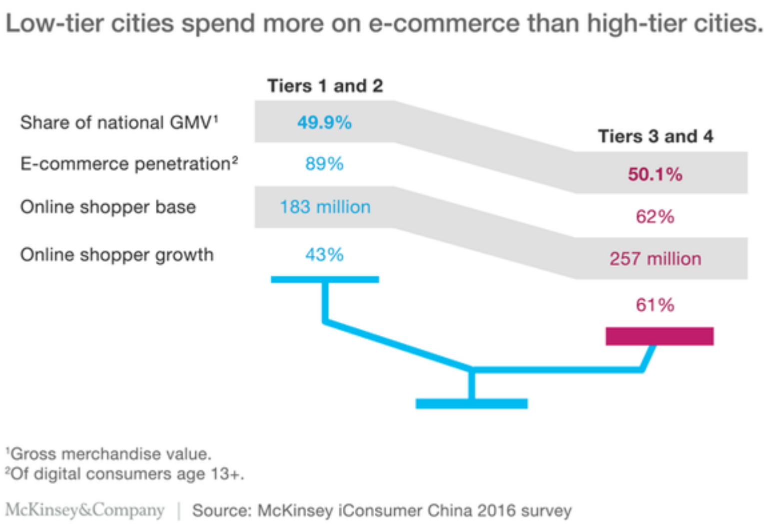
Facebook is the current gold standard for effectively applying user data in social-media advertising, but Tencent's integration into multiple aspects of its users' digital existence makes it able to gather far more relevant data than Facebook can. (Recent estimates are for 600-plus data points for advertisers on Tencent, vs. the 98 available on Facebook as of last year.) Prioritizing the user experience over monetization, the company has been slow to take advantage of this aspect of the business — management began testing the display of a mere two ads per 24 hours in select cities recently. But over time, we think its average revenue per user should begin to catch up.

We also believe that WeChat will ultimately be able to monetize the value it is creating by facilitating countless business-to-consumer (B2C) and consumer-to-consumer (C2C) interactions. Consider e-commerce: According to PwC, in China, the sector saw 32.1% growth to more than $210 *billion* in the first quarter of 2017 -- more than twice what was reported here in the United States. That's thanks in part to Chinese consumers' preference for shopping online via mobile.

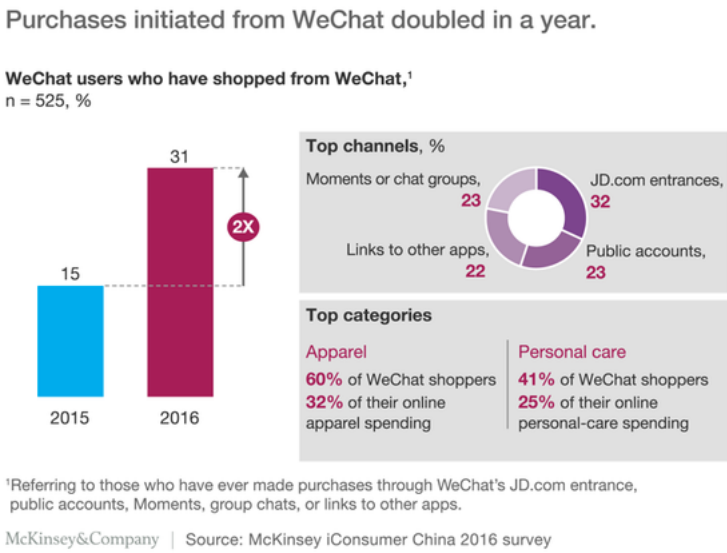


Source: *PwC China, eCommerce in China - the future is already here*

Despite this massive size, the Chinese e-commerce machine still has a long runway ahead. Although they contain 74 million more online shoppers, lower-tier cities' e-commerce spending only caught up with that of their higher-tier counterparts in 2015. And the low rate of penetration means that the number of people who use some online services, but don't yet *shop* online, in low-tier cities nearly equals the total number of online shoppers in high-tier cities.



Tencent is already far ahead of its Western counterparts when it comes to getting users of a social app to buy stuff online. You may not have heard of Singles Day, Nov. 11, but worldwide, it's the biggest online shopping day of the year -- and in 2015, more than 50% of the first-time Singles Day customers at huge Chinese online retailer JD.com came by way of WeChat and QQ. WeChat has also seen a huge influx of official brand accounts over the past year, and more than a third of these are already selling some form of product through the app (with 12.5% already generating at least 10% of their revenue this way).

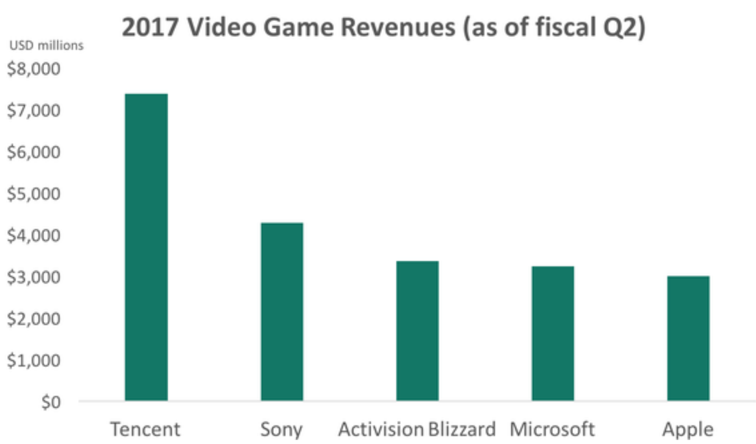


One way Tencent could ultimately monetize these transactions is through its digital payments platform, TenPay, which already has a monthly active user base roughly three times the size of PayPal's. TenPay is currently the second-largest digital payments platform behind Alibaba's alipay, with 40% market share vs. 54%. The Chinese mobile payments industry is a $5.5 *trillion* market (that's 50 times the size of its U.S. counterpart), and Tencent has rapidly been taking share from Alibaba as the former's WeChat integration has made it the go-to payment platform for peer-to-peer payments and cheaper purchases.

Long Live the Gaming King

"What's the largest video game company in the world?"

Ask any gamer -- or investor -- this question, and I suspect most wouldn't even list Tencent in their top three. But Tencent is in fact the largest, and it isn't even close:



Source: newzoo

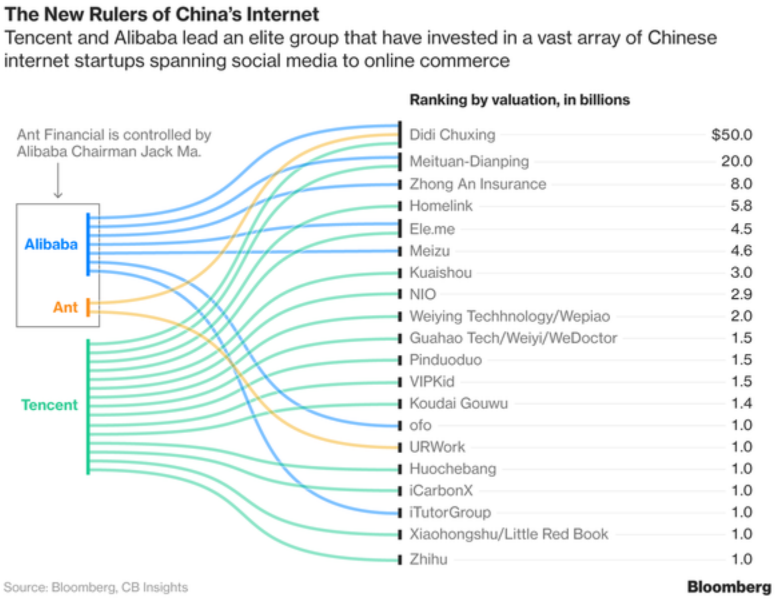
League of Legends, Tencent's PC crown jewel, is considered by many to be the most successful game ever created, given its longevity and massive player base. As of September 2016, *League* had more than 100 million monthly active players, representing a 16% compound annual growth rate since 2014. (If you created a country out of every individual who plays *League* at least once a month, it would be the 14th most populous country in the world!) It's not so surprising, then, that despite being "free-to-play," *League* was also the world's highest-grossing video game in 2016, generating more than $1.7 billion in revenue according to SuperData. And lest you think Tencent is a one-hit PC wonder, it's also the Chinese publisher for the third highest-grossing game, *CrossFire*.

But you don't get this big by focusing exclusively on desktop games. CEO Ma's focus on mobile has extended to Tencent's aggressive moves into mobile gaming, as well — an $8.23 billion market that Niko Partners forecasts will more than double, to nearly $18.5 billion, by 2021. In 2016, the company was responsible for publishing 25 of the top 100 mobile games in China; its latest smash hit, *Honour of Kings*, has actually become so successful that the *People's Daily* (the Communist Party's newspaper) has called it "poison." With a daily active player base of 70 million to 80 million people, *Honour of Kings* is on pace to generate roughly $3 billion in revenue in fiscal 2017. In 2016, Tencent also led a group that purchased 84.3% of Supercell, the Finnish publisher of the wildly successful *Clash of Clans* and *Clash Royale*.

If You Can't Build It, Buy It

"Tencent's services are so pervasive in China that startups there find it difficult to refuse forging alliances with or accepting investment dollars from the company. 'It's a little bit like the Godfather Don Corleone saying, "I'm going to make you an offer you can't refuse,'" says Andy Mok, founder and president of Beijing-based consultant Red Pagoda Resources LLC. 'If you don't take their money, and they invest in a competitor, it can be deadly.'" -- Bloomberg, June 2017

Tencent's success in multiple high-ROIC business lines has given management cash to invest in opportunities to ensure that Tencent becomes as inextricably intertwined with its users' daily lives as possible. TenPay and *Honour of Kings* are great examples of this, but the company's reach extends far beyond internally developed offerings. Management has made more than 40 investments in 2017 alone, and Tencent has meaningful stakes in several notable Chinese Internet startups:



We currently estimate that Tencent's major investments (a list that excludes many of these startups, despite the attention they're currently garnering) are likely worth upwards of $6 per share. That's for the company's positions in video games (including the aforementioned stake in Supercell as well as a 5% stake in Activision Blizzard), e-commerce (Tencent owns roughly a 20% stake in JD.com), online-to-offline (O2O) services (it owns a large minority stake in Meituan Diaping, the world's largest O2O platform with a reported gross merchandise volume of $35 billion in 2016), search (it has a stake in China's second-largest mobile search engine, Sogou), and other notable investments (like a 5% stake in Tesla, a 5.2% investment in China's second largest wireless telecom, China Unicom, and a meaningful minority stake in "the Uber of China," Didi Chuxing). We expect that valuation to rise sharply in the coming years -- plus, these products will add value by keeping users in Tencent's ecosystem, thanks to their integration with Tencent's social platforms.

Risks

One of the biggest risks with Tencent is a dwindling user base. If users abandon WeChat, it could result in a vicious cycle that undoes everything WeChat has accomplished. There's also a risk that the primary reason for WeChat's success -- the fact that it allows users to do everything in one place -- could ultimately become its downfall if the user experience becomes too cumbersome and cluttered. And from a valuation standpoint, I wouldn't be surprised if we begin to hear cries of peak Tencent when WeChat's user base starts to stagnate (unlike Facebook, Tencent has struggled to find success outside its home country). If this does happen, we'll likely see it as a buying opportunity, given the untapped revenue streams embedded within WeChat and the secular tailwinds powering the rest of Tencent's businesses. There is also the unavoidable risk that is the Chinese government, especially given a recent announcement that it may look to purchase sizable stakes in the largest Chinese tech companies.

The Foolish Bottom Line

The case for Tencent is perhaps best summarized thusly: Are you interested in investing in a company with similarities to Facebook, WhatsApp, Instagram, YouTube, Netflix, PayPal, ApplePay, MasterCard, Visa, Spotify, Apple Music, Gmail, Nintendo, Activision Blizzard, EA, Uber, Lift, Yelp, Groupon, and more? In 2014, *The Economist* questioned whether Tencent's $100 billion valuation made sense. With the benefit of hindsight, we can now see that the answer to this question was an unequivocal No -- but because the company was vastly *under*valued, not too expensive as the article suggested. Today's investors must similarly question whether a $424 billion valuation makes sense. While risks do exist, we think it's likely the answer will yet again be No -- and this time, as before, it will be because the market is failing to see Tencent's true potential.

Pro Video Chat, October 2017

Published Oct 24, 2017 at 4:28PM

The *Pro* team will be holding **a live video chat on this page at 2 p.m. Eastern on Monday, Oct. 30**! We'll be using Slido to communicate with members during the chat; to join, click here and enter the code **#ProChatOctober**, or click here to join the chat directly. We recommend opening Slido in another browser tab (or on a mobile device) so you can see both the video and the Slido questions at once. See you soon!

Transcript

JP Bennett:Greetings Fools and welcome to the monthly live chat for pro. I'm JP Bennett and I'm joined today by the irreplaceable Jeff Fischer. How is it going Jeff.

Jeff Fischer:Nobody's irreplaceable JP, but I'm doing well. How are you?

JP Bennett:I'm doing great. By phone or Skype we have the unparalleled Billy Kipersztok. How is it going Billy?

Billy:It's going well JP. I'm here by phone. I'm having some glitching issues with my Skype video so unfortunately here by phone. Also, yeah I don't know about unparalleled, but thank you.

JP Bennett:I'm laying on the compliments to hope to get this chat off to a good start, but the fact that you can't connect by Skype means that we're not off to the best start today. Our standard reminder Fools, we want this to be as interactive as possible, so please go on over to Slido and click the link above this video in order to do so.

If it prompts to add in a hashtag to get to the page, the code this month is prochatoctober. I'm on top of things so I actually know it this month, unlike the chat for options. Enter that in, find the questions that other people have entered in that you agree with, thumbs them up, add other questions that you haven't seen in the chat yet that you want to be answered, because the goal here for us is to answer as many questions as possible. With that in mind, unless either of you have opening statements we can just jump right into the questions.

Jeff Fischer:Sounds good JP. The first question is from [Lan 00:01:30] it's about Celgene, which is a company I of course follow most closely. We have written puts on it in pro in the past. I'll start with questions, but before I do that I'll say that the portfolio is up 18.2% as of this morning, year to date. So the portfolio is doing well. We're still about 74% net long. Does that include Tencent? I might have to update that number, so 75-ish, 76% net long. Well ahead of north star, ahead of ... Yes?

Billy:What was that number Jeff, the year to date return?

Jeff Fischer:18.2% for pro.

Billy:So it looks like on our portfolio page year to date we have through September 30th was 12.9%, so we had a really good October.

Jeff Fischer:That is true Billy. It's been driven by everything from Facebook to the MasterCard and Visa, to Amazon now, to NVR.

JP Bennett:Square.

Jeff Fischer:Square, Johnson & Johnson had a big jump too. It's been good. What I love seeing about the portfolio, and this is very true to life, or for a portfolio anyway, not everything is doing great, but the things that are doing well are doing well enough to give us a very pleasing return. Hopefully in future months, or even a year or two, the things that are lagging will hopefully have better goes at it as well.

JP Bennett:The first vacation is a beautiful thing when it works out.

Jeff Fischer:When it does work out it is. Speaking of that, Celgene. I wanted to end my preamble by saying I hope you're having a great year, enjoying yourself. We, the three of us, are. We love our team. We love working together. We love working for you and we love what we do, so we hope to continue to provide you with a pleasing service for years to come in Motley Fool Pro. That's both long and short, we continue to look at shorts, but so far it's very good that we were not compelled to short almost anything, because most things would have worked against us. The few that did work out, if we had shorted a bunch of things, they wouldn't have made up for the things that haven't worked out.

That sounds a little like market timing, maybe, but it isn't. It's just when you see an opportunity that you want to act on, you act on it. But in this market we haven't seen. We take the macro in consideration, we haven't seen things we wanted to jump on short-wise. We just saw a GDP growth of 3%, which adds more fuel to that fire. That's pretty strong growth for our country. Economies are growing even more all around the world, so it's been a good year for earnings growth because of that.

Alright, now enough, into Celgene. So, Lan and other Fools are interested. I am looking at Celgene. The news on it just broke Thursday or Friday, so I'm still looking at it afresh. But for those who don't know, the shares have fallen from 140 all the way to 100 or so after one of its promising drugs in the pipeline has been canceled at phase two trials. It didn't show positive results, so that's gone. That's unfortunate.

Then one of their lead drugs, or their lead drug, had weak sales and the quarter just ended. Management admitted they really got it wrong on their forecast for what that drug could do. That extends further down the line too. So they had to lower their guidance not only for this year but more importantly for 2020. Years ago they took the chance of guidance all the way til 2020, saying, "We'll grow earnings per share about 25% annualized," and sales by some high, high teens number annualized as I recall. Now, they lowered that earnings per share growth guidance to 20% annualized. 5% a year is a large difference. That goes far to account for the stock falling so much.

That said, shares now trade at about 13 times earnings, last I looked. About eight times 2020 earnings estimates if they hit those estimates. So we are looking at it seriously, that said we do not want another Gilead on our hands, meaning a high quality business, which both of there are, at a very attractive looking price. But if you don't have the growth that Wall Street wants from it, and in most cases that means surprise growth, more than what's already expected, you may not see the type of returns that you're hoping for.

We want to make sure Celgene, and still Gilead, which we still keep analyzing every quarter, is not a so-called value trap, a cheap high quality business that is not on track to grow the way we would hope. I don't believe Celgene is, as of yet, but it does have the added risk of only having a few big products drive the most of its sales and profits. That's not a pro-like feature. It also doesn't have pricing power, once a drug is out for a long time it has anything but pricing power. The price has to go down of course. Third point was, but I do want to say it has a great pipeline. About 50 compounds in trials, many of those look promising.

Overall, I lean positive on Celgene, but not certain that we're going to bring back into the portfolio yet. But I'm looking at it for maybe a bull call spread we talked about, maybe writing puts, because if we can get shares even cheaper that might be hard to pass up. Last time we wrote $100 puts on it for about $6 or $7 each and made that income. Let's end on that happy note. We've made more by writing a put on Celgene than shareholders have made since, that was more than a year ago I think. Yeah, it's a good business overall and I think it will hopefully earn a north star, but we're still thinking about it. Next question from someone else to talk is JP.

JP Bennett:Alright, hold on I'm pulling that back up. Question's on Starbucks' role in the pro portfolio. Yeah, that is a great question because it goes back to what you said, in terms of not every stock is doing amazing in the portfolio. Especially this past month you've had great winners but Starbucks is not really one of them. I'm pulling up the chart. It's been kind of muddling along since August, after it got hit. Where you had that run up on the unicorn frappuccino, or something along those lines. And then it got hit afterwards, when people realized that that was more of just a one hit wonder. We have earnings coming up, I believe they'll be on Thursday this week, November 2nd I believe.

Jeff Fischer:I know they're soon, they're this week.

JP Bennett:Yeah. I believe it is this Thursday. That's basically one of the wait and see companies. We haven't had much news from Starbucks in the interim. Until we get that, you don't want to run and make a rash decision, so we want to get earnings, digest them. We know that they're in a pretty tough spot, right? But it's looking out the next three, five years, can they continue to execute, continue to generate really great returns on invested capital, on their new stores, continue to open them up. Kind of right the ship in terms of the new initiatives in their existing stores that they're putting out there to try to help bump up their same store sales.

We're in wait and see mode with Starbucks, kind of, "Show me what you can do and if you can still execute. Even if the stock doesn't follow suit, that's not necessarily a bad thing, because what happens if the business continues to create value and compound but the stock price doesn't go anywhere, assuming they're not overly aggressive with their stock comp, the valuation is going to increasingly get cheaper, and that makes the company increasingly attractive in terms of an investment. That's where we stand with Starbucks.

Jeff Fischer:Well said. As David Gardner likes to say, "Past performance often reflects future performance."

JP Bennett:[crosstalk 00:09:37]

Jeff Fischer:Not always but frequently. So far we have to give Starbucks the benefit of the doubt after a few decades, even longer, of overall strong performance, as with all companies that's had its pockets of weakness. But even as we look at the challenges that it faces right now, and we take them to heart, our bias is still to give this team the benefit of the doubt because they've put in place a system and a business hopefully that really has staying power and the ability to grow.

JP Bennett:Yeah. If you think in terms of a portfolio and diversification, Starbucks is one of the names we still feel comfortable in having that retail-esque exposure. I would much rather own Starbucks than a Bucco, a company that we sold previously. That's another kind of additional value that Starbucks for having it in the portfolio. Ultimately at the end of the day we want all of our stocks to offset each other when they're struggling. So we want companies that are doing good to zig when the companies that are doing bad zag, and then the other ones that are doing poorly can hopefully pick up the slack when our leaders slow down for a little bit.

Jeff Fischer:Especially if they're all high quality businesses. Which we're trying hard to-

JP Bennett:That's the key, right? You can't hold a stock just because you say you want diversification. It has to actually be a good business.

Jeff Fischer:Speaking of irreplaceable, [Fusky 00:11:01] is asking, or saying, hey Fusky, "What one pro company would you think is irreplaceable? What one pro company would be the first one you would replace if you had to?" Great question. Billy, have you had time to think about that?

Billy:Yeah, I took a look at that one. It looks like a great question as well. I guess I can give my answer to that, and then I'd love to hear what you guys think for your answers as well.

For the one company I would think is irreplaceable it's really tough to decide because obviously when you're running a portfolio, you're not really banking on the results of any one position. You want to be, as we mentioned earlier, kind of broadly diversified. It's really the aggregate of all of your positions together that create your portfolio's performance.

But with that said, I think one of the good ways to answer this question would be think about it in terms of our pro quality checklist. Which is the eight qualities that we look for in our pro stock. I can run through them really quickly. One is a sustainable competitive advantage, another is pricing power, another is a dependent customer base, another is predictable revenue, growing free cash flow with compounding returns, financial resilience, expanding possibilities and then good management.

Among the positions that I cover, one of the companies that fits all of our pro qualities really, really well is Broadridge. I actually wrote a memo I think in 2016, last year, running Broadridge through our pro quality checklist, and it scored and eight out of eight on our checklist, which is awesome. It has all of the qualities we look for in a pro stock. I really love that company in the context of our goals.

We look for stocks that are stable, not too volatile, that have good pricing power, that can be really consistent and provide good earnings over time. I think Broadridge fits that category really well, as evidenced by its eight out of eight score on our checklist. For me, if I had to pick one it would be Broadridge.

Now the company that I would be the first to replace if I had to, I think Jeff and JP know the answer to this answer. We kind of talked about it a little bit. I'm not too keen on Open Text. I've advocated a couple of times for maybe considering replacing that with something else. But yeah, that would my answer, Broadridge for the irreplaceable and Open Text for the one that would the first to replace. What do you guys think?

Jeff Fischer:Alright, I like that answer. Broadridge is our second largest holding now too. JP do you have thoughts, or do you want me to go?

JP Bennett:I can go because Billy did both of us a favor by going first and giving us some time to think, because it took me a little while to think about this one. I think I'll take a bit of a different approach from Billy in looking at the companies for the ones I would want to hold for extended of time, I go back to a lot of the research that shows that ultimately it is the strong secular industry tailwinds that propel the winners for an extended period of time. If you are a company that is able to establish yourself in those industries that just have years and years and years of above average growth and strong returns on invested capital, then unless you're run by a bunch of chimpanzees, you're probably going to do pretty well.

So in that light, I would go with either Visa or MasterCard in terms of the companies that I would want to buy and hold them for an extended period of time. I don't need to spend much time talking about it, right? We all know about how great of a setup that is for the next 10, 15, 20, 30 years potentially. That would be my pick.

As far as the companies I would sell, the ones that I was the bearish in terms of coverage are names that I ultimately got rid of. To that end, I don't have any that are currently in my coverage universe that I'm eager to unload, because I don't really have an answer for that one. There are some companies that maybe Billy or Jeff follows that I don't understand as well because I'm only in the group discussions and that last mile in terms of really understanding. The business doesn't fall me and so that's where I may have some pause. But it's a question that I don't feel comfortable making, knowing that I don't have complete information, or a full grasp of everything going on within the business.

Jeff Fischer:Fair enough, and a very reasoned answer. Interestingly I viewed it a little bit differently from both Billy and JP, but similarly at the same time. So, irreplaceable I took to interpret as something that you wouldn't ... assuming you couldn't duplicate it, there wouldn't be anything else like it. So I chose Facebook. If Facebook were to go away and you weren't allowed to make a social media site or they just didn't exist.

JP Bennett:Tencent would probably be pretty happy if Facebook went away.

Jeff Fischer:See, so the nuance of my thinking needs to be described better. If social media had never come along ... Well, I guess that's true of every business, but anyway, I view Facebook as something that's difficult to duplicate, at least in this country at this moment. Because if Facebook did go away, a bunch of different social media apps would probably rush to fill in the gap, and who knows if one would congregate people the way Facebook had, has. Maybe they would but maybe not, maybe people would disperses and that would be it.

So for whatever reason, I view Facebook as irreplaceable as a platform of two plus billion people around the world. If it went away I don't know that something would step in and fill that gap as cohesively as Facebook is, flaws and all at Facebook.

As far as one I could or would replace, I view everything in the portfolio as actually replaceable and nothing as irreplaceable, when you really get down to it. But to play the game, I would say Gilead Sciences are one stock that is on hold, is the one that we could sell at any time to replace with something we like better. It's been on hold for a long time, when the stock rose some people who didn't buy were not happy about that. And now the stock is all the way back down, so hopefully they're happy about that. It's been hold for a reason.

Yeah, I hope that answers your question Fusky. We've got MasterCard, Visa, Broadridge, Facebook. Not surprisingly all big holdings in the portfolio. And then the ones we would replace, Billy mentioned Open Text. Part of his reasoning there is we have quite a few software companies. I mentioned Gilead Sciences.

Billy:Great question.

JP Bennett:Yeah. I like those questions that beyond asking about what's going on currently with a company, kind of the bigger philosophical questions.

Jeff Fischer:Make you think, yeah.

JP Bennett:Yeah.

Billy:You can see that we all have different answers to that. It's because it's more of a general type of question, we can all put our own spin on it.

Jeff Fischer:This is true. Let's see what we have next, we have Bob V, hello Bob, asking, let's see. Well, let me read it because he's writing. "I jump in on a Tencent transaction, or Tencent investment. I've always been weary of Chinese stocks due to transparency issues. Do you share any of those concerns?"

JP Bennett:I would say, yes of course we share concerns. There's no risk-free investment, so there's always issues. Especially when you're dealing with a Chinese company, right? We're getting ownership, or rather we're getting a stake in the company by way of an ADR, so there are definitely some potential issues there, should things play out in an unadvantageous manner.

However I would counter, with respect to all really big corporations, there's tons going on behind the scenes that you have no idea. Go back to Wells Fargo. We flash back a couple of years, it is by most people's standards the best large bank in the US. They have such high ethical standards. They're an upstanding company that really can't be duplicated. Warren Buffet loves it, lots of the Motley Fools advisors, analysts, members, they all love it.

Jeff Fischer:Everybody trusted it.

JP Bennett:Yeah, and then look what happened, right? So there's always going to be things that you really can't fully understand or grasp. So you just have to think to yourself, do the potential positives for the business and the investment kind of, not necessarily offset but outweigh the risks? In this case we believe that the answer is yes, just because although it's already a huge business, the competitive positioning that they've had, it's something that I really haven't come across.

We all know how amazing Facebook is, but in terms if you're looking at just China and Tencent and Facebook only in the US, it's, yes Facebook is further along in terms of monetizing advertising and things along those lines. But Tencent has been able to integrate into so many more aspects of its users' daily lives. It gives them so much optionality there. The opportunity for this business the next three, five, 10, 15, 25, go on and on, the opportunity there is huge. It was something that we talked about and considered, but at the end of the day we felt that the positive justified at least starting out at a 2.5% stake.

Jeff Fischer:Yeah, and that's another good point, it's one position in the portfolio and so that mitigates the risk as well. Okay, thank you JP. Karen, hello Karen, is asking to talk about Gilead Sciences. "Is it creepy or is it okay?" I haven't gone through the results from last week in depth yet, but they look more along the lines of middling. Once again, hepatitis C is more spooky than euphoric, I guess.

That market, there's pricing pressure, there's volume pressure. It quickly became, as you know Karen, Gilead's largest revenue driver, and then we've had to watch that contract without other things to pick up all of the slack. HIV, unfortunately but fortunately, is doing well. It's fortunately helping people, but that franchise continues to grow. Overall, our story hasn't changed in that Gilead has strong management, strong products, strong balance sheet, although now that they acquired Kite that's going to change. Overall we're right back where we were. We have a very inexpensive company, inexpensive stock that doesn't grow in the bottom line, that we're looking to write covered calls on.

We purposely did not before earnings because the earnings results could have driven shares much higher, you never know. We're always looking to make a small amount on covered calls, as you know the 1% a month or so. So why risk missing a bunch of upside for that little yield, which we can now, now that earnings are out, we can go to the stock and write covered calls on it more safely presumably. Yes, at a lower strike price, but with more knowledge. That's the trade off on that one. So our strategy there stays the same and we're close to on track to ... we're actually right on track to earning a north star, a better return on that stock this year with our covered calls and the dividend yield. But that said it's still on hold and we don't think it's worth newcomers getting into the stock when we could let it go at any time. We've driven newcomers instead to our other new positions, which have done on the whole much better than Gilead has this year. So good question Karen.

Quarter by quarter we see how this hepatitis C industry is shaking out. Unless it picks up steam soon, I think Gilead is likely to keep treading water. Hopefully it doesn't have much of a low from here, much lower, but it's hard to see it going much higher either with earnings from its recent acquisition not arriving until at least 2020. We'll take that in mind as well and we may indeed close the position if we want to raise cash, but meanwhile look to keep monetizing it. If we ever think the downside risk is very large from here, of course we'll let you know when to sell right away.

Anonymous is asking, "With the market running so high, are there more protective strategies we could use on our portfolio?" There are many, and we can address maybe why we haven't so far. I can say for my own thinking, is that one, we see earnings growth for the first time in a long time year over year, strong earnings growth. You see the macro economy doing well. You see policy that's going to aim to keep interest rates relatively low. You see very importantly growth in Europe and Asia again, most of Asia. So really at no time since the recession have we seen, so no time I can remember really, all major world economies growing at the same time. We're seeing that right now. We're also only about 75% net long. We have a lot of cash. We like what we own. We sold things we didn't own, or we didn't like, to be defensive. So we feel good about the portfolio and that's why we haven't spent money yet to put on more protective strategies, but when we feel compelled to we will.

JP Bennett:I could also add that now that we have Tencent out, that was perhaps the biggest distraction or takeaway in terms of preventing me from continuing on with our hedging series and pushing forward to the potential next hedging update and potential strategy. Now that Tencent is out and in the portfolio we're going to be able to shift gears and put more time behind that initiative. Potentially you could see something reasonably soon, however it gets back to what you said, we're not of the mind currently to pay an arm and a leg to setup a hedging strategy, especially given where we are in terms of our percentage net long and what the overall economy is looking like.

Jeff Fischer:You also have a market- Sorry Billy, go ahead.

Billy:Yeah, I was going to add, also in the context of this question, whenever I see a question that starts of like that, it's like, "With the market running so high ... " I always like to reinforce and give a reminder, that is a normal tendency to feel like, okay, stocks are up, the market is high. You have to have a crash coming soon, or it's going to drop back down.

It's a very normal feeling to have, but we have to always keep in mind that just because stocks are high doesn't necessarily mean that there's a decline coming or anything like that. Stocks are high, yes, but take a look also at, as Jeff and JP mentioned, the economy. Look at global GDP and look at the graph of what global GDP looks like, and that's also at an all time high in the world's history. So as populations continue grow and economies continue to grow, you would expect naturally that stock markets will grow alongside that. You can't always think, just because the market is high we should be scared. That's kind of a normal thing actually.

Jeff Fischer:Well said Billy. A final thought from me is that we are looking at protective strategies for some of our largest positions, and that's not a fear of the market but just a way to be smart about where our risk is concentrated. There are ways to do that, including buying puts or setting up collars. But I guess the bottom line is the three of us are thinking about it and are always looking for the portfolio to reflect our current thoughts.

JP Bennett:I think another thing we could also quickly throw out there is, if there is a company that is already a large allocation in the portfolio, if you want to reduce your long exposure for the portfolio overall, one potential way you could that if you're concerned about the company running into earnings or something like that, look to set up a hedging strategy on just that one name for very little cost.

Jeff Fischer:Anonymous is asking a simple question now, "What are you thoughts on Skyworks options with the recent rise?" Indeed, the last two days the stock has risen a lot on Apple iPhone X chatter. I was hoping we'd get under the bell on that so to speak and close that out before earnings. Earnings are coming up on the six of November I believe, and my plan, the plan we have, is to close the short calls on Skyworks before then, let the puts expire because they're well out of the money.

Although their value is shrinking so much we may just close those too and then see where we are after earnings. I don't want to keep it covered through earnings right now because the stock is still reasonably priced. We've earned back a lot of the stocks upside with the puts we've written, not with the calls. We've kept chasing it but the puts we've written have paid us pretty well. So we're sitting pretty well overall. After earnings we can see where things are and consider writing calls again. I don't plan to write puts again on it though, because our exposure is plenty high. So yes, we'll probably take care of those calls soon, and then look to write new ones potentially after earnings in about a week.

JB is very conflicted, getting old. I think we're all conflicted, I am, about time. But it gets richer as you get older too. Yes, richer experiences and what not. GB is happy with following pro but curious about our advice about switching the great allocation to bonds. Billy or JP, if you have any thoughts on that. We have talked about it with pro members in the past, where it's, the most simply put, it's a matter of having more cash, we usually carry at least 20% cash, which is kind of a bond equivalent these days practically with bonds paying so little. Or, owning less of our stocks, try to own all of them because it's a whole portfolio approach, but put smaller allocations in them. What you don't put in, you put into bond.

So if you want a 20% bond allocation or 30% or what have you, just be sure whatever money you're putting into bonds you're going to keep in the bonds for the whole duration so that you get the full value of the bond at the end. If you're doing that, it's simply a matter in my opinion of what sort of allocation you want, what percentage in bonds. Put the rest across all of our stocks.

JP Bennett:Yeah, I think this question really gets to understanding each individuals setup in terms of their temperament, their age and their goals and their financial status. That is probably dealt with a financial planner, just because of all the things that you need to take into consideration. But it something that even they are yielding very little, it often does make sense as you get older to switch your allocation to some percentage waiting in bonds. But without knowing the specifics and with the qualification, I'm not a financial planner, it's definitely a question where I don't necessarily feel comfortable giving a detailed example.

Billy:One way I like to think about pro in the context of greater portfolio planning is, even though we do stocks and options and EPS and shorting, I like to think of the entire pro portfolio as though it were like a stock basket. If you go to a financial advisor and they recommend 60%-40% stock and bond, if you have 50% of your overall portfolio in pro, you could consider pro as that stock portion of your portfolio.

That's how I like to think about pro, even though yes, we are in those different asset classes, we really do behave on a aggregate portfolio basis like a stock portfolio, but a more sort of conservative type of stock portfolio that doesn't bounce around or have as much volatility as the overall market. A lot of that is due to the fact the we hold some cash, but also due to the fact that we do try to take consideration to protect downside and do hedging and also pick companies that tend to be more stable and less cyclical. That might be some help.

Jeff Fischer:Sounds good, thank you Billy. We have about 23 minutes left so let's go into a semi speed round. We have quite a few questions here, thank you for asking your questions. Let see how many we can get through with decent answers still.

Anonymous is asking JP, "What is a reasonable steady state percentage of our pro portfolio to hold in the Chinese market, for example Tencent and any future Chinese recommendations?" Good question.

JP Bennett:It's a good question and I personally don't have a definite answer. I think it goes on a company by company basis, with an acknowledgement that them being located in the Chinese market there's definitely some risk, especially with regards to the government. So we haven't' given that much thought to it yet, just because we only have one investment in it. But I would say there's definitely a hard that cap, that assuming we research more Chinese companies and really like them and want to invest in them, that we run up against and we wouldn't want to push above.

Jeff Fischer:Yeah, I think I'm personally at 7% or 8%. I'm probably not going much more above that. I think I can go more than 10% in China myself, but we'll see what pro does.

JP Bennett:It also gets back to something we've talked about on countless occasions in the past in terms of a lot of our other companies already have ... Starbucks, Apple, the list goes on and on, we already have a lot of companies that have exposure to China.

Jeff Fischer:What impact if any do you see for Facebook from fake news? Do either of you want to share a thought on that, or do you want me? Stock I cover, I guess I can do it.

Billy:Yeah, go for it man.

Jeff Fischer:I guess, I love that confidence.

JP Bennett:It's the one you listed as irreplaceable too, so ...

Jeff Fischer:It's true. I feel like I'm talking a lot so I wanted to ... and frankly I know they want to fix the problem and I think with time they'll be able to. I think the way they've dealt with it so far has not been nearly as forthright it seems, or as expedient, as I would have liked to have seen. I think Zuckerberg has been embarrassed and even feels a bit ashamed about this happening. He has a very idealistic view of Facebook and what it should be and what he thought it was. He believes of course getting people together will make the world better, and he's learning, we all are learning perhaps, that bringing people together can also lead to unfortunate outcomes.

They need to find a way to, one, to find what's allowable and what's fortunate versus unfortunate, and two, make that happen on the site and make it safe and positive for everybody. I don't think there'll be any real impact to the business though from what's happened so far. If it gets worse, if it continues and grows, it could then lead to some sort of impact, if advertisers don't want to be associate with the Facebook name. But I think we're a long from that right now, and from all accounts it sounds like they're working to really get on top of this and hopefully eradicate, all but eradicate fake news from the site. When you think about it, fake news has been a part of the world in one form or another for as long as humans themselves, I guess.

Billy:I think it's also gets to another thing that you can tie in to general investing. Which is the power of social proof, where if you see a large group of people believing in something or sharing something, there's a natural tendency for the next person to just believe it, without really vetting it. It's just another example of how powerful those forces are of social psychology, that really are kind of ubiquitous in investing.

Jeff Fischer:So true, and then, this not directly related but the internet brings you closer to other parts of the world in a sense, but also keeps you very distant from them. Some of the things that fake news centered on are right around the corner from us in DC, so we can go there and know it not to be true, and yet people at the other end of the country don't have that familiarity with it.

The internet can easily conjure up what isn't real. Great question, it's going to be intereresting to see how they deal with it. We, as investors, are very concerned how it might affect financials at Facebook. So far, I'm not concerned about that. We'll see soon. Keep in mind, Google also has had big problems with fake news, as well as Twitter it sounds like at least a little bit, if not a lot. Google just reported, Alphabet just reported strong results.

Bumper Cars is asking, "Current thoughts on Gilead?" We did talk about that and so we can move on. We are planning to write more options. I think, well I'll just move on. Okay, Lance, "What are your thoughts on how today's developments ... " Okay, we have a political question, but not really. "How will this affect stock prices?" It's a great question. You might argue that stocks, some people argue that stocks have risen on the hopes of this administration, and it's true, stocks have gone up since November a lot.

I would argue at least half of that is driven really by the fundamentals, by earnings growing and GDP growing as we talked about earlier, and having clarity on interest rates as well. Do you guys have thoughts?

Billy:I personally do not. I'm not really following this investigation all that closely, so don't feel qualified to comment.

Jeff Fischer:I would say if doubts arise about the administration staying power for example in the extreme, you would expect we'll see more volatility. But in the longer run, meaning even a year or two, the stocks will be valued based on earnings.

JP Bennett:I would also throw out there that even if more and more starts to come out in terms of the worst case scenario, so then just in terms of what's getting out there, I'm not taking a side on the political sense. But worst case scenario, in terms of he's continuing to find more and more things that he can go forward on, and so all of these uncertainties start to arise with regards to what's going to happen, you may see some volatility but in the even intermediate term, in the long run, you don't really know how the market's going to react.

If you flash back to the election, market's rising because Clinton is a sure thing. It could be more the status quo, and we love the status quo. The market's been rising, so it's awesome. Then what happens? Trump wins, and before that everybody's like, "If Trump wins the market's going to tank because who knows what's going to happen?" Well, he wins and then what happens, the market continues [inaudible 00:38:45]. You don't really know what's going to happen. Maybe a lot of people get removed from the administration, they basically lose a lot of the power and the political capital that they had, and the market sees that and it loves it and it continues to rally, because man, maybe this administration wasn't cut out to do good things for businesses. So the fact that they're losing their power is a great thing. You really don't know what's going to happen. You have to watch it and see how things play out.

Jeff Fischer:That's a great point, especially because during this investigation playing out, you'll have all these other factors playing out that are economic, and that will drive prices as well. Which companies in pro do you feel have the best untapped pricing power?

JP Bennett:Tencent.

Jeff Fischer:Tencent.

Billy:I have a no brainer answer to this question, mine would be Amazon for sure.

Jeff Fischer:I like that answer, both good.

Billy:Yeah, they have the prime membership, which I think they raised from $79 to $99 per year a couple years ago. They saw very little blip in renewal rates. just thinking about me, personally, what I would pay for that Prime service is well over that $99 per year amount. I get a lot of value out of that, and not to mention they keep adding all kinds of different features and streaming and other things that you can utilize as being a Prime member. I think Amazon has a lot of room to increase their membership rate and grow profit that way.

Jeff Fischer:Nice. Tencent is a great one, Amazon, that's a great one, and kind of unexpected. I'll throw an expected on there, Verisk has great pricing power, raising prices each year. But many of our companies do, Starbucks is one of them, we'll see how long that continues. I think it can to modest amounts.

JP Bennett:Don't jinx it Jeff.

Jeff Fischer:Yep, exactly. 15 minutes to go, so we'll move even more quickly. Jim is asking a question related to FAZ. He's still short FAZ, any thoughts? I would stay short it if you can. We're waiting for 2020 options and then we may setup a synthetic short, perhaps. It depends where the portfolio is at at the time. I personally have stayed short FAZ as well through TD Ameritrade. It's such a small position now I'm just letting it go for now. I'm just keeping it short. You can do so as well and we conveyed that on the boards and in a memo as well. You can keep it if you like it.

JT Northern, would we ever consider including Alphabet in the service? We've talked about it. We own Facebook though, which is driving revenue from the same source, from online advertising. So far we've liked Facebook better, but there's a good argument to be made for owning Alphabet as well. I think we all do own shares of Alphabet too personally, but we just haven't put it pro, mainly because we put a lot into Facebook when it was beaten so. We have a large Facebook position.

Are we thinking Tencent could become another Amazon? JP?

JP Bennett:Perhaps this is a question that isn't best suited for the lightning round. The short answer, and I'll try to be somewhat pithy here, is no, just because that's not really what they're doing. They're more of a facilitator and enabling online transactions. They're like, they'll push you to, what is it, jd.com or some other retailer. They're not really the one that is holding the inventory, making the sale and things like that. They're kind of the facilitator that is enabling those online transactions and driving incremental transactions just because they're able to get people to buy stuff through [inaudible 00:42:21] and things like that. But they're not really looking to go after Alibaba and JD and the other big players in the space.

Jeff Fischer:Which small caps, mid caps and international stocks do you currently recommend other than Tencent? We'll move on from that one because that's a lot to cover in a short discussion, but we have some smaller caps in the portfolio itself. Paycom was one, still is sort of one. Square's qualified as a mid cap. Coherent is relatively small. Things that are in portfolio are what we recommend, both in pro and in Motley Fool options. We also own the international stock ETF for small caps, that's DJS. But we continue to look at other international companies as well. Thanks Lance for the question.

RS is asking about Disney, which is Motley Fool options. We will continue. The plan is to continue diagonal calls there or some sort of position there, as long as we believe in Disney. We'll cover that over in options itself. Right now there's a new trade coming there before long, it's the plan.

Jim is wondering about holdings for SVXY. It's grown to become more than 2% position for the portfolio. We're looking at trimming it perhaps, probably at some point, but we're happy with how it's done so far of course. Even though volatility is low we know it can stay low for a long time. We're happy to keep that as it's been a buy all this time and everybody should own some shares. Any plans to include crypto stock to pro?

Billy:We actually have some limited crypto exposure, somewhat, with Broadridge. They do have blockchain operations. They made some acquisition last year, of a company that focuses on blockchain technology. They're now integrating that into their communication solutions and trade processing, sort of architecture. Yeah, with Broadridge we get a little bit of exposure to that kind of crypto/blockchain space. That is definitely something that, I don't if any of you guys who are on the chat were in Chicago at our meetup this year, I didn't mention that one of the big trends in the market and the economy is cryptocurrency and blockchain technology. That is something that I'm looking at and researching. So yeah, that would be something I'm interested in and maybe potentially space for another long idea in that area in the pro portfolio.

Jeff Fischer:Sounds goods. My Boss David is asking, "Any thoughts on adding Shopify to pro?" You know, I love the questions we get about Nvidia or Shopify or MercadoLibre or things that are doing really well in recent years, because it means you're plugged into other services as well. You've heard about these stocks somehow. If you like them from day one, you should own them. We can't add them all to pro, being a focused portfolio. If we were an idea service that could have 100 or 200 ideas, they would be in there. They're in the Fool universe as it is. I think we appreciate that pro is seen as a high water mark if a stock gets added to pro, but we won't always be right, obviously, and we don't at all buy everything that we would like to buy because we can't. So we've looked at Shopify, it's a position in Motley Fool options now. I liked Square better than Shopify when I compared the two earlier this year, so that's something we added. Shopify is obviously on our radar and it's in Motley Fool options. I don't know if it will show up in pro.

"I didn't jump into Tencent because I don't trust Chinese stock. Am I crazy?" Instead of throwing every one these to JP I'll just say, it depends what you're comfortable with. If you're not comfortable with something, by all means, your comfort is more important than owning something. There are a lot of great companies to own. We felt the same way for a long time, or I did anyway, and have come around in the last year or two, to starting to own Chinese stocks. Start small, it's what I did, and see if your comfort level grows. That's how pro is starting too with just a 2.5% position. Maybe you want even smaller to dip your toes into Tencent. I do know that we like the company a lot obviously and see a lot of potential for it. So if you want to start with a little bit you could, if you're comfortable.

"Any current thoughts on hedging?" We did talk about that Mike, maybe 20 minutes ago. This will be recorded and available for you. Sprint-T-Mobile merger effect on AMT Billy?

Billy:Yeah, that's been something that analysts and investors have been concerned or talking about for quite some time with American Towers, ever since there was chatter about this merger. Last year, I think November, American Tower sent out a press release detailing the business that they do with T-Mobile and Sprint. What we're concerned about here for a merger is only areas on the Towers were both T-Mobile and Sprint share equipment that would be redundant. Because if those two companies do merge, and they have equipment on the same tower that is redundant, they would just remove one of those pieces of equipment and keep the one that they need.

So we're only concerned about that overlap, and according to American Tower's press release, which they released last year, I think it was areas where Sprint and T-Mobile had overlap on their towers, was 4% of their revenues. So it's not insignificant, I mean 4%, it's not a tiny amount, but it's not huge either. That doesn't mean that for the area of overlap every single one of those pieces of equipment would be coming down. There's also cost associated with bringing down equipment that American Tower would actually benefit from. I don't think it would make too big of an impact. Also, there was news today that that merger is kind of breaking down, or the deal talks are breaking down. Now we see today that cell tower stocks are up quite a bit.

I think American Tower today is up 3%, Crown Castle today also up 3% on that news. Which makes sense because, okay, if we're talking about 4% of revenue is represented by that overlap, if that deal goes away now the market's bidding up shares by 3%. I don't know, I'm not too worried about that. I don't think that really affects the long term trajectory of the business, which they're more now positioned internationally, where there's a lot of growth potential in markets where cellular and data services are far behind where they are in the United States. That's where a lot of the growth is going to come from. The United States is quite mature at this point, although it is a big profit driver for American Tower it's not going to be where most of growth comes from in the future.

Jeff Fischer:Thank you Billy. Member Morris Pearl is asking for Home Depot for the long in the money call. What reasons did we have for choosing the particular call strike that we did, as opposed to a different strike? Since Billy just talked quite a bit I'll just throw in there that we're looking to minimize time value on the call that we purchase and minimize the amount of capital that we're putting into the trade, and still look to target a good leverage return if the stock does rise. Billy, unless you have anything else to add there?

Billy:No, not really. You do have a tendency, or at least I do, to look at delta, which is how the option moves in relation to the stock price, which is basically a reflection of how much time value is embedded in the premium. That particular strike was where there was a little bit of an inflection point in the delta, where the time value for that strike was quite a bit lower than the time value for the next strike. That one looked particularly attractive to my eyes, but it does change.

Jeff Fischer:Very appropriate for the holiday tomorrow, Karen is asking, "What is the scariest thing about the pro portfolio at the moment?" Scariest thing, maybe I'm too complacent but nothing in it scares me. I really believe in all the companies we own. We all know the market could fall at any moment, and fall significantly. We also know, historically that has always been temporary and prices have come back. We have cash that we can invest when the market does fall. We own companies that we're going to be comfortable owning, even in a decline. So short answer for what's scariest, it's probably SVXY, because it's something that-

JP Bennett:Good answer.

Jeff Fischer:Yeah, it could get cut in half pretty quickly and go from a 2.6% position to 1.3% if the VIX say went from 10 to 25, which of course it could do. You guys have scary things that keep you awake at night? No, but things that scare you?

JP Bennett:I don't know [crosstalk 00:51:26] Go ahead Billy.

Billy:I was going to say SVXY as well.

JP Bennett:I don't know if this necessarily qualifies as scariest, but one the big driving factors for me is when you're working on something and you always, in the back of your mind, especially if it's a timely options position, it's like, "Can I get it finished in time before the event plays out or something happens to make all of this work worthless or to miss the opportunity?" Because I know, talking about shorts, we've had how many shorts where we're on the hunt, and we're getting really close and then something happens and the thesis plays out maybe a day or two before we're ready to go.

Jeff Fischer:You just keyed into it like a key anxiety. Now I'm very nervous again JP. That's what keeps me awake at night, literally. We do miss quite a few things, but look how it works out anyway, but yeah, that's a good answer JP. Thanks for making me anxious.

JP Bennett:I do what I can.

Jeff Fischer:Hello Marc. Marc is asking, "With the unknown surrounding the upcoming tax legislation what are out thoughts about any risks to NVR?"

JP Bennett:I would say personally for me that's the one thing where I want to watch and see, because if you think about it, let's say something does play out and it's a negative for NVR, like a meaningful negative, not just a bump in the road and the business is going to adjust and continue to compound. If it's a permanent impairment type of situation, odds are because of what this is, it's not like a biotech where their drug doesn't make it through and so the stock gets clocked 30% on a single day. This is something that would play out over time, so maybe the news comes out and the stock gets hit 3%, 4% or something like that as the market starts to digest it. We'll still have plenty of time.

If it's permanent impairment type situation and it's going to ultimately drive the stock down 30%, 40%, I believe we would still have time. With that kind of framework I don't want to rush to judgment or try to anticipate the future, because this is politics, who knows what the heck is going to happen. This is another situation, and I think in investing in general if often pays to be in wait and see type of mode. If we need to react, we'll react. But then again, you look at this, we can't hedge out the position so to speak just because of the issues with the options not being existent and the stock is super highly priced. So even if they were, the odds are most members fall through. How many shares do we have? Could we even do buying puts or setting a type of-

Jeff Fischer:[crosstalk 00:54:08] options.

JP Bennett:... some type of option strategy, even if-

Jeff Fischer:We have 31 shares.

JP Bennett:See, we couldn't even do it.

Jeff Fischer:We could overpay for [crosstalk 00:54:16]

JP Bennett:Yeah, so it would either be sell your shares or continue to hold. As of right now, we're still of the mind to continue to hold.

Jeff Fischer:Mariano is asking, have we thought about creating an ETF for pro and making it public? I would love to, that'd be exciting. Can't say it's in the works right now but maybe some day, you never know. It would make a lot of sense in a lot of ways to have an ETF, and then people can invest and all the trades are done for you, there's not the delay, there's not all the writing. We also love what we do and love that we know that many of you love doing it yourself. But there's something to be said for a service like pro, and something to be said for an ETF that was pro like, which would be exciting. Maybe some day.

Alex is asking about comment about Chic Shack. Yes, Chic Shack has risen up with the market the past month or two. It's now, the short is down 13% for us. It's still a 0.5% position. I'm not concerned about the performance in this market. It's legging the market in small caps since we've been short it. Trends has been the last three quarters, whenever it reports results it falls and it slowly climbs its way back up, or at least this time it did. If it goes much higher and we see results that we still don't love, we might add to it finally. Every time it hits the high 30s we've thought about adding. If our thesis has to change we'll close it and there's very little harm done. If we like it we'll keep it and potentially add to it. We'll see earnings soon on Chic Shack. Right now it's status quo and hopefully no big surprises around the corner from their results.

My Boss David, he sold out SVXY thinking he was selling at a high. Do you think he should sell puts to match pro's allocation? It's a tough question.

JP Bennett:I would say for starters no, just because of what Jeff said, we could pare that down. Let's say you sell puts to open up and match us straight out of the gate, and then two days later we're like, "Hey, guess what? We're closing half of our position."

Jeff Fischer:As it tanks.

JP Bennett:Yeah, that wouldn't be a pleasant experience. Then the other thing to keep in mind too is how quickly this thing gets gutter. Selling puts with the knowledge that that premium could really not justify the risk that you're currently taking on, unless it's a situation where it's already gotten hammered and the volatility is really high, and so the IV's high and so the puts pay a really high price. Personally I've done that, but in terms of writing puts I've always waited when doing most things options related to the VIX, I've always waiting until volatility spikes, just because that's when they pay the best.

Jeff Fischer:As always, write puts if you're willing to buy the shares and keep them. [inaudible 00:57:07] Ross is asking, how do we avoid groupthink. That's a great question we could talk about for quite a while if we had time. The number one answer I would say is that we, for the most part, work independently on our research and our thinking. We only come to the team when we start to develop a thesis and have a pretty strong understanding of our argument. Then the other analysts take a look at it with a fresh perspective, their own perspective. It's not from day one that we're all working together on the same thing and cheering each other on. We're each independently typically working on different things, our own things. A lot of which we don't even tell each other about, except for the broad stroke brushes of it. I think that helps us avoid all thinking the same way about issues.

JP Bennett:Yeah. I would also add too, one of the big benefits of the team being together for such a long stretch of time in terms of pro's history, because I know in the past we had quite a bit of turnover, is that you start to develop trust with the people that you're working with. That trust is really important because it basically makes it a lot more likely that you won't take any disagreements or discussions as a personal attack on your character. If I bring something to the table and Billy points out a huge flaw, in my head I'm not like, "Oh man, Billy thinks I'm a horrible analyst. He's attacking me personally. What's this guy doing? I can't trust him anymore. I don't like him."

That's not how it works out, right? We've worked with each other long enough that we trust each other. We ultimately only want what's best for pro. So if I bring something to the table and the other two can point out what's wrong with it, that's actually a win for us. A, I get to learn something valuable, and so hopefully I don't make the same mistake twice. B, I didn't put something horrible into the pro portfolio and have members suffer as a result.

Jeff Fischer:Well said. We only have about a minute left so we should probably wrap up. Are there any that are timely that we must answer that are pro related and timely?

JP Bennett:I'll grab on from Fusky, who was saying that China just had held the national congress of communist party, cementing Xi's power for the next five years and codifying his theory and part constitution. What does this mean for pro? This is obviously in relation to our latest investment in Tencent. It's something that we actually gave a lot of wait to and spent a good amount of time thinking about. I know I have plenty of discussions with Jeff around our desks as this was happening. One of the things that you saw come out of it was the rumblings that China's potentially going to take up to a 1% stake in some of the largest companies, and maybe even with the goal of having some more say in their future decisions as far as the businesses are concerned.

Obviously this is a big risk, and once again why only started at a 2.5% position, but ultimately we felt like odds are they would want to not overly hurt the ... they ultimately want to do something that is good for the country but also good for the business, because at least our assessment of the situation is you wouldn't want to spend all these years trying to become a global powerhouse, to compete with the US and create these companies that can finally stay in toe to toe with the behemoths in the US, only to then turn around and neuter these companies, make them weak and unable to compete and see all the value that they've created over the years dissipate just in the name of doing what they thing the communist party should ultimately do.

I think there will be a lot of incentive to work with these companies and make sure that they're toeing the party line so to speak. It's a risk. We're definitely watching it, but you saw Tencent, they put out an app where you could clap for Xi and it was kind of ... they're going to do thing to try to stay on their good side and work with one another. As long as we see that happening, we think that the positives of the business will ultimately outweigh any type of potential drag on the business that the Chinese government can cause to happen.

Jeff Fischer:Excellent. Thank you JP. Another timely one I see is from Ross. He's asking about options on Home Depot. He has a diagonal call there. Ross, go over to Motley Fool options, that service, and ask there. Because that particular position you have is from Motley Fool options. Now pro just started a Home Depot position but it's different than that one. Then once you get your answer there you can probably meld it with pro's coverage over time and marry what we have.

Oggy Dog is asking plans to reinvest our dividends like we have done in the past. Yes, certainly. We do that every quarter when we like, when we want to, when we see things we want to buy. We do plan to do it again and we're due to in early November.

JP Bennett:Yep.

Jeff Fischer:I think with that we need to wrap it up, although I like the top question, so let's end on a retirement question. 3,000 a month, that's $36,000 a year in Costa Rica. That's a lot of money in Costa Rica, where the average family I think still makes $6,000 or less in median income. The average house, decent house is $80,000 to $120,000. So yeah, you can live comfortably on that budget and pretty well in Costa Rica. They have a good healthcare system, better infrastructure than people give it credit for, great climate, good food.

Yeah, you can live there for $3,000 a month. But what I would do first is go down there and rent a place and get to know it that way, get to know different areas, rent for a few months at a time and get to know different areas, because there are so many different climates there and different areas. You want to find one that you like best before you really put down roots. Thank you guys. Thank you JP Bennett for being here.

JP Bennett:Thanks for having me Jeff.

Jeff Fischer:Thank you Billy.

Billy:Thank you Jeff, great to be here.

Jeff Fischer:Great to see you, or to speak with you. We hope you have a great Halloween tomorrow if you're celebrating. We thank you for being a Motley Fool Pro member with us and a Motley Fool ... with the Motley Fool. We appreciate that you have trust in us and are following us. We hope you're enjoying your investments this year with us. We look forward to our November chat with you next month. Fool on.

JP Bennett:Fool on.

Billy:Fool on.

At NVR, the Numbers Speak for Themselves

Published Oct 20, 2017 at 12:56PM

Management at homebuilder **NVR Homes** (NYSE: NVR) doesn't hold quarterly earnings calls. When we asked about this the first time we called them, before we bought shares (they'll take your call if you ask!), their response was that although they aren't opposed to communicating with investors -- and to their credit, they've been very responsive thus far -- they'd much rather spend time focusing on running their business. As shareholders, we like this approach, although it does mean that a short press release and 10-Q is all the insight into the business that investors get each quarter. So far, we're pleased with what we've seen from NVR since it was added to the portfolio, and with the stock up 13% over the past two days in reaction to third-quarter results (as well as almost 38% since we first purchased shares a mere four and a half months ago), it's clear the market likes it, too.

This quarter was more of the same from this best-in-breed business, whose focus on local dominance and efficient production means impressive results during strong and weak markets alike. Excluding the excess tax benefit from adopting a new accounting standard, EPS was up 27%, thanks to a 35% increase in homebuilding income. That, in turn, was largely driven by a 6% increase in settlements, as well as an increase in the average settlement price to $393,000. The company's new order cancellation rate has also declined nicely, to 13% from 18% in the third quarter of 2016. Looking forward, robust growth in both new orders (up 21%) and backlog (up 16%) suggests that investors should expect more strong results from NVR in at least the near term, as long as pricing holds up. (The average new order price declined more or less back to third-quarter 2016's average settlement price of $384,000.)

Valuation multiples can be deceiving for cyclical companies like NVR, since they say nothing about where we are in the cycle. I still believe there is at least some room to run in the housing market as long as the overall economy overall holds up, but NVR simply isn't as cheap as it was six to 12 months ago, despite the impressive financial performance. We'll be updating our fair value for the company once the 10-Q is filed, but for now the stock moves down to a Buy from Buy First. That's OK -- with the stock having already delivered roughly four years' worth of North Star returns, we think it deserves a bit of a break!

Watching Apple Watch

Published Oct 19, 2017 at 2:13PM

Dear *Pro* member:

Apple (Nasdaq: AAPL) doesn't break out details of its Watch sales, but GBH Insights is reporting a couple of interesting data points: About 70% of the sales of its new Series 3 model are going to first-time Watch buyers, and 80% of unilts sold include cellular connectivity. Both numbers could be meaningful to Apple's future.

Apple has likely sold about 32 million Watches since 2015, yet the device still hasn't cracked two digits' worth of Apple's total revenue (it probably hovers at about 5%). However, margins on the watch should compete with those on the iPhone, and mainstream adoption of the wearable square could eventually turn it into another "repeat sale" hit for Apple, not unlike the iPhone. (About half of Apple Watch owners were already interested in an update before the new Watch was released.)

Do robust early sales data indicate that Apple has cracked the code to draw in millions of new wearable customers? The Series 3 can be used as a phone, and while talk time may be limited to an hour or so, this feature is certainly helping to push newcomers (including our own J.P. Bennett) to try it out. And the more customers who buy it, the more viral attention it gets, with word-of-mouth recommendations weighing heavily in new tech product sales.

Apple Watch sales increased 50% year-over-year last quarter, and IDC estimates had earlier put Watch unit volume ahead of the iPhone's during its earliest years (which you would expect, given Apple's customer base today). Growth is rising enough that the next few years may indeed be soon enough to tell us whether the Watch will break into the mainstream, becoming a real contributor to Apple's revenue.

Meanwhile, Apple's stock and that of its suppliers -- including **Skyworks** (NASDAQ: SWKS) -- are lower today on rumors (just rumors) that Apple is greatly scaling back iPhone 8 production already. If that's the case to any extent, it may be because customers are waiting for the iPhone X, due Nov. 3. Without more information to go by, right now we would consider any slowdown in production of the iPhone 8 models to be unsurprising; and we don't believe the long-term strength of Apple's franchise product is in trouble.

Apple remains a Buy in our portfolio, with a 4.5% allocation.

Do you own an Apple Watch yet? Do you like it? Are you getting one? Tell us about it on the Apple board!

Pro Catch-Up Trades and Upcoming Expirations: Oct. 19, 2017

Published Oct 19, 2017 at 1:41PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. But remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your portfolio — start there! Follow our allocation shown on our Portfolio page if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio (often around 3%).

- **American Tower** (NYSE: AMT): Buy up to 4%.
- **Broadridge** (NYSE: BR): Buy up to 5.7%, or, if you've yet to start a position, consider buying a one-half or one-third position, looking to fill out the rest over time. You could also (or instead) "sell to open" November 2017 $80 puts, lately paying you $0.75, or nearly 1% in 29 days.
- **Coherent** (NASDAQ: COHR): Buy 2.5%, or "sell to open" November 2017 $230 puts, lately for about $5 each, for a 2.1% yield in 29 days. (Or choose another strike price.) Sell one put for every 100 shares you want to buy.
- **FactSet Research** (NYSE: FDS): Buy 2.1%.
- **Medtronic** (NYSE: MDT): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.5%.
- **OpenText** (NASDAQ: OTEX): Buy 3.1%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Short 0.4%.

Options:

- N/A

Hedges:

- N/A

Next options expirations (October):

- **Gilead Sciences** (NASDAQ: GILD): Oct. 20, 2017, $86 calls, currently out-of-the-money, on track to expire as income with (as of now) no action required.

Face Your Fears: Recessions and Declines

Published Oct 16, 2017 at 12:44PM

Dear *Pro* member:

Countless investing conversations center on the *one thing* many speculators seem to fear most: recessions. Yet many can't even define the term. A recession consists of two quarters in a row in which gross domestic product, or GDP, declines year-over-year. When this happens, many companies report a decline in earnings per share, and that usually sends stocks lower.

But truly, how common and drawn-out are most recessions? When you get to understand your enemy, they're often not as fearsome as you thought. Take a look.

Recession	GDP Decline	Duration	Time Until Next Recession
August 1929-March 1933	(26.7%)	3 Years, 7 Months	4 Years, 2 Months
May 1937-June 1938	(18.2%)	1 Year, 1 Month	6 Years, 8 Months
February 1945-October 1945	(12.7%)	8 Months	3 Years, 1 Month
November 1948-October 1949	(1.7%)	11 Months	3 Years, 9 Months
July 1953-May 1954	(2.6%)	10 Months	3 Years, 3 Months
August 1957-April 1958	(3.7%)	8 Months	2 Years
April 1960-February 1961	(1.6%)	10 Months	8 Years, 10 Months
December 1969-November 1970	(0.6%)	11 Months	3 Years
November 1973-March 1975	(3.2%)	1 Year, 4 Months	4 Years, 10 Months
January 1980-July 1980	(2.2%)	6 Months	1 Year
July 1981-November 1982	(2.7%)	1 Year, 4 Months	7 Years, 8 Months
July 1990-March 1991	(1.4%)	8 Months	10 Years
March 2001-November 2001	(0.3%)	8 Months	6 Years, 1 Month
December 2007-June 2009	(5.1%)	1 Year, 6 Months	8 Years, 4 Months (so far ...)
Median Recession	**(2.7%)**	**9 Months**	**4 Years, 2 Months**

Source: National Bureau of Economic Research. Table shows that since 1929, the median recession sees GDP shrink 2.7%, the median recession length is nine months, and it takes on average four years and two months until the next recession.

The median recession since 1929 lasted all of nine months before GDP began to grow again -- that's just three quarters. After that, the median time until the *next* recession was greater than four years.

In other words, once every five years or so (roughly 20% of the time), investors will go through a recession before seeing GDP grow again. You could say these recessions are basically the "cost" of being an investor in your economy and its stocks. As long as you believe the country will continue to get more things right than wrong, and thus that growth will resume, each recession is an opportunity to buy a greater share of economic output at lower prices.

How much do stocks fall, and how wide is your window in which to purchase? That, of course, depends. With GDP falling 2.2%, the 1980 recession was sizable, but after gaining 31% in 1980, the S&P 500 only lost 4.1% in 1981. And 1981-'82 saw *another* recession, with GDP dropping 2.7%, yet the S&P 500 was up more than 20% in 1982.

Another example: In the 1990-'91 recession, the S&P 500 only lost 3.1% over the first year, then soared 30.5% in 1991. Take a look below to see how infrequently stocks *actually* have dismal years. (The yellow shows the longest winning streaks.)

S&P 500: Total Returns (1928 - 2017)

Year	Return	Year	Return	Year	Return	Year	Return	Year	Return
1928	43.8%	1946	-8.4%	1964	16.4%	1982	20.4%	2000	-9.1%
1929	-8.3%	1947	5.2%	1965	12.4%	1983	22.3%	2001	-11.9%
1930	-25.1%	1948	5.7%	1966	-10.0%	1984	6.1%	2002	-22.1%
1931	-43.8%	1949	18.3%	1967	23.8%	1985	31.2%	2003	28.7%
1932	-8.6%	1950	30.8%	1968	10.8%	1986	18.5%	2004	10.9%
1933	50.0%	1951	23.7%	1969	-8.2%	1987	5.8%	2005	4.9%
1934	-1.2%	1952	18.2%	1970	3.6%	1988	16.6%	2006	15.8%
1935	46.7%	1953	-1.2%	1971	14.2%	1989	31.7%	2007	5.5%
1936	31.9%	1954	52.6%	1972	18.8%	1990	-3.1%	2008	-37.0%
1937	-35.3%	1955	32.6%	1973	-14.3%	1991	30.5%	2009	26.5%
1938	29.3%	1956	7.4%	1974	-25.9%	1992	7.6%	2010	15.1%
1939	-1.1%	1957	-10.5%	1975	37.0%	1993	10.1%	2011	2.1%
1940	-10.7%	1958	43.7%	1976	23.8%	1994	1.3%	2012	16.0%
1941	-12.8%	1959	12.1%	1977	-7.0%	1995	37.6%	2013	32.4%
1942	19.2%	1960	0.3%	1978	6.5%	1996	23.0%	2014	13.7%
1943	25.1%	1961	26.6%	1979	18.5%	1997	33.4%	2015	1.4%
1944	19.0%	1962	-8.8%	1980	31.7%	1998	28.6%	2016	12.0%
1945	35.8%	1963	22.6%	1981	-4.7%	1999	21.0%	2017	14.2%

Pension Partners — @charliebilello — Source: Pension Partners

Even the Great Recession in 2008, which was torturous, doesn't look that bad through the wider lens of time: Stocks gained for five years in a row before 2008, then declined 37% that year -- but by 2009 the index had popped back 26.5%, and you know what happened from there.

This isn't to belittle how difficult recessions are as they happen. If you depend on your portfolio for income, watching its value fall 20%, 30%, 40%, or more rips at your heart and bends your mind. Part of that is because of anchoring: Most of us fixate on our portfolio's highest-ever value and measure everything against that. (Try not to! It can help to always mentally consider your portfolio as being worth 20% less than its recent peak, so declines are less jarring.) Either way, it is natural to feel fear and hurt during declines, even when you're buying more stock. We don't discount those feelings. We just recommend keeping these facts in mind, too.

How often do declines happen? You can see above that the S&P 500 posted an annual loss in 12 years since 1960, and it increased the other 45 years. So, 21% of years since 1960 saw a negative return -- right in line with our stat about recessions occurring about 20% of the time. But we know that recessions aren't the only precursor to volatility. Usually stocks fall "just because." Call these situations corrections if you want; they're basically just periods of time with more sellers than buyers, sometimes brought on by surprising news or a rise in uncertainty. If recessions represent the No. 1 fear on Wall Street, then corrections are next in line. But these typically *intra-year* declines are common.

Market Decline Size (1900-December 2016)	Average Frequency (1)	Average Length (2)
(5%) or more	Approximately three times per year	47 days
(10%) or more	Approximately once per year	115 days
(15%) or more	Approximately once every two years	215 days
(20%) or more	Approximately once every three and a half years	341 days

Source: Capital Research and Management Company. Measures DJIA. (1) assumes 50% recovery rate of lost value. (2) measures market high to market low. Table shows: Market declines of 5% to 10% typically happen several times a year, and larger declines occur every two to three-and-a-half years, and all last less than a year from top to bottom.

Although we haven't seen a 10% (or even 5%) decline in the S&P 500 since January 2016, we should expect the former at least once every year, and the latter several times. Larger declines are less frequent, but still occur every few years (and typically take much longer before recovery). *However*... even the largest declines (on average and historically) experience a selling peak in less than one year, after which recovery can begin. Aside from rare back-to-back years of losses, the brevity of most market declines leads to the slew of positive annual returns shown in the table farther above.

In fact, while the S&P 500 showed a negative return in 26% of years since 1928, it has only experienced back-to-back losses in three periods outside of the Great Depression (1939-1941, 1973-1974, and 2000-2002). All other annual losses were greeted with a gain the very next year. And today more than ever, more and more of us are set up to buy stock automatically each month in retirement plans, perhaps increasing the odds for a similar type of recovery.

So what's the takeaway? We should all expect meaningful market declines at some point each year -- and, yes, another recession eventually. But knowing that these rising and falling tides are natural, and usually not prolonged, should help all of us keep our investment strategies on an even keel, and take advantage of opportunities as we see them.

Pro Catch-Up Trades and Upcoming Expirations: Oct. 12, 2017

Published Oct 12, 2017 at 1:30PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio — start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week, to buy in approximately the size shown or (if you prefer) equal-weight at your own typical starting size:

- **American Tower** (NYSE: AMT): Buy up to 4.1%.
- **Broadridge** (NYSE: BR): Buy up to 5.6%, or, if you've yet to start a position, consider buying a one-half or one-third position, looking to fill out the rest over time. You could also (or instead) "sell to open" November 2017 $80 puts, lately paying you more a bit than $1, or more than 1.2% in 36 days.
- **Coherent** (NASDAQ: COHR): Buy 2.5%, or "sell to open" November 2017 $230 puts, lately for about $6.30 each, for a 2.7% yield in 36 days. (Or choose another strike price.) Sell one put for every 100 shares you want to buy.
- **Medtronic** (NYSE: MDT): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.5%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8%.

Shorts:

- N/A

Options:

- N/A

Hedges:

- N/A

Next options expirations (October):

- **Gilead Sciences** (NASDAQ: GILD): Oct. 20, 2017, $86 calls, currently out-of-the-money, on track to expire as income with (as of now) no action required.

Pro Guidance Changes and Completed Trades: Oct. 9, 2017

Published Oct 9, 2017 at 12:17PM

Pro Guidance Changes from the past two weeks (see any related trade alerts):

- **Broadridge Financial Services** (NYSE: BR): Rejoins the ranks of our Best Buys Now (which today numbers eight companies -- check them all out here by sorting the "What to Do" column). Our fair-value estimate for Broadridge increases to $77, and we have a 5.6% allocation. Start with 3% and build as close to our position as you wish.

Pro Completed Trades from the past two weeks (see transaction log; trades take a day to appear):

- None.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Oct. 5, 2017

- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- **Gilead Sciences** (NASDAQ: GILD): Sell to open Oct. 20, 2017, $86 calls, selling one call for every 100 shares you already own (the stock remains on Hold). As of this morning, these pay about 0.6% in 15 days, or $0.50 on the $82.60 stock. (Set your option quote chain to "See All" strike prices.)

Hedges:

- N/A.

Next options expirations (October):

- **Gilead Sciences:** Oct. 20, 2017, $86 calls, currently out-of-the-money, on track to expire as income.

Broadridge's Fair Value Increases

Published Oct 5, 2017 at 2:13PM

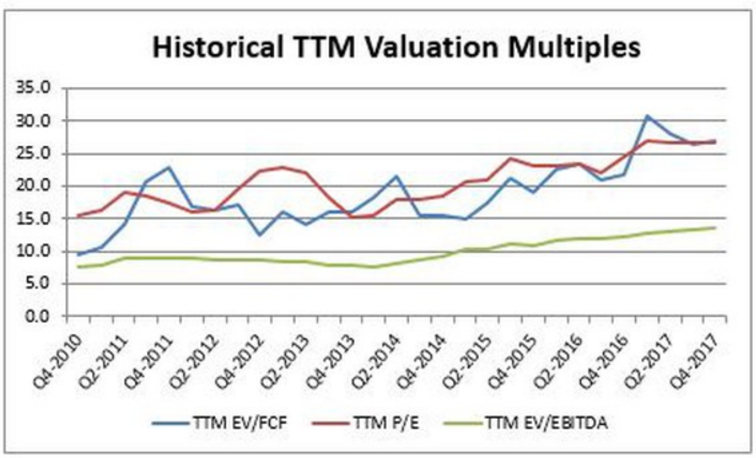
Fiscal 2017

- Recurring fee revenue growth (year over year): Up 29% to $2.5 billion (+6% organic growth, ex-NACC acquisition)
- Closed sales growth (year over year): +25% to $188 million
- EPS growth (year over year): +7.4% to $2.72

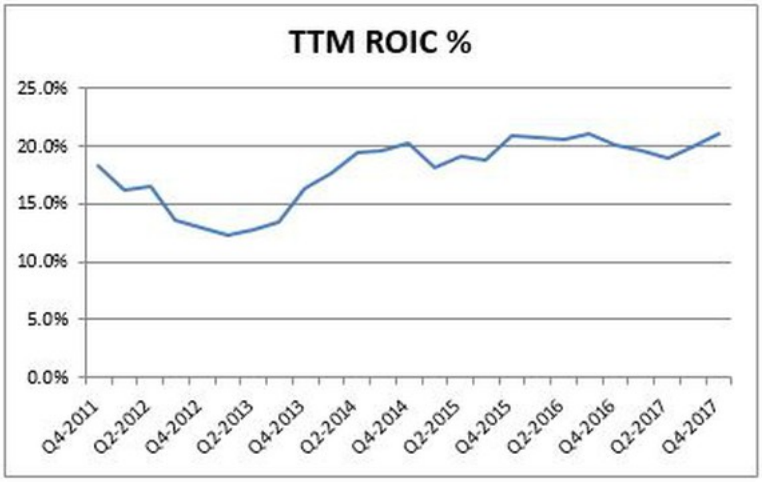
With a full year of acquisition-boosted results under its belt, Broadridge is poised for continued growth into fiscal 2018. Our provider of investor communications continues to expand at a steady pace and produce significant amounts of cash flow from a capital-light asset base. Although companywide margins are lower after the recent $410 million acquisition of DST's North American Customer Communications (NACC) business, Broadridge reported organic growth in recurring revenue of 6% in fiscal 2017, and margins should expand over time as the acquisition is integrated and operational synergies are achieved. We look forward to Broadridge's next Analyst/Investor Day, when management will provide updates on its longer-term financial plans and goals.

- **Updated guidance**: Best Buy Now (from Buy)
- **Recommended allocation**: 5.6%
- **Fair-value estimate**: $77 (from $65)
- **Current price:** $81.66

Based on management's guidance, at $81.66 per share, the stock is priced at about 25 times projected 2018 cash flow and 26 times projected 2017 GAAP earnings per share. Both of these valuation metrics are elevated relative to the company's history:



However, Broadridge features stable cash flows, a steady growth profile, excellent management, an increasingly strong competitive position, and margin expansion opportunities, with the company's return on invested capital (ROIC) trends serving as evidence of that point:



After incorporating a full year of results that include the NACC acquisition and accounting for management's 2018 guidance, **our fair-value estimate increases to $77 per share (from $65), and Broadridge moves to Best Buy Now (from Buy) on our scorecard.** Members who have yet to start or fill out their position can feel comfortable doing so at current prices.

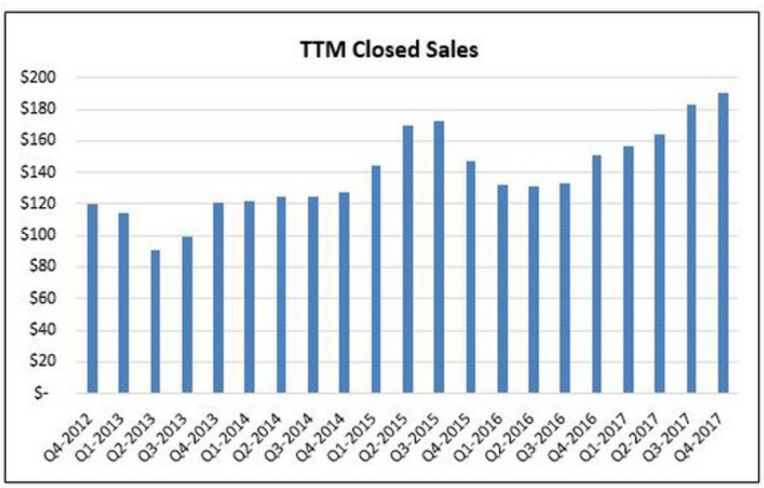
Our Thesis

Broadridge has a near-monopoly on proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make Broadridge a sturdy rock upon which to build the *Pro* portfolio. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow, and a growing stream of dividends to help achieve North Star-like returns.

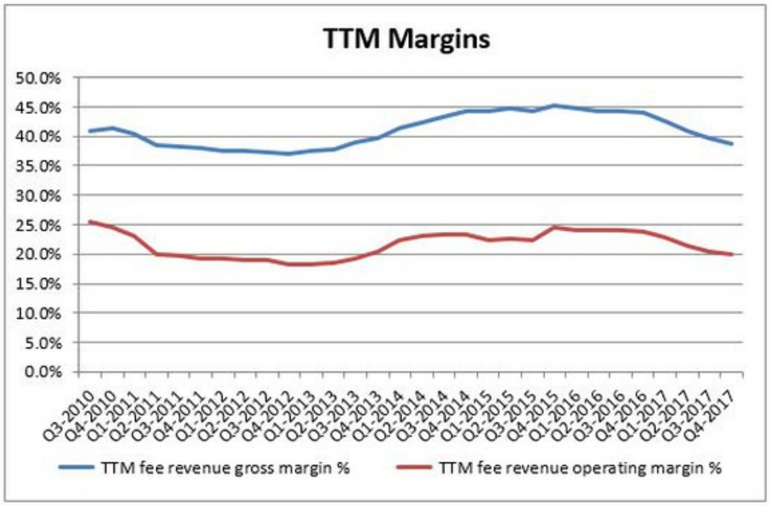
The Most Important Things

1. Closed Sales: This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%-plus). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

Broadridge has had a strong fiscal 2017 with respect to closed sales, which came in at a record $188 million, up 25% compared with 2016's $151 million. Fiscal 2018 guidance calls for closed sales of $170 million to $210 million for fiscal 2018, up 27% from last year's guidance. Management continues to feel confident about the company's sales pipeline, and momentum is strong, with fiscal 2017's closed sales beating the high end of last year's guidance. Broadridge's success in closed sales is a reflection of continued investment in and expansion of the company's products and services as it continues to cement its position as a leading provider of infrastructure to the capital markets.

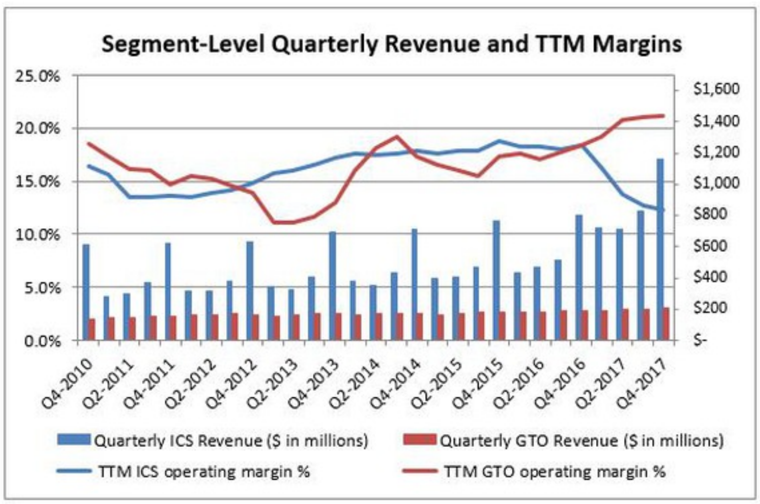


2) Fee Revenue Margin Performance: In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing-12-month (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 38.7% (down significantly from 44% a year ago), and TTM fee revenue operating margins came in at 19.9% (down from from 23.9% a year ago):



The reason for the decline in margins is the 2016 NACC acquisition. That business has a lower margin profile than Broadridge's legacy businesses, and it represents about 30% of total companywide revenue, so it drags down the margin profile overall. However, Broadridge should be able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency. Now that we've fully lapped the acquisition, we should hopefully start to see margin expansion as we progress through fiscal 2018.

When looking at Broadridge's separate divisions, we can see that the non-NACC business is doing quite well. While the Investor Communications Solutions (ICS) business has seen significantly lower margins because of the acquisition, the Global Technology Operations (GTO) business has shown strong margin expansion, generating a record TTM operating margin of 21.1%:



We'll want to monitor the ICS division's margins (expecting longer-term margin expansion as we progress through fiscal 2018) to make sure NACC integration is on track, and we also want to watch GTO to see whether recent margin expansion trends continue.

3. Capital Allocation: Although Broadridge is a slow grower, it generates a lot of cash and has low reinvestment needs. Between fiscal 2015 and fiscal 2017, management had very clear plans to put that cash to work: targeting a 45% payout ratio, using incremental debt capacity to make acquisitions, and using the rest for share repurchases. At an Analyst/Investor Day sometime before the end of this calendar year, management plans to provide updates on its financial goals for the next three to five years; after that, we'll have a better idea of capital allocation plans going forward.

On the dividend front, the company has paid out $1.32 per share on a TTM basis, good for a 49% payout ratio and about a 1.6% yield on the current price. Management also bought back $343 million in shares in fiscal 2017.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash-flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Pro Guidance Changes and Completed Trades: Oct. 2, 2017

Published Oct 2, 2017 at 11:28AM

Pro Guidance Changes from the past two weeks (see any related trade alerts):

- **Gilead Sciences** (NASDAQ: GILD): Write covered calls if you own 100 or more shares. The stock remains on Hold.

Pro Completed Trades from the past two weeks (see transaction log; trades take a day to appear):

- **Gentex** (NASDAQ: GNTX): We bought to close our December 2017 $17.50 puts for $0.39 each, ending the position.
- **Gilead Sciences:** We sold to open Oct. 20, 2017, $86 calls for $0.89 each, selling one call for every 100 shares we own.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Sept. 28, 2017

Published Sep 28, 2017 at 11:51AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio — start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week, to buy in approximately the size shown or (if you prefer) equal-weight at your own typical starting size:

- **American Tower** (NYSE: AMT): Buy up to 4%.
- **Coherent** (NASDAQ: COHR): Buy 2.4%.
- **Medtronic** (NYSE: MDT): Buy 2.6%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.6%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- **Gilead Sciences** (NASDAQ: GILD): Sell to open Oct. 20, 2017, $86 calls, selling one call for every 100 shares you already own (the stock remains on Hold). At today's market open, these pay about 0.7% in 22 days, or $0.62 on the $82.55 stock. (Set your option quote chain to "See All" strike prices.)

Hedges:

- N/A.

Next options expirations (October):

- **Gilead Sciences:** Oct. 20, 2017, $86 calls, currently out-of-the-money, on track to expire as income.

Pro Guidance Changes and Completed Trades: Sept. 25, 2017

Published Sep 25, 2017 at 1:03PM

Pro Guidance Changes from the past two weeks (see any related trade alerts):

- **Gilead Sciences** (NASDAQ: GILD): Write covered calls if you own 100 or more shares. The stock remains on Hold.

Pro Completed Trades from the past two weeks (see transaction log; trades take a day to appear):

- **American Tower** (NYSE: AMT): Per our alert, we rolled our short October 2017 $120 calls to April 2018 $130 calls for a net debit of $7.05 per spread. This keeps our diagonal call going longer, with more upside. [Correction: We previously wrote that we rolled $130 calls to $140 -- we apologize for the error! It was $120 to $130, as the trade alert instructed.]
- **Gentex** (NASDAQ: GNTX): We bought to close our December 2017 $17.50 puts for $0.39 each, ending the position.
- **Gilead Sciences:** We sold to open October 20, 2017 $86 calls for $0.89 each, selling one call for every 100 shares we own.
- **GoPro** (NASDAQ: GPRO): We closed our synthetic short for a net credit of $1.40 each, ending the short position with a decent profit.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro options:

- **Gilead Sciences** (NASDAQ: GILD): Sell to open Oct. 20, 2017, $86 calls, selling one for every 100 shares you already own (the stock remains on Hold). Lately, these pay about 1% in 29 days, or $0.86 on the $82.67 stock. (Set your option quote chain to "See All" strike prices.)

Hedges:

- None today.

Next month's options expirations (October):

- Gilead Sciences: Oct. 20, 2017, $86 calls, currently out-of-the-money, on track to expire as income.

Do You Behave Like a Pro?

Published Sep 21, 2017 at 12:56PM

From the *Pro* Archive

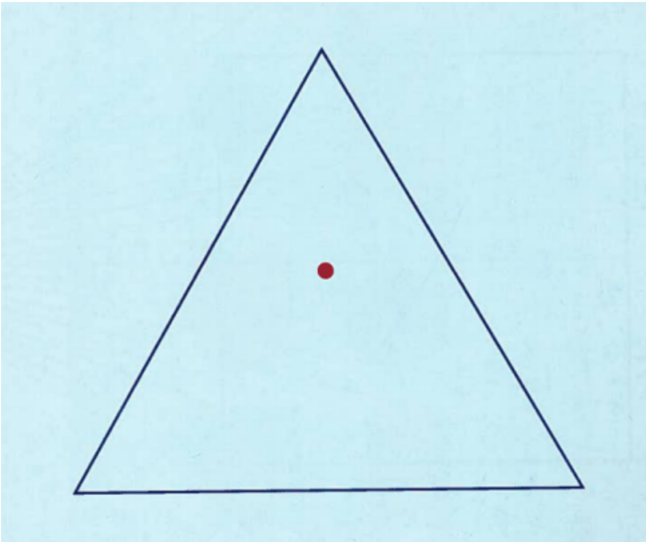
One benefit of longevity? A bevy of past lessons, successes, and losses to learn from. Today, in a bonus column, we go far back to April 2011 to revisit classic advice from long-term Fool Nick Crow. Fool on! -Jeff

At least half of being a *Pro* investor is having the right temperament. Fortunately, if you weren't born this way, it's something you can learn. In today's Memo, I'll show you how to improve your ability to think about investments.

Heuristically Thinking

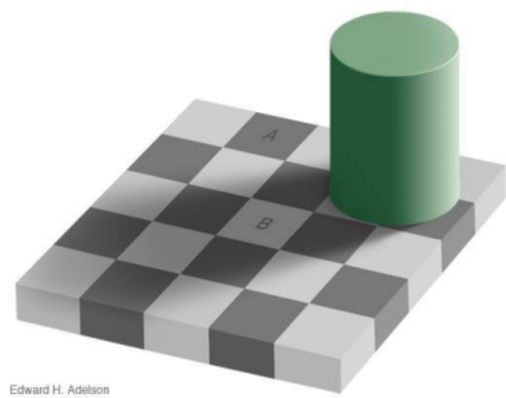
Our brains are hard-wired to help us survive in the wild — just think about our fight-or-flight instinct. But we often have to solve problems that can run counter to our pattern-seeking, choice-comparing, fleeing-to-safety mental coding. So we use heuristics, experience-based methods learned through trial and error, to quickly solve problems. This elaborate system of shortcuts serves us very well in "the real world," but when it comes to investing, heuristics might cause you to zig when you should be zaggin'. Check it out:

Is the red dot halfway up the triangle?



If you're like most people, the dot appears to be higher than halfway up, even though halfway is exactly where it is. Here's another example, just for fun:

Which square is darker, A or B?



It might take some convincing, but both squares are exactly the same shade of grey. They look different because we use our eyes to determine the color of objects in the world — not the amount of light being reflected off a surface. Our visual system, like the rest of our cognitive systems, is very good at solving particular problems but not other, related problems.

To tie all this back to investing, it would be good to know when we might be as easily tricked; that way, we can fight back.

Cognitive Errors

The field of behavioral finance has helped identify the mental shortcuts we use and the cognitive errors associated with them. Here are a few cognitive errors *Pro* investors should defend themselves against:

Anchoring: Focusing on a number is one of the most dangerous traps investors can fall into. If you've ever hesitated to make an investment simply because the price moved a bit, you were probably anchored. Alternatively, if you're holding a losing position just to get back to breakeven, you're anchoring on the price you originally paid.

- *Pro* tip: Focus on value, not price, and allocate your money to the most promising opportunities — even if that means recognizing loss [or adding more to big winners! -JF].

Hindsight Bias: Through the deceptive gift of hindsight bias, past events appear to be more predictable than they were in real time. Worse yet, when we look back, we actually believe that we knew what would happen before it did, even if we didn't make a prediction.

- *Pro* tip: The future is inherently unknowable. Keeping a journal and writing down the reason you traded a stock or your thoughts on the market will help keep you from tricking yourself.

Myopic Loss Aversion: We are more sensitive to investment losses than gains, and we measure outcomes too frequently. In fact, our emotional ability to take on risk increases the less frequently we measure results. When we measure results too frequently, we make decisions based on the next minute, day, or month rather than a longer period consistent with our investing goals. This results in higher stress and lower returns over time because our decisions are inconsistent with our actual time horizon.

- *Pro* tip: Check your portfolio performance infrequently, and base your decisions on your actual investing horizon.

Overconfidence: In the example above, how sure were you that the "B" square was lighter than the "A" square? Even upon close inspection of the graphic, you may have doubts. Overconfidence is being surprised more frequently than you anticipate. For example, analysts might set their valuation ranges too narrowly (i.e., the high end is too low and the low end is too high), which can lead to surprises when a stock quickly outruns their top-end valuation scenario. That's one reason *Pro* doesn't always insist on selling when a stock reaches our fair-value estimate.

- *Pro* tip: Let your winners run (and let us let your winners run, too). [This has sure been valuable since 2011! -JF]

Investors make interesting choices when faced with risk and uncertainly. After all, what's investing if not risking capital to earn a return in the uncertain future? By being aware of your biases and using our tips, you too can behave like a *Pro*.

Give Back

Investors join *Pro* because they want to steadily grow their portfolio while managing their risk. The team works vigilantly to deliver on this goal. But after they join *Pro*, many members express their amazement not about the *Pro* team's efforts but about our vibrant community. If you haven't visited or posted on the boards recently, you're missing out! Here are some easy boards to participate in:

- Meet & Greet: Light social atmosphere. Get to know your fellow *Pro* Fools and even share success stories, like paying off your membership in one week.
- Philosophy & Strategy: Talk about *Pro*'s strategy and investing tenets in general. It's a great board for general investing discussion.
- Social Banter: If you have something to talk about that's not related to investing, this is the place to go. The bar is low here: If *you* find it interesting, someone else will, too.

There's also a message board for every *Pro* holding, past and present. Just head here and look for the ticker you're interested in whenever you need the latest scuttlebutt or want to share your analysis. Some members thrive on doing their own research or on sharing their expertise in the industry in which they've made a career. We love that, too!

Pro Fools are always polite and use descriptive subject lines when they post to our boards. We hope to see your posts soon!

Foolishly,
-- Nick Crow (TMFCrow)

Write Covered Calls on Gilead Sciences

Published Sep 18, 2017 at 12:48PM

Is this for you? This is for *Pro* members who own at least 100 shares of Gilead Sciences, and who wouldn't mind capping upside in return for near-term income. Those who own less than 100 shares can continue to hold them.

How You Participate

- **Action:** Sell to open Oct. 20, 2017, $86 calls on **Gilead Sciences** (NASDAQ: GILD).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover all 900 shares we own, representing 2.5% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but **use a limit order** to split the option's current bid/ask spread. When we quoted it, that was about $1.02. Later, aim for about a 1% yield (option premium/current price of the stock) per month to expiration; with shares at $83.18, the minimum to accept is thus about $0.85.
- **Guidance:** The stock remains a Hold at a 2.5% allocation.
- **Prices** (12:40 p.m. ET):
  - Gilead: $83.18
  - Sell to open Oct. 20, 2017 $86 calls (bid/ask): $1/$1.04 (at your broker, click "See All" strike prices to see these)
  - $1.02 pays 1.2% ($1.02/$83.18) in 32 days.
- **Alternative Trades:** You can write a higher strike if you want more breathing room, or a slightly lower strike if you want a higher payment. We're using Oct. 20, though, to ensure the calls reach their expiration date before the next earnings report.

What We're Thinking

The long-awaited "major" acquisition expected from Gilead was announced Aug. 28, so unless there's *really* something up its sleeve, we shouldn't expect another large acquisition anytime soon. (That said, it could always buy a few drugs from another business, so we should keep that in mind.) Gilead shares have gained about 10% since the news was announced last month, even though the $12 billion acquisition of **Kite Pharma** (NASDAQ: KITE) -- while it has long-term promise -- won't bring earnings anytime soon.

Kite is a development-stage company working on novel immunotherapy-based cancer treatments, with a substantial pipeline of mostly early-stage candidates. Management at Gilead doesn't believe that Kite will add to its earnings for least three years. Gilead's shares remain reasonably priced today, trading at 10.3 times expected earnings one year out and yielding 2.5% in annual dividends. But without earnings growth, the stock may again be rangebound as investors wait to see how the volatile young Hepatitis C market plays out quarter by quarter.

As we've said for several quarters now, we want to hold the shares to target at least a North Star-level return by periodically writing covered calls on them (covered strangles down the line are also something to ponder), collecting the dividend yield, and eventually enjoying stock upside. So far this year, shares are up 15% (mostly in the past month), and the dividend and our two past covered calls bring our total 2017 return on the position to 20% (we made a 3.7% return on the *current* share price with our two previous covered-call positions that expired this year). That means we have almost two years' worth of North Star returns this year.

Even so, our sense is that we can write another covered call today to pad our returns, assuming the stock stays below our strike price over the next month. Next quarter's earnings report will occur *after* our Oct. 20 expiration date. Just be aware that anytime you write covered calls, you run the risk of missing out on a large run-up in the stock, and you may have little recourse in that case. So we need to be ready to let the shares get sold at our strike price if that should occur.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up:** If the stock price rises above our strike price by expiration, we may let our shares get sold; it's more likely right now that we'd roll our calls to a later date, or simply close them. We'll see as expiration nears.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions, please visit the Gilead board.

Pro Guidance Changes and Completed Trades: Sept. 18, 2017

Published Sep 18, 2017 at 12:00PM

Pro Guidance Changes from the past two weeks (see any related trade alerts):

- None. See all current guidance on the portfolio page.

Pro Completed Trades from the past two weeks (see transaction log; trades take a day to appear):

- **American Tower** (NYSE: AMT): Per our alert, we rolled our short October 2017 $130 calls to April 2018 $140 calls for a net debit of $7.05 per call. This keeps our diagonal call going longer, with more upside.
- **Direxion Financial Bear 3x** (NYSEMKT: FAZ) ETF: Our entire short position was closed by Interactive Brokers. There's nothing you can do when a broker initiates a forced buy-in. The 1.4% short is now closed. We're considering setting it up in another form (such as a synthetic short), and we'll let you know our decision soon. Members still in the position can stay in it. For more, please see last week's Memo.
- **GoPro** (NASDAQ: GPRO): We closed our synthetic short for a net credit of $1.40 each, ending the short position with a decent profit.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Sept. 14, 2017

Published Sep 14, 2017 at 12:10PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio — start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.2%.
- **Coherent** (NASDAQ: COHR): Buy 2.6%.
- **Medtronic** (NYSE: MDT): Buy 2.7%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.

Continue building your portfolio with our Buys, including:

- **FactSet Research Systems** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy up to 4.3% (perhaps starting with 3%).
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2.1%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- N/A

Hedges:

- New ones being considered.

This month's options expirations:

- None.

Pro Guidance Changes and Completed Trades: Sept. 11, 2017

Published Sep 11, 2017 at 1:55PM

Pro Guidance Changes from the past two weeks (see any related trade alerts):

- **Apple** (NASDAQ: AAPL): Fair-value estimate increased to $150. Remains a Buy.
- **American Tower** (NYSE: AMT): Fair-value estimate increased to $142 (from $135). It remains a Best Buy Now.
- **Facebook** (NASDAQ: FB): Moves to Buy (from Best Buy Now).
- **Gentex** (NASDAQ: GNTX): Moved to Sell.
- **GoPro** (NASDAQ: GPRO): Moved to Cover. We're closing our short exposure.
- **MasterCard** (NYSE: MA): Fair-value estimate increased to $119 (from $105). Remains a Buy.
- **Medtronic** (NYSE: MDT): Moves to Best Buy Now (from Buy).
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increased to $100 (from $96). Remains a Buy.
- **Visa** (NYSE: V): Fair-value estimate increased to $97 (from $93). Remains a Best Buy Now.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Direxion Financial Bear 3x** (NYSEMKT: FAZ) ETF: Our entire short position was closed on Friday by Interactive Brokers. There's nothing you can do when a broker initiates a forced buy-in. The 1.4% short is now closed. We're considering setting it up in another form (such as a synthetic short), and we'll let you know our decision when ready. For more, please see today's Memo.
- **GoPro:** We closed our synthetic short for a net credit of $1.40 each. Our short exposure is now ended.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Takes the Windy City; Plus, Our FAZ Short Is Closed

Published Sep 11, 2017 at 1:55PM

Our thoughts are with everyone affected by Hurricane Irma.

Dear *Pro* Member:

On Friday afternoon, Billy Kipersztok, Jim Gillies, Jim Mueller, Toby Bordelon (TMFEpsilon), and I joined about three dozen *Pro* and *Options* members for a gathering at Gino's East pizza parlor just outside Chicago. We offer great thanks to members marksrjm, RockyTopBob, and HeckCreek (I'm using TMF names, so you can more easily know them!) for setting up the party, which they did well. Deep-dish pizza was loaded onto steel-reinforced tables (*Pro* likes to mitigate risk), and cold beverages were served. What more do you need but conversation?

Happily, we had that in spades as well. RockyTopBob led the initial introductions of team members, and we then went around the room hearing introductions from the exceptional group of Foolish investors who attended, many of whom have been with *Pro* since the early days. I won't name a few because I would prefer to name them all: They're listed here. After this (and some mingling!), we kept up an extended Foolish conversation and Q&A session about investing throughout the evening. It was a pleasure.

Chamonyx asked us to name our biggest mistakes of omission and commission. Many past lessons (i.e., mistakes) were sprinkled throughout the conversation, but our early answers included closing **American Airlines** (NASDAQ: AAL) call options when they had almost no value (they went on to a full rebound without us), as well as not buying more calls or setting up more synthetic longs in general on various stocks.

We spent a fair amount of time discussing the difficulty of finding good short candidates when the risk-to-reward ratio is so stacked against a short, and the market continues to be so strong. We've done fine with our shorts in a bull market, but we've spent an inordinate amount of time on the strategy. Shorting doesn't seem worth it these days, but it probably will (if we execute) during a bear market, so we're not stopping the pursuit of individual shorts. Meanwhile, we know that we can throw on a market hedge -- shorting a market index -- instantly if we feel the desire. We could become a "market-neutral" portfolio in 24 hours if so moved. That we haven't yet is fortunate.

We also talked valuation. Both of the Jims, Billy, and I agreed that valuation models shouldn't be taken to heart more strongly than business quality and long-term prospects. A valuation is a snapshot in time even as it attempts to predict 10 or 20 years down the road, and the best companies are adding new opportunities all the time; your valuation model is not initially going to capture that. *Pro*'s valuations are meant to be conservative -- what we seek from our companies are high odds for a North Star-like return from current prices, and we hope we're buying businesses dynamic enough to exceed even that.

Consider that strong companies continue to grow even after decades -- our own **Johnson & Johnson** (NYSE: JNJ) is an example. But as Billy reminded us during the conversation, valuation models typically apply a "terminal value" that assumes just a few percent annual growth after a decade or two. That drastic slowdown is not what happens at companies that keep winning, and this makes an enormous difference in a fair valuation.

We discussed some investments we like today (even as we like our whole portfolio); names included **Skyworks** (NASDAQ: SWKS) (the stock and written puts), **Square** (NYSE: SQ) (ditto), and **Lowe's** (NYSE: LOW), particularly in light of J.P.'s trade alert on Friday for *Motley Fool Options*. (His recommendation, writing puts, made sense to us given current events, as Lowe's largest two markets are Texas and Florida.) Billy also pivoted to offer a speculative name in telehealth, **Teladoc** (NYSE: TDOC). Speaking of J.P., we missed him, and his famous hair was spoken of fondly by the group, which also mentioned missing Ellen and her charming, energetic wit. [*Editor's note: I like you people. I will not forget this when the revolution comes.*]

Before the evening ended, we heard about the 18,000-mile road trip around the U.S. that couple John (JSergeant) and Anna have just begun. They mapped it to stop at this event first. From there, they're circling the country in their **Tesla** (NASDAQ: TSLA), hoping over the next two months to take the lead position in a national contest to see who can visit the most Tesla supercharger stations. They're already ahead of the pack. We root them onward! (Track them above, through John's screen name.)

As always, the event went by far too quickly. If you've yet to meet your fellow Fools in person, we highly encourage doing so the next chance you get! At 8:30 p.m. Friday, I took off from Gino's East, near O'Hare Airport, to catch a 10 p.m. flight -- from *Midway*. It was tight, but in the end I did make it back to D.C., while the rest of the group pressed on to a casino. I'm told that pink martinis were had (not for the first time!) by Jim Gillies and his better half, among others.

We again say thank you to our kind and good-humored hosts, and thank you to all of the members who traveled from near and far to attend. It was excellent to see each of you, and to have a few precious hours to talk investing! (And if you missed the party, a recap thread has already been started here.)

From left to right: Jim Mueller, Billy Kipersztok, Toby Bordelon, RockyTopBob, Jeff Fischer, Jim Gillies, Luan Z.F. (S.O. of Jim Gillies; her last name abbreviated by me for privacy!)

Our FAZ Short Has Been Closed

One important order of portfolio business: Interactive Brokers closed our short of the **Direxion Daily Financial Bear 3X** (NYSEMKT: FAZ) ETF on Friday. When a short gets "bought in" like this, there's *nothing* you can do. The broker could no longer borrow the shares, and so they had to return them to owners, taking them from short sellers like us. Many members using Interactive Brokers were closed out on FAZ last week, too.

So, our 1.4% short on FAZ was closed at gains of 91.5%, 86.5%, and 6.1%, respectively (we recommended it twice in 2013 and once this March). It's a shame that this happened after four years; not only does it mean the end of a profitable position, but the tax man will come running after our profits. Alas, there's nothing a short seller can do in such a situation. Now we have to decide whether we want to enter the position again in another way (using options, such as a synthetic short), invest more in our favorite financial stocks instead, or do nothing.

The FAZ ETF is *short* financial leaders such as **Visa** (NYSE: V) and **MasterCard** (NYSE: MA); since we were short FAZ, we were effectively *long* the financial giants through our position. This leveraged long via a flawed short ETF was the cherry on top of our already sweet long financial exposure, which we of course maintain. Our portfolio's net long exposure declines by 1.4%, to less than 80%, as this short is closed, while our true long exposure declines to just more than 75%. We usually run closer to 80%, and we don't have a strong reason to change that now, so we may be increasing our exposure one way or another.

Members who are still short FAZ should sit tight and see what we decide to do. We'll let you know. If we set up a similar position using options, you can stay short FAZ. If we go about getting more exposure some other way, you can decide then whether you want to follow us on that path or stay short FAZ instead. To ask questions, please visit the FAZ board.

Thank you for reading! Foolishly,

-- Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: Sept. 7, 2017

Published Sep 7, 2017 at 3:22PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio — start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.4% (or start with 3%).
- **Coherent** (NASDAQ: COHR): Buy 2.4%.
- **Medtronic** (NYSE: MDT): Buy 2.7%.
- **Square** (NYSE: SQ): Buy 2.5%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2.1%.
- **Visa** (NYSE: V): Buy 3.3%.

Continue building your portfolio with our Buys, including:

- **FactSet Research Systems** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **MasterCard** (NYSE: MA): Buy up to 5.5% (starting with 3%).
- **Skyworks Solutions** (NASDAQ: SWKS): Buy up to 4.2% (starting with 3%).
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2.1%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- N/A

Hedges:

- New ones being considered.

This month's options expirations:

- None.

Pro Video Chat, September 2017

Published Sep 7, 2017 at 3:19PM

The *Pro* team will be holding **a live video chat on this page at 2 p.m. Eastern on Wednesday, Sept. 20**! We'll be using Slido to communicate with members during the chat; click here to join directly, or go to slido.com and enter the code #ProChatSeptember. We recommend opening Slido in another browser tab (or on a mobile device) so you can see both the video and the Slido questions at once. See you soon!

Transcript

JP Bennett: Greetings Fools, and welcome to our monthly live chat for Pro. I'm JP Bennett, and I'm joined today by Billy Kipersztok down in Florida; and our fearless leader to my right, Jeff Fischer. How's it going, you two?

Jeff Fischer: Hey, JP. Great, how about you?

Billy K: Going well, JP, thank you.

JP Bennett: Awesome, all right. Before we get going, let me just quickly remind you all that, once again, this is supposed to be an interactive hour. It's not just an hour of us rambling about whatever suits our fancy. In order for that to work, we need you all to go to Slido and submit your questions. Make sure you thumbs up the questions that other people submit, that you want to make sure we answer before the hour is out. And if you click the link above this video, you'll go straight to Slido. And, if for some reason it asks you to submit a password to get to the Pro page, I believe this month it's "pro chat September." Am I correct here?

Billy K: I think that's right, yeah.

Jeff Fischer: Pro chat September. It might say on the page, "options chat September." That's a mistake.

JP Bennett: Just a bit of a typo. All right. But, as is normally the case, before we get to the interactive portion we're just going to ramble here for a bit, so I'm gonna backtrack on what I said; just to give you all time to submit your questions. As we are getting to the end of September, we're essentially rounding third base and heading for home in the year, and I thought, "This is as good a time as any to quickly reflect on what we've done so far this year, and what we hope to accomplish before the year is out; giving members something to hold us accountable for. We can't just coast for the last three months.

Jeff Fischer: Great, great.

JP Bennett: I'm gonna look here, and I'm going to read off my computer to make sure I get it right, so Jeff doesn't criticize me. But as of 1:00 PM, the Pro port is up 13.1% year-to-date, essentially in line with the S&P 500 total return index, which is the one that reinvests dividends. We are 75.4% net long, excluding our QQQ hedge that is pretty far out of the money. If you step back and you take a look at that, and peel away the layers of the Pro port, you'll see that we've actually been far more active on the long side than we were in 2015. At this point last year, I can't remember offhand how many long positions we had added to the portfolio, but we added almost 2x so far this year.

And so far, they've actually been doing pretty nicely, Amazon and NVR, they're both up over 17%. Pretty much across the board they're strongly contributing to our returns, in addition to the stalwarts that were already in the Pro portfolio. And I feel like, if you look at Pro as a trifecta: longs, hedging and shorts all working together. Longs are always going to be our top priority, in terms of ... If we have an option to work on all three, we're going to prioritize longs more, simply because of the return on time you get for longs. So, let's look at Paycom. Paycom has been in the portfolio for, what? Almost two years? It was added last year, I believe, right?

Jeff Fischer: November of last year, so 10, 11 months almost.

JP Bennett: All right, so we're getting there. And last time I checked it's up almost around 75%. It's an amazing performer. But, if you compare that, let's say instead of Jeff working on Paycom, he had worked on a short. We set up a 1% short position on a stock that did the best case for short. It went straight to zero. Well, we actually have been able to, so far, generate twice the amount of returns as we would have if that short ended up in portfolio and Paycom didn't. If the short was a percent and a half, which is kind of our upper limit for a short. We'd essentially be breakeven. But, the best part with Paycom is, hopefully, knock on wood. This table isn't wood, so I don't know if it necessarily counts. But, hopefully we still have years more. Knocking on your head? All right. I guess that works. Hopefully, we still have years' worth of returns to go in the future.

The return on time you ultimately get from finding a great long company and adding it to your portfolio; it's almost always going to be higher than finding that perfect short or setting up that perfect hedge. And so, for those of the members that really want to see what's going on behind the scenes at Pro right now, I will note that there are actually a few longs that are seriously being considered; and I would be shocked if at least one of them didn't make it into the Pro portfolio before the year is up. We still have more work to do on that side, but that's not to say that we're excluding hedging and shorting. They are a key part of Pro's strategy, and personally, I believe they will be the deciding factor with regards to whether Pro is able to hit our lofty objectives during the next bear market. We don't know when that's going to come, but those are going to be the key.

We're not just completely disregarding them. We haven't been as active on that front, but we are working. It's important to stay ahead of the curve and not wait until we're kind of, "Oh my gosh, we need shorts. We need hedges. The economy has really deteriorated, and we're about to be in trouble." There is more work going on behind the scenes then actually makes the light of day, the hedging and shorting side of things. And we hope to have something on hedging relatively soon, though. I'm pretty sure you're going to shake your head in agreement when I note this, that option pricing has been quite poor with regards to hedging, and so we don't want to press and either set up a hedge that is unfavorable, in terms of breakeven potential losses and things like that, because we want to make sure we can set up for roughly breakeven. Or, pay an arm and a leg to set up a hedge that ultimately expires, worthless. There are a lot of things going on behind the scenes. We've been pretty active, and I think there is actually quite a bit that we hope to get accomplished before the year is out.

Jeff Fischer: All right. Thank you, JP. Definitely good thoughts to start on, and to serve as a springboard from here. Go to Slido.com if you haven't. And you can, from the video page, you can click directly to join the Slido.com chat. Put your question in there, thumb up the questions you want to see answered, and we will start on those right now. You'll have two windows open if you want to have Slido open, and the video portion as well. The first question, JP, is perfect. It's from Mark, who is asking us to discuss hedging strategies and times Pro is considering. I assume that means time frames.

Some strategies we're considering are synthetic shorts, bearish spreads; not put-ratio spreads right now, but other spreads. And the timeframe that we're looking at is anywhere from a few months down the line, to a year or two down the line, very long term. We're also looking at just buying puts outright. We're looking at strategies where we'll minimize our cost, and yet we acknowledge we're gonna have to pay something to hedge, in most cases. That would work over a long enough period of time that, hopefully, they'll be there when we need them; and that, ideally, will not grow if the market keeps going up, will work against us. We're leaning towards buying put options strategically, long-term and repeating that process, even though we know there is a cost to that, obviously.

But, as JP mentioned, our focus has been elsewhere. And so far, that's been for good reason. We've gone through many possible shorts this year, but we've worked just as much, if not a bit more on longs, for other reasons JP mentioned; but also, because that's what we're compelled to work on in today's environment. We watch the economy, we know that most bear markets, almost all of them, start because the economy deteriorates, because we hit a bear market, because earning start to shrink. Instead, we're having earnings grow this year in the S&P 500. We're having the economy moving at a moderate, but stable pace of growth. Until we see reasons to doubt that that can continue, we're more compelled to work on the long side than the short side.

You short at the wrong time and that can be as bad as shorting the wrong thing, period. Even if it would ultimately work out, it may hurt you too much while you're waiting. We look at all factors, and then we move in the direction in which we are compelled. I completely agree with JP, that during bear markets or sharp, so-called "corrections," our hedges and our shorts are going to make a big difference in our performance. They remain key to us, but I think it's also good that we continue to follow our instincts and invest how we feel is most appropriate for now.

JP Bennett: Yep. If you look at the two main goals for Pro: positive rolling returns over three year periods, and then double real purchasing power every 10 years. For me, the second goal, which was kind of the big focus, what you really want to do, because even if you have a shorter investing horizon, you don't want to be overly concerned with shorter periods like three years; unless you have to make a significant payout, or you're nearing retirement of something like that, where you really have a hard deadline. The longs are going to be what ultimately drives that 10 year performance and gets us that goal. We need to make sure our long book is watertight; that we really like exactly what we have in the portfolio, and we firmly believe that they're going to drive us there.

The hedges and the shorting, those are the ones that are gonna steady the ship and help us navigate those rockier, short-term movements. They play a bigger role when we start to have more concerns over, "All right, what do we think the market's gonna do over the next three years?"

Jeff Fischer: So true, and that's been part of our transition this year, selling positions where have a few too many concerns or questions, and buying new positions that we hope are going to drive returns, or help drive returns the next three to five years. In a world economy and world business landscape that is changing so rapidly, we want to own companies that are riding the wave instead of caught behind the tide, so to speak. And we think we're doing that with the new buys that we're making. It's fascinating how quickly business is changing, and how software is driving so much value creation. If you're not developing a relationship with your customer; like a deep, meaningful one, you stand a good chance of being left behind.

JP Bennett: I think the benefit we have with a lot of those type of companies is that, at least from my perspective, the way I view most technologies is that people, when they first hear about it, they immediately overreact to how quickly it's going to disrupt an industry, but they constantly underestimate how long the tailwind is and how much disruption will always take place. Amazon first bursts on the scene, "Oh man, it's gonna really disrupt the book industry." People get super hyped up about it, and then maybe they lose enthusiasm for it. Well, let's fast-forward a couple years. Look what's happening: they're disrupting multiple industries, and the tailwinds behind the business are getting stronger day-by-day.

Jeff Fischer: So, to close up on hedging and shorting, it's on our radar. All of the hedges we've considered this year I then track, watch loosely; and of course, none of them would've paid out. Most would've cost us considerably. The large basket of shorts that we've been watching, which has mostly been retail focused would have been neutral, at best. Several of them have fallen quite a bit, but others have risen substantially. So, in this environment where, generally speaking, earnings are growing, the economy is stable, shorting, we need to be very confident in any short that we put on; because one, the returns are skewed against you. Two, the rewards are small, so why take the big risk? Three, four, so forth, so forth. We need to really believe in our shorts. But, Mark, hedging and shorting is still one third of what we do.

Russ is asking, "Interested in hearing about opinions about increasing our exposure to European equities." I'll throw out there quickly, and then you guys can share whatever you think as well. So many Pro positions have exposure to Europe. We look at that as we consider our purchases as well. We want companies that have opportunities, not just in the US, but around the world; including Europe. And we've looked at plenty of European companies, especially last year and early this year, and even some European ETF's. We haven't liked them as much as what we have bought, the half-dozen or so new names that we've bought in the last 10 months or so. We're looking, but we tend to favor companies, so far, that operate here and have a lot of exposure to international sales as well.

JP Bennett: Didn't you write a memo on this a few years back, Billy?

Billy K: On European exposure?

JP Bennett: I just remember on looking at ... Was it international exposure?

Billy K: Yeah. I think what I did is I went and analyzed the percentage of revenue from different geographies among all of our companies. So I did; I can try and find that in, of course, this chat, and see if I can link to that.

Jeff Fischer: We like the idea of looking at international equities, of course, to diversify our risk a bit more away from just the US. We've been looking at a lot of China-based companies, as well as European ones. Anonymous is asking, "Any thoughts on Goldman's downgrade to sell on J&J today?" Billy, have you had a chance to see Goldman's argument?

JP Bennett: I did, a bit. Let me pull that up again. But, I think the gist of the argument was just that the valuation is a little bit, I think "stretched." And it's ironic; I actually hadn't seen that report before the three of us, Jeff and JP had a meeting this morning, and we were talking about how Johnson & Johnson's valuation multiples is getting a little higher than it has been in the past. It is something that you want to monitor and watch, but also, Johnson & Johnson is a very high quality business. I have this Goldman report here right now, or at least some comments from the media about the report, and they mention that ... Okay, the Goldman analyst predicts that Johnson & Johnson will grow its earnings-per-share 7% annually during the next five years, versus her 10% industry average forecasted.

When we invested in Johnson & Johnson, we kind of did so under the pretense that we know that it's not going to be a super-fast grower. It's not going to be that type of a company that's going to generate 10, 15, 20% earnings-per-share growth. But, it is going to be the type of company that fits into the Pro portfolio as a stable ballast, where it's going to be a steady performer with consistent earnings-per-share growth in a dividend, and we should probably see a pretty high likelihood of Northstar matching returns over time. Johnson & Johnson has a dividend around 3%, and the analyst who did the downgrade here is predicting that they're gonna grow earnings-per-share by 7%. So, 7% earnings-per-share, 3% dividend, 10% total return; assuming, of course, that the valuation multiple remains the same. But, I would be pretty happy with 7% earnings-per-share growth, alongside that 3% dividend, and I think that bodes well for Johnson & Johnson's stock price.

Also, we've mentioned in the past about Johnson & Johnson, that we could've done something differently, as far as our allocation by implementing options, or maybe making it a bigger allocation; but we chose to keep it at a lower allocation to give us the flexibility, such that if the stock does decline, we have the flexibility to implement new option strategies. And that's something that's definitely still on the table. If the evaluation is stretched and it doesn't grow for a while or we see a pullback in the price, we can start to think about using options to help generate further returns from that position.

Jeff Fischer: Thank you, Billy. Lon and Rockytop Bob are asking about a 10 year Pro celebration. Pro turns 10 almost exactly a year from now next October, early October; and the hope is, next year to have a Pro member gathering. It may tie into Fool Fest in May or June, in the spring, actually; a bit before 10 years. But, we are talking to the Fool about possibilities for hosting such an event, so let's hope it happens. It was great to see members, including Rockytop Bob in Chicago just a week or two ago. It's always great to see members, and very rewarding in so many ways. So yes, we're looking forward to hopefully having a get together for Pro's 10 years next year. I think that would mean a lot of presentations on our part. It's mainly on you, JP.

JP Bennett: Hooray.

Jeff Fischer: You're gonna review what we've done, all the mistakes we've made.

JP Bennett: All the mistakes I've made.

Jeff Fischer: What we've learned, how we've done well anyway. That's the real take away from long-term investing. So, thank you both for your interest in that. Anonymous is asking, "I presume Gilead is still on hold," yes, "given the recent acquisition. Any thoughts on exiting or removing the hold?" I love the question. I'm mildly discouraged that the question exists, because we've written about Gilead in a memo, and then with a trade alert, which linked to the board and the memo. We've covered it two or three times, and we keep trying to get our message out. It just tells me our communication needs to keep improving.

Our thoughts are, the acquisition looks promising for the long term, but Kite Pharma does not have any products to speak of on the market right now, and it won't add to Gilead's earnings for at least three years. But it's promising, the stock is up about 10% since the news. The stock is still on hold, because more importantly right now, we want to see how the hepatitis C market develops over the next few quarters. As we get more and more clarity on that, we have, hopefully, more confidence or not to move the stock back to buy, assuming we want to. But right now, we're still in a wait-and-see period. So, we're content to hold it; we're running covered calls on it to increase our returns, ideally, but it remains on hold.

Members who do not buy it, the definition of hold means don't act, don't buy it, wait-and-see what we do. Members who own it, you should keep on owning it and write covered calls on if you can, as well. I hope that helps answer the question. We'll have updated guidance as soon as we have it. But right now, we're waiting for quarterly results the end of October, early November. Let's see ... Anonymous is asking us to comment on the merits of selling puts or covered calls on some of our favorite Pro companies, such as Paycom, Coherent, Square. Do you guys have thoughts?

JP Bennett: I feel like the latter is pretty easy, in that we would never set up a cover call on those names unless we bought additional shares, with the specific purpose of setting up a covered call position. Because we go back to options investing 101, covered calls, the number one thing is do not sell calls against the stock you hope to own for the long term. If you look at those three names, those are names where that long-term mindset is imperative. If Paycom, or Square, or Coherent go on to do great things, it'd be pretty tough to sit there and say, "Man, I'm super happy I got that two bucks to sell that covered call that expired in three months, and subsequently missed out on a double over the next couple of years. Those of pretty rough. They can almost hurt more than not doing anything, sitting on the sidelines and watching a stock run away from you.

With regards to that, I don't think you'll see that anytime soon, unless it is a specific, "Buy these shares and set up a covered call, because we want the extra income." With regards to puts, that is something that is something that could definitely be seen in the future. I know in the past we've opted to just nibble on something like a coherent, like a Coherent, like a Verisk, or fax it and buy some shares to increase our allocation. But, we're always considering, "Hey, at this level do we want to add to the position to make it a bigger weighting in the portfolio? And if so, why do we want to do it, and what do we hope to get out of it?" If it's a case where we want to buy it, and we think that eventually it's going to turn the corner, but we don't know exactly when, and the puts pay a pretty nice premium; that is something that we definitely will consider. If it's something where we want to buy it right now because we think the catalyst is about to materialize, it's best not to get greedy and just buy some additional shares.

Jeff Fischer: So true. We said in various places that you could write puts on Paycom, Coherent or Square if you so desire, but we hope that you'll own our allocations, because we own them because we like the upside potential. It's important with covered calls to keep in mind your intention with each position that you own. As JP said, we're owning these for upside; so then, somewhat randomly or opportunistically even, you hope, writing covered calls on them goes against your purpose, and can ultimately cost you in not only returns, but in clarity of purpose. We have positions that we want to own for the long-term, we have others that we set up for income; and it's good to have a distinction between the two and not blur the line too frequently. But, if you lack these positions, they are rated buy or buy first, but if you'd rather target a lower price, as JP said as well, you could look at puts to sell.

JP Bennett: I would also quickly note that, with businesses like this that are growing really fast, there is always the possibility where the gains in the stock don't mirror the growth in the company. The gains can all be concentrated in a really short time, and then it can languish for a while. Paycom or Square, they can continue to compound value and grow the business really quickly, but if there are some concerns that investors have, maybe the stock does nothing for a year. And then, once that headwind or cloud over the company disappears, then all of a sudden you just see the stock shoot up. And, those are the cases where you can't even roll unless you're just pumping in tons of money, and then it kind of defeats the purpose.

Jeff Fischer: One-Eyed Man is asking, "Your trade desk recommendation in the options showed confidence in a long-term expectation of growth. Why is not the stock or the sin long a good fit for Pro?" It might be, it just showed up in options first. And in our meeting this morning, I actually said maybe it could fit into Pro. I know the company pretty well from following it the past the handful of months, several months actually, but I'd like to see a few more quarters. If it merits a place in Pro as well, then we'll do that. But behind the scenes, keep in mind that we were recommending it to the same base of members. If you're in Pro you also get options, so we know you've received this recommendation in options, and that if it's a good fit for you, you'll do it. So, if we then recommend it in Pro as well, we feel like some people view that as doubling down, and some people will double down.

We have to be really mindful before we recommend, in our two services, the same thing in both services; because we know some members will set it up twice and have twice the exposure. We've always viewed options as a complement that add on to Pro, and Pro members, as experienced investors who follow the Pro portfolio as much as they want; and then, add on any options positions, Motley Fool options positions as well that they like. We hope that's how you best see to using the two services, if you want to. "What did we not see," Drew is asking, "in Gentex when we sold it? It's up about 14% since the recommendation. Looking through the rear view mirror, I know, but what's happened?" It's funny, we talked about that this morning too. I don't know, Billy, if you want to say anything, or ...

Billy K: Yeah. Obviously, when you sell a stock you have no idea where it will go in the short term. Stock prices kind of move randomly over the short term, even up to a one year period. And then, when you're selling, you're not really thinking about, "Okay, how's it going to perform in the month ahead? And based on that, was my sale a mistake?" We also want to keep in mind, we sold Gentex not because we think that the businesses is doing poorly and that it won't continue to do well from here, it was more a portfolio consideration, thinking about how the position risk has changed over time as the automotive industry is changing very significantly, as I'm sure a lot of you know with the advent of electric vehicles, and the commitments by a lot of specifically European automakers, but also United States automakers to go to electric vehicles. And then, what does that mean for potentially any of the automotive suppliers, which includes, obviously, Gentex; talking about self driving cars and how that is changing the industry as well. There's lots of question marks for Gentex, and these questions marks didn't necessarily exist 5, 10 years ago, but they definitely exist now.

That position is certainly more risky than it was when we initially invested in it. And add to the fact that it appears that the auto industry in the United States has peaked, and we're now entering a slower period, and it's not accelerating anymore. We just thought it was a good idea to exit the Gentex position and move on, and try to find companies that we think are better suited for the next three to five years to provide consistent growth, and be less cyclical and more resistant to a potential recession.

Jeff Fischer: Spot on. Sounds good, Billy. By the way, we our 1750 puts for December will be closed tomorrow. We haven't closed them yet, but our 30 days are coming up. We'll buy to close those, and then our Gentex position will be entirely closed. Looking at our transaction, we sold our shares at 1850. Let's see ...

Billy K: I want to add, also to that comment. Gentex, going back to a previous question about the European exposure, Gentex was one of the companies that we had in our portfolio that had significant European exposure; and that is referring to those European automakers that I mentioned, like BMW, Mercedes, any of those companies. But, that segues into the previous question about European exposure, and I was able to find that memo that JP was referring to, and I'm going to type a link to it into the chat. And, I just click send here. Now it's at the bottom coming from Anonymous, that's me. That link there is to our international exposure memo. This is old; it's from 2015 in April and the data that I used for that memo was from the fiscal year 2014. So, now we're looking at almost three years old data. But, I think it's probably still in the same ballpark.

The Pro weighted average revenue was 60% domestic in the United States and 40% international at that time. You can see that we have significant international exposure, of which some of that is European, not all of it. We do have significant Asian exposure as well, especially with Apple and Skyworks. But, 6040 domestic international, that gives you a sense that we do have significant international exposure, given the international companies that we own.

Jeff Fischer: Thank you, Billy. Anonymous is asking, "Despite a rising market, Pro holding Starbucks, FactSet, and Verisk have not done much of anything for us the past two years. Thoughts on prospects going forward?" I think we need to look at the numbers, JP, if you can look up Starbucks and Verisk, because the perception is frequently not as accurate as reality, when it comes to moving prices. I know FactSet, which we recommended in May of last year, so a year and four months ago is up more than 10% since the recommendation went out. And we added a little bit to the shares at a price lower than today's as well; so we've slowly bought more of that. So, overall our position is only up modestly, from the initial rec it's up less than the market, but it is up.

It's had headwinds as the business struggles to replace customers who are closing up shop. Funds, actively managed mutual funds are being pressured by passive funds, which happens in a bull market, especially. But FactSet's business is doing fine. Their earnings-per-share growth and free cash flow is strong. Prospects going forward, most importantly, look healthy; and the stock has held up okay despite headwinds. Verisk, we have a more than 10% return on as well, I believe.

JP Bennett: Yep. If you just kind of take a step back and don't really look at timing, and entry points and stuff like that, I think he's probably just generally looking at stock charts. If you look at, just over the past year, using today as the ending point, Verisk and Starbucks are pretty close to being flat, and FactSet is down less than 10%. So, just keying in on markets rising, these ones aren't following suite. What's going on? And I think that always goes back to just understanding that there's always going to be stocks that zig when other stocks zag, and that's kind of what you want in a portfolio, so to speak. As long as you still believe in the underlying dynamics of the thesis, and the business, and the ability to compound value over the long term.

I think it's a bit of a copout if people just keep a stock in the portfolio, just because. Not everything can outperform, sometimes things are going to do bad, but it will recover, right? The key is making sure you still like the businesses, even if they're going through a rough patch. Not everybody is going to be a secular grower for 20 years straight, and never post a year or a quarter's worth of results that are little bit troubled, excuse me. I think that's kind of what you get with a lot of these. If you just look Verisk in particular, this is one where we understand that until they reinvestment in the energy business ... And I'm not just talking about traditional fossil fuels and things like that, because they are moving into solar, and alternative energy and things like. They are investing heavily in those business lines. Until that reinvestment renormalizes, so to speak, you won't see Verisk really take off; because they're almost doing like countercyclical investment. The industry right now is still a little bit weak, so they're trying to find the best of breed businesses in those lines, and buy them up now when maybe there are motivated sellers, and things aren't working out the best for those. So, the returns are muted on those particular business lines.

One could argue that they paid too much for Woodmac, they got in a little bit too early, the market fell a little bit, and then they snapped it up because they were worried about it going public or someone else acquiring it. That is a debate that, I think, you should give them a little bit more time to play out. But, we still obviously believe in the business; we bought more recently. And we think once that re accelerates, that business re accelerates, I think you're going to really see the stock take off again. It's kind of like what I said before, in that it is a stock that, right now, it looks like it's setting up to just muddle along for a while. And then, once the business wakes up the multiples could re-rate, or the business really accelerates; so the stock just begrudgingly has to follow along higher.

That's kind of where we sit. If we still like the business, we're okay with suffering through one or two years worth of maybe not amazing results, because we still believe in the ability to compound value over the long run.

Jeff Fischer: Yeah, we did add a tiny bit more to FactSet in April, and more Coherent and Verisk in August, our dividend reinvestment; which are small, but they're a vote of confidence. If we're buying more of anything, it means we like it quite a bit. Well said, JP, I won't add to that. It's true, you have some businesses that will not go far, stocks that won't go anywhere for a while; but as you believe in them, we keep them. Of those three, I'm probably most concerned about Starbucks.

JP Bennett: Yeah. And I would also, just a quick note before we jump to the next question. When we said that we're, "Sticking with Starbucks," we called out that, "Hey, this isn't a 'everything is okay now, and the company and the stock are going to take off.'" We sat here, I know we had during our meetings when the stock subsequently started going higher, it seemed like day in and day out, and it pushed above 60, where we were just sitting here and we're like, "Well, I know the Unicorn Frappuccino is a good one-time boost for these guys," but all the headwinds we identified and were concerned about didn't it disappear. We're not sure why the stock is going gangbusters; and so it's kind of just pulled back to the level it was, when we were like, "Okay, we're cautiously optimistic so we're sticking with it."

I feel like that recent struggle in the stock is a little bit misleading, in terms of the business all of a sudden now hitting a rough patch. It was a rough patch before, and I guess the hoopla from the Unicorn Frap just maybe disguised the underlying struggles, or just gave people something to focus on and draw the stock higher.

Jeff Fischer: Another one of our holdings that has been flat the past year is OpenText. That's one we've been talking about as well. The business continues to perform fine; the share valuation multiples have contracted, so hopefully with a good quarter or two it will start to get re-rated to higher valuation multiples, and we'll see it appreciate a bit more. But yeah, we'll always have some lagging stocks, and hopefully those will perform better down the road, whether the market is then weak, or strong, or what have you. As long as we believe in the thesis and the business is still performing. Sam is saying, "They are still short, FAZ, and paying 8.5% annualized short interest fees. Are we any closer to a decision as to how Pro will succeed? Good seeing you all in Chicago." You as well, Sam.

We have written that you should stay short FAZ, if you still are. No reason to close it and initiate a tax when we still believe in the position long-term. We were called out of it involuntarily. We've looked at the options, and you can set up a synthetic short for 2019, for a reasonable cost, but we're going to wait and see 2020 options, which should come out soon, and then see where the portfolio as a whole is. We're looking at other financial positions as well, because this is basically a long financial position, shorting FAZ. If it still fits into the portfolio better than other possibilities, then we probably will short using a 2020 synthetic short, once again. But members can stay in it, and if we think you should close that short, we'll of course let you know with an official report. But for right now, even with that fee of 8.5%. I like to think of it, remember it's a 3x short, so it only takes a few percentage move in the index to earn that fee back. That said, you should keep the fee in mind and make sure it's worth it for you.

John is asking, "What's happening to iRobot?" That's not a recommendation in Pro or options. The stock, I do know, happen to know it fell on word of competition from LandShark, I believe the name is called, another vacuum cleaner maker. But you should check out, I guess, Supernova or Motley Fool One to get the latest on iRobot. Yeah, enter the quote into the Fool page and go to the services that cover that stock.

JP Bennett: And also, there was an active short fund that put out another "hit piece" on the company, and it's obviously having a negative impact on the stock.

Jeff Fischer: Bruce is asking, "Any new healthcare stocks Pro is considering? Or, are we happy with our current positions as sufficient?" I'll just start off by saying we're looking at Medtronic. And when the stock dipped considered adding more; if it would fall a little bit more we might add a little more to Medtronic. Billy talked about J&J just recently, and if you two have anything else to add about ...

JP Bennett: Nope, nothing on that one.

Billy K: Yeah. There are a couple of industries ... Sorry, I'm getting some feedback in my headphones. There we do. A couple of sub industries in the healthcare industry that I'm interested in want to look at more closely for some long research. One of them, if you were there in Chicago at our little member meet up, you know that I have been looking in the telemedicine industry; which is like videoconferencing and being able to provide medical advice and consultation via teleconferencing, rather than in person. I think that is a burgeoning industry with a lot of potential, but it's very new, and regulations in that industry are changing quickly. It's hard to identify which company in particular is going to be a winner. That's going to require maybe some more time for the industry to shake out, or some more research on my part.

And then the other area in the healthcare industry that I'm interested in would be software. We started off this chat by mentioning how software is changing the economy as a whole. And it's definitely doing that in the healthcare industry as well, which is an industry that, in the past, has been burdened with tons of paperwork and administrative overhead. Software is taking a lot of that out of the picture and making it a lot easier for companies. There's opportunities, I think, in those two sub sectors of the healthcare industry, and deserving of more research.

Jeff Fischer: We also continue to look another biotechs, including Celgene which we flirted with in the past, but didn't get shares writing puts. Of course, Gilead is under active monitoring for what we want to do next with it. Thanks for the good question, Bruce. We're down to about 15 minutes left, so we'll go into our speed round.

Billy K: Speed round.

Jeff Fischer: We have quite a few good questions here, we will to answer succinctly. A question on Intel: is Mobileye the saving grace? Are they on the right path? Intel isn't active in Pro or options, so I'll move quickly from it. I still follow the company. I don't have a strong opinion either way, other than to say that shares look inexpensive right now. I've been looking at possible diagonal calls again on it, but no strong opinion right now. Debbie is asking, "Are we looking at stocks that tend to stay steady or go up in a recession? If so, what are those companies?" In most true recessions, almost everything goes down. What we're trying to buy are companies that will be stronger than average, even in a recession. Indeed, even companies that may grow earnings despite a recession. Many of our stocks did, shockingly, grow earnings even in the 2008, 2009 period. We're hoping to have plenty of those that can grow, despite the next recession.

JP Bennett: Or, they took a little hit and they recovered far quicker than the overall economy. I think, personally, the thing I'm looking for is the businesses. Even if their earnings get hit, they have the capital available to further solidify their dominance in the market, or increase their competitive position so that when things rebound, they're far better off. It's kind of like what Verisk is doing right now, or something like NVR, where there were a lot of people getting hit and really hurting in the home building market during the downturn, the GFC and the housing bubble collapse and everything like that. Well, because they're an asset light home builder that didn't have a ton of debt, they're able to go, "Hey, look at this market, this market, this market. We would really love to be a bigger player in these markets. We have the capital, other people don't; let's go in and make sure that we can dominate during the next upswing."

Jeff Fischer: It's so true. If you have a strong company, a recession becomes an opportunity for it. It can step in and take business away from weaker companies. Anonymous is saying, "I've been avoiding shorts. Every one I've started as a non-winner; I don't think I get it yet." I'll just say, shorts are not for everybody. They're difficult, especially in a rising market. I feel gratitude that our shorts have, on the whole, made us some money. Our direct shorts of companies, despite this bull market ... but, not enough to make a difference. Not surprisingly, they haven't made enough money to make a difference. So, if shorting is not for you, you will not suffer long-term because of that. If you want to keep trying at it, then the next time we short something, short a tiny bit; and hopefully, you'll learn as you go. The Domino's Pizza, for example, was a paired trade, shorting Dominoes while owning Papa John's. That's different than a direct short.

Nuance in shorting is very important, as well as context, but we're sorry it hasn't worked out for you so far. If you want to keep learning more about it we are a good place to do that, even if it takes a long time, because we're not actively addressing it right now. But there will come a time, as this chat started, with the topic on shorting being a much bigger part of what we do. That will happen.

Skyworks? I don't know yet why Skyworks is down $5 today, so I have to go into the news to try to suss out what's going on. I'll leave it at that. We are short deep in the money calls on it, which have completely eradicated the decline today, so that's nice to have it hedged out on a day like today. But yeah, the news is more important, and I'll be looking at that. Charlie is asking, "JP: Duncan, have you considered a diagonal call?" That's a Motley Fool options position. Your thoughts on that?

JP Bennett: Really quick take is yes, we considered it. We opted for just doing a cover call in options, because of the income focus and getting the addition of dividends. And also, somewhat related to that is part of the thesis behind Duncan is the ability to do debt restructurings and to recapitalize the business slowly over time, because they are a franchising business that is far more stable than if you were actually taking ownership of those restaurants. I know [inaudible 00:45:10] doesn't like to call them, but taking ownership of the restaurants and selling everything yourselves, it's a far more stable business. It enables you to support a higher leverage ratio, and whenever they do that they obviously, over time, free up additional capital to either A: return to shareholders through special dividends, or buyback shares.

Obviously, if they are just buying back shares it's good for covered calls, it's good for diagonals, but if they're issuing special dividends when you buy those long calls, the calls may not have factored into; because it's hard to know ahead of time how much additional debt they're going to raise during the life of the call, and so how much additional capital they're gonna free up to potentially offer in the form of a special dividend. If you just want to play it safe and you're okay with potentially missing on the leverage gains from the long call, a cover call is a far safer way to capture that additional income.

Jeff Fischer: Oracle: are they going to succeed with the cloud ambitions? I think so. Cloud revenue at Oracle grew 51% last quarter, year-over-year. They estimate it will grow about 43% this next quarter, and that estimate is, I think, what mainly drove the stock lower, because it was a little lower than Wall Street hoped. But, they're one of the largest companies, at scale, growing the fastest in the cloud. They're growing faster than a lot of competitors. I think their installed customer base, their transition to the cloud or letting you stay on a license if you prefer; I think their whole, comprehensive approach is going to work for them, and their margins are going to keep going higher. This dip in the stock should be an opportunity, for anyone who doesn't own it yet. And we'll put that out there and catch up trades.

I think they are on the path that they want to be on towards becoming a more cloud-centric company. Cloud will never be all of their revenue; they think it'll be more than half at some point, and that'll be just fine, is the hope. Jim is saying, "I have a 2018 syn long on Starbucks. I plan to roll to 2020. Any comments on the timing of that?"

JP Bennett: It's awfully hard to predict what a stock is going to do for the rest of the year. At the end of that he noted, is there going to be parts improvement, or did Hurricane Harvey eliminate that? With respect to that, it all depends on what the market ultimately thinks. You can use hindsight, being 20-20, and after the company reports, if the stock popped, well then it's clear that the market under appreciated how well Starbucks would be able to withstand that. So, maybe the results aren't as bad as the market expected. Or, maybe they end up being worse than expected, and the stock get hit. It's something that the market is obviously trying to digest, but it's really rough to tell how it's going to play out once they report earnings.

Jeff Fischer: On the option, since you're trading one call for another, the sooner you sell your 2018 call, the more time value you'll recoup; but the sooner you buy the 2020 call, the more time value, so it washes out. Just roll when you're ready, and take taxes into mind. If you sell that 2018 call this year and have again in it, you'll pay the taxes this year. Or, you could move it into next year if you wait. Mentioning the hurricanes makes me think of Gentex as well. Gentex, the car makers, and pulling Gentex along with it, increased quite a bit in price as the hurricanes hit, and that's back to an earlier question. That's part of the reason the stock rose so much in the past month, unfortunately.

Billy K: If you get a chance, take a look at the ETF CARZ, C-A-R-Z, and the recent price action in the last month. It's up 8%, and year to date up 16, 17%

Jeff Fischer: A member is saying, "Gilead's been on hold. It's frustrating to sit out on covered calls and the share is going up. What's the plan?" We put things on hold if we're not certain that we're going to own it the next three years, if we don't believe strongly enough that we are going to own it the next three years. We do that because we don't want you to buy and have you lock in a loss. We understand your frustration, but we are trying to operate this way to help more members, rather than harm them. It's a fairly small position for us, since it was around 2% when it was on hold. The shares are up maybe ... They're up about 15, 20% the past year. We understand that you've missed that gain and we apologize, but we are trying to have a hold process that keeps you from entering a position, and then having to sell it in a short timeframe, potentially at a loss.

As our confidence grows in the business, assuming it does, we may reach a point soon in a quarter or two where we move it back to buy. Meanwhile, it does remain on hold. Thank you, Foolish Fox, for the virtual hug. I'll accept that on my behalf and the whole team. Give some to JP, some to Billy, some to Anne behind the glass. Thank you very much. Do I look like I need a hug? Maybe, I don't know.

JP Bennett: It's one of those days.

Jeff Fischer: I'm feeling pretty good today. Why is the lighting in your faces so dark? It makes you look sketchy.

JP Bennett: That's why we need a hug.

Jeff Fischer: Yeah, that's why we need it. But I know you're not sketchy, JP. Anne is like, "I don't know. The lights are like, normal." I don't know. Good question, though. We can work to improve upon that too.

Billy K: Upon your sketchiness.

Jeff Fischer: We have less than 10 minutes left, let's see if we can fly through these. "Explain how to calculate the price at ..." A tough one, right off the bat. What are our thoughts on IPG versus Coherent? I looked at both. I like Coherent's growth rate. I like Coherent's focus on microelectronics, and coherent is now moving into fiber lasers as well, which is IPG's sweet spot. They're both great companies, the Fool recommends both of them. We were the first to recommend Coherent.

JP Bennett: Gotta get that in, right?

Jeff Fischer: And so far, the only ones. Just for context, IPG has been recommended for years, and Coherent just this year by us; so keep that in mind too. Over the long term, Coherent has outperformed IPG as a stock, but they've both been really great. I think some members own a bit of both. I'm just partial to Coherent, just for the reasons just mentioned; but both have done well over time. Now, to Greg. "Please explain how to calculate the price at which a short in the money option would likely be assigned." You guys want to just touch on the time value?

Billy K: Yeah. What you want to look at is the amount of time value remaining. Obviously, the difference between strike price and the stock price is going to be your intrinsic value. And then, the difference between the intrinsic value and the value of the option itself will be time value. Any time when time value is approaching zero, or is getting very close to zero, that is when you are at risk of assignment for a short option. Particularly in the case of calls, when there's a dividend, if you're around the ex-dividend date, and the amount of time value left in the option is lower than the expected dividend on that ex-dividend date, you are also at risk of being assigned. Just keep an eye on that time value. If it's a call, make sure you're monitoring dividends and dividend dates as well.

Jeff Fischer: Awesome. Thanks, Billy. With five minutes to go, let's challenge ourselves and see if we can touch on every question remaining. Please don't enter any more questions. Questioning period is closed. Charlie says that we spoke to guidelines for buying calls.` How much downside and what data can you revisit? So, generally speaking, we look to buy a call option that's about 20% to 10% in the money, and that minimizes the time value that you pay. We seek to pay no more than 3 to 5% time value per year, typically, on a call that we're buying; and ideally less, if you can. As for downside, you realize you're getting maybe 20% of the downside of the stock, and you're paying a 3 or 4% time value per year, generally speaking.

That's how we do it, and we're looking for a call that we believe could at least double, assuming the stock, generally speaking, gains about 20%, 30% or so. We want to believe that the stock could do that over the next few years, and our calls would then line up to at least double [crosstalk 00:54:00]

JP Bennett: One minute down and 22 questions left.

Jeff Fischer: So sorry, that was bad. Doug: "Does the team ever look at special ops, such as spinoffs: investments that might be held for just a year or two?" Too much effort for the return.

JP Bennett: For me, only if it's a company that I had been following previously, just because the time needed to get up to speed on it, like you said, it's not always worth the time.

Jeff Fischer: Yeah. We're open to everything, but we're mostly looking for, ideally, companies that will compound over many years, as JP started today with. We're looking for the most bang for the research buck over the long term.

Billy K: I will say, also, that I do like spinoffs, and that can be a very fertile area to look for good investments. Broderich, one of our companies, is in fact a spinoff. Spinoffs, there is some research that suggests that they tend to do better than the average market. I like looking at that category.

Jeff Fischer: Great point, Billy. Will I be at the Fool One conference at Isle of Palms? It's October 2nd and 3rd. Yes, the inception date I will be there. The inception date of Pro was October 7, 2008. So, almost 9 years ago now. What's our thinking on SVXY? Should we consider reducing? Yes, we're considering that. It's more than a 2% position. We're considering reducing it to 1%, because the VIX is so low. Last I saw it was under 10. And what might we select to profit with a rise in VIX? We looked at VIX options; it's very tricky. You can look at VIX-related ETF's, but again, tricky. You need the VIX to rise a lot and sustain that gain to make a profit in most of these vehicles. It's trading, it's speculating, so I'm not sure that will do it. But, if there's long-term way, perhaps. GB is saying, "My allocations of gotten out of control. Is there a recommended strategy for getting back to roughly in line with what we have?"

JP Bennett: I guess it depends what he defines as "roughly." I would start there and figure out what your target is, in terms of what you want to ultimately get to. And then, once you have that, you should be able to figure how much cash you need to deploy, and then look at Pro and decide, "All right, do I want to put it evenly across the names? Do I want to do just the buy first? Do I want to do buys and then buy first?" It's all a matter of how quickly you want to get into those positions.

Billy K: I'll also say that as long as you're within roughly about a percent or so of our allocations, you should be fine. You don't need to try to get it exact.

JP Bennett: Then, to just quickly finish up, you can either just buy them in all one chunk and get them back, and obviously that is a much more easy process. There's isn't much hassle, I don't have to worry about it, stress about it. Or, you could look to slowly increase those allocations over time, and buy thirds or something like that.

Jeff Fischer: Yeah. And look overall to be in the ballpark instead of precise. I wouldn't sell positions down by small amounts and incur taxes just to get to some exact number, because they will keep changing anyway as the market moves; so be in the ballpark. Current thoughts on FactSet research? We did talk about that. It's still rated a buy. I believe in the long-term attributes and potential of that business just the same. They have pricing power, they have strong recurring revenue, they have strong customer retention. They face some headwinds right now, but when the business starts growing more aggressively again, it should reward us quite nicely, is my belief, on a compounded, annualized basis. We still like it for the long term, but of course, we're watching it closely; as with everything.

Anonymous: "FireEye owns the company that was hired by Equifax to investigate the hacks. Do you see fallout in lawsuits?" Since we're not in Equifax or FireEye, I guess we'll move on, because I don't know enough to say anything. And Anne, do we have maybe five more minutes? Al right. I think we can wrap up in five minutes.

JP Bennett: 16 questions.

Jeff Fischer: Sweet. Is it? Are there that many? It doesn't look like that many. Let's just give five more minutes, see what we can do. "Any plans to implement a stock replacement strategy?" We look at that, and I can't say when or which stocks we'll do it on, but if we want to raise cash and maintain our exposure, upside exposure, and downside to certain company, stock replacement is a pretty easy way to sell the shares, buy a call option instead. Eventually we'll probably do that on something.

Charlie: this question is tricky. "Unless you have a lot of money, contributions far outweigh investing returns, vis-à-vis portfolio growth. Is that right?" I don't want to do all the talking guys, but I'll just say early on when you're saving a lot, your portfolio may benefit most by that savings. That may grow it the most, generally speaking, except during very strong bull markets. Target savings, I'd save as much as you can while still enjoying your life, reasonably.

Billy K: More important ... Oh, sorry Jeff. Didn't mean to cut you off.

Jeff Fischer: Go ahead, Billy.

Billy K: Okay. I would say more important, I think, than contributions is how long you've been invested. Contributions are important, but what's really gonna drive your returns is compounding, and interest that happens many years compounded upon itself.

Jeff Fischer: So true. "Year to date, how have we done, and since inception?" Generally, the portfolio is up more than 13% this year, and 203% since inception. That's mostly all driven by our long positions. We've made some money on options as well, and some on shorts and hedges; but mostly it's driven by the longs, as you would expect in this market. I'm not sure ... Okay, that's the link to our international exposure. We talked about the FAZ synthetic, stay in it. We might join you again, we'll let you know. New hedges, we did discuss at the early outset of this discussion, and this will be archived on the site; so you can check that out.

PayPal: "Should I also buy square, or would that be over allocating?" Good question. We also own MasterCard and Visa. I would say, look at your exposure to the payments industry as a whole, and if you already have enough in these names: MasterCard, Visa, PayPal, then you probably may not also want to add Square as well. Rockytop Bob has a question. His margin to his net account value is around 30%. "Am I playing with fire?"

Bob, it depends what your positions are in, and what's margined, basically. That does sound pretty high, 35%. We generally say if you're going to use margin at all, and we don't. We don't borrow money that is to invest in the market; but if you were going to, to do no more than 10% as far as borrowed funds go. That's just a personal take. I know other people do carry margin. But, the Fool from day one has always said, "Don't use margin. Don't borrow money to invest," and that's just where we stand. So, Bob, you might want to post on the boards what you're doing and let's see if we can get some more insight on the risk that you might be exposed to. We need details to really know what that might be. And we should wrap up. We have one more minute. Any of these questions that you guys see that you want to, and are able to answer?

JP Bennett: I've been following Deer not as closely as I used to, for obvious reasons. It's a case of the business treading water, like we said. We figured it would continue to struggle for the time being. Cost-cutting measures, the market seems to love that because, obviously, valuation multiples continue to rise; though it did get hit some recently, so they came back some. As of this point, it'd be tough to say if we're going to revisit the name, simply because the thesis was, "The business will continue to struggle, and the market is under estimating how long it's going to struggle, and how much of a struggle it's going to be, and they were too enthused on a comeback." Well, clearly the market became even more enthused on a come back. How far it's gonna ultimately fall if things cool down, in terms of market enthusiasm? It's a bit tough to call at this point.

Jeff Fischer: Anonymous is saying, "Rockytop Bob might be pulling our legs on the margin. Maybe he doesn't have 35% margin." Let's let's hope not. One or two more questions here. We do look at protective collars in the portfolio, definitely. We've used them in the past. They're a good way to set up out-of-the money positions that can protect you on a decline, although you do cap your upside a bit about the current share price. And I think that's about it, that we can do today. I thought I saw one more that I could answer quickly, but ...

Billy K: I'll answer more, quickly. "The foreign companies do not have to meet the same accounting standards as the US. How to be sure reports are reliable?" One way to do that is to invest in United States companies that have international operations, and then they have to comply with SEC regulations, which is kind of what we do in Pro with our companies that have extensive international exposure with their business.

Jeff Fischer: Excellent. Thank you, Billy. And Bill is asking about buying long-term calls instead of stock, and the delta. Generally, look for a delta of 0.8 or higher, so you're getting 80% of the stock's move. That will also help you minimize the time value that you pay, generally speaking. I think with that, we need to wrap it up. We do have about 20% in cash, but that's strategic. We hope to use it, or we will use it when we see opportunities; and it's a way to try to meet our rolling three year and 10 year goals, because we know when the market falls, we need to take advantage of that if we really hope to earn stronger than average returns that go towards our 10 year return goals. The cash is there for a reason. With that, Anne, we will wrap it up. Thank you all for being here. JP, thank you for leading us into the chat.

JP Bennett: Happy to give you a break, for once.

Jeff Fischer: It's always good, too. Maybe Billy will do it next month. We hope to see you next month. We appreciate that you are putting your trust in Pro and in the Motley Fool. We thank you for it. And to everyone affected by hurricanes and earthquakes: you're in our thoughts daily as well. It's been a rough fall, as far as natural weather goes. With that, we hope that you're doing well, you and your family; and we hope that you're enjoying your day-to-day life. Thank you for being a Fool with us. Thank you, Billy.

Billy K: Thank you, Jeff.

Jeff Fischer: Thank you, JP, and thank you Anne and Ellen behind the scenes, and many other Fools as well, and we'll see you again soon. Thank you and Fool on.

JP Bennett: Fool on.

Billy K: Fool on.

Roll Your Diagonal Calls on American Tower

Published Sep 7, 2017 at 12:25PM

Is this for you? This is for all *Pro* members who wrote October 2017 $120 diagonal calls on **American Tower** (NYSE: AMT) as per our alert in March. If you have yet to establish a diagonal call position on American Tower, or if you wrote diagonal calls at a different strike price, please see the Alternative Trades section below. Remember that all members should already own an unencumbered 4.4% stock allocation to American Tower, so if you have yet to establish your stock allocation, do that first before considering this additional diagonal call recommendation.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - "Buy to close" all Oct. 20, 2017, $120 written calls.
  - "Sell to open" the same number of April 20, 2018, $130 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all five of our calls.
- **Recent Prices** (11 a.m. ET):
  - Stock: $146.23
  - Buy to close Oct. 20, 2017, $120 calls (bid/ask): $26.10/$26.70 (midpoint $26.40)
  - Sell to open April 20, 2018, $130 calls (bid/ask): $19.00/$19.70 (midpoint $19.35)
  - Net debit to roll: Approximately $7.05 (this price will change)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls, and aiming to roll for as much of a credit as possible. The midpoint of the bid/ask spreads currently implies about a $7.05 net debit for this roll, although that number will change as prices change and as *Pro*'s collective volume affects the bid/ask spreads. However, realize that with time value on the short calls approaching zero (and with American Tower's third-quarter ex-dividend date likely near the end of September), you should roll these calls soon, or you risk getting your owned *shares* (rather than calls, assuming both securities are owned in the same account) called away. **We want to avoid that scenario!** So, accept lower credits if need be, but still use a limit order. As of today, the bid/ask spread on the October $120 short call implies about $0.10-$0.15 or so in time value remaining. As we approach expiration, time value will continue to erode, so the longer you wait to make this trade, the more likely it is that your short calls will be assigned.
- **Fair-Value Estimate:** After incorporating last quarter's results into our valuation model, our fair value has increased to $142 from $135.

What We're Thinking

In November 2016, we took advantage of U.S. election-related volatility to re-establish a diagonal call position on American Tower at particularly advantageous prices. Then, in March 2017, we rolled our diagonal calls out and up to capture further upside. So far, the position has been a success (with a 22% simple return since inception if we were to close the diagonal call today), and American Tower's stock price has run up well beyond the strike price of our October $120 short calls.

As we mentioned in our second-quarter review, given our assessment of the company's fair value and business momentum, we're content to pay to roll our diagonal calls out and up in order to capture further upside and keep the diagonal call position going. In exchange for $7.05 or so in incremental investment, we gain $10 in additional upside to our position (a 42% return on incremental capital in about seven months, well above our North Star), and we extend our expiration out to April, with the flexibility to eventually convert the position to a January 2019 bull call spread as market and business conditions dictate. As we approach April expiration, we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write $125 calls instead of $120 calls like *Pro*?** If you wrote higher-strike calls than *Pro* did, you're in a slightly better position than *Pro*; you can complete this rolling trade at a lower cost. You can roll your October $125 calls out and up to April $130 calls, lately for a rolling debit (i.e. cost to you) of about $2.30 or so. You will be paying $2.30 or so to gain $5 in additional upside (a potential 117% return on incremental capital). If you prefer to target more upside, you can consider rolling out and up to April $135 calls, targeting $10 in additional upside for a rolling debit of about $6.10.
- **New to the position and have yet to set up a diagonal call?** Do so by simultaneously buying ("buy to open") January 2019 $105 calls and selling ("sell to open") January 2018 $150 calls for a net debit of about $39.40 per diagonal call (this price may change). Invest 0.7% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $450,000 or so you manage), and keep in mind that this position is "off-reservation" from *Pro*, so if you're not comfortable managing a position on your own, this choice might not be the best one for you.
- **Have a different position not addressed here?** Check in on the American Tower discussion board and we will do our best to answer your questions.

Pro Can Help

- **Questions?** Consume data and ask your questions on the American Tower board.

Pro's Portfolio's Leaders Drive Our Fate

Published Sep 5, 2017 at 5:05PM

Greetings, Fools,

We began September with a handful of guidance and valuation updates; most are minor, but be sure to check them out in today's guidance change roundup. You can also see where everything stands just by looking at the portfolio page. There, you'll see that we're also focused down to just 21 long stocks and a few ETFs right now. We've introduced many new names to the portfolio in the past year, but we've sold even more companies, all in the interest of focusing on what we believe will do better over the coming years.

As of today, our updated exposure table is on the portfolio page, too. Here's a copy:

***Pro* Exposure**

Long	82.7%
Short	1.6%*
Net Long	81.1%
Hedged Out	4.3%
True Long	76.8%
Cash Ex-Shorts	22.7%
Short Puts	6.3%

Last updated Sept. 5, 2017. [What do these numbers mean?](#)
*As a hedge, we also have a (lately) 14% allocation to QQQ via a put ratio spread, but until it's near-the-money, it's not being counted as a short, as it doesn't come into play.

We've averaged 76% "true long" this year, and that's where we stand today. That's our long exposure minus our direct short positions (equities and options) and any positions that are hedged out -- right now, our covered calls on **Skyworks Solutions** (NASDAQ: SWKS) hedge out that equity's upside and downside within a price band.

You can see we're light on shorts, especially after closing several this summer. We will likely add more shorts this quarter, if all goes to plan, as well as additional hedges. Our current put ratio spread hedge on the **PowerShares QQQ Trust** (NASDAQ: QQQ) isn't calculated in the above numbers because it's far out-of-the-money. It is, however, about a 14% hedge on the Nasdaq index, albeit with a long put strike price currently more than 13% below the current index level.

That's a lot for the market to fall before it hits our strike price, and this in part points to how far the index has climbed since December, especially because we rolled that hedge up once already. We don't want to roll it any higher, because it carries with it short put exposure (an obligation to buy shares of QQQ). We're considering other hedges instead. But history says that if the stock market falls by about 15%, it usually falls more than that, so even as it stands today, this hedge could come into play in a downturn. If it did, our net long exposure would adjust to about 60% or lower at that point.

Given the strong market all year, we've been fortunate to have shorts that worked out, or didn't hurt us much. The same is true for our hedges to date. Below is our updated returns table as of the Aug. 31 close.

	Annualized		*Total Return*	
	Since Inception	Rolling 3-Year	YTD	Inception
Pro Portfolio	**13.1%**	**12.6%**	**12.3%**	**200.7%**
North Star	**8.4%**	**8.1%**	**6.2%**	**104.7%**
S&P 500 Total Return	12.4%	11.0%	11.9%	183.8%
MSCI World	7.0%	4.6%	11.9%	82.6%

Pro historical returns show 13.1% annualized gains.

Though we've been carrying cash and some shorts all year, have had some notable losers, and have kept our market exposure at about 80%, our returns are pleasing. They've been driven by some of our largest investments. Just check out the strong year-to-date results from these "obvious" (you could say) leading companies. I say "obvious" with a touch of irony (that's what the quote marks are for!), because plenty of people did not expect these giants to continue to rise, let alone by 40%.

- **American Tower** (NYSE: AMT): 37.8%
- **Apple** (NASDAQ: AAPL): 39.7%
- **Facebook** (NASDAQ: FB): 48%
- **MasterCard** (NYSE: MA): 28%
- **Oracle** (NYSE: ORCL): 32%
- **Skyworks Solutions** (NASDAQ: SWKS): 42%
- **Verisign** (NASDAQ: VRSN): 35%
- **Visa** (NYSE: V):31%

Year-to-date returns as of 2 p.m. ET via Google Finance; and excluding dividends!

We've had American Tower, Facebook, and Visa (among others) as "Best Buys Now" (what was once known as "Buy First") for as long as I can remember. Today, Facebook moves down to Buy, simply on price.

It has been a good year to be an investor, but then again, when isn't it? Even when the stock market falls, isn't it better to be a part owner of your world rather than not? That's especially true because while timing the market is folly, as an owner who is paying attention, you can hopefully take advantage of downturns by purchasing more. There's no denying it has been a good year so far for investors who own strong businesses -- and that's Foolish.

Thank you for being here! Foolishly,

Jeff (TMFFischer)

We look forward to seeing and talking with [members in Chicago](#) on Friday from 4-8 p.m.! RSVP and come by if you can!

Pro Guidance Changes and Completed Trades: Sept. 5, 2017

Published Sep 5, 2017 at 4:41PM

Pro Guidance Changes from the past two weeks (see any related [trade alerts](#)):

- **Apple** (NASDAQ: AAPL): Fair-value estimate increases to $150 as we approach iPhone upgrade "super-cycle." Remains a Buy.
- **American Tower** (NYSE: AMT): Fair-value estimate increases to $142 (from $135). It remains a Best Buy Now.
- **Facebook** (NASDAQ: FB): Moves to Buy (from Best Buy Now).
- **Gentex** (NASDAQ: GNTX): Moved to Sell.
- **GoPro** (NASDAQ: GPRO): Moved to Cover. We're closing our short exposure.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $119 (from $105 -- it was due for an update). Remains a Buy.
- **Medtronic** (NYSE: MDT): Moves to Best Buy Now (from Buy).
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $100 (from $96). Remains a Buy.
- **Visa** (NYSE: V): Fair-value estimate increases to $97 (from $93). Remains a Best Buy Now.

Pro Completed Trades and Option Expirations from the past week (see transaction log; trades take a day to appear):

- Gentex: We sold all of our shares at $18.49, bringing our stock allocation to 0%. (We are still working to buy to close our December 2017 $17.50 puts, using a limit order lately of $0.65.)

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

American Tower Benefits From Growth in Mobile Data

Published Sep 1, 2017 at 12:31PM

American Tower (NYSE: AMT) notched another strong quarter, continuing the company's multi-year momentum. It had solid organic growth and improved margins across its growing global asset base.

The company remains a Buy First, with an **updated fair-value estimate of $142 per share** and an allocation of 4.4% in the *Pro* portfolio.

What Happened?

CEO Jim Taiclet:

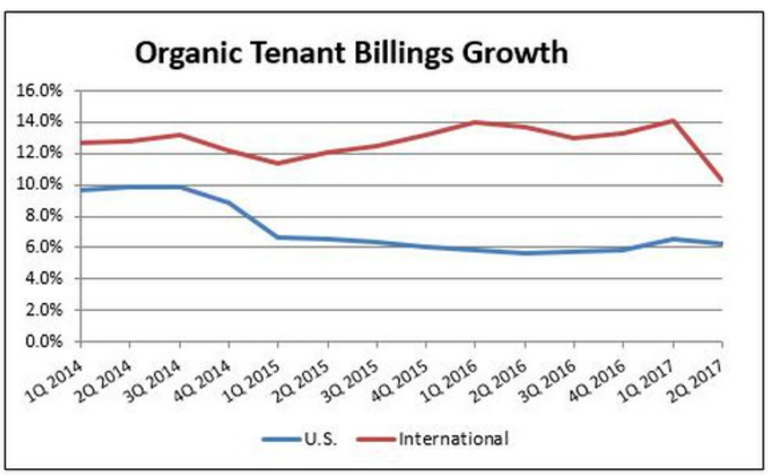
> "The second quarter of 2017 represented our 17th consecutive quarter of double-digit growth in property revenue, adjusted EBITDA and consolidated AFFO per share, driven by strong demand for our tower real estate from Los Angeles to Sao Paolo to Paris. Organic tenant billings growth in the U.S. of over 6% was complemented by organic tenant billings growth of more than 10% in our international markets, where the pace of advanced handset adoption and mobile data usage growth continues to require the addition of substantial network equipment on our sites."

Get More

- Q2 2017 press release
- Q2 2017 supplemental materials
- Q2 2017 earnings presentation

Organic tenant billings (growth attributable to tenant co-locations, lease amendments, and price escalations, net of cancellations) came in at 6.2% in the U.S. and 10.3% internationally (vs. 5.6% and 13.7% in the same quarter a year ago).

International organic growth was broad-based across all regions, up 10.1% in Asia (i.e., India); 8.9% in Europe, the Middle East, and Africa (EMEA, which includes France, Germany, Ghana, Nigeria, South Africa, and Uganda); and 11.2% in Latin America (which includes Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, and Peru).

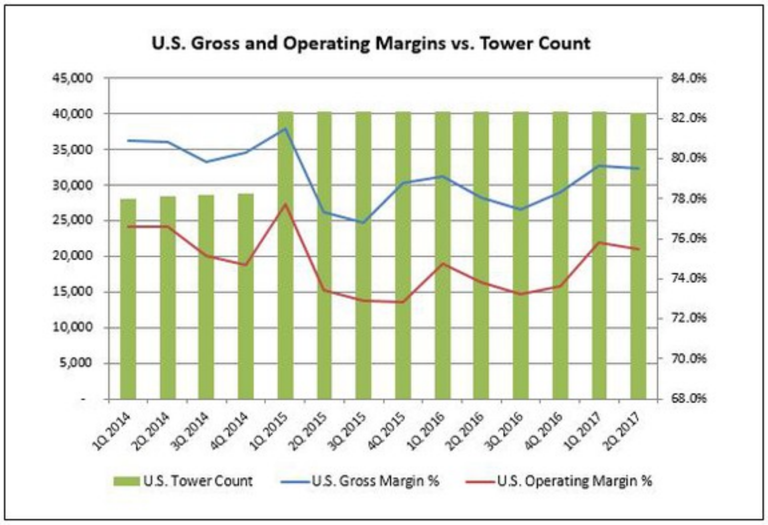


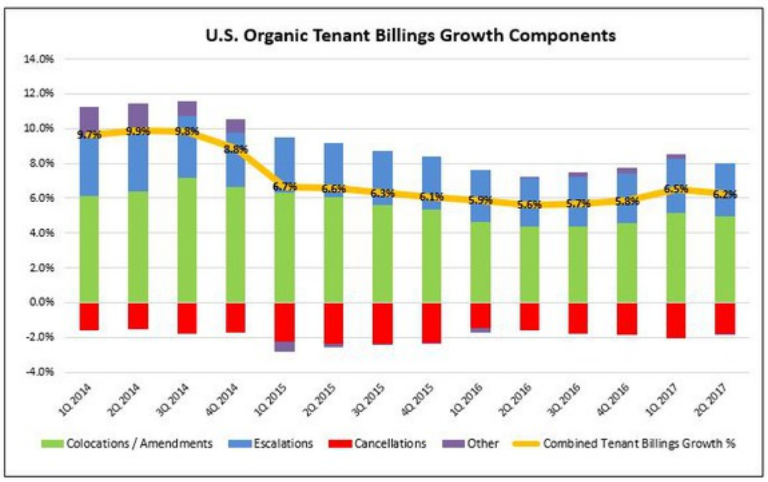
So What?

Although the company experienced double-digit growth internationally, that growth decelerated sharply, with international organic tenant billings growth coming in at its lowest since I've been analyzing the company. The closest to the current 10.3% growth figure was 11.4% growth in the first quarter of 2015. International growth was affected particularly in Asia, where organic tenant billings growth decelerated from 28.5% last quarter to 10.1% this quarter because of elevated consolidation-related churn. Despite the deceleration of growth, management raised its outlook for international organic tenant billings growth to 10% at the midpoint, up from 9.5% at the start of the year.

Margins increased in the quarter thanks to the strong organic growth, cost controls, and the continued integration and lease-up of nearly 70,000 low-tenancy sites built, leased, or acquired since the end of 2014. These include newly acquired towers in the U.S., Nigeria, Brazil, India, France, and Argentina. Management expects a broad margin expansion trend as the company continues to generate organic growth on its extensive existing portfolio of assets.

U.S. gross margins increased year over year to 79.5% (from 78%), and U.S. operating margins increased year-over-year to 75.5% (from 73.8%), reflecting those trends:





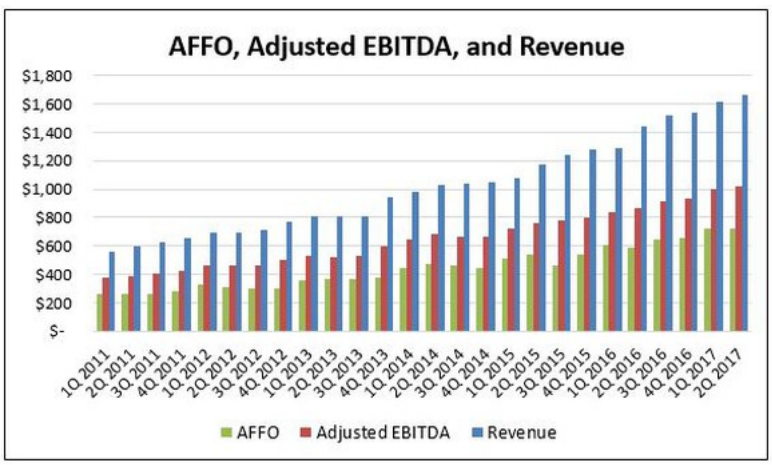
The next graph shows U.S. gross and operating margins on a trailing-12-month (TTM) basis, which smooths out the lumpiness of individual quarters and shows the longer-term trend in margins. We can see that since the significant **Verizon** (NYSE: VZ) acquisition in 2015 that acted to lower the margin profile of the entire U.S. business (due to the lower tenancy ratio on those new towers), management has been successful in slowly increasing margins via organic growth of the newly acquired (and existing) assets:

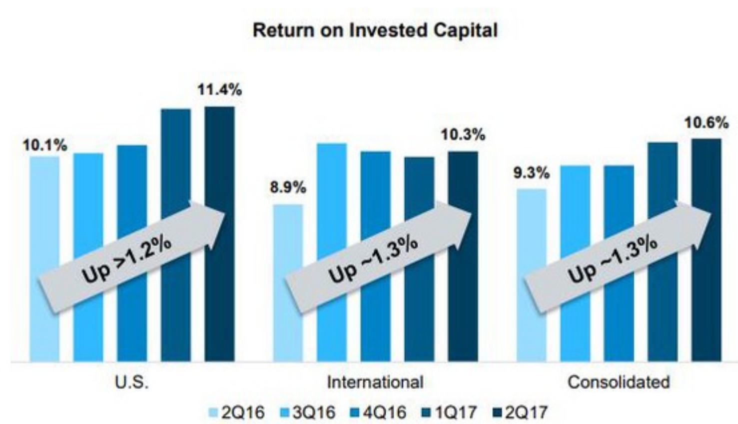
Internationally, margins increased sequentially (gross margins up to 82.7% from 80.7% a year ago; operating margins up to 72.1% from 69.4% a year ago) as the company continues to integrate its recently acquired assets in Brazil, Nigeria, India, France, and Argentina:

As for debt, the company continues to de-lever and ended the quarter with a net leverage ratio of 4.5x, the lowest the leverage ratio has been since the third quarter of 2013. Yearly distribution growth continues to track in line with management's 20% long-term growth target, coming in at 20.8% ($0.64 per share, a 1.7% forward yield on the current share price). Twenty-percent annual distribution growth continues to look like a more than reasonable target for 2017 and beyond.

Now What?

This quarter's report confirms that our investment thesis -- that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time -- is continuing to play out. The company's impressive operating history, excellent management, and strong competitive position in a growing industry give me confidence that American Tower will continue to increase revenue and cash flow at high rates for a long time, providing strong returns on capital (ROIC). The company's portfolio of nearly 150,000 sites worldwide positions it to benefit from secular mobile data demand trends on five continents, and acquisitions and incremental leasing activity should continue to drive revenue, cash flow, and ROIC higher over the long term:





Data and Guidance

- Current Price: $146.80

- Fair-value estimate (**updated**): $142
- Allocation: 4.4%, plus 0.6% in January 2019 / October 2017 $80 / $120 diagonal calls
- EV/EBITDA (TTM): 21.5

AMT remains a Buy First, with an updated fair-value estimate of $142 per share and an allocation of 4.4%. We also have 0.6% in deep-in-the-money diagonal calls, which will be addressed in a separate alert. Given the update to our fair-value assessment, we're content to pay to roll our diagonal calls up and out, so if you feel comfortable acting ahead of *Pro*, feel free to do so.

Even as the stock has gained 38% year to date, the company continues to generate shareholder value, and our fair-value estimate continues to rise along with the stock price. If you've yet to start a position, now is as good a time as any to match us. The stock has had a tendency to experience volatility in the short term because of its correlation to the interest rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through.

Fool on!
-- Billy (TMFBillyTheKid)

What You Don't Know Will Reward You

Published Aug 31, 2017 at 1:17PM

Dear *Pro* member,

Each day, we're thinking of everyone affected by the deadly Hurricane Harvey — if you'd like to help, please consider giving here.

Sometimes, it seems that investing is what happens while you're busy living the rest of your life. But whether it's world events, work, family, adventure, or something else that periodically draws you away, investing remains a faithful companion in the background. You can count on the process working when your attention is elsewhere because the companies you buy into are doing the hard work, striving to grow over time. In fact, your companies don't actually care if you're at the beach instead of checking your stock quotes. And this feeds into our thoughts for the day.

New Value Is Created by the Unforeseen

No one valuing **Apple** (NASDAQ: AAPL) in 2005 assumed the company would, in two years, debut one of history's most profitable products. Years ago, I saw no one suggesting **Netflix** (NASDAQ: NFLX) would start producing its own award-winning content, let alone that **Amazon.com** (NASDAQ: AMZN) would create a new Web services industry. The folly of trying to value any dynamic business is that the business is going to expand its offerings in unforeseen ways.

This is the power of optionality: It's a key part of many of our investments, and those that lack it are given a shorter leash.

Gilead Sciences (NASDAQ: GILD) has gained 15% in the last five days (as of this morning), mainly on news of its planned $12 billion acquisition of **Kite Pharma** (NASDAQ: KITE). Kite is a development-stage company working on novel immunotherapy-based cancer treatments, with a substantial pipeline of mostly early to mid-stage candidates. As luck would have it, just yesterday the FDA made history by approving the country's first gene therapy treatment for cancer (acute lymphoblastic leukemia). It approved a drug by **Norvatis** (NYSE: NVS) that uses science similar to what Kite Pharma is pioneering; this news led to Gilead's biggest stock jump in a long time.

This was all unforeseeable just five days ago. We knew Gilead was working on acquisitions and would likely focus on oncology, but we didn't know what it would buy. We still don't know what sort of value will be created, if any, by the new venture. But that's the point. New value creation — beyond what is already visible and expected — is not foreseeable. A valuation on **Microsoft** (NASDAQ: MSFT) in 1990 did not foresee the emergence of its computer gaming business in 2000, let alone the rise of the Internet.

We want to invest in management teams that remain curious; that accept the risk of being wrong for the sake of eventually being right and growing; and that cradle the pursuit of optionality. **Visa** (NYSE: V) wasn't content to just process transactions, as powerful as that business is; now its related data and services business is growing sharply. Likewise, **Square** (NYSE: SQ) is rapidly growing its small-loans business, creating a new industry — or at least a new way for businesses to borrow capital. This wasn't part of its original plan. In other surprises, nobody I know of assumed the average selling price for an Apple iPhone would go *up* over 10 years. That's unheard of with tech products, but it appears very likely to happen as new iPhones debut next month at even higher prices.

It's What You Don't Know That Will Reward You

When you invest in a healthy business that has the wherewithal to keep exploring its potential, you invest in optionality alongside its traditional business metrics. When you do this, you know that your valuation estimates may be woefully inadequate. All a company needs to do to lay your careful spreadsheet to waste is surprise you with a successful product, or make an acquisition that unlocks much greater combined value.

We don't like to generalize, but it seems the younger you are, the more you think you can know. And the older you get, the more you realize you can't know. With this humility, you may relinquish some of your illusion of control, and instead invest in the unknown. After all, the unknown is going to reward you much more than what's already known (and already priced in).

Today, we're investing during a period of rapid and vast change. For instance, it seems almost inevitable that even the simplest forms of artificial intelligence are going to change life — and consumer habits — across the globe in the coming 10 years. Companies with the optionality to capitalize on our changing ways of life have much better odds to thrive. Those without the ability to pivot risk being left behind in the proverbial abandoned strip mall. If we invest well, it's what we don't know today that will reward us most tomorrow. And that's liberating.

As always, share any thoughts on the Memo Musings board, and Fool on!

Only eight days until a bunch of awesome Fools meet up in Chicago. It's not too late to crash the party! Show up!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: Aug. 31, 2017

Published Aug 31, 2017 at 1:17PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio — start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.4%.
- **Coherent** (NASDAQ: COHR): Buy 2.4%.
- **Square** (NYSE: SQ): Buy 2.5%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.

Continue building your portfolio with our Buys, including:

- **FactSet Research Systems** (NYSE: FDS): Buy 1.9%.
- **Medtronic** (NYSE: MDT): Buy 2.7%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- N/A

Hedges:

- New ones being considered.

Next month's options expirations (September):

- None.

Today's Bull Market vs. History

Published Aug 31, 2017 at 11:55AM

The stock market bottomed out in March 2009. If you told someone at the time that stocks would basically go straight up for the following eight years, I'm telling you, not one person in a thousand would have believed you. Including me.

Why? Because there just aren't many periods in history where stocks do really well for eight years. It's only happened a handful of times in the last 100 years.

To put these last eight years of market gains in perspective, let's compare it to other historic bull markets.

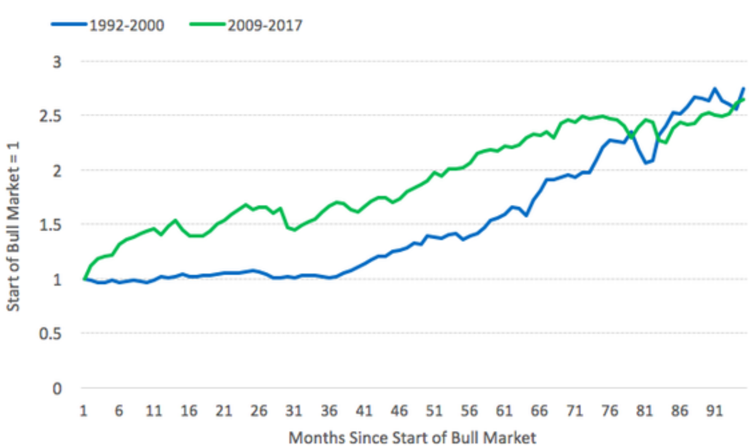
One caveat, and it's an important one: Comparing today's market to the past is not an attempt to argue that today's market will follow the same subsequent path as one in the past, especially in the short run. It's merely context on how far we've come.

The 1990s Bull Market

The dot-com era was born, and the economy roared, making the 1990s one of the most famous periods in market history. For the first time ever, small retail investors (like you!) could participate in the market without the guidance of a broker.

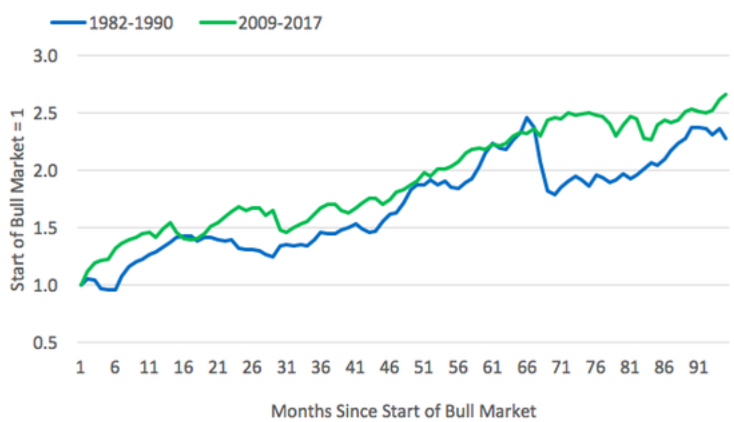
A recession in the early 1990s dragged the market down. Stocks began rallying in 1992, and didn't look back until peaking in 2000.

How do the 1990s compare to the last eight years? Pretty similarly, in both magnitude and duration:



The 1980s Bull Market

The market peaked in the mid-1960s and then went nowhere for the next 20 years, adjusted for inflation. The 1970s and early 1980s were a miserable time to be an investor. But high future returns are born in miserable periods, and by 1982 stock valuations were so low that a new rally was born. Morning In America was here, and stocks surged from 1982 to 1990 — even with the crash of 1987 in the middle:



Here again — both the magnitude and duration of the 1980s bull market is about on par with what we've experienced in the last eight years.

The 1920s Bull Market

Next to the 1990s, the 1920s are the most famous period of market excess and insanity — a period that both soothed the pain of an economy torn by World War I and set the seeds for the pain of the Great Depression. In his diary of the Great Depression, author Benjamin Roth wrote:

As I look back now to the 1921-29 period it seems to me unreal and almost unbelievable. After the war pressure people wanted to have a good time and to spend money.

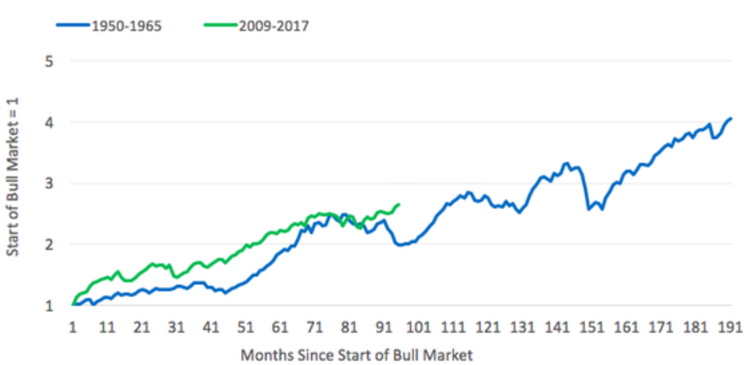
Here's how the 1920s stack up to today:

The 1920s is one of the only eight-year periods when the market performed better than it has in the last eight years. And it did far better: Equivalent eight-year returns would put the Dow at more than 34,000 today.

The 1950s and 1960s Bull Market

We remember the 1950s and '60s as a glorious time for American economic growth — and it was. Global dynamics that came out of World War II combined with an incredible amount of factory productivity learned during the war combined with pent-up consumer demand caused by rations during the war set the stage for 15 years of amazing growth.

Here's how it compared to today's bull market:



The eight-year rally from 1950 to 1958 is about on par with what we've experienced since 2009.

Then came a series of declines — moderate, but not severe. The 1950 to 1965 bull market, if taken as one, was an incredible period of wealth creation.

I left in the whole 15-year period in this chart not to predict what might come next for us today, but to show what's possible over long stretches of time even after big run-ups like we've had over the last eight years.

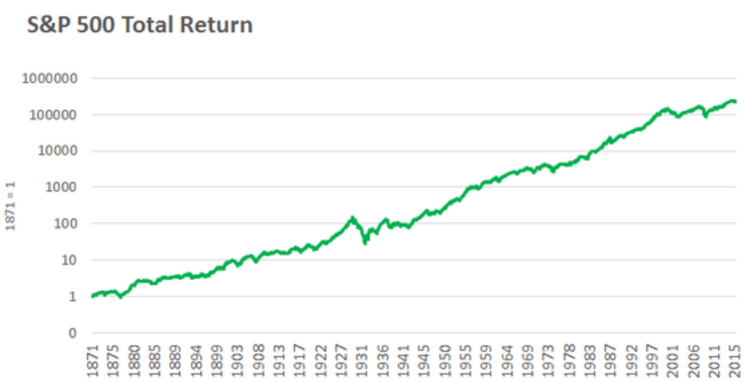
We've Been Here Before

The last eight years is not unprecedented.

What gets dangerous is when you assume we've come too far, too fast, and think that the rally of the last eight years means we're due for crash.

We will have more bear markets. Maybe starting next month, maybe next year, maybe five years from now. The fact that we're surprised at how far we've come since 2009 should be a reminder that outcomes are surprising, not that your prediction of a new bear market is due to come true.

The most important thing any of us can do is contextualize big rallies and big drops against two things: our own personal needs and goals, and the long-term record markets have produced over time:



Pro Guidance Changes, Completed Trades: Aug. 28, 2017

Published Aug 28, 2017 at 3:27PM

Pro Guidance Changes from the past week:

- **Gentex** (NASDAQ: GNTX): Moved to Sell. We're completely closing our long position(s).
- **GoPro** (NASDAQ: GPRO): Moved to Cover. We're completely closing our short exposure.
- **O'Reilly Automotive** (NASDAQ: ORLY) moved to Sell (and was sold from our portfolio via long puts).

Pro Completed Trades and Option Expirations from the past week (see transaction log; trades take a day to appear):

Pro Catch-Up Trades and Upcoming Expirations: Aug. 24, 2017

Published Aug 24, 2017 at 2:19PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.4%.
- **Coherent** (NASDAQ: COHR): Buy 2.3%.
- **Square** (NYSE: SQ): Buy 2.4%.
- **Verisk** (NASDAQ: VRSK): Buy 2.1%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.8%.
- **Oracle** (NYSE: ORCL): Buy up to 4%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- N/A

Hedges:

- New ones being considered.

This month's expirations (Aug. 18):

- **Gilead Sciences** (NASDAQ: GILD): With the stock below our strike price, our August $75 covered calls expired as income last week. We'll consider new calls with a new trade alert.
- **O'Reilly Automotive** (NASDAQ: ORLY): With the stock below our strike price, our long August $220 puts were exercised this weekend, selling all of our shares. The stock was moved from Hold to Sell on Monday.

Close Your Synthetic Short on GoPro

Published Aug 23, 2017 at 2:08PM

Is this for you? This is for all members who have any short exposure to **GoPro** (NASDAQ: GPRO). We're ending our short.

How You Participate

- **Action:**
  - Buy to close all short January 2019 $12 calls, and sell to close all owned January 2019 $12 puts.
- **Price guidance:** To the best we can judge, this synthetic short can be closed for around a net credit of about $3.20. Use a limit order and experiment to see if you can get that price or higher. If the market makers don't cooperate, you may need to close for a lower credit.
- **Recent prices:**
  - Stock: $9.10
  - Buy to close January 2019 $12 calls (bid/ask): $0.87/$1.58
  - Sell to close January 2019 $12 puts (bid/ask): $4.10/$4.85
  - Mid-range of bid/ask: $1.22 buy to close/$4.45 sell to close = a $3.23 net credit, rounded down to a $3.20 net credit.
- **Allocation:** We're taking our 0.4% exposure down to 0%, closing all of our contracts of each option.
- **Status:** Cover (close) all positions.

What We're Thinking

On Nov. 1 of last year, with GoPro stock at $12.85, we recommended our synthetic short at a net debit of about $0.75. Today, with shares just above $9, or 29% lower, we can close that synthetic short for a net credit of about $3.20. At that price, the recommendation as written has made about $2.45 per share while the stock is down $3.75 per share.

That discrepancy shows the cost of shorting calculated into the options prices. In fact, before shares became unavailable for shorting entirely, it cost more than 80% per year to short GoPro, which was why we went with the synthetic short. The trade has worked out favorably, with shares down sharply despite a strong market. With the business now starting to improve its financials, we're going to close our short exposure. Our shorting conviction is simply lower now than it was last November, and we've already capitalized on the stock's fall in price by nearly a third.

Improvements Coming?

After several quarters of growing losses amid much lower sales, GoPro cut its staff by 20% and lowered operating expenses by a massive 30% year-over-year as of its recent second quarter. While such cuts can be a death knell for a technology company, GoPro's refocus on just a few higher-end cameras, and on making its camera content mesh seamlessly with smartphones, has the potential to succeed. Management has been addressing the lack of focus and poor execution that helped drive our short position.

GoPro's $399 Hero5 Black camera accounted for more than 70% of camera revenue last quarter, and total camera units shipped topped 1 million, up 40% year-over-year. Management now expects total annual revenue growth of more than 10% this year (up from admittedly weak results a year ago) and full-year non-GAAP profitability (both to be achieved in the next four months), as well as growing opportunities overseas. Brian Withers wrote more for Fool.com, if you're interested.

How It No Longer Fits Into *Pro*

My overall skepticism about the company's long-term prospects hasn't diminished that much; I still believe it will be difficult for GoPro to increase profits reliably for years to come as competition grows. But with management committed to producing only enough cameras to achieve about 10% revenue growth and non-GAAP profits this year, and flat-out saying they won't meet any demand above that, I'm convinced they're managing for the long term. And given that, the odds of growing losses at GoPro are greatly diminished. The inventory gluts of the past may be over, and stability alone could help shares slowly recover.

Meanwhile, we have January 2019 options, and expiration is closer than it seems. If GoPro is about to enter a period of modest financial recovery, we don't want to keep our time-constrained synthetic short open. On its current trajectory, and with a new camera model due out this year, GoPro's business could do fairly well at least over the coming three quarters.

Today, we can sell our long $12 puts for about $4.45, providing us an effective net sell price on the stock of $7.55. That's good time value we'll capture with the shares at $9.10. However, we need to pay hefty time value to close our $12 calls, and we're doing that despite the stock only trading at about $9. It's simply not worth the risk to keep our short calls open. Our short has provided us with a profit in a rising market. With the business story starting to evolve, we'll take that gain and move on to the next thing.

Alternative Trades: You probably don't have any, since shares weren't available for shorting. But our advice is to close all short positions. If you just bought puts, sell to close those with a limit order.

Sell (Close Your Position on) Gentex

Published Aug 22, 2017 at 1:18PM

Is this for you? This is for all members who have exposure to **Gentex** (NASDAQ: GNTX). We're ending all of our exposure to the company. If you're of the school that *never* sells anything, you don't have to join us, you can hold on; but otherwise, to follow the portfolio, exit the position with us. Note that **this stock is thinly traded, and limit orders are vital.**

How You Participate

- **Actions:**
  - Sell all Gentex shares, using a **limit order** at the active price (lately $17.20, but that will of course change). **This stock is thinly traded. Limit orders are vital.**
  - Buy to close your December 2017 $17.50 puts, using a limit order splitting the bid/ask at the active price (lately $1.15 - $1.20).
- **Allocation:** We're taking our 2.6% holding down to 0%, and we're closing all of our outstanding December 2017 $17.50 written puts.
- **Status:** Sell (close) all positions.

What We're Thinking

As described in our recent report on Gentex's second quarter, there's reason to believe the company's lower valuation multiples may have become its new norm. Gentex is now in a time of greater uncertainty than at any point since we bought the stock in 2012, thanks to a combination of macro factors (slowing U.S. auto sales) and technological ones (the market thinks self-driving and/or mirrorless cars will have a big impact on Gentex's business). Throw into the mix a recent short report that calls into question the validity of the company's financials, with accusations that are difficult to disprove because of the company's limited disclosures, and we've decided that we're happy to view this position through the rearview mirror. We're closing all of our positions in Gentex. As noted above, **this stock is thinly traded. Using a limit order is vital.**

By and large, the position has been a success since its inception in 2012, significantly besting the North Star via a combination of strong capital appreciation, a growing stream of dividends, and a series of options for income. We're content to close our position now rather than risk further erosion of capital based on the growing risks that come with a slowing auto market and a shifting competitive landscape. Although our position has done well over time, Gentex's cyclical nature and lack of pricing power have always kept it from being the ideal *Pro* stock, and we think we can find better places for our capital from here forward.

Alternative Trades: Our advice is to close all positions. (Remember about that limit order.) We're moving on.

- **Questions?** Please visit the Gentex board.

Pro Guidance Changes, Completed Trades, and More: Aug. 21, 2017

Published Aug 21, 2017 at 3:35PM

Pro Guidance Changes from the past week:

- **O'Reilly** (NASDAQ: ORLY) moves to Sell as our August 2017 $220 long puts were exercised, thus selling all of our 500 shares following last Friday's expiration, leaving our allocation at 0%. If you still own shares of O'Reilly and wish to align with *Pro*'s guidance, you should sell all shares you own.

Pro Completed Trades and Option Expirations from the past week (see transaction log; trades take a day to appear):

- Our O'Reilly August 2017 $250 short calls expired fully as income following last Friday's expiration.
- Our **Gilead Sciences** (NASDAQ: GILD) August 2017 $75 calls expired fully as income following last Friday's expiration.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Uncertainty Ahead for Gentex

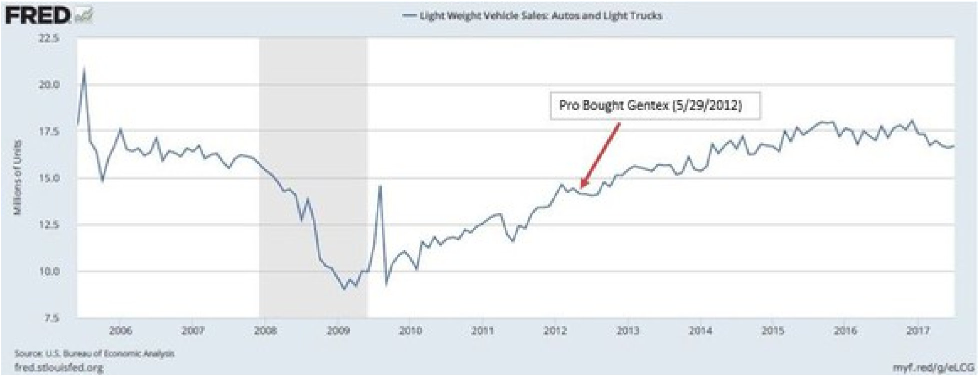
Published Aug 17, 2017 at 10:58AM

What Happened?

- Q2-2017 press release
- Q2-2017 10-Q

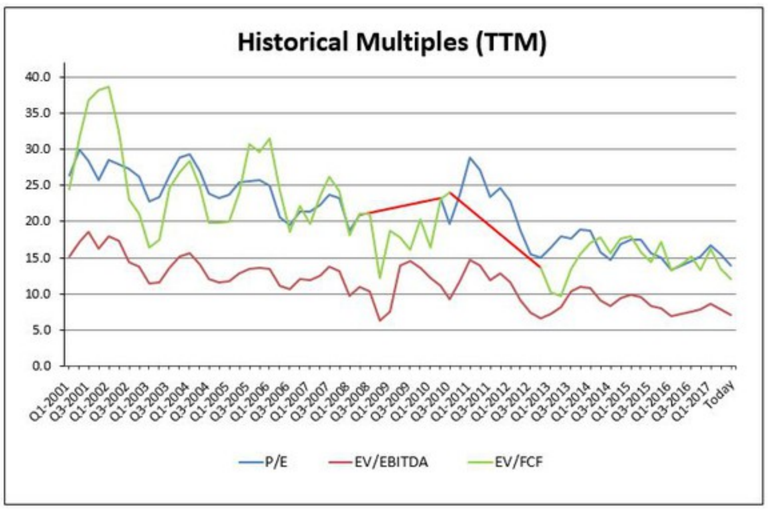
Guidance Update

Our maker of smart auto mirrors, **Gentex** (NASDAQ: GNTX), has released its second-quarter earnings, and after incorporating the results into my valuation model, **our fair value remains unchanged at $20.50 per share.** As mentioned in Jeff's writeup on the company in late July, there are several reasons to be cautious with Gentex, mostly surrounding macro issues and technology. For one, while we've ridden Gentex higher over the course of its history in *Pro* (since 2012), that's been coincident with an upcycle in the U.S. auto market that appears to be moderating:



We bought two blocks of shares in 2012, for a total of 4,400 split-adjusted shares with an average cost basis of $10.05 each. Since then, we've collected $7,248 in dividends and $7,554 in options premiums (net of the market value of our current December 2017 written puts). Including dividends, earned option premiums, and stock price gains since 2012, our annualized return on our original 4,400 shares has been 15.4%.

Although Gentex is now trading at lower multiples than it has throughout its history, we could argue that because of the macro-level and technology-based uncertainty, the stock no longer deserves to trade at the premiums it once enjoyed. Our thesis (summarized below) has come into question, and we are strongly considering exiting our position. But for now, the stock remains on Hold.



Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and free cash flow levels.

- **Updated Guidance**: Hold (no change)
- **Recommended Allocation**: 2.6%, plus 0.9% in December 2017 $17.50 written puts.
- **Fair-Value Estimate**: $20.50 (no change)
- **Current Price:** $17.42

Our Thesis

Gentex will:

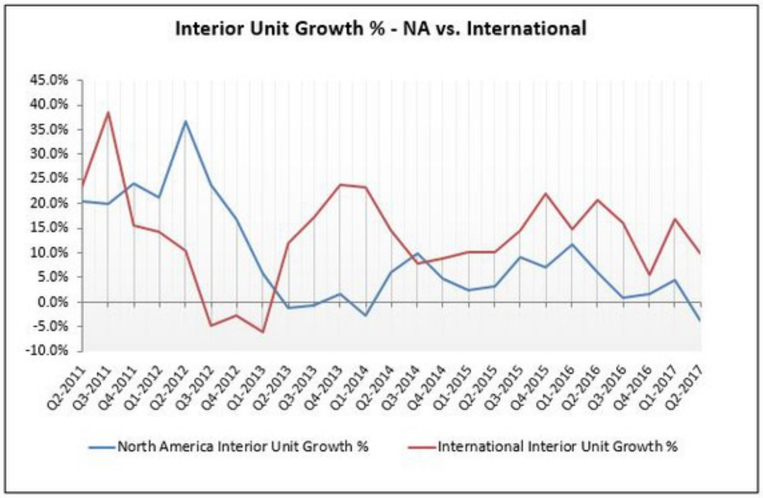
1. continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology, and ...
2. drive up the value embedded in each unit through new technology and functionality.

We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1. Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors continue to gain market share. If the company is increasing units sold faster than autos are being produced, it's moving in the right direction. In the second quarter, global interior mirror unit volumes grew at 5.2% year-over-year (vs. 15.1% in the same quarter a year ago). This compares to a 1% year-over-year decline in auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share.

However, interior mirror unit growth was significantly different when looking at North American vs. international markets. Interior units sold in North America for the quarter showed a 3.7% decline, down from 6% a year ago, and the growth rate for international interior units decelerated to 9.9% from 20.6% the year before. Since interior units account for about 72% of total mirror unit volume, trends in interior mirror unit volumes are important.



Exterior mirror unit shipments showed a similar slowdown in North America, with exterior unit volumes down 1.6% in North America from the 9.2% they posted in Q2 2016, but showing growth at 11.5% internationally, up from 8.8% a year before.

2. Pricing and value: Unit growth vs. automotive division sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2.5% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins.

In 2016, total units (interior + exterior mirrors) increased by 5.6% and automotive segment sales were up 5%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3. Margin performance. Gross margin came in at 37.7% in the second quarter, down from from 39.4% the year before. Management noted that the decline in gross profit margin is the result of annual customer price reductions (referenced above) that were not fully offset by reductions in purchasing costs. Also noted was the company's inability to leverage fixed overhead costs because of its unfavorable product mix, which itself was driven by a higher percentage of base auto-dimming mirror shipments vs. advance feature mirrors.

Margins have been declining consistently since peaking at 40.5% in the third quarter of 2016, which may indicate increased competition, lower leverage in negotiating with automotive suppliers, or a lack of corporate innovation around new features or reduced production costs.

What We Think Now

Gentex's safety-enhancing mirrors have continued to earn their place in new cars across the globe, and the company anticipates increased adoption of its products over the next few years. However, an increasing rate of change (and potential disruption) in the automotive industry has led to increased skepticism from the market, resulting in lower multiples than the company has seen historically. In the past, technology from acquisitions and in-house R&D fueled new product development and drove adoption of Gentex's feature- and technology-rich auto-dimming mirrors, but we're not so sure of the company's ability to continue that success. The company's competitive advantages may be in question, and the stock is on Hold until further notice.

If you have questions, drive on over to the Gentex discussion board.

Pro Catch-Up Trades and Upcoming Expirations: Aug. 17, 2017

Published Aug 17, 2017 at 10:54AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **Coherent** (NASDAQ: COHR): Buy 2.3%.
- **Square** (NYSE: SQ): Buy 2.4%.
- **Verisk** (NASDAQ: VRSK): Buy 2.1%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.8%.
- **Oracle** (NYSE: ORCL): Buy up to 4%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.4%.

Pro options:

- N/A

Hedges:

- New ones being considered.

This month's expirations (Aug. 18):

- **Gilead Sciences** (NASDAQ: GILD): With the stock below our strike price, our $75 covered calls are currently on track to expire as income this weekend. We'll consider new calls with a new trade alert.
- **O'Reilly Automotive** (NASDAQ: ORLY): With the stock below our strike price, our long $220 puts are on track to be exercised this weekend, selling all of our shares. Assuming this goes as planned, the stock will be moved from Hold to Sell on Monday as a matter of course. We don't believe O'Reilly is destined for failure, by any stretch, but we do believe headwinds in the retail industry in general will continue -- and perhaps grow -- as shopping habits continue to change. Given this concern, we're not comfortable owning O'Reilly at premium prices any longer (and that's where it still trades).

Put a Bow on It: Some Earnings Wrapped Up

Published Aug 14, 2017 at 2:48PM

Dear *Pro* member,

Let's review some earnings. [*Editor's note: These companies are not in alphabetical order as usual, but rather in the order in which Jeff wanted to write about them. We'll call it Jeffabetical order. Square, OpenText, Shake Shack, and GoPro, at your service!*]

Square (NYSE: SQ) reported excellent progress that suggests strong long-term promise. The company appears to be run exceptionally well, is headed in the right direction, has large opportunities, and is set to steadily expand its margins. It's addressing customer problems in ways others aren't -- and creating new markets, and an ecosystem, in the process. In addition, sequential quarterly growth on top of strong year-over-year growth usually speaks volumes about demand and the company's ability to execute on that demand. Well done. On top of all that, subscription and services revenue nearly doubled year over year.

Adjusted revenue was up 41% in Q2 over last year, up from 39% growth in Q1. Gross payment volume grew 32% to $16.4 billion, and larger sellers ($125,000 or more in annual GPV) grew 45% year-over-year to become 46% of total GPV, up from 42% a year ago. Mid-market sellers (more than $500,000 in annual payment volume) grew 61% over last year. Square's transaction-based revenue percentage and profits per dollar held steady even as it added more large customers.

The company's Square Capital loan volume was up 68% year-over-year, to $318 million. Under this unique offering, Square loans capital to businesses based largely on past sales and processes repayment on these loans directly from the company's future revenue. About 49,000 sellers are using this program, earning Square interest on the capital, and the average loan is $6,000. More than 90% of customers are automatically approved thanks to machine learning and analysis of past business results, making the loan process quick and easy. Businesses increasingly use it to bridge cash flow needs. Is there some risk here? Of course, especially early on while we wait for machine learning to steadily improve. So far, the loan loss rate has remained steady at about 4% (higher than at **American Express** (NYSE: AXP), but still a safe level). With improvements in process, it should head lower.

Square increased its guidance for the year to adjusted revenue of about $930 million, and adjusted earnings per share of $0.21 to $0.23. Management puts its revenue opportunity in the U.S. alone at around $26 billion. Most promising, operating margins improved 8 percentage points over last year, suggesting that margins will keep climbing higher over time. Meanwhile, Square targets a three- to four-quarter payback period on its new customer offerings and investments in the business. CFO Sarah Friar says, "We're always making sure we keep the balance sheet pristine." This is a tight ship on a good path. New to our portfolio (and to the Fool universe through *Pro*), Square is a Best Buy Now. We have a 2.4% stake and hope to have good cause to make it larger over time.

OpenText (NASDAQ: OTEX) is growing quickly, with revenue up 37% last quarter to $664 million. When we first bought shares five years ago, the company's sales were just above $1 billion per *year*. Much of this growth is from acquisitions, which is part and parcel of the strategy. Most of OpenText's revenue is recurring, making it easier to grow off the base, while renewal rates remain in the low-90-percent range -- companies need software to manage digital data.

On the heels of some large acquisitions, OpenText has $2.1 billion in net debt. The company also has ample cash flow to gradually pay it down, which is what we want to see. We've also been closely watching a years-old dispute with the IRS, which represents a potential $585 million liability; management, of course, strongly disagrees with this possibility, and discussions with the IRS continue. But on its results, the company is inexpensive, trading at less than 13 times expected earnings per share for the year ahead and 16 times trailing free cash flow. As fiscal 2018 starts, OpenText is focused on operating cash flow growth, margin expansion, and revenue growth, all of which will serve to strengthen the balance sheet. The stock remains a Buy; we have a 3.1% stake.

Shake Shack (NYSE: SHAK) is so far a "flat" short for us, while the Russell 2000 is up more than 14% over the past year. Perhaps the strong market is the main thing keeping the Shack afloat at all. Same-store sales declined 1.8% last quarter, and no matter how much management downplays this (citing a small store base and a 4.3% same-store sales gain a *year* earlier), the lag says something. The whole industry is struggling, but concepts with greater draw -- like **Starbucks** (NASDAQ: SBUX) -- should be able to increase same-store sales anyway. After all, the Shack improved its price and sales mix by 2.5%, yet still saw same-store sales decline because traffic fell 4.3%. Beyond today, as the hot "burger and fry" concept cools in years ahead, the hundreds of new restaurants that Shake Shack promises to open will debut to smaller crowds than in the past, partly because of weaker locations. Yet the stock still trades at 61 times expected earnings for the year ahead.

In a strong market, this short has treated us kindly at a 0% return. Management is on track to open 23 to 24 new company-owned Shacks this year, for unit growth of 37%. And they're doing other things right, too, including their digital efforts. But with labor costs rising and traffic headwinds, and with lower margins ahead, we're keeping the short open at this valuation. We're content to wait and see how much more the concept cools off, and we may finally add to this short if the stock rises to the high $30s again without good cause. We only have a 0.4% short right now (though for a short, that sizing isn't uncommon).

Finally, **GoPro** (NASDAQ: GPRO) surprised with better sales and lower costs than expected, leading to higher operating margins, although losses continued. Management is aiming for full-year non-GAAP profits by year's end. It's a tough call right now regarding what to do with our synthetic short. The company is downsizing, is more focused, and is executing better, and its CEO, Nicholas Wood, is having fun (don't discount the eventual value of that!). Most impressive, GoPro is repositioning its products to be an extension of your smartphone, a savvy (in my opinion) shift to draw new customers. Making GoPro cameras simply mesh with a phone will help, but it still operates in a tough market, and profits are far from guaranteed. We'll decide soon whether we want to keep the short longer or close it up.

To close on this August day, here's a brisk musical outro to see you on your way, with 32-year-old Mari Samuelsen.

As always, share any investing thoughts on the Memo Musings board, and Fool on!

-- Jeff (TMFFischer)

Pro Guidance Changes, Completed Trades, and More: Aug. 14, 2017

Published Aug 14, 2017 at 2:19PM

Pro Guidance Changes from the past week:

- None

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Coherent** (NASDAQ: COHR): We bought 22 more shares at $219.56, upping our allocation by 0.15%.
- **Verisk Analytics** (NASDAQ: VRSK): We bought 57 more shares at $82.27, upping our allocation by 0.15%.

Some of This Week's Foolishness to Come

- **Coverage:** This week, we'll continue to review earnings from **Gentex** (NASDAQ: GNTX), **Paycom** (NYSE: PAYC), **Facebook** (NASDAQ: FB), **Broadridge Financial** (NYSE: BR), and others, and we'll be looking at new ideas including some shorts and hedges.

Touching Base and Fighting Noise

Published Aug 10, 2017 at 2:00PM

Dear *Pro* member:

The S&P 500 is down 0.96% today as I write this, and the Nasdaq Composite is down 1.53%. This is not remarkable, except that we haven't seen much volatility for months. The S&P 500 is now down just 1.6% from its all-time high hit on ... Aug. 8. Two days ago. The only notable thing to change since then has been the saber-rattling taking place between the 71-year old president of the U.S. and the 33-year old dictator of North Korea. I don't have any words of wisdom to share on that front. But second-quarter earnings reports have been healthy, and if consumer confidence remains high, the U.S. economy should remain on stable footing for now (all else equal).

That said, I'm not here to defend the stock market. Stock indexes could easily decline by 10% and still be reasonably valued -- and if that happened, it's likely you'd nonetheless have much more value in your portfolio than you did one year ago. It's important to remember that price fluctuations are natural. Most investors should just wait them out, or use them as long-term buying opportunities.

In *Pro*, we want to protect against market drops with strategies that don't cost us dearly each year, but we're not concerned about market declines of 5% or so. Declines of 10% or greater, though, we do want to have some protection against. We've been working on new shorts and hedges over the past several weeks, along with earnings reports that need our timely attention, so it's likely that we'll have some new positions before long.

We remain confident in the positions we own, and we are ready to add to positions at any time. With our buys, we continue to have a three-year outlook at minimum, meaning today's market slide is not relevant to us. It's noise. Today, let's use the four criteria of noise as defined in Shawn Achor's book *Before Happiness* to help identify it, avoid it, and be more productive and successful as a result. Achor notes that noise is:

1. Unusable: Your behavior won't be changed by the information.
2. Untimely: You are not going to use the information imminently, and it could change by the time you're ready act.
3. Hypothetical: The information is based on what someone randomly thinks could happen, instead of what is.
4. Distracting: The information distracts you from your goals.

It's fair to say that much of the daily news fits these four criteria. And it's fair to say that most of our investing is based on "what is." We work to recognize what is a strong business, and invest in it. To us, "what is" is found in a business' stated financials, its place in its industry, its appeal to customers, its brand, its clear opportunities. These realities stand tall at the best companies, and position investors for growth down the road.

Today, though, we just wait. Meanwhile, it's a quiet time around Fool HQ. Many Fools are wrapping up vacation before school resumes, and we know many of you are vacationing in August! Enjoy, and bring any thoughts to the Philosophy & Strategy board.

-- Jeff (TMFFischer)

Pro Guidance Changes, Completed Trades, and More: Aug. 7, 2017

Published Aug 7, 2017 at 4:13PM

Pro Guidance Changes from the past week:

- **Coherent** (NASDAQ: COHR): Via Friday's trade alert, our allocation increases by 0.15%, to -- lately -- about 2.25%. Shares are a Best Buy Now.
- **Verisk Analytics** (NASDAQ: VRSK): Via Friday's trade alert, our allocation increases by 0.15%, to about 2.15%. Shares are a Best Buy Now.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Coherent** (NASDAQ: COHR): Late this afternoon, we bought 22 more shares at $219.56, upping our allocation by 0.15%.
- **Verisk Analytics** (NASDAQ: VRSK): Late this afternoon, we bought 57 more shares at $82.27, upping our allocation by 0.15%.

Some of This Week's Foolishness to Come

- **Coverage:** This week, we continue to go through recent earnings reports from **Gentex** (NASDAQ: GNTX), **Paycom** (NYSE: PAYC), **Square** (NYSE: SQ), **GoPro** (NASDAQ: GPRO), **Shake Shack** (NYSE: SHAK), **Facebook** (NASDAQ: FB), **Starbucks** (NASDAQ: SBUX), **OpenText** (NASDAQ: OTEX),.
- **Next Earnings: Broadridge Financial** (NYSE: BR) will report results on the morning of Thursday, Aug. 10.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Buy (More) Coherent and Verisk Analytics

Published Aug 4, 2017 at 12:04PM

Is this for you? This recommendation is for all *Pro* members who have year-to-date dividends to reinvest, or who have ample cash to make a small additional investment and want to match us.

How You Participate

- **Action and Allocation:** Buy 0.15% more in **Coherent** (NASDAQ: COHR) and 0.15% more in **Verisk Analytics** (NASDAQ: VRSK), raising these positions to a 2.25% and 2.15% allocation, respectively. At recent prices, *Pro* will buy about 21 more shares of Coherent and about 56 more shares of Verisk.
- **Price Guidance:** Use a **limit order** at the prices available when you place your order. We'll buy in the next one to 30 days.
- **Price Ranges (Aug. 3):**
  - COHR: $210.74-$221.98
  - VRSK: $82.23-$83.74
- **Guidance:** Both are rated Best Buy Now, Coherent with a fair value estimate of $280, and Verisk with $83.

What We're Thinking

As you probably recall, last quarter we outlined our plan to begin reinvesting our dividends when we see incremental purchases we're happy to make (assuming we'll still be comfortable with our cash balance post-investment). We have plenty of cash today at about 20% (ex-shorts), and we can afford to invest the net dividends we've collected since our last reinvestment in April. In the second quarter (April, May, June), we collected $9,414 total in new dividends that we're now going to reinvest. Usually we would reinvest in July, but we wanted to wait and see earnings -- so, bully for us! This time around, we're targeting two stocks we believe have been unfairly punished after reporting earnings this week. Here's what we're thinking.

Coherent

With only 24.7 million shares available on the market and $5.3 billion in market value, relatively small Coherent is lately our most volatile stock during a year in which we've had much higher-than-average volatility in several positions (both positive and negative). Coherent's price volatility was highly negative after its third-quarter 2017 earnings report, even though it recorded record results and boasts record backlog. The stock fell 21% the day after earnings, likely because Coherent is facing supply constraints with its recently acquired fiber laser business (it can't make the lasers fast enough), and because its fast-growing microelectronics business is booked nearly through fiscal 2018, so new orders there will start to be filled in fiscal 2019. This is a good problem to have in the long run, but having more business than you can handle right now is also a missed opportunity -- and Wall Street rightly hates that, because some sales will presumably go to competitors instead. Coherent is moving as quickly as possible to meet demand.

The good news in the immediate term is that Coherent's many business lines are performing well, with fast-growing microelectronics making up 52% of revenue, materials processing 31%, OEM components and instrumentation 11%, and science and government 6%. Service and parts (a decent recurring business) accounted for 26% of sales. After a record $464 million in third-quarter revenue, Coherent expects $465 million to $485 million next quarter. Lately at about $215, the stock trades at 15.3 times expected earnings for the year ahead. That's well below its five-year average P/E of 27.7, for what that's worth (we're not saying it deserves that, either; our valuation affords it a multiple closer to 20).

More importantly, the long-term story remains promising. As the need (and it is a need) for lasers in manufacturing increases, Coherent is set to serve existing customers on their evolving needs and countless new customers as applications grow. We need patience, however. The recent acquisition of Rofin-Sinar's fiber laser business is going well, but it will take several quarters before Coherent can meet all the demand it's seeing in that particular market. Thankfully, patience is what we have in spades. We're just weeks into a minimum three-year investment (assuming all goes well), and ideally much longer. This addition to our stake may be just the first.

Verisk

Verisk has managed to keep within striking distance of our North Star since our initial purchase in July of 2015, but it has been anything but smooth sailing for this prototypical *Pro* holding. The biggest reason for this has been the company's 2015 acquisitions of WoodMac, a global leader of commercial intelligence for the energy, chemicals, metals, and mining markets. In retrospect, this acquisition appears to have been mistimed (something we're all too familiar with as investors), leaving investors and analysts alike starting to question whether the deal will ultimately end up creating or destroying value for shareholders.

However, as long-term shareholders, we're not ready to throw in the towel on WoodMac just yet. So far, we've actually been impressed with WoodMac's resilience during one of the worst industry downturns in recent memory, and although we don't know when the energy market will turn in Wood Mackenzie's favor, we still believe that it's a question of when, not if. We want to make sure our stake in Verisk is large enough to see it make a meaningful contribution to the portfolio once the segment returns to mid-teens revenue growth, so we're taking this opportunity to continue building our position. This, our third addition to Verisk, is just another (very) small bite of what could be a larger portion down the road.

Though the stock fell by almost 4% on the heels of the company's second-quarter results, we're actually satisfied with what we saw. The insurance business finally reaccelerated, WoodMac reported positive revenue growth on a constant currency basis, and management continues to manage the company for the long run by making investments to both strengthen its core offerings and expand its total addressable market. One area where management has occasionally come up short over the years is in managing investor expectations. For better or worse, management has historically given aggressive guidance and occasionally downplayed issues that could impact the business in the near term. Although this is a moot point when you consider our position from a long-term investing perspective, it has meant a negative market reaction to what we consider acceptable quarterly results. However, since this affords us the opportunity to pick up additional shares after a price decline, we're willing to cut management some slack this time around.

The Foolish Bottom Line

As we reinvest each quarter to take advantage of the long-term benefits doing so will provide, we plan to pay at least a bit of heed to the fact that much is unknowable. Though what we're doing isn't "auto-reinvestment," in some senses we want it to be *like* that. We don't want to overthink it -- we want to think just enough. Nudge these two positions up by about 0.15% each if you have dividends you want to reinvest or more than ample cash and want to follow along. Helping to make this economically feasible, our trading commissions at Interactive Brokers are very low. Hopefully, given the commission wars going on, yours are, too. Fool on!

NVR and Verisign: Masters of Their Domain

Published Aug 4, 2017 at 11:34AM

What do homebuilders and domain-name registrars have in common? In the case of *Pro* companies **NVR** (NYSE: NVR) and **Verisign** (NASDAQ: VRSN), we're happy to report the answer is a rising stock price. Here's *Pro*'s quick take on both companies' second-quarter earnings.

With NVR's stock popping 8% the day after the company reported quarterly results, I think it's safe to say the market liked what it saw. The best-of-breed homebuilder saw an 11% increase in revenue, driven primarily by a 9.4% increase in settlements and a 2% increase in the average settlement price. Moderating construction costs resulted in an impressive 40% incremental operating margin, above the company's historical norms (high teens to low 20s during upswings in the housing cycle, low teens overall). NVR also enjoyed a $16 million tax benefit after adopting a 2016 accounting standards update; combined, these forces resulted in a 60% increase in diluted earnings per share.

Looking forward, new orders continue to be solid, with an 8% increase this quarter. And NVR's backlog of homes sold but not settled increased by 10%. This growth will likely be offset somewhat in the future by a shift in new orders toward lower-priced communities, given that the average price for new orders declined 2% this quarter, but a single decline doesn't make for a troubling trend. NVR's new order cancellation rate — a metric we track closely because it can give insight into the financial health of those currently shopping for a new home — came in flat for the quarter at 13%, good news to us because it represents a 300-basis-point sequential decline. All in all, this was a very solid start to our relationship with the company, and we still strongly believe it is well-positioned to compound value over the long haul. The stock remains a Best Buy Now.

VERISIGN™

Verisign's stock may not be acting like the ideal candidate for the covered strangle we currently hold (though we're definitely not complaining about a 28% gain in eight months!), but its *business* definitely is. The global leader in domain-name registry services yet again reported modest revenue growth and strong operating leverage, as well as continuing its aggressive share repurchases. As a bonus, management also completed a $550 million debt offering earlier this month; we believe this, too, will largely be used to repurchase shares, given the company's modest maintenance capex requirements. Last month, the company also reported that its .net registry agreement had been successfully renewed without any material changes -- we'd considered this a foregone conclusion, but we were still happy to hear it. This means we'll continue to see wholesale prices rise by 10% annually, with the next increase scheduled for February 2018.

With new domain-name registrations continuing to pace above 9 million per quarter this year (after three consecutive sub-9-million quarters to end last year) and the renewal rate recovering from the decline brought about by the Chinese surge we've [talked about previously](), management felt comfortable raising the company's full-year guidance. Likewise, we feel comfortable raising our fair-value estimate to $90 today.

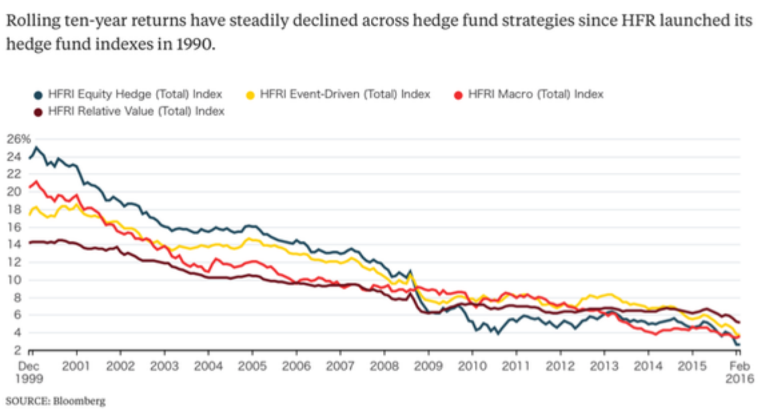
Hedging Our Bets, Part II: Change Is Coming

Published Aug 3, 2017 at 3:38PM

This article is the second in our series about the whys, whens, and hows of *Pro*'s approach to hedging. For the first, [click here]().

First, do no harm.

In recent years, this phrase, which is commonly associated with the Hippocratic oath, has been one of the cornerstones of our approach to hedging here in *Pro*. And to see why, one only needs to glance at how hedge funds have performed over the past many years. Spoiler alert for those who don't follow the industry closely: It isn't pretty. By and large, these funds' attempts to deliver the best of both worlds — above-average returns with below-average volatility — have brought about lackluster results since the 2008 financial crisis. In fact, according to data and analysis provider Hedge Fund Research, 2008 was the last year the industry as a whole outperformed the S&P 500.



Source: Kaissar, N. (2016, March 26). Hedge Funds Have a Performance Problem.

To be fair, there is far more contributing to the industry's woes than just hedging mishaps. But you'd be hard-pressed to make a convincing case that hedging isn't at least partially responsible. There are no free lunches when it comes to investing, so if you want to gain protection from an untimely decline in the market, you need to offer up something in return. And odds are that the more complete the hedge, the more it's going to cost you -- and eat into your returns while you sit around waiting for the market to fall.

This trade-off might be something we'd be willing to stomach if our only goal was wealth preservation, but here at *Pro*, we hold ourselves to an extremely high standard: We seek to achieve positive returns over rolling three-year periods while also doubling our real purchasing power every 10 years. Continuously exchanging upside for downside protection is a luxury we simply cannot afford when our North Star, our guiding light, steadily marches higher day in and day out. At the same time, however, forgoing any type of hedge also places our portfolio at risk of falling short of our investing goals during the next bear market. (Recent history may have lulled some investors into concluding that bear markets are extinct, but we do not share this opinion.)

So, how do you reconcile two ideas that appear to be locked in mortal combat? Although we would never claim to have all the answers here at *Pro*, we believe the best approach is to accept that there is no hedging panacea. Instead, one should look to effectively create a hedging arsenal from which you can select what you believe to be the optimal strategy at a given point in time.

Another Market, Another Approach

For many years, put ratio spreads have been *Pro's* hedging strategy *du jour*. With this options-based approach to hedging, we buy a number of put options, then sell more put options of the same underlying stock and expiration date at a different strike price; this strategy does a great job of minimizing (often completely eliminating) the cost of setting up a hedge, without capping your upside should the underlying ETF move higher. In fact, we've occasionally managed to set them up for a net credit, meaning we actually made money on our hedges when the market was flat or went *up*. As well, put ratio spreads can typically can be set up to start making money after only a modest decline in the market. However, there are two big trade-offs associated with these ratio spreads:

1. In selling twice the number of puts that we buy, we cap our maximum profit, and we run the risk that our hedge might actually start to accumulate losses if the underlying index ETF falls too much. That would mean our hedge could transform into a liability at the exact point when we want it working in our favor the most -- during a big market decline.

2. In most cases, it's hard to realize a sizable profit on a ratio spread prior to expiration, even if the underlying ETF falls to our written strike price. That's because a decline in the markets is usually accompanied by a spike in implied volatility, which in turn makes our our written puts rise in value.

   For example, if the QQQ (the underlying instrument for our current ratio spread) were to fall to the price associated with the maximum profit for our spread ($114 per share) at some point in the relatively near future, odds are we'd have an unrealized loss in our brokerage account in the neighborhood of $5 to $10 per spread. Although this loss would subsequently become a gain if the QQQ remained around this price come expiration (January 2018), the situation would be less than ideal -- we'd be forced to sit on our hands and wait to see whether our hedge would make money, while we'd prefer that it immediately buffer the portfolio from the decline, providing us with additional funds to invest and take advantage of the subsequent recovery.

We still believe that put ratio spreads are a valuable tool in our hedging arsenal, one we'll want to use for smallish hedges that don't cost us, and that position us to buy into the index at a price we favor. However, things have changed quite a bit for put ratio spreads in just the past several months. Let's take a look at a few of the intertwined reasons why.

Pricing

When we first returned to regularly using ratio spreads as a primary means of hedging in 2014, a three-month SPY ratio hedge that started making money after the market fell by 2.5% and would break even on a 15.5% decline could be set up for no cost. Today, put prices have deteriorated to the point where setting up a no-cost ratio spread of a similar duration and starting point would give you a breakeven point just 10% lower. Given that ratio spreads always run the risk of becoming a liability, this shift has made them relatively less attractive.

Macro and Market Uncertainty

We've found ourselves agreeing lately with Oaktree Capital's famous saying of "move forward, but with caution." As Howard Marks, investing legend and Oaktree co-founder, noted about the current environment in his most recent memo:

> The uncertainties are unusual in terms of number, scale and insolubility in areas including secular economic growth; the impact of central banks; interest rates and inflation; political dysfunction; geopolitical trouble spots; and the long-term impact of technology ... Pro-risk behavior is commonplace, as the majority of investors embrace increased risk as the route to the returns they want or need.

Now, as Foolish investors, we know that uncertainty is unavoidable when it comes to investing; in many cases, it's best dealt with by simply acknowledging its existence and getting on with your day. However, hedging and shorting require one to develop a more nuanced approach to dealing with uncertainty than long-only investments (the latter being the only approach where time is almost always on your side). Although we're still cautiously optimistic about the next three years, we don't sense that put ratio spreads are the best fit today given their aforementioned risks, including today's unfavorable pricing.

Valuations and Entry Points

Are market valuations high right now, relative to historical norms? Yes. Does this suggest that mean reversion (i.e., multiple contraction brought about by declining prices) should be a foregone conclusion? Not necessarily.

Over the past few years, we've heard many convincing arguments for why higher valuation multiples are justified in the current environment. However, it's worth noting that over the past three years, the S&P 500's P/E and EV/EBITDA multiples have expanded by 27% and 22%, respectively, while revenues have increased just 4% and margins — save for gross margins — declined slightly. We may very well have entered into a new era in which the justified multiple is higher than in years past, but if history is a guide, market sentiment will swing from its current bullish state to bearish at some point -- at least for a while. And it's not unreasonable to think that the recent multiple expansion could result in an even greater decline in the market if (when) this occurs.

So what does this have to do with ratio spreads? Well, they leave us on the hook to purchase shares at our written put price, and that means we have zero business setting up a ratio spread if our short strike price is not one where we'd be comfortable buying shares in *any type of market condition*. (Our last put ratio spread, rolled in April, has a breakeven price now 26% below QQQ's price, and has a long put strike 12.5% below the ETF's current level.) Given the aforementioned concerns, we've been unable to identify a new ratio spread that fulfills this key requirement. So we've decided to use a new approach for our forthcoming hedge, which we plan to issue to you soon.

Remember, as always, that you don't need to hedge to succeed. However, as part of our goals, in *Pro* we typically carry cash or hedges or both. To discuss this, please visit our hedging board. Fool on!

Pro Catch-Up Trades and Upcoming Expirations: Aug. 3, 2017

Published Aug 3, 2017 at 12:41PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **American Tower** (NYSE: AMT): Buy up to 4.2%.
- **Coherent** (NASDAQ: COHR): Buy 2.1%.
- **NVR** (NYSE: NVR): Buy 2.8%.
- **Square** (NYSE: SQ): Buy 2.4%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.8%.
- **Oracle** (NYSE: ORCL): Buy up to 4.1%.
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.

Pro options:

- N/A

Hedges:

- New ones being considered.

This month's expirations (Aug. 18):

- **Gilead Sciences** (NASDAQ: GILD): In the next few weeks, we plan to roll our August $75 covered calls higher if needed once time value dissipates.
- **O'Reilly Automotive** (NASDAQ: ORLY): Our protective collar hedge remains in place and we're currently on a path to let our stock get sold via our $220 puts. If this situation changes, we'll communicate well before expiration.

Coherent Gets Smacked

Published Aug 2, 2017 at 11:35AM

Dear *Pro* member:

Laser producer **Coherent** (NASDAQ: COHR) is having a very rough day, down 20% as I write this. As you've seen in recent weeks, this stock can be volatile even without news, sometimes rising or falling 5% day by day, but today's move is extreme for any stock. What gives? The company reported record sales, earnings, and backlog last night. Results were above the mid-range of management's own guidance, but fell short of average analyst expectations. Investors wanted still more from the company.

Even so, management shared that backlog demand now stretches out for nearly five quarters (through fiscal 2018), and the company is already investing for 2019 demand. Across the board, sales are strong and growing -- so much so that Coherent can't make enough of its high-powered fiber lasers (one of many types it sells) to meet demand. That, in fact, may be what's hitting the stock hardest. Investors hate to hear about supply constraints, because it opens the doors to competitors taking away sales. Coherent didn't give a time frame for solving this, but management is working as fast as possible to pick up the supply slack and meet all the demand that's out there.

I'm still going through results, but I had a bit more to say in several posts on the Coherent board last night and this morning (starting at post 112, at 5:55 p.m. last night), and members have posted, too. Anytime a stock moves sharply, you can bet we'll be on the appropriate *Pro* discussion board to address it. Shares remain a Best Buy Now, and we have a 2.1% allocation that we're considering adding to. (You will of course be the first to know if we do!) We just have a bit more research work to do first before deciding.

Here's to long-term investing -- and riding through the ups and downs in good companies.

-- Jeff (TMFFischer)

Hedging Our Bets

Published Jul 31, 2017 at 1:37PM

Interested in learning more about our approach to hedging? You're in luck! This is the first in our ongoing series on the whys, whens, and hows of *Pro*'s approach to hedging.

"Why even bother hedging?"

As the current bull market nears the halfway point of its ninth year, investors could be forgiven for asking this question — especially given the recent lack of volatility. However, to understand why *Pro* often has some type of hedge in place, you only need to go back and look at our Strategy Guide:

> Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years.

We believe that it will be impossible to consistently achieve our two primary objectives without thoughtful hedging. Since the start of 1990, the rolling three-year return for the S&P 500 has been negative more than 23% of the time. And although the annualized 10-year return has only been negative 14% of the time, it has come in below the bare minimum return required to double real purchasing power every 10 years, assuming zero inflation (7.18%), a daunting 66% of the time. This means that a single untimely decline in the market could significantly impair our chances of hitting our ambitious 10-year objective.

Data source: S&P Global Market Intelligence, author's calculations

By and large, *Pro* favors investing in companies we believe to be best-of-breed, not index ETFs. However, odds are that this will not be enough to protect our portfolio enough during the next downturn; widespread negative market sentiment often punishes the stocks of great businesses, too. Think of your favorite company during the bear markets brought about by the dot-com bubble and the global financial crisis (GFC). How did the stock perform? Odds are it took it on the chin, even if the performance of the underlying business didn't skip a beat. Among the current constituents of the S&P 500 and Nasdaq Composite, only 2% and 2.9% of them, respectively, had a positive return during the GFC bear market. And even fewer kept up with the North Star (0.6% and 1.8%, respectively). Things are a bit better if you look out three years from the market peak immediately prior to the GFC, but the odds were still stacked against you beating the North Star, with a mere 13% of the stocks in the S&P 500 and Nasdaq keeping pace.

	Peak to trough		Three years post peak	
	Postive return	Kept pace with North Star	Postive return	Kept pace with North Star
S&P 500	2.0%	0.7%	31.4%	13.5%
Nasdaq	2.9%	1.9%	25.0%	13.5%

Data sources: S&P Global Market Intelligence, author's calculations

"But JP," you might say. "Why are you so preoccupied with a recent history that just happens to include two bear markets brought about by bubbles?" To which I might reply, "Dear member, that's exactly the point." At the outset of the 21st century, no one expected two of the largest bear markets ever to hit in the following 10 years. The future is always full of surprises, and by actively hedging our portfolio, we aim to reduce the odds that negative surprises derail us from our investing objectives. Specifically, our hedges seek:

1. To protect our portfolio from a decline that would put us so far behind the pace of the North Star that our 10-year goal of doubling members' real purchasing power becomes unlikely unless we take excessive risks.
2. To provide the portfolio with an additional source of funds with which to take advantage of the eventual recovery in the markets after any meaningful decline, thereby increasing the odds we are still able to meet our rolling three-year target.

From a psychological perspective, these hedges serve as a tool to help us remain calm during a market downturn; they enable us to take positive actions to seize opportunities rather than becoming more defensive. They also serve to greatly reduce our reliance on timing market declines, a welcome benefit given that attempting to call the top in the market has historically been a foolish (lower-case "f") and costly endeavor — in terms of both explicit costs (shorting fees, option premiums) and of lost gains if the market continues to rise.

Because companies like Apple, Facebook, Visa, and MasterCard are continuously creating value for their stakeholders (and thereby justifying a higher stock price), a rising stock market often begets a rising stock market. This continuous value creation also means that "timing" a market recovery after a sizable market decline has become a much easier endeavor — over the past 18 years, the market has risen an average of 31% during the three years following a decline of at least 20%. Though the use of intelligent hedging, we aim to generate gains during market declines, then invest those profits to position the portfolio to earn even more during the subsequent recovery.

To talk about this with fellow Fools, head over to the hedging board.

Pro Guidance Changes and Completed Trades: July 31, 2017

Published Jul 31, 2017 at 11:58AM

Pro Guidance Changes from the past week:

- **Oracle** (NYSE: ORCL): Fair-value estimate increases to $48 from $46. Shares remain a Buy with a 4.1% allocation.
- **Visa** (NYSE: V): Fair-value estimate increases to $94 from $90. Shares remain a Best Buy Now with a 3.2% allocation.
- **Verisign** (NASDAQ: VRSN): Fair-value estimate increases to $90 from $87. Shares remain a Buy with a 1.7% allocation for our covered strangle.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Verisign** (NASDAQ: VRSN): Per our alert, we rolled our $90/$95 covered strangle to a $100/$105 covered strangle, expiring January 2018. We paid a $0.49 debit to roll.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: July 27, 2017

Published Jul 27, 2017 at 12:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our actively recommended stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, aim to follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Highlights this week:

- **NVR** (NYSE: NVR): Buy 2.8%.
- **Visa** (NYSE: V): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Oracle** (NYSE: ORCL): Buy up to 4.1%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy up to 4.3%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.

Pro options:

- **Verisign** (NASDAQ: VRSN): Roll your covered strangle per yesterday's alert. This morning, you need to pay a small debit to do so, but we plan to before tonight's earnings.

Hedges:

- New ones being considered.

Next month's expirations (Aug. 18):

- **Gilead Sciences** (NASDAQ: GILD): We're going through last night's earnings release and will manage our August $75 covered calls as needed, rolling higher if desired after time value dissipates, or letting them expire if possible.
- **O'Reilly Automotive** (NASDAQ: ORLY): Our protective collar remains in place -- it's just a hedge -- and we're currently on track to let our stock get sold via our $220 puts. But ever wanting to be comprehensive, we'll go through last night's earnings release to make sure this is what we want to do and will update everyone.

The Pro Portfolio Surpasses a 200% Gain

Published Jul 27, 2017 at 12:26PM

Dear *Pro* member:

We're very pleased to announce that, this morning, the *Pro* Portfolio surpassed $3 million in value for the first time. This marks a 200% return since our inception in October 2008, less than nine years ago. About 3,200 days have passed since *Pro* opened its doors, so our $2 million in gains ($1.1 million of which are unrealized) amounts to earning $625 every day. It's equivalent to about a 1.87% yield on our money per month.

We're also happy to reach this milestone with all of our current long positions showing a profit since inception; over our history, more than 75% of our closed positions have made money. Not only that, we can report that looking back even farther -- way back to the original Fool Portfolio, which ran from 1994 to 2004 -- we're the first Motley Fool portfolio since then to return at least 200%.

Now, clearly we were aided by the timing of our launch, in October 2008. But the S&P 500 did fall another 30% after that, hitting its bottom in March 2009; and given our investment approach, even at the end of 2009 we still held more than 35% in cash. What I'm saying is, we didn't pile in during the downturn. We can't credit our gains to that. We simply invested over time -- and that makes our results all the more Foolish. We didn't do anything magnificent; we didn't time things just right (at all); we didn't zero in on one stock that then created most of our returns (although **Facebook** (NASDAQ: FB) is now 8% of the portfolio). In short, we aren't stock market geniuses. Far from it. We just patiently moved our money into strong companies and held them. We invested in some losers along the way, too, as well as (thankfully by design, so far) a rather modest number of shorts and hedges.

What we're saying is, anyone can do this, and the results over your lifetime are bound to surprise you. We may not expect the stock market to continue to rise over the next five years as much as it has in the past five, but the truth is that nobody knows, and we're bound to be invested in some large winners over the next five years regardless. Plus, the S&P 500 is only up 6.9% annualized since its peak in 2007, and its valuation is still within historical averages, so despite the steady ascent we can't write these consistent gains off as an anomaly. The market is just doing what it historically does.

Now what's all the more pleasing is that compounding continues to be our friend -- in fact, a better friend all the time.

To reach a 300% total return, we now need the portfolio to grow by "just" another 33%, to $4 million. From there, we "just" need another 25% gain to $5 million to hit a 400% total return. And so forth. Ever-smaller percentage gains on our portfolio's total value are required to double our original investment dollars. But I think that no matter how many times or in how many ways you consider it, compounding is more powerful than you can fully realize. We need to be in good companies for another nine, 18, 27 years to really see how much it can do. As Warren Buffett demonstrates so well, the vast majority of an investor's wealth is compounded in the last quarter of one's investing life.

That's not to say we won't face rocky periods and big setbacks. The stock market typically falls 20% at least once every 18 months. We're overdue for that. Even with hedges and shorts ideally helping us cushion the hits, we'll still have to build from a lower base after a fall. But that's how it works: Four steps forward, one step back -- sometimes a big step. This almost certainly won't be the only time we pass 200%. We'll likely fall back below this marker many times (even today!), and it may take a long time to get past it for good. But it's worth celebrating today.

We hope veteran members have enjoyed the past eight years and nine months with us, and we thank you profoundly. We also hope to serve new members with satisfying results. We'll do our best to keep improving our investment approach, to learn from our mistakes and weaknesses, and to capitalize on our strengths and successes. We always have a mind to improve the service and our communications, too.

Thank you for being a Fool with us! As always, to chip in with any thoughts or questions, visit the Memo Musings board.

Fool on!

-- Jeff (TMFFischer) -- also writing on behalf of Ellen, Billy, J.P., and all past *Pro* analysts and editors

Roll Your Covered Strangle on Verisign

Published Jul 26, 2017 at 1:51PM

Is this for you? This recommendation is for investors already participating in our **Versign** (NASDAQ: VRSN) strategy. If you lack any position, consider the Alternative Trades at the end of this report to get on board.

How You Participate

- **Trade:** Use a multi-legged or rolling order on Verisign options to:
  - Buy to close your September 2017 $95 calls.
  - Buy to close your September 2017 $90 puts.
  - Sell to open January 2018 $105 calls.
  - Sell to open January 2018 $100 puts.
- **Allocation**: *Pro* will continue to write a covered strangle on all 500 shares we own. After completing this roll, this will represent a look-through allocation of approximately 3.4% (half in shares, and half through written put exposure).
- **Price guidance:** As we publish this, you would use a limit order and aim to roll your strangle for a net credit of at least $0.90. Prices may change, but should not change much; use a limit order, aiming complete this trade before market close July 27.

Pricing update (market close 7/26): Orders have pushed the cost to roll into debit territory, well below what we initially anticipated. Given that the primary goal of this trade was to capture additional upside by rolling up our short call strike price, we still intend to complete our trade before the close Thursday. But we ask that everyone continue to use limit orders to optimize the price to roll.

- **Prices (1:41 p.m. ET)**:
  - Stock: $101.11
  - Buy to close your September 2017 $95 calls, bid/ask: $7.55/$7.85
  - Buy to close your September $90 2017 puts, bid/ask: $0.63/$0.74
  - Sell to open January 2018 $105 calls, bid/ask: $4.20/$4.45
  - Sell to open January 2018 $100 puts, bid/ask: $5.00/$5.20
- **Note:** Earnings are due after the market closes tomorrow, July 27. We aim to roll before then to give our stock more upside breathing room... just in case.

What We're Thinking

We've been chasing Verisign, having rolled our covered strangle up and out twice this year, but the position is trying its hardest to be the one that got away. With the stock having moved up another 10.3% since our June roll, a strong earnings report later this week *could* push the price up enough that rolling up and out would be too expensive. Because we don't want to give back any of the $5.50 per share in income that we've extracted since setting up the position last December, we're opting to pre-emptively roll the position up and out to potentially capture an additional $10 in stock upside should the stock finish above $105 come expiration.

Although we're once again able to gain both income and upside with this roll, we do acknowledge that adding an additional four months to our current strangle makes two scenarios more likely: either our puts end up in-the-money, leading us to buy more shares, or we find ourselves in a situation similar to today, with the stock price making future rolls too expensive. Regarding the former: The $100 put price represents a purchase price that's 27 times our estimate for 2017 diluted EPS. Given the additional clarity we've received so far this year, we're comfortable with the prospect of picking up additional shares at this price (especially given that it excludes options income). And as for the latter, although it would be unfortunate if the strategy came to a premature end because we couldn't find an attractive rolling opportunity, it would be hard to consider the strategy anything other than a success at that point -- the options will have generated almost $6,000 in income to go along with our 32% return on the stock over 13 months.

Alternative Trades

- **New to this position?** If you can afford a potential $20,000 or so in shares (representing an initial look-through allocation of approximately 3% to 3.5%), buy 100 shares today and then "sell to open" the same January 2018 $105/$100 covered strangle described above (sell one call for every 100 shares now owned, and sell one put for every additional 100 shares you could buy). Use a limit order, you could lately collect about $9.40 per share in combined credit to write both options; you should demand a minimum of $9.30 for now.
- **Have you previously only written puts?** We suggest waiting until they expire before you consider writing new puts.
- **Have you previously only written covered calls?** You'll need to decide whether you want to put additional capital into the position to increase your potential capital gains. If so, buy back your previously written September $95 calls and sell January 2018 $100 calls for a net debit of approximately $0.90.
- **New and only want to write either covered calls or puts?** We're forgoing recommending a new sole put or call write this time around because we don't believe the risk/reward trade-off for either one is all that favorable, given the decline in the option premiums and the current stock price. (With the stock currently close to the $100 strike price, prices for out-of-the-money options in either direction are too low for our liking.)

Investing for Accuracy as Well as Growth

Published Jul 24, 2017 at 2:06PM

Dear *Pro* member:

The past six months have been a time of unusual transition in *Pro*, with more turnover than has been typical in previous years. We've been selling stocks that concern us and adding new companies, ones we believe are strongly positioned for our changing world and that should enjoy various tailwinds for the coming years.

However, conducting multiple stock transactions has its near-term downsides. It leads to higher costs, and your returns will typically stall or at least slow down as you wait for new positions to start to prove out after taking the place of older ones that typically suffered before you sold them. In this case, though, the strong stock market (and our strong positions) is helping our portfolio to a healthy 11.1% gain so far this year (as of this afternoon), and we're doing well on another measure that matters to us: accuracy.

Since we first launched in 2008, accuracy has been a key goal here at *Pro*. We define this to mean that we want at least 75% of our investments to end profitably. It's a common belief that if just more than half of your long stocks are profitable, you'll do well; Peter Lynch wrote that a 60% success rate is more than enough to "beat the market" in the long run. Our goal here is to come as close as possible to our always-positive North Star, and seeing profits on most of our long stocks is one key step toward that.

So, we're happy to report that all 25 of our current long positions have made money since inception . The strong stock market certainly helps, but plenty of stocks out there have been large losers in recent years, and we've avoided most of them (my ill-timed **American Airlines** (NASDAQ: AAL) call option trades come to mind as an unfortunate exception). We can, and should, celebrate our high accuracy, and call it out from time to time. Most investors accept having many losers as part of the process of investing, and they should -- losers are inevitable, and are great to learn from, so we strive to do so with our own mistakes. But overall, we do our best to avoid losers, period. (This is the perfect moment to note that we *expect* most of our hedges to be "losers," because they're mere insurance policies -- but we still count our accuracy goal against all our positions, including hedges, even though today we're focused on our longs.)

Not all of our 25 long positions have beaten the North Star or the S&P 500 (many don't come close), but all of them, including dividends or any options written on them, have generated a positive return now since inception (dividends aren't shown in our individual stock returns on our portfolio page, unfortunately). This accuracy is one big step in the direction of our two most important goals: earning positive returns every rolling three years, and doubling our real purchasing power every 10 years. The more we can avoid losers, the more likely we'll float close to our North Star over long periods -- as long as we also own some large winners for growth.

Now, I'm well aware that not all members have made money on all of our stocks. Far from it. Newer members are down significantly on positions such as **Gilead Sciences** (NASDAQ: GILD), and have lost on stocks we and veteran members sold for gains, such as **AmTrust Financial** (NASDAQ: AFSI). That's on us. We're working to improve our process. For instance, in limited cases, we want to keep new members from buying into certain positions at prices much higher than we paid, when merited, by erring on the side of caution. (This is reflected in our new Hold guidance definition, where we put anything on hold that we *may not* want to own the next three years.) We've seen how we can improve our guidance to serve everyone better; we're already working under that new construct, and we're looking to further improve on it.

But today's news should be reassuring to all members. Over the years, most of our closed positions have made money, and today all of our active long positions (our most important investments!) show a profit since inception. Even in a strong market, accuracy that tops 75% is something to celebrate, and something we hope to continue for you.

Thank you for being here. Please share any thoughts on the Memo Musings board, and Fool on!

Best,

-- Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: July 24, 2017

Published Jul 24, 2017 at 2:00PM

Pro Guidance Changes from the past week:

- **CurrencyShares Euro Trust** (NYSEMKT: FXE) moved to Cover.
- **Gentex** (NASDAQ: GNTX) moved to Hold.
- **O'Reilly Automotive** (NASDAQ: ORLY): Fair-value estimate decreases to $187. The stock remains on Hold/pending Sell -- the sell is pending via our long $220 puts, which expire in late August.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **CurrencyShares Euro Trust**: We covered (bought to close) our 440 short shares, paying $111.42 to do so. Our position is now closed.

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Guidance Update: Gentex Moves to Hold; Plus, What Hold Means

Published Jul 20, 2017 at 11:13AM

The Details

- **Gentex** (NASDAQ: GNTX)
- **Recent Price:** $18.58
- **Fair-Value Estimate:** $20.50
- **Allocation:** 2.8%
- **Dividend Yield:** 2.1%
- **Guidance Update:** Shares move to **Hold** from Buy.
- **Option Position:** We are keeping our written December $17.50 puts open -- effectively also on Hold.

What We're Thinking

Seeking to improve our process for members in the wake of **AmTrust Financial** (NASDAQ: AFSI) and other sells made earlier this year, this spring we rolled out new practices and definitions on some key terms (they're detailed in the Glossary at the end of the Recommendations page). One of the largest changes was the following.

For us, "Hold" *used* to mean that members who owned the shares should keep them, but new would-be buyers should wait for us to complete a review of the position, usually within 30-90 days (sometimes we wanted to see a whole quarter). The status meant a short-term pause, so to speak, before a new decision. Now, however, "Hold" means something quite different.

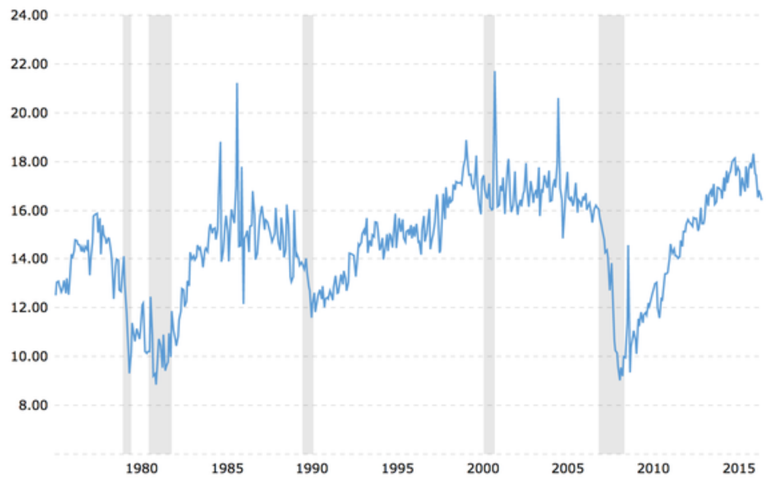
To help prevent new members from buying something that we may sell in months -- or even a few years -- "Hold" is now the label we use for any position that we're currently unsure we'll want to keep for at least the next three years. If we believe the position may be playing itself out (or if concerns are emerging for some other reason) and we're likely to exit a position within a few years, we now put it on Hold.

In doing so, we hope to prevent new members from buying something that we then end up selling too quickly for those new owners to really see results. Price changes in the short term can be random, after all. We saw members buy stocks last fall that we sold this spring, and we would like to avoid that (as much as possible) going forward.

Also, "Hold" now conveys to all members which positions we're currently considering exiting in the near future ("near" meaning less than three years). As you know, you look far ahead as you consider and manage your positions in a focused portfolio. The more transparent we can be with you about our thinking, the better. This ties into our recent decision to email you our meaningful guidance updates any day of the week (rather than sticking to a Monday-only schedule), as well.

Mirrors in the Rearview?

With Gentex, our concerns are mostly macro- and technology-based. On the macro side, auto sales have been nearing record results over the past few years (at 16.4 million annualized as of June), and although growing prosperity in emerging markets will bring still more buyers to the auto market, any slowdown in the U.S. or Europe will be keenly felt by carmakers and Gentex -- and a slowdown is almost inevitable at some point. This is nothing new; business here is cyclical. But after a long run higher, we may want to exit Gentex *before* having to ride through the next down cycle.



Auto and light-truck sales by millions. Source: Macrotrends.net.

Beyond that, we have concerns about technology making Gentex's auto-dimming mirrors appear quaint. "Heads-up technology" that puts data on car windshields, cameras, sensors, and autonomous driving all pose some eventual threat to Gentex's business. Will cars of the future be mirror-free? That sounds ludicrous today, but if you need to see behind you, why not look at a computer screen fed by a smart camera -- perhaps a screen enhanced with warnings and prompts -- rather than a simple mirror? Will Gentex develop the solutions of the future? With Tesla, Apple, Intel, Alphabet, Nvidia and so many others working on technology for cars, rethinking them from the ground up, there's a long-term risk that Gentex could be intermediated.

Beyond that, new concerns raised by a short seller have enough merit to demand more investigation; anytime we have business concerns, we need to shorten the leash, including on companies we have known and held for years.

We'll see quarterly earnings from Gentex tomorrow (Friday, July 21), before the market opens. Billy has successfully analyzed our Gentex stock for us for years, and has also generated significant income for us by writing puts on the stock. After we see earnings, we'll share our updated thoughts and let you know whether Gentex is going to remain on Hold for now, or something else.

For today, it moves to Hold. Owners can stay strapped in, as we are, but we're advising would-be newcomers to refrain from buying shares or writing puts because, at the moment, we may not want to keep our stock for at least three more years.

For any questions, please zoom over to the Gentex board. Fool on!

Pro Catch-Up Trades and Upcoming Expirations: July 20, 2017

Published Jul 20, 2017 at 10:42AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.2%.
- **NVR** (NYSE: NVR): Buy 2.6%.
- **Square** (NYSE: SQ): Buy 2.5%, per our recent recommendation.

Continue building your portfolio with our Buys, including:

- **FactSet Research** (NYSE: FDS): Buy 2%.
- **OpenText** (NASDAQ: OTEX): Buy 3.1%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- None today.

Hedges:

- New ones are being considered.

This month's expirations (July 21):

- None! Enjoy the summer heat!

Pro Guidance Changes and Completed Trades: July 17, 2017

Published Jul 17, 2017 at 3:26PM

Pro Guidance Changes from the past week:

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Shares move to Cover (meaning close the short). They were previously on Hold (as a short). We are closing our entire short position, as shared in today's alert.
- **Square** (NYSE: SQ): Shares were introduced to the service last week as a Best Buy Now, with a 2.5% allocation.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Square** (NYSE: SQ): For a 2.5% allocation, we bought 2,800 shares at $26.13 average. (Our limit price obtained 1,608 shares at $25.98 the first day we could buy, and we bought the remaining shares at $26.33 the next day.)

You can see all of our guidance, positions, returns and transactions on or from the Recommendations page.

Close Your Short of the CurrencyShares Euro Trust

Published Jul 17, 2017 at 3:26PM

Is this for you? This is for all *Pro* members who are short shares of FXE, directly or using options, and who want to close as we do.

How You Participate

- **Action:** Buy to close (cover) your position in the **CurrencyShares Euro Trust** (NYSEMKT: FXE).
- **Price Guidance:** Use a **limit order;** this is a thinly traded Trust. Today, ideally set your limit at less than $111. Later, since the price is unlikely to move much anytime soon, use a limit order at prevailing prices.
- **Allocation:** We're closing all of our 440 shares, taking our 1.7% short allocation in FXE to 0%.
- **Today's Price Range:** $110.85-$111.06
- **Guidance:** Cover
- **Fair-Value Estimate:** N/A
- **Alternative Trades:** If you're using options to short the euro, and closing those options is logical (meaning they're not about to expire, or they're not nearly worthless, etc.), then close them to exit the position to match us.

What We're Thinking

Happily, our short of the euro via this exchange-traded trust has generated a positive return over the five and a half years we've held it -- and yet the European Union is in *better* shape now than it was when we started the position. That's a win-win for us, and for the world. That said, we don't want to overstay our welcome; several factors suggest that closing our short now is a sensible move.

Jeff's son, Grey, at the Eiffel Tower.

But first, some ancient Roman history: We first recommended this puppy way back in December 2011 using a synthetic short. We later let that position turn to short shares, then added directly to the short in April 2012. When we inked our original report, the euro-to-dollar exchange rate was $1.32. Today, it's nearly $1.15, down 12.9%. On paper, our short gained 14.9%. That's more than the decline in the euro thanks to the costs of the vehicle, but our gain comes to a bit less than the decline in the euro when you add *our* costs of shorting, which started once our synthetic short turned into shares. Still, overall, this has been a rewarding result.

Back to the Euro: At its worst, the dollar-to-Euro exchange rate hit $1.05 in January this year on hopes the new U.S. administration would be a positive for the former. We were looking for parity to the euro from Day One, and we were close to it this year, but then the tide turned. Still, overall, our patience paid off. After shorting FXE in late 2011 and April 2012, we didn't see gains until 2014. Waiting longer then to see how the European Union fared seemed rational, but our current patience has not provided additional payoff as Europe has begun to stabilize, and we think the tide may now be beginning to turn still higher for the euro.

Here's a 10-year chart of the USD/Euro exchange rate.

10-year euro chart. Source: Macrotrends.net.

Several recent factors suggest continued recovery for the euro:

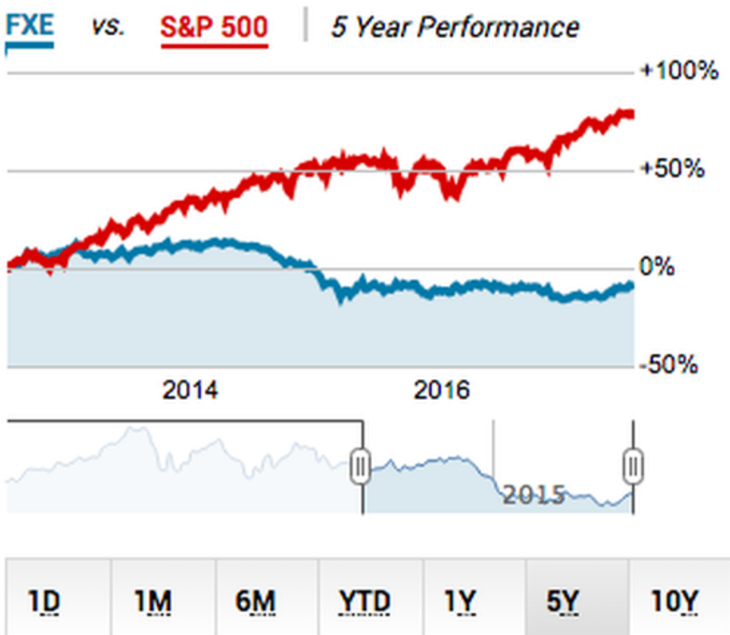
- The European Union's economy appears on pace to expand faster than the United States's this year. As measured by PMI manufacturing orders, new orders in Germany (the heart of the EU) in June outpaced U.S. orders by the widest margin since 2007, and German output prices (a measure of demand) are outpacing U.S. output prices by the widest margin since 2011. Both ramped up recently, suggesting the EU is finally headed toward decent growth, while the U.S. is now tepid.
- The European Central Bank (ECB) is tapering its stimulus now, positioning itself to begin to increase interest rates down the road -- something the markets will anticipate far ahead of time, just as they did with the dollar.
- According to Bloomberg, data shows that leveraged investment funds increased their euro positions to "net long" in June for the first time in more than three years. Whether hedged funds will be right or not, they're going bullish on the euro.
- Emmanuel Macron's presidential win in France is renewing political faith in the stability of the EU, as are some other developments. Greece recently reached an agreement with creditors to release more loans; an anti-establishment faction in Italy lost badly in local elections; and Spain's GDP is about to return to 2008 levels.
- Meanwhile, low inflation in the U.S. may slow the pace of interest-rate hikes in the land of the free, a possibility that hit U.S. bank stocks last week.

- Finally, the current U.S. administration is frustrated by U.S. trade deficits, and a weak dollar policy (whether intentional or as a result of gridlock) could be employed to improve deficits and claim a victory.

Couple all this with a euro that is still relatively depressed compared with its historical levels vs. the dollar, and our reasons to remain short are diminishing. Once, this short position had a lot of possible downside and little potential risk (that we could see), but now that situation has reversed. Our thesis has been played out for now.

How It (Once) Fit Into *Pro*

Our short of the euro served us fairly well. We earned a small gain while the S&P 500 soared over the past five years. A short of many U.S.-listed stocks or ETFs would have been a losing proposition on our strong market since 2012. Like a kid who follows the rules, the euro short caused us no such stress or strain.



S&P gains while euro loses. Fool.com.

And remember, the S&P 500 increased even as the U.S. dollar grew stronger, hitting overseas earnings at multinational U.S. companies, including many that we own. Our short of the euro helped hedge against lower overseas earnings at our companies in at least a small way. Nobody is talking about it yet (that I've seen), but now the weakening U.S. dollar should be a boost to foreign earnings at multinational companies, including all the ones we own. We welcome that.

And over the course of recent years, shorting the euro offered us a large potential return if the EU were to break up, but relatively muted risk if it didn't. That theory proved out.

As we close, we'll keep watching the euro; we could revisit the short if it appears merited. Currencies often cycle in valuation, and if the U.S. dollar just peaked in January, the euro may have years to appreciate now. If it can recover to $1.40 or higher, we may want to short it again, but that will depend on the circumstances, of course. For now, we'll get out of the way, closing our short.

Should we next *buy* shares of FXE, going long? Well, we'll at least consider it. (What do you think? Tell us on the boards!)

Pro Video Chat, July 2017

Published Jul 17, 2017 at 3:20PM

The *Pro* team will be holding **a live video chat on this page at 1 p.m. Eastern on Thursday, July 20**! We'll be using Slido to communicate with members during the chat; the specific Slido code for the event is #ProChatJuly -- you can join in by clicking here or by going to the Slido homepage and entering #ProChatJuly. We recommend opening Slido in another browser tab (or on a mobile device) so you can see both the video and the Slido questions at once. See you soon!

Pro Catch-Up Trades and Upcoming Expirations: July 13, 2017

Published Jul 13, 2017 at 12:52PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.6%.
- **Square** (NYSE: SQ): Buy 2.5%, per yesterday's recommendation.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy up to 4.5%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.
- **WisdomTree Emerging Markets SmallCap** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.3% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for about $1.10 each.
- **Gilead Sciences** (NASDAQ: GILD): Set up a covered call by selling one Aug. 18, 2017, $75 call for every 100 shares you currently own, per our recent alert. Lately, this can be done for $0.81, or a 1.1% yield in 36 days.

Hedges:

- N/A. New ones are being considered.

This month's expirations (July):

- None! Hey, we figure you're on vacation, right?

Buy Square

Published Jul 12, 2017 at 2:22PM

Is this for you? This is for all *Pro* members who are comfortable with a young, just-turning-profitable recent IPO. We have our usual long-term outlook: a minimum of three years and ideally much longer.

How You Participate

- **Action:** Buy 2.5% in **Square** (NYSE: SQ).
- **Price Guidance:** Please use a **limit order;** this is still a thinly traded stock. Today, ideally pay less than $26. Later, the stock will remain a Best Buy Now until we change that status with an update.
- **Today's Price Range:** $25.16-$26
- **Guidance:** Best Buy Now
- **Fair-Value Estimate:** $26-$34 (putting us at $30 for now)

What We're Thinking

Plenty of Foolish investing success can be achieved simply by being observant in your daily life. Whether it's seeing where lines appear for daily coffee, or spotting how many coworkers' screens are actually on Amazon.com, or noting *how* people are paying for transactions, being mindful of what's happening around you helps fuel new investment ideas, especially in the consumer arena.

Over the past few years, we've witnessed more and more businesses and individuals using Square payment products at the point of sale (POS). Our initial thoughts were that this was a crowded field, that the company lacked advantages, and that we already owned the credit-card giants, so we didn't need to buy Square. But that thinking has changed.

The field *is* crowded -- but with patchwork solutions. In contrast, Square has created a complete e-commerce ecosystem that is proving sticky. Customers are staying with it for its ease, versatility, and data analytics, all at a reasonable cost. It's also worth noting that Square may not ultimately be riding on the credit-card giants, because it *can* be agnostic on payment methods in the future.

And it's not just about moving money around. Square's related software helps a company manage its inventory, employees, payroll, deposits, gift cards, and more. Our own Billy Kipersztok is launching a pizzeria in Gainesville, Fla. (that's the *real* news behind this trade alert!), and he and his business partners went with Square after evaluating several offerings. Billy wrote:

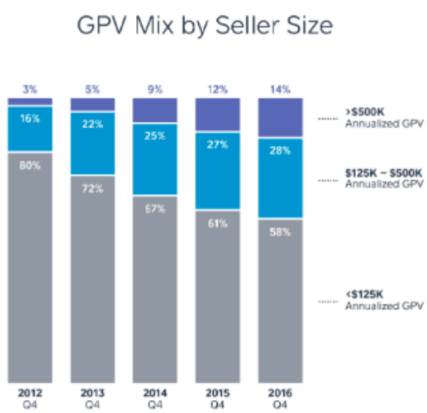
> "They are, from my research, the best and most complete solution. It is incredibly useful to have your POS, payment processing, payroll, loyalty program, and employee management all with one vendor -- with online ordering as well [Square's Caviar service]. This allows us to have one login for all of this data and information that is completely integrated, rather than having to manage several accounts across several vendors. [This also leads to] excellent data granularity and reports for business analysis ... There are many companies who do different links of this chain, but Square is the best, most clean, most professional solution I've seen. Not the cheapest, but the best."

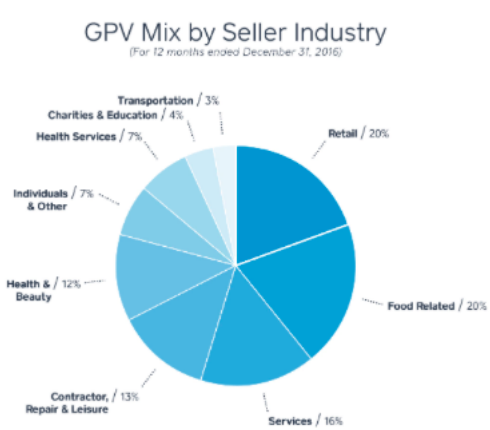
The Business

Founded in 2009 with a mission to spread economic empowerment, Square's app-based commerce ecosystem positions it to run circles around older solutions. Providing the same tools once available only to large businesses, Square is helping smaller sellers succeed -- and doing it well enough that bigger companies are going with Square, too. In a nutshell, Square provides a way for any business to accept digital payments and track and analyze the related data. Square accepts [major credit cards,](#) and its platform should adapt to new digital methods that may arise.

In the year ended Dec. 31, Square processed $49.7 billion of gross payment volume (GPV), which was generated by about 1 billion card payments from approximately 245 million payment cards. In doing so, Square earned $687 million in adjusted revenue, up 52%. Now, Square is increasingly serving larger sellers -- those generating at least $125,000 in annualized GPV. These larger sellers represented 42% of Square's total GPV in the fourth quarter of 2016, an increase from 39% a year before. Square's transaction-based revenue (or "fee") held steady at 2.93% of dollar volume even as customers grew in size. We expect this "take" to slip over time, but it should remain healthy well above 2%.

The following charts from Square's 2016 10-K SEC filing show how its customer base is growing to include more large vendors, and how Square is spread across various industries:





Source: Square 2016 10-K

Many of us have interacted with Square -- buying from a local business, signing the screen and leaving a tip, getting the receipt via email. It's simple, quick, and appealing. It's also mobile. The taxi fleets in Washington, D.C., are adding Square to all cars, for instance. And household services (i.e., plumbers, etc.) account for 16% of GPV, as customers pay the bill on the spot using Square. But while it's attractive, the mobile and countertop hardware that Square offers is not where it makes its money; equipment is offered free, or at a deep discount, to land a customer. Square profits on the subsequent transactions, and increasingly on software and services as well. Its operating system works with Apple and Android, and can be set up so quickly that a vendor can accept digital payments within minutes. Various software modules can be added at the start or later, leaving Square plenty of up-selling opportunities as a customer expands.

Beyond transactions and software, Square offers Square Cash, which individuals can use to send money between themselves free of charge or to pay a business (in which case the latter pays the normal Square fee). And Square Capital, through a partnership with an FDIC industrial bank, makes loans to businesses based on the business's payment processing history with Square. With the use of its data, Square can fund businesses with loans, and better manage the risk of default. From May 2014 through December 2016, Square made 200,000 loans worth $1.3 billion. Finally, as mentioned by Billy above, Caviar is a Square service (a website and app) that makes it easy for restaurants to offer food delivery. Square collects a fee each time. This ancillary business serves Square's sizable customer base that operates in the restaurant industry.

Financials

Square is investing in growth. It won't provide its customer count beyond saying "millions," but that's likely very the low millions, with the opportunity far surpassing its current size. The company remains U.S.-centric, but it's so far launched in Canada, Japan, Australia, and the UK, with more new markets likely. Given its newness, you might expect it to be losing a lot of money today, but Square turned profitable on a pro forma basis last quarter, and increased pro forma profits are expected in coming quarters. Full-year positive GAAP earnings should finally emerge in 2019. Square benefits from about half of its new vendors arriving thanks to word of mouth rather than marketing efforts.

Within a few years, the company should be showing the power of its recurring revenue business, with healthy margins and returns on investment. The brand, market share, market opportunity, and likely profitability should make today's valuation reasonable. We are looking several years ahead and seek to remain invested as long as the financials appear on the right long-term trajectory. To help propel it, Square enjoys $545 million in net cash as of April 30, and earned $56.5 million in positive free cash flow the past 12 months.

Over the longer term, assuming profits increase and its competitive moat holds, Square should be able to maintain a premium valuation multiple in line with those of other payment leaders including **PayPal** (NASDAQ: PYPL) and **Visa** (NYSE: V). The stock trades at about 25 times expected earnings (an educated, but reasonable, guess) for 2020. That's not cheap. But it's also not uncommon for this type of business, let alone one set to grow as much as Square.

Risks

Founder and CEO Jack Dorsey is also CEO of **Twitter** (NYSE: TWTR). We don't like that his attention is divided (especially if he spends much time surfing Twitter itself!), but many successful CEOs are busy in similar ways, whether on corporate boards (or corporate yachts) or overseeing a few companies (or even just multiple divisions in one truly giant company). The competitive risks are many, so we need to be as sure as possible that Square continues to offer a compelling solution with advantages that make it unwise for customers to switch. We face the risk of changing forms of payment or even payment methods (including crypto-currency), and we're already keeping abreast of those amazing developments. Regulations are also a risk for the whole industry. *Pro* already has exposure to **MasterCard** (NYSE: MA) and Visa, so there is overlap here, for sure. Additionally, Square rewards employees with stock, so share dilution will continue.

How It Fits Into *Pro*

We always have a desire to populate *Pro* with more high-quality growth companies -- leading businesses that are strongly expanding revenue and free cash flow. These "next-generation" companies should ultimately boost our returns even more than our investments in large, established giants. We want to invest in powerful long-term trends with branded and profitable leaders, and Square is poised to become that in the digital-payment space. We have significant exposure to the sector called "financial/technology" already, but there's a reason for that, and each investment therein serves a purpose.

Consumer spending still drives 70% of the U.S. economy, and though the retail space (outside Amazon.com and a few others) has been a train wreck, we nonetheless want to invest in the consumer in various ways. MasterCard, Visa, and Amazon are our largest, most obvious investments in consumer spending. But at $135 billion, $220 billion, and $478 billion in market value, respectively, they're not small companies. At $10 billion in market value, we're hoping that Square is another way to invest in consumers -- in commerce in general -- with a company that could grow considerably over the next five to 10 years.

Guidance Update: Paycom's Fair-Value Estimate Increases

Published Jul 11, 2017 at 12:16PM

The Details

- **Paycom Software** (NYSE: PAYC)
- **Recent Price:** $68
- **Fair-Value Estimate:** Increases 9.6% to $57.
- **Guidance:** Despite the premium valuation, the stock remains a Buy at a current 3.1% allocation.
- **Alternative Position:** If you lack shares and want to target a lower potential buy price, consider "selling to open" August or November 2017 $65 or lower puts. Sell one put for every 100 shares you could buy.

What We're Thinking

Paycom runs the payroll and provides human capital management (HCM) software for about 18,000 companies and their more than 2.7 million employees. It offers a complete human resources cloud-based software solution "from hire to retire," covering everything from benefits administration to compliance to expense management. Since the stock was recommended here in November, it's up 61%, running well ahead of expectations.

The quarter that ended in April was the first time the company surpassed $100 million in quarterly revenue (with $119.5 million), increasing sales 39% year-over-year. What's better, those aren't sales it will enjoy just once. A full 99% of revenue was recurring in nature, and that recurring revenue is growing. Once a company signs with Paycom, it's not only likely to stay, it's also likely to give it more business.

While Paycom's sweet spot has always been businesses with between 50 and 2,000 employees, its software does scale well beyond that without meaningful additional costs. Last quarter, Paycom signed a workforce solution company with more than 6,500 employees, and a hospitality company with more than 6,700. As the company swims upstream to larger clients, already high profit margins could trend even higher, and its long-term picture gets still brighter.

All clients must sign up for Paycom's payroll service to get started; after that, they have the option to seamlessly add more than two dozen other human resources-related software modules at any time. Most clients end up using at least half of the available modules, padding Paycom's revenue with each one. And there's plenty of room to grow; Paycom sees its annualized revenue-per-client-employee opportunity at about $400 (as of 2014 – it purposely hasn't updated this since then), but today it earns closer to just $120 annually for each client employee.

Paycom is also gradually opening new sales offices around the country (each one takes time to ramp up), meaning the business has plenty of room to grow organically, geographically, and by increasing its sales to existing clients.

And Wall Street is catching on to the favorable attributes of Paycom's business model, sending shares higher. A founder-run business started in 1998 that had its IPO in 2014, Paycom is still young, and its $4 billion market value is dwarfed by its industry's total size. As long as Paycom continues to take market share and sign on young companies, someday it might be as well-known as a current industry leader, **Paychex** (NASDAQ: PAYX).

Our investment made in November is up 61% so far, well ahead of what we hoped for. Of course, our outlook focuses on the next five years (or longer!), and members should be aware that there's a chance the stock could give back some ground, or go nowhere, for a good while. This is another case (of many) in which we want to own a business for the long term, so we're willing to wait through some potential fallow periods in hopes of higher returns later.

Plus, if we sold now to capture this short-term gain, we might miss any good chance to get back in later -- and after short-term taxes, it'd be tough to come out ahead either way. As well, software leaders can maintain premium prices for years – just look at **Salesforce** (NYSE: CRM). So, as long as we still believe in Paycom's business and the stock's potential, we'll stay in it, as our Foolish investing principles dictate. We have a 3.1% allocation, and the stock remains a Buy as part of our long-term portfolio strategy.

To discuss it anytime, just visit the Paycom board. Fool on!

Pro Guidance Changes and Completed Trades: July 10, 2017

Published Jul 10, 2017 at 3:32PM

- *Pro* Guidance Changes from the past week:
- **O'Reilly Automotive** (NASDAQ: ORLY): The stock moves to Sell from a previous Hold. We still have our protective collar, though, so please read today's update for context.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **Gilead Sciences** (NASDAQ: GILD): We sold to open nine August 2017 $75 calls, covering all of our shares, being paid $1.29 each.

You can see all of our guidance, positions, and transactions from the Recommendations page.

O'Reilly Automotive: A Sell in Process

Published Jul 10, 2017 at 3:32PM

Is This for You? Yes, if you own O'Reilly Automotive with us. If you have a protective collar, you don't need to do anything; just wait. If you own shares, please be aware that we're waiting to sell ours via our puts at expiration. Since our shares are as good as sold (completely hedged out), those without options should consider selling, too; read on for details.

How You Participate

- **Stock: O'Reilly Automotive** (NASDAQ: ORLY)
- **Recent Price:** $172.74
- **Action:** Those with the protective collar don't need to do anything, just wait; those with only shares should be aware that we're positioned for our shares to be sold in August.
- **Allocation:** 3% -- on track to be sold to 0% by Aug. 18 via $220 puts we own.
- **Scorecard Status:** Moving from "Hold and Protect" to "Hold Pending Sell" because of our put options -- read more below.
- **Fair-Value Estimate:** Roughly $150-$200. The present fog makes things too uncertain for us to publish a more meaningful number; we do know lower same-store sales will hit margins, affecting cash flow, and may change store opening plans. But more important to us now are the changing competitive landscape and expected long-term headwinds.

Foolish Summary: As long as O'Reilly Automotive shares remain below the $220 strike price of the August puts we own (at $172, they're lately 22% lower), we plan to let our shares be sold at expiration on Aug. 18 for $220 apiece. Accepting the long-term gain on our shares in this way is more tax-efficient than the alternative, selling our shares directly and also selling to close the $220 puts, which lately have a nearly 900% short-term gain. By letting the puts be exercised, we avoid the short-term tax bill on the options, booking all of our gains in the long-term stock position instead. We bought at $99, which makes this about a 124% long-term gain in just over four years. For members who joined much later and haven't done well with this position, please read on.

If you have options on O'Reilly with us: Right now, we plan to do nothing and let our shares be sold at $220 via our puts at expiration Aug. 18.

If you just own the stock: We're ready to sell come Aug. 18, and right now we're not inclined to keep our stock, despite its lower price, so Sell is the logical guidance. That said, please be aware that given the negativity of investor sentiment right now, the stock *could* fall enough in the next five weeks to lead us to revise our plan, instead "selling to close" our puts (to capture our gain) and keeping the stock to wait for a recovery. If that happened, we'd have to tell members who previously sold that the stock was returning to Buy. But that's OK. At any rate, it's more likely that we won't change our stance, and we will simply let our shares get sold on Aug. 18.

If the situation changes, we'll update you, and you can adjust!

Scorecard Status: If everyone used options and owned puts, we would just keep the stock at "Hold and Protect," and wait and let it play out. But some members only own shares. Given that, we’re moving the stock to Sell (for them) on the assumption that’s what we’re going to do. This is the most logical step when trying to address both audiences, so the stock is moving to Sell (from Hold and Protect), even though members with options don't need to sell right now -- but should instead use the puts to sell at expiration. It can be costly to call and exercise options early, and we have no pressing reason to do so.

What We're Thinking

Investors have quickly grown leery of auto-parts retailers. The bogeyman named **Amazon.com** (NASDAQ: AMZN) showed its face to the industry early this year, and O'Reilly investors grew increasingly skittish as business the following six months proved tepid -- same-store sales are up just 1.3% against 3% to 5% guidance. Though Amazon isn't making a difference to the business yet, investors are fleeing the company and its competitors. Down the road, a backdrop of more electric cars with fewer parts and more autonomous cars causing fewer accidents doesn't help. All of these concerns are taking a toll on sentiment even as the business has been stable so far in 2017 – sales are even up this year. In most cases, we'd likely view this negative sentiment as an opportunity.

The market looks far ahead with retail, though, and it doesn't seem to like what it sees. One reason *Pro* bought Amazon.com early this year was because online shopping is becoming the *first impulse* habit of more and more consumers. This is a shift: By default, older generations always used to think of running to a store first to buy something. But younger generations look online first, and then only run to a physical store if they need to. For a growing number of shoppers, the Internet is the first place to shop.

O'Reilly believes it's insulated from this risk by the fact that people often don't know which auto part they need; this, plus assistance with installation, often necessitates a physical visit. But if companies (and I mean Amazon, but others, too) are serious about selling auto parts online, artificial intelligence should make it ever easier to discover which part is necessary, order it, and tell you how to install it -- all online. Even before the same-store sales disappointment, members and Fool analysts alike were discussing the long-term outlook for O'Reilly, and how soon distant risks could emerge. It's unfortunate timing that external short-term factors (including weather) hit the business while we considered the long-term risks on our thesis.

Lately, O'Reilly trades at about 15.7 times trailing earnings and 9.2 times EBITDA, both below market averages for a company that has performed far above average for years. The last few quarters may be a short-term anomaly, and the stock may recover nicely if a coming quarter or two are stronger, but odds don't favor the old days returning anytime soon. Even before the stock started to fall, we were considering whether it still belonged in *Pro* for the long haul.

How It Fits Into *Pro* (or Moves On)

As we've shared before, this is a transitional year in *Pro*. We're selling many positions in many cases because we see the competitive landscape changing and headwinds forming. As we replace positions in which we lack faith, we're buying new ones that should have long-term tailwinds. Turnover has costs, and assuming we're right, it will take some time to see most of the benefits.

Because it's a retailer, we wanted to give O'Reilly a short leash no matter what -- to be prepared to sell if we saw challenges forming for the business. Even if the stock price were much higher today, we'd very likely be writing this report and exiting the position because of the long-term challenges likely ahead. It just happens that the stock declined on other factors first. That's unfortunate, especially for new owners, but it's on us now to look ahead and make decisions that should benefit us in future years.

As we position ourselves for the next five and 10 years, it's hard to imagine sentiment turning markedly positive for auto parts retailers -- barring, perhaps, a big surprise jump in same-store sales. Employment, which feeds miles driven, which drives these auto parts businesses, may be about as strong as it can get. The drumbeat of electric cars, autonomous vehicles, and vehicle sharing will continue to get louder. And online sales giants who are willing to cut margins to the bone are a growing threat. At the very least, it's fair to say that the competitive landscape is changing, consumer habits are changing, and perhaps the parts industry itself is going to change as cars evolve.

This all led us to the question of whether O'Reilly still fit into our portfolio, and we set up our protective collar to prepare to potentially sell it. The business itself looks to be facing too many headwinds to fit well with our focused portfolio. If at some point it became incredibly cheap (a cigar-butt value stock), we might want to consider it for a shorter-term value investment. We still believe in management. But right now, the sell price we set up is favorable, and the stock isn't cheap enough for us to merit keeping it in light of the risks.

In Summary

Assuming Gentex remains below $220 (it may not), our protective collar will sell our shares for us at $220 by Aug. 18 if we take no action. That's currently our plan. Since we anticipate a sale, the most accurate guidance for us to give to those without options is also Sell (though it's a pending sell). We doubt this guidance will change, so members should feel free to sell now or as we do next month; but if the guidance does change, we'll alert everyone, of course. We're trying to serve different investors using different tools, so please forgive the awkwardness of that! This situation does show how much more flexibility options can provide.

Questions? We may not be very skilled under the hood, but please visit the O'Reilly board to ask anything germane to this investment.

Our North Star to Guide Us

Published Jul 6, 2017 at 2:41PM

Dear *Pro* Members:

We hope your summer is off to a Foolish start, one dappled with sunshine and glimmering water, time with family and friends, perhaps travel to exotic places, and some new stock investments, too.

Here in *Pro*, we aim to combine all those things into one successful outcome. Over the next few months, we'll be judging how this summer has turned out, and we'll rate our stocks compared with years past ("How are our businesses doing?") and on the returns we find in the years ahead. As we do, we'll be taking stock of the things we do differently here in *Pro* -- one of which is our North Star.

The North Star

In 2011, we introduced the North Star to *Pro* members as a way to guide our investment and portfolio decisions. Our North Star metric consists of the broadest U.S. measure of inflation (the CPI-U), calculated monthly by the federal government, plus 7% per year, added mostly in increments.

Since 1971, this measure has grown by more than 11% annualized, topping the S&P 500's total return index by more than one percentage point per year. This tells you that inflation has roughly averaged 4% per year.

What are we driving at with the North Star? The ideal is that we will at least double your "real" (read: after inflation) purchasing power every 10 years. That's no small feat; historically, it would mean topping the return generated by the S&P 500 with all dividends reinvested. That venerable index tops most investors handily even with dividends excluded.

Guiding Light for Positive Returns

It's important to remind you that the North Star is not a benchmark – it's a guiding light. Having it at the forefront of our minds should help us make decisions that we hope will lead to strong investment returns even as we have less than 100% market exposure (which means lower risk). Lately, we're about 82% exposed to the market. Sometimes, that exposure will go much lower.

A second part of our goal is to achieve positive returns every rolling three years. That goal, plus the pace of our North Star, plus our desire to double your real purchasing power every 10 years, all serve to remind us of our aim to avoid the worst of the market's declines. We can't afford a 40% drop and still hope to meet our three-year goal, for example.

We're not market timers, but by managing our exposure (through all means available: cash, options, hedges and shorts), we hope to be able to decline less than the market when the market declines.

The S&P 500 is not our benchmark, and our North Star reminds us not to chase the market with abandon when it goes up and up, because we have to be set up more defensively than average when the market turns south. Anyone who laments their returns not going up as much as the market when it rises (whenever that happens) should remember that they're less than 100% invested, and they should benefit with a smaller drop when the market declines.

Driving Returns

The next part of our equation for compounding returns demands that we buy good companies. We believe we have done this. Of course, not all of our stocks will always go up -- some will fall out of favor in the marketplace, and others will falter -- but historically we have bought companies that reliably increase their income and free cash flow. Historically, the vast majority of our stocks have grown in value. We hope to improve upon that going forward, fine-tuning our selection process, and getting better at the rare sell decision, too. We can always improve.

And we always want to, because your market exposure and hedging tools mean little if you're not putting the bulk of your money into strong businesses that deliver long-term results.

Keeping Returns

Last month, our North Star passed a milestone: It is up 101% since *Pro's* 2008 inception, less than nine years ago. Up 185%, the *Pro* port has passed the North Star so far (as well as the S&P 500, incidentally), but our gains are vulnerable in the short term to the market's whims, while the North Star's total return will never be lower than it is today. The North Star will keep going up (barring greater than 7% deflation). That's the rigid taskmaster we strive to emulate. We want to keep growing your value in the market over time, and we want to protect what we have achieved so far the best we can, because the North Star will keep growing in that way.

This is what we're working toward as we make our portfolio decisions and share them with you. Today's little missive serves as a reminder to old-timers here, and may even be new to those who've joined us more recently, and I hope you enjoyed this pause for reflection on our overall investing mission.

Thank you for being here. We hope you enjoy the summer evening! Fool on!

-- Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: July 6, 2017

Published Jul 6, 2017 at 2:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.3%.
- **NVR** (NYSE: NVR): Buy 2.6%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.4%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.3%.
- **Oracle** (NYSE: ORCL): 4.1%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 4.1% (and don't write calls on it if you're new to it).
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.
- **Verisign** (NASDAQ: VRSN): Buy 1.6% and then look to set up a covered strangle.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.4% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for about $0.75 each.
- **Gilead Sciences** (NASDAQ: GILD): Set up a covered call by selling one August $75 call for every 100 shares you currently own, per our recent alert. Lately this can be done for $0.85, or a 1.2% yield in 1.5 months.
- **Verisign**: We rolled our June strangle out and up to a September $90/$95 strangle earlier this month. Those who own at least 100 unencumbered shares can look set up this short option strangle for a credit of approximately $4.40. Those lacking the position who can buy at least 200 shares (100 now and potentially 100 later) with it all being a 3% or smaller allocation, lately will pay around $93.50 for the first 100 shares, and can simultaneously write the covered strangle, leading to a net debit of approximately $89.10 per share.

Pro Catch-Up Trades and Upcoming Expirations: June 29, 2017

Published Jun 29, 2017 at 12:50PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.2%.
- **NVR** (NYSE: NVR): Buy 2.6%.
- **Visa** (NYSE: V): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.4%.
- **Apple** (NASDAQ: AAPL): Buy 4.5%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.3%.
- **MasterCard** (NYSE: MA): Buy 5.1%.
- **Starbucks** (NASDAQ: SBUX)**:** Buy 3.3%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.
- **Verisign** (NASDAQ: VRSN): Buy 1.6% and then look to set up a covered strangle.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.4% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for about $0.85 each.
- **Gilead Sciences** (NASDAQ: GILD): Set up a covered call by selling one August $75 call for every 100 shares you currently own, per our recent alert. Lately this can be done for $1.29, or a 1.8% yield in 1.6 months.
- **Verisign**: We rolled our June strangle out and up to a September $90/$95 strangle earlier this month. Those who own at least 100 unencumbered shares can look set up this position for a credit of approximately $4.30.

Write Covered Calls on Gilead Sciences

Published Jun 26, 2017 at 1:09PM

Is this for you? This is for *Pro* members who own at least 100 shares of Gilead Sciences, and who wouldn't mind capping upside in return for near-term income. Those who own less than 100 shares can sell the shares now (since we're accepting that we might lose our shares with this position), or wait to see whether we sell at $75 through our covered calls (if we do, we'll move the stock to Sell on our scorecard).

How You Participate

- **Action:** Sell to open August 2017 $75 calls on **Gilead Sciences** (NASDAQ: GILD).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover all 900 shares we own, representing 2.2% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but use a **limit order** to split the option's current bid/ask spread. When we quoted it, that was around $1.35. Later, aim for about a 1% yield (option premium/current price of the stock) per month to expiration.
- **Guidance:** The stock remains a Hold; newcomers are advised to stay out, given that we're accepting a possible sale of our shares. Our fair-value estimate remains at $80, and assumptions are based on revenue stabilizing, which it may not yet.
- **Prices** (12:30 p.m.):
  - Gilead: $71.33
  - August 2017 calls (bid/ask): $1.34/$1.36
  - $1.35 pays 1.9% ($1.35/$71.33) in 54 days. Don't accept much less.

What We're Thinking

Since the June 16 expiration of our previous covered calls on Gilead Sciences, the stock price has increased by 11% to more than $71 per share; the **iShares Nasdaq Biotechnology** index (NYSEMKT: IBB) has rallied 8.8% over the same time frame . We're taking this opportunity to reinitiate our covered call position at a higher strike, bumping up from the $70 strike in June to $75 in August with this alert. We continue to wait to see what unfolds with Gilead's revenue trajectory, while cushioning our risk and targeting income at the same time with our covered calls.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: If the stock price rises above our strike price by expiration, we may let our shares get sold, or roll our calls to a later date. We'll see closer to expiration.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions, please visit the Gilead board.

Pro Video Chat, June 2017

Published Jun 26, 2017 at 9:48AM

The *Pro* team will be holding **a live video chat on this page at 3 p.m. Eastern on Monday, June 26**! We'll be using Slido to communicate with members during the chat; click here to learn more about how that works. The specific Slido code for the event is #ProChatJune -- you can join in by clicking here or by going to the Slido homepage and entering #ProChatJune. See you soon!

Transcript

Ellen: Hello, Pro Fools. Welcome to our June live chat. I am Ellen Bowman. I'm the editor and publisher of Pro and this is JP Bennett. He is the JP-est analyst we have. Are you -

JP: The JP-est analyst. I like that.

Ellen: I blanked on if you're a research analyst or I don't remember what your formal title is.

JP: I'm still employed. [crosstalk 00:00:20] For all intents and purposes, I am still employed at the moment.

Ellen: JP is an employed analyst at The Motley Fool. Then we have Billy Kipersztok on Skype. Say hello, Billy.

Billy: Hello, Ellen.

Ellen: Hello! Billy is a senior analyst. We do not have Jeff Fischer with us today because Jeff Fischer is in France enjoying a much deserved vacation. He may be watching. We can't get him to quit us, no matter how hard we try. He might be tuning in, but we do not have him with us in the studio today.

Billy: Jeff, if you're listening, write us a question.

Ellen: Yes. Communicate to us in a secret code. If you would like to join in, which we hope that you do, please use Slido to do so. You're going to want to go to Slido dot com and enter the code ProChatJune, all one word, ProChatJune. There's also a link above this video player on the page that you're watching it. That is where you can enter and vote on questions and then we will answer the ones that get the most votes. We'll just go through the hour doing that and proceed.

Let's look at the first one we got is from Bruce. It says, "Are you suggesting," so we sent a Gilead trade alert as part of our Monday memo, "Are you suggesting that we sell Gilead at 75 dollars? The recommendation seems to suggest that with less than 100 shares, one should exit the position now."

Billy: Bruce, I think we are not explicitly recommending that you sell. I think more the intent of the alert was to provide a choice. For those of you who have less than 100 shares, you have two Options. You have one which is to just sell the shares now because if you remember with a covered call, essentially it's a contract agreeing to sell the shares at a specified price. We're basically agreeing to sell the shares already by writing these calls.

That's one choice. You can sell the shares now or the second choice is wait and see whether the stock price rises above 75 and Pro ends up selling its shares and if and when Pro does that, you can sell alongside us.

The two choices depend upon how much risk you want to take on or whatnot. If you're more conservative and you're fearing downside, you might sell now or if you would like to have Gilead appreciate more or you're looking more for some upside, you might wait and see if we end up selling at 75, but we're not specifically recommending that you sell now. It's just you have a choice to either sell now or wait and see if we sell and sell alongside us.

Ellen: Cool. The next one is from Lon. Hello, Lon. I hope you're having a lovely summer.

Lon says that since Jeff and others are fans of chocolate, he wishes us a Happy Chocolate Pudding Day. That is extremely kind. Thank you.

JP: Thank you, Lon. I love pudding.

Ellen: Yes. We will enjoy Chocolate Pudding Day. Johnny Loves Beaches says, "Greetings to Pro and welcome back to Jeff." He's not back yet. I'm sorry, Johnny Loves Beaches. You'll have to put up with us. "I would love to know your thoughts on O'Reilly since it's been around the 220 range at the bottom of our collar." Thank you, so we will ask JP I think to channel Jeff.

JP: Yep, I will tackle this one. I think there was another question on O'Reilly. Yeah, Bruce asked one down and I'm just going to loop both of those in together and so to start, with respect to O'Reilly, yes it is down near the bottom half of our collar.

If you kind of take a step back and you look at why we set this up, it was go back a couple of months. O'Reilly was struggling versus the market and then The New York Post put out the article about, "Oh man, Amazon's going to get into this industry and it's going to be really competitive," and then people start chattering about autonomic striving maybe coming a little bit quicker than some people had anticipated. Those longterm threats are starting to weigh on this stock.

We looked at those and we're like, "All right, those are serious threats, but in terms of impacting O'Reilly's business, that's more of a longterm plan." That's going to take a couple years to really start to play out, even if autonomic striving does kind of take hold at a much quicker rate than people were originally anticipating.

In the interim, O'Reilly is still a pretty awesome business so the returns on invested capital they're going to be able to generate in that short to medium term would necessitate us, or suggest that we should keep it in the portfolio because the stock had been getting hit, and so the valuation in terms of the returns for the business that they should be able to generate would make sense to keep O'Reilly around and see if that's what played out.

That was our original thinking, but then as time went on, we had more news about retail and Carl Icahn getting into this base and all of these other factors starting to weigh on the stock. When we saw those things, we kind of had to take a step back and say, "All right, this is a big development because this could essentially be the bridge that kind of provides the negative headwinds in the short and medium term and gets us to the longterm." If that is what's going to play out, then O'Reilly is going to be troubled for now to the point where we get to those longterm risks.

Because of that, we still want to give management some credit because they've been able to navigate some issues in the past. We don't want to just be a little bit quick to jump the gun and get rid of the stock when there is still potential there. By setting up a collar, we can essentially give ourselves this time where we can let things shake out, see if it really was just a tax issue, if it was a timing issue with regards to weather being bad when they wanted to be good and being good when they wanted it to be bad, but if we progress through the year and it looks like those aren't just temporary factors and these other bigger issues are starting to take hold of the business, then we have the exit that we were looking for and we're not going to just ride this one all the way back down.

If you go down to the other question in terms of, "I don't have 100 shares of O'Reilly. Should you sell at these levels or hold since you can't participate in our Options trade?" I think it kind of gets back to what I said in terms of our original thesis for O'Reilly. We love having businesses that we can essentially buy and hold forever, right? That's the thing that a lot of longterm investors like to anchor their process around.

However, there are very few businesses that are buy and hold forever businesses. O'Reilly was one of those 15 years ago. Is it one of those today? I don't really think so and so it was more of at this point, we want to have it for the next couple of years, but we understand that there are longterm threats that would probably necessitate us exiting the position sooner rather than later. It was more an issue of timing when we wanted to get out of the position once we saw these longterm threats develop.

If you look at the collar, maybe if prices enable us to roll it down at a very attractive rate, we'll consider doing so, but for all intents and purposes, when we set it up, it was, "If it pushes through the lower half, we're just going to probably let these shares go. If it pushes above the sold calls, then we may look to roll." If you think about it in that kind of frame of mind, if you aren't optimistic about the longterm prospects for the business and you think there are immediate or near-term headwinds and you're really looking for businesses to own that you really think you can own for the next 10 years, it may be a position that if you're looking for cash, that you want to exit.

We are still kind of wait and see mode. We want management to show us that it was temporary issues. There isn't a fundamental shift. You look at something like Brick and Mortar Retail and Clothing and things like that, The Buckle, a position that we had in the past that we had to get out of because there was essentially a fundamental change taking place within the industry and management was, if we're being perfectly frank, doing a horrible job at reacting to it.

There's this fine line where you want a management team to stick to what they're really good at and focus on that and not go down too many different avenues and divert their attention and lose focus, but at the same time, you need them to be cognizant of how the landscape is changing and what role they need to play in order to remain relevant.

Right now, you hear management. They want to stick to their guns. They want to stick to what they do best and they think they still have this potential to continue to compound value at a great rate for the foreseeable future, but we've heard that story countless times before in other industries where that wasn't the case. We're very much in show me mode.

Ellen: That was an excellent answer.

JP: Mm-hmm (affirmative). I'm doing my best to channel Jeff today.

Ellen: Well you did wonderfully. All right, Bruce and Johnny Loves Beaches, I hope that that was a good answer for you because I found it extremely enlightening. [Dabcha 2 00:09:00] says, "NVR has crept up a bit. It's still recommended today in the memo. Any more to elaborate on what confidence we have on the home building sector?"

JP: This one is for me too. NVR is very much a case of if you look at Pro and how it's constructed, we want businesses that zig when others zag. We don't want everything that just goes up and all gets crushed at the same time. If you look at it in that context, we want businesses where we're really optimistic about the next three to five years that they're just going to absolutely crush it, assuming the overall economy and the markets hold up.

NVR is one where the industry tailwinds are more of a longterm play and so it is one where we have a lot of confidence in the five to ten year time span. You want those businesses. You don't want to be overly focused on a near-term objective of having positive returns every rolling through year period and lose focus on our number one goal, our longterm goal, which is the double wheel purchasing power every ten years. You need to have those businesses that you have a strong conviction in over ten years of going to really compound value at an amazing rate and be those winners because although accuracy is one of our top priorities in Pro just because of how Pro is structured and our overall objectives, we are also cognizant of the fact that in many cases, you're going to have a couple positions that just really crush it. The impact they're going to have on the portfolio as a whole is going to be outsized.

I would say you look at something coherent, like an NVR. Those are businesses where if you look at the next ten years, we're really confident in that. If you go back why with respect to NVR, I would say jokingly, "The threat of disruption from Amazon is very little as of right now." [crosstalk 00:10:55]

Ellen: You say that now.

JP: Yeah, as of right now, right? It seems like every business is under threat from Amazon right now, but it is a business where the industry as a whole is extremely fragmented and the benefits from becoming a large national player don't really accrue to those big players like they would in other industries. It's very much about local market knowledge and having that decentralized operation and being one of the biggest players. You can get local economies upscale, right? If you're the biggest player in a small market, you can get huge advantages over your competitors, but if you're the biggest player globally, there aren't as many advantages as you might think if you're much bigger than the smaller players.

It's a really fragmented market, but within that, NVR focuses on like I said, being a really big player in smaller markets. It means if there are tailwinds in the industry, they're probably going to do better than most. If you look at NVR, they have a great track record of sticking to what they do and being the best of the best. That is being an asset-lite home builder that generates insane returns on their invested capital over the full market cycle.

When you think about what delivers returns for stocks, it's not just growth. They have to create value. The businesses themselves have to generate value.

Ellen: Sure, you say that.

JP: I know, depending on who you are in the market cycle, an investor sentiment, right? Over the full market cycle, stocks that go up, it's because they're creating value. NVR does an amazing job in doing that and just kind of sticking to their guns. If you look at ... We believe that, perhaps not as much as some other people in terms of the millennials causing this next huge wave of positive momentum for the home building market, but we think the setup and the overall dynamics in terms of people living longer, staying in their homes longer, the average age that people are staying in their homes is around seven or eight years, which is the highest that it's been on record since some people started tracking that.

In terms of the used inventory coming on the market, there's not a ton of supply that is getting ready to flood the market. Since the bottom home builders haven't been super eager to build new homes, so in terms of supply from new homes and existing homes, there isn't a huge overload of supply that is set to hit the market. In terms of demand, like I said with respect to millennials and a lot of people that were really hurt from the financial crisis, they are kind of getting ready to start to get back into home building because ... Or into buying homes because what do we know from surveys? You might think that because the younger generations favor experiences, they don't want to own a home, but most surveys have found that their desire to home is actually quite high and it's more in line with their grandparents. They, in many cases, think of homes as part of that experience. They want a good home and a good community that's close to shops and close to coffee shops and things like that so they can build a family and have all these experiences.

NVR, it's not just that, it's also where they are in terms of being in mature markets that aren't going to go through as crazy of a boom and bust cycle that you might see in hotter markets out West and things like that. They're in this really great setup in terms of their locations and to benefit from those tailwinds. Our conviction in the next ten years is still very high.

I'm also apparently channeling Jim Gillies today because my answers are extremely long-winded.

Ellen: That's okay. It's like with editing, right? I will let you talk as long as you are saying useful saying useful things, not that I can control whether you talk or not, but -

JP: With respect to whether or not it's useful, I'm not always convinced there.

Ellen: This [rec 00:14:45] was interesting to me anyway, just because since they are such a big home builder here.

JP: Yeah.

Ellen: We're in Northern Virginia. I think everybody who's watching us knows that and they are huge right around here. What you said about boom and bust was interesting because this is one of the parts of the country that's not going to ... I hesitate to say anything about the government, but it's probably still going to be located here for the foreseeable future and so this is an interesting market compared to some out West, like you said in Florida or some of the other places that could be a little bit more peak and valley.

JP: Yeah, and a little bit more insight into kind of how NVR ultimately ended up in the Pro portfolio, so I've owned it personally for a lot longer than it's been in here. It was for the longest time one of my favorite compounders, a business that I really believed over the next ten years is going to do great things, but I had always questioned whether or not it was a good fit for Pro because it is the industry ... At the end of the day, it's a cyclical industry. There's going to be peaks. There's going to be valleys.

For the longest time, I didn't really feel confident in that, but then as you look at what we've done with Pro in terms of continuing to trim the positions we don't have high confidence in and positions that we really thing are going to be like the Johnson & Johnson's, like the Verisign's that are going to really be kind of these steadying positions even if the market over the next year or so is a little bit troubled.

As the portfolio kind of shifted, we felt like we had a little bit more liberty to go with these businesses that may, if we get a little bit unlucky in terms of timing. When we buy NVR, we still have really strong conviction over the next ten years because I think history doesn't always repeat itself, but it is worth mentioning that if you bought NVR right at the peak of the stock, right before the housing cycle went bust and the markets just got crushed.

You would think that because it's a home builder, you would have done horribly, but it's like not only did NVR from that point to today actually meet our North Star guidelines or beat the North Star, it crushed the SMP by 150 percent or something along those lines. It's a great business. It's a really strong management team that has been with the business for a really long time and at least for right now, they are not in The Buckle or O'Reilly position where their industry is undergoing a fundamental shift. They can continue to do what they do really well and hopefully the stock returns will follow.

Ellen: Excellent. There is a question here from Anonymous that I could like to tackle real quick because it is mine to tackle.

"What is going on with Interactive Brokers? Don't understand the rec. Was it supposed to be published in Options and put out under Pro by accident?" Yes, Anonymous. That is exactly what happened and I apologize. We had a recommendation for Interactive Brokers, or sorry, IPR in Options last week and it was published there. Then today, when we sent the Monday memo, it accidentally got swept up into that email. It should not be accessible on the Pro site. If you click that link, it should give you a 404. There should be no way to see that information anymore or act on it. We deleted it as soon as we found out.

If you can access it, please let me know. I'm EBowman at Fool dot com or you can post on the boards and I will track down any traces of it and delete them because that is Options advice, not Pro advice and you should not have seen it. I apologize for the error. Still not entirely sure what happened, but I will track it down and discipline the hamster in question as soon as I found out which hamster it was. I apologize.

There's one that went missing that I have to find. In the meantime, we've got a question from Ron. "American Tower, October 20th, 125-dollar calls are in the money. TDA called to warn me. What's the plan, or Pro's position on the risk of X dividend and potential loss of my shares?"

Billy: All right, Ron so Pro has 120-dollar calls. I see that you have 125-dollar calls, which means that you're actually in a better position than Pro is as far as not being assigned on those calls when the dividend comes.

Let's see. I'm looking at option quotes right now for the October 125's that you have. It looks like you have ... As I click through. Looks like you have about two dollars or more of time value and the dividend is not that much. I'm not sure exactly what it is. American Tower raises their dividend every quarter and I can't remember exactly what the dividend amount is, but it's definitely not two dollars. It looks like you're not really at risk of getting poached out of your position and you should be fine, but as we get closer to October maybe at the next dividend date, if American Tower continues to rise and it's still well in the money and we're now closer to October and there's another dividend, then you might want to start paying attention, but for this round of dividends, it seems like you are okay.

Ellen: Cool, and I found the missing question is also from Lon. "Curious about recent thoughts regarding FXE," which is the currency shares Eurotrust. This has been asked about on the board. "I'm among those with a bear put spread."

Billy: Jeff is doing research right now on the Euro in France, so when he returns, he should have some thoughts.

Ellen: I do not know if that is a euphemism for drinking wine or not.

Billy: Ask Jeff. I don't know.

Ellen: All right, so do you have more to say on that question or are we going to leave it for Jeff when he returns?

Billy: Yeah Lon, I don't follow the short. I don't have much to offer on it. I don't have much to say about the Euro or really the management of that position. It's more kind of a Jeff position. JP, I don't know if you have anything to say there, but no for me, I don't.

Ellen: Okay.

JP: Yeah, it's Jeff's position.

Ellen: It's Jeff's baby, okay.

JP: We'll have more soon.

Ellen: Sorry, Lon. When he comes back from his research, we will share.

"Any good recommendations for visiting Paris?" I've never been. Anybody else?

JP: Nope. [crosstalk 00:20:45]

Billy: Haven't been either. We'll have to ask Jeff on the next chat.

Ellen: This chat without Jeff is maybe not quite the chat it is with Jeff. Billy, please address AMT issued for people with the 120. Sounds like we just sort of did that, but do you want to ...?

Billy: Kind of yeah. Let's do this a little more thorough. I'm going to look up American Tower's dividend so I know exactly how much it is.

Ellen: Okay.

Billy: American Tower's dividend with the X dividend date ... Let's see. The next dividend is going to be in the 60-cent range, probably a little more than 64. The last X dividend date was the 15th of June so that's already passed. It looks like our next X dividend date may be some time in September, so that one we might need to be more careful for, but anyway if the dividend is in the 60-cent range and right now we're looking at the October 120 calls, which is the position that Pro has. The bid ask on the 120-dollar calls is 14 dollars and 10 cents at the midpoint. That means the break even is 134 dollars and 10 cents. The stock is trading at about 132.50, so we are still over a dollar, a dollar-60 cents, dollar-50 cents away from that call being in danger of being assigned because of that dividend.

The 120-dollar calls look fine right now, but there's no upcoming dividend anyway, not until September I believe.

Ellen: Cool. "For those of us who own IYR in lieu of shoring SRS," I do not know off the top of my head what IYR is and I apologize, "How does that play with NVR [inaudible 00:22:27]?"

Billy: IYR is the rate index.

Ellen: Yeah! Okay.

Billy: US rate index.

Ellen: If you own that, then you also own our home builder.

Billy: JP, I don't know what you have to say, but I would say that in many cases, they're not ... Rates and real estate can run the gambit between commercial and residential and a lot of other things in between. NVR is more residential and so IYR gives the exposure to more real estate activities outside of the residential arena. That would be my answer. What do you think, JP?

JP: Yeah, I don't know what IYR is made up of so I would be a little bit hesitant in answering with respect to that. I would say though that NVR, it's not just an industry play, right? It's an industry and business play in that we think they are a best of breed operator. We like those two combinations enough to want to just focus on one single stock, instead of just going with an industry ETF or something along those lines.

Ellen: Okay. There's a question and an answer here from [Hett Creek 00:23:36] and Lon. Hi, Hett Creek, about the weekly calendars from [Mucey 00:23:39] and in a banner that covers up the X dividend dates. I will look into the thread that you mentioned. I'm not going to address this here because I think that it would be confusing to do so via this format, but I will look at the thread that is mentioned and get back to you both on what, if anything, I can do about it.

Dennis says the answers are too long and repeating information. I apologize, Dennis, noted.

Billy: Sorry, Dennis.

Ellen: Yes. Dabcha 2, "Oracle got a nice bump. Sounds like because of its cloud exploits, just like you said. Are you partying yourself on the back? Any commentary, considering?"

JP: Where is Jeff when we need him?

Ellen: I know, right? Jeff is not patting himself on the back. I can tell you that much, that he doesn't know how.

Billy: When we say ... Sorry, getting a little feedback here. When we say it got a little bump, it looks like we are talking about recently the stock price increased from about 45 or so just a few days ago, just six days ago, and now we're up around 51.

I don't have too much to say about that because it's Jeff's position and he covers that stock for us. He doesn't tend to pat himself on the back that much, so I don't think that he would be doing that, but he probably has some commentary to talk about that when he returns. Oracle, we've been waiting for a long time for that stock to really start to appreciate. The transition to the cloud has been long and slow. The revenue affiliated with that transition is delayed and into the future, so it looks like maybe we're starting to see that really pick up, which would be great for our Oracle position because as we talked about it for a couple years now, we've been kind of waiting for that to gain traction. Maybe this is a sign that it is and I'm curious to hear Jeff's thoughts.

Ellen: Cool. Jim, hi Jim! "Thoughts on ..." It could be anyone. It could be one of our colleagues. "Thoughts on Starbucks? I said of a January 18, 60-dollar of a synthetic long in December, 2015 for no cost. If I don't exercise the call, when should I be looking to roll out, 2020 leaps?"

JP: Yep, Jim did a great job of answering his question because that's exactly what I was going to go for. Just wait until those new leaps come out and then that's probably when I would look to roll.

Ellen: Jim is a self-contained question and answer package, excellent. Do you want to elaborate on that, or has he pretty much covered everything you would?

JP: I think he kind of understand why you would want to do it in terms of maximizing the amount of time that you have with your new synthetic long and so it's pretty much just a matter of getting the most bang for your buck and just waiting.

Ellen: Then we will stop it there to show that we have heard Dennis. We are listening to Dennis. Dabcha 2 again says, "Verisk is going nowhere. Are we still hopeful for some movement upon a federal infrastructure bill? Are there any thoughts of trimming or moving out of the position?"

JP: Yeah, it's one where it is very much a position that is just probably going to muddle along until it kind of wakes up. The sleeping giant finally wakes up. If you look at something like Apple where it seemed like, "Oh man, everybody hates Apple. The business is just struggling," and then you finally get that shift in sentiment once things start to look up. What's really going on with Verisk is the energy market in terms of Wood Mackenzie, their acquisition.

It's holding up better than some might thing, given just how hard the energy industry got hit as a whole, but until that business wakes up, you're really not going to see Verisk take off. There's also some issues with regards to cat bond pricing and things in the insurance business that made it so the acceleration that they were expecting as you worked through last year never really materialized, but it is very much a case of you look at Verisk pre-Wood Mac, the growth rates look a lot more impressive and then people maybe just looking at the numbers, they see Verisk post-Wood Mac just because it was such a big acquisition.

The fact that Wood Mac kind of pulled all of the growth rates down makes it so it looks like the business isn't doing as good and so people are probably a little bit more hesitant to buy the stock or be fans of the stock, but that is very much a position where once Wood Mac kind of wakes up and the energy industry kind of starts to normalize in terms of spending, the business should be off to the races.

We're just kind of, for better or worse, we're having to stick around for that because we think that is going to be a large upside for the stock. We had considered covering it in the past, but the Options just, they don't pay halfway decent. It's not something that ... The reward that we get for writing cover calls is is worth the risk of potentially losing shares, should the business take off a little bit sooner than we expect.

It is one where as of right now, we're not considering trimming it or cutting it. We're actually, in the past we've considered adding to it a little bit because it is a business that we still have high conviction in, but for right now, it is kind of just a wait and see, so cap spending, it does have to normalize. Eventually, if people don't return to spending as far as energy and things like that are concerned, then we won't have enough energy reserves and things like that. It has to return. It's just everybody's kind of holding their wallets close to their vest right now and it will potentially be that way for the next year or two.

Ellen: Okay. "Any comments," says Anonymous, "On the Pro shorts?" Sorry, Len. I skipped you. We'll do yours next.

My comment on Shake Shack is that they have one at The Washington Nationals ballpark and it is delicious. That will not help you investing, I apologize. Y'all take it from here.

JP: You want me to go first, or you want me to jump on, Billy?

Billy: Let's see. I'll provide my limited thoughts here. The Pro shorts, I mean we're not talking about very many right now because we've culled our portfolio a little bit over time. We've got, as Ellen mentioned, Shake Shack. We've got our Go Pro synthetic short, which so far is going pretty well and we plan to maintain that and see how far that business can or may fall.

Then we've got the Euro short, which we talked about a little bit. That's kind of Jeff's territory. The financial short we continue to like. That's more really of a long than short. We're shorting a short. We're basically long financials there and you can kind of see that in the rest of our portfolio. We have a lot of financial exposure, MasterCard, VISA, et cetera, Broadridge and then SRS, which is on hold.

Shorts are something that we continue to try to get more of and we would like to have more short exposure so that it can offset some more long exposure and it makes it easier for us to find stocks that we like without feeling that we're adding too much risk to our portfolio by taking on too much long exposure, but at the same time it's very difficult to find shorts and it's a significant time sync and in many cases, the positions are very small. It's hard to find a good return on the time investment it takes to find really good shorts that you're confident about.

That's my thoughts on our shorts. What do you have to say, JP?

JP: Yep. I would say you could almost lump these two questions here together because what I think you'll see going forward in Pro is that now that we feel a lot more confident about our long book. We've trimmed some positions. We've added some new positions that we really like and so that kind of frees up time to kind of work on these other two, the hedging and the shorting.

With respect to shorting, I think the first rule of shorting in my opinion is try to do no harm. You don't want to short a bunch of stuff just so you're shorting it and you want to reduce your long exposure. If that is the case, it's probably far more effective from a risk management perspective to just have a lower long exposure, instead of shorting a bunch of companies just to have a short book.

The second thing is that shorting in many ways, one of the keys to it, is idea velocity because you don't want to bet the house on one or two positions because if you look at something like a home capital group, that was a favorite short for a lot of short sellers and it did get really hard. Then Buffet came in and kind of back stocked the company and the stock just went on a tear higher.

There is definitely a lot of, especially in this market, there's a lot of that idiosyncratic risk that you want to not have a large exposure to with just one or two really big shorts. You want to kind of spread your bets. In order for that to be effective, you need to have that idea velocity where you're constantly moving through a bunch of positions and putting them on when they make sense and taking them off once you've had a return because the best you can do on a short is double your money, but in most cases that's not going to happen and if the catalyst you foresee plays out, you're in most cases happy with maybe a 20, 25 percent positive return for you as the short seller.

Because you're going to be going through a lot of the positions, you have to have idea velocity. You have to be able to spend a lot of time on shorting. It's really hard to do that when you're also focusing on your long book because you're not 100 percent satisfied with where you are with your long positions. Now that we've kind of got the long book in a much better place than it was say six, twelve months ago, it will hopefully free up some time to move more towards focusing on shorting and hedging in the future.

Ellen: Cool.

JP: Just to kind of tackle, like I said, Len's QQQ trade. He said that it's up since they set it up. Would it be worthwhile to roll up for credit? The pros and cons of doing so, so we have in the past rolled it up periodically if the QQQ continues to rise and we kind of end up really far out of the money.

It is something that we will definitely be considering. The one thing to keep in mind though, when you're dealing with a hedge that's kind of long dated like that, there is definitely a risk to being a little bit early to the party in terms of if you roll it up and you put it really close and then the market starts to fall. The risk in terms of bear markets, it tends to be that the way the market declines, you end up in a position, ideally with the ratio spread is we can close it out right and buy leaps loan. Essentially, we can generate some money on the spread and use that to generate additional profits by harvesting those gains and buying leaps for when the market ultimately recovers because that's kind of what the markets do. They fall, but then businesses create value and the market recovers.

If you end up in a position where you roll up and you're super tight to the QQQ after it's gone on a huge gain and that's a lot closer to the top. The QQQ starts to struggle and it starts to fall and we end up in more than just one of those 10 percent down, hit the bid, the stock market quickly recovers and it goes down. It goes down 15, 20 percent and it's this continued slide and maybe we're down to 30. It's an actual bear market.

Then we're in a position where you might not be able to close that spread for a profit. It has the potential to become a liability and so that's just not ideal. With respect to rolling the QQQ, it's not always a case of, "All right, it's now X percent out of the money. We need to roll up." There are other things to consider and so that's why there's no hard rule of thumb for when or why we're going to roll the QQQ.

Ellen: Right. It's not like, "It's hit this threshold, we need this much money."

JP: Exactly. It's on the table, but we don't have anything to say right now. I think our approach to hedging as a bit of a teaser, it could actually change a little bit in the future as we attempt to kind of iterate and continue to get better at it.

Ellen: Okay, cool. Are you teasing a potential Monday memo or commentary coming in the future, or is this more like ...?

JP: If we do it, there will definitely be commentary along with it to kind of give a deeper background into why we're doing it and what we hope to accomplish.

Ellen: That's cool. I'm not only the president of The Hair Club for Men. I'm also a client. Half of my savings are in the Pro portfolio as well as the editor and so I love when they get into deeper explanations of hedging and shorting in particular because I'm still learning about that stuff and I really want to know why we do it because I am also following along.

All right, Anonymous wants to know, "When will the new Starbucks leaps become available?" I think I could Google that, but you could probably Google it faster.

JP: I probably could. Go ahead and Google it because I don't know offhand. I think [crosstalk 00:36:38] ...

Ellen: Billy, can you?

JP: I think the cycle is ...

Billy: I'm going to Google it as well.

Ellen: Okay.

JP: It's like September, October, November when the cycles start to become available. I can't tell you offhand which one Starbucks falls into.

Billy: I will figure it out and let you guys know. [crosstalk 00:36:49]

Ellen: Okay, Billy's working on it while we move on here.

Chris says, "Is O'Reilly still a hold? Has anything changed now that Amazon is going after Whole Foods in groceries? Does an Amazon a threat on O'Reilly alleviate a bit with the new ...?" Okay, so I think what she's saying is, or he, with O'Reilly ... Or with Amazon going after Whole Foods in groceries, does that mean that the threat pulls back a little bit on O'Reilly -

JP: Because they're distracted by Whole Foods, yeah.

Ellen: [crosstalk 00:37:15] Because they're, yeah, they've got this big thing too.

JP: I would say O'Reilly probably hopes that that's the case.

Ellen: O'Reilly would feel good about that, yeah.

JP: Yeah, but I don't necessarily think it is. I think in many cases with respect to the auto parts industry, the balls are already rolling in terms of what Amazon hopes to accomplish there. They probably already have the people that they need deployed working on those relationships, working on those contracts and things like that.

It probably isn't going to. Maybe you get a month or two or something like that, but I don't think that they only have a limited number of resources where they're going to pull everybody from that move and go over and work on Whole Foods. Amazon is definitely going after any industry where there are profits that they think they can steal and are big enough to actually warrant them going there. I think the auto parts business is definitely one that is in their cross hairs just because if you look at the returns that O'Reilly has been able to generate, not just O'Reilly, the other big players in the industry too, those are dollar signs in Amazon's eyes and they probably look at those profits and are like, "Man, this is a multi-billion dollar industry and the returns that these guys are generating are very juicy. Let me get a cut of that action."

Ellen: Yes. Would you like your prime serpentine belt now, or later?

JP: Yeah.

Ellen: Exactly, all right. Billy, anything on the leaps?

Billy: I do, yeah. Starbucks is in cycle one and cycle one 2020 leaps list on September 11th, 2017.

Ellen: Very nice. Thank you. Anonymous asks, "I did not receive the Monday memo. How was it delivered via email? I didn't see it on the site."

The Monday memo has undergone a recent change. There are details about it on the site. I will find them so that I can point you to them directly, but basically we will be sending you a roundup of news every Monday, the same way that we always have, but it is not necessarily going to contain a piece of commentary called the Monday memo. In some cases, if we have more actionable content than that, we will send you that instead, which is what we did today. We sent a trade alert that was Gilead

Sciences and this was where previously ... Billy would have been assigned this week's memo, so he would've been writing a piece of commentary, we'll say, for publication this afternoon.

Instead today, he turned his attention to the Gilead Sciences trade, which was more actionable, hopefully more valuable to members, and more important to get in front of you in a timely way. That sort of took the place of the main content that would've been sent to you in the Monday memo and went out as our Monday publication.

We will still be publishing commentaries and our thoughts and when JP writes his magnum opus about hedging and all that stuff, it might not be on Monday. We will publish it and send it to you when it is ready and when it is the most timely. This change was affected so that we can send you ... It's across the full change, but I think for Pro and Options in particular, it was really important because we found that we were getting some non-timely content that was getting in the way of our trade alerts and our stuff that we really needed to get in your hands as quickly as possible.

I know for Options last Friday and then again today in Pro, we were able to send actual ticker-based real stuff that he needed to act on, instead of being hemmed in by deadlines for stuff that could have gone, maybe any time.

Perhaps this answer is too long as well, but basically the Monday memo will still exist, commentaries will still exist, and you will still get a weekly roundup from us, but you may not see a Monday memo in terms of a long sort of a think piece on a Monday afternoon. You might see a trade alert for example in the place where you would have found that before.

This Monday memo would have hit your inbox as Trade Alert Gilead Sciences Plus Weekly Roundup was the subject line. Hopefully that will help you find it and the explanation for how all of this went down, if you go to the Pro site and you look under Alerts and Coverage, scroll down a little bit and I will ... We'll go onto the next question and then I'll jump in when I have found the right explanation for this, rather than make you sit through this.

All right, Chris says, "Is Skyworks short put at 100 dollars a Pro position or Options position?"

JP: It's an Options position. We have a covered strangle on Skyworks, but the May 26th put right is over in Options.

Ellen: Okay, so we will tackle that in an Options chat.

Anonymous says, "But has Jeff been talking about selling Oracle?" Not from France, at least not that I know of. You guys know?

JP: Is that inside information?

Ellen: Yeah, it is, but you know.

Billy: In my memory, or at least from what I remember, there hasn't been much talk about selling Oracle. I'm not sure exactly to what you're referencing. We've been a little bit kind of muted on Oracle, definitely not listing it as one of our buy first's or being really excited about its growth prospects, but I don't remember Jeff talking about selling it.

Ellen: Cool.

Billy: Do you, JP? Am I wrong?

JP: Offhand, I can't remember. I don't believe so.

Billy: Right, yeah.

Ellen: Anonymous says, "Is Amazon too expensive to consider a synthetic long, similar to what we have on Facebook?"

Billy: I would say unless you're really wealthy, then probably because ... It's 1,000-dollar stock and every synthetic long exposes you to 100 shares so we're looking at, what? 10,000, no 100,000.

Ellen: That's a lot of zeroes.

Billy: Yeah, lot of zeroes is my point. It may very likely be, most likely is too expensive, yes.

Ellen: If it's not, congratulations. Enjoy your synthetic long. "Any thoughts about the shake short?" We kind of touched on that earlier with the roundup of shorts. Are there any specific thoughts about that one in particular?

JP: I would say that that is one that you could probably expect to have an update on, in terms of just being one of the first stocks in general of having an update on once Jeff gets back because it is one that we were discussing prior to him leaving and he's dropped in a couple bullet points while he's been away.

Ellen: Mm-hmm (affirmative). We can't get him to go on vacation, not for real.

The Monday memo that explained the changes to the Monday memo was from June 5th, 2017. If you go to the Pro site and then Alerts and Coverage, scroll down. You will find it. It is called We Won't Miss AmTrust, which is retrospect is a pretty cold headline, Plus Content Changes Afoot so that will explain what we're doing with the memo and why you saw what you saw today.

All right, next is from Global Rhino. "You mentioned changing hedge strategies in future. Should new folks still set up QQQ ratio put spread, or wait?"

JP: I would say ... I don't often know pricing right now, but with respect to just the changing strategies and whether you should wait or not, it's not something where it's going to be a giant change. It's right around the corner so you should just kind of wait and see. It may just be more of an iterative change and in that case, if you want to follow along with Pro while we've already got the spread set up, or the ratio spread set up, and so we're going to have to kind of potentially change that, but from my vantage point as of right now, it looks like that would probably be something that ties into how we iterate and try and improve on our hedging strategy.

It's not like it's going to go away. Even if for some reason, we do decide we have to change that, move it up, move it out, do something with that, you're still going to be aligned with us. It would all depend on pricing and my internet connection is not cooperating right now. I can't tell ... I can't talk about pricing.

Ellen: Okay, no worries, but I think what you're saying is that ... At least I think the way that Jeff has always said to sort of approach our portfolio and what you see on that page is match us as best you can because wherever we go from here, you're going to want to come there from where we are.

JP: Mm-hmm (affirmative).

Ellen: I would assume that new folks are encouraged to set that up as much as old folks have been, as much as anything that's not on hold is ... With the caveat that JP can't look at pricing and so he's not confirming or denying that.

JP: Yep.

Ellen: Fool NSD says, "Will Monday memo's priority be lowered so it doesn't delay recs and other more important, timely matters?" Yeah, basically although ... Priority lowered is probably not what the corporate office wants me to say, but yes. It will definitely be moved so that the more timely stuff that pricing could affect for example will get out faster and so that these guys have time to spend on the stuff that will affect returns before they have to turn their attention to stuff that does not affect returns.

Ideally, it'll make everybody more efficient and it'll make Pro's returns even better and just generally make the portfolio function a little better. I know Jeff in particular has talked about a couple of opportunities that have passed him by because he's needed to write more commentary-based stuff. I don't want anyone to feel like they're going to miss out on any insights that would otherwise have been shared. You might just get them on like, Wednesday instead of Monday if there was something more important going on Monday that we had to get in your hands first.

JP: I would also quickly note too, one of the things I'm most excited about, kind of the change in the content strategy is that it frees us up in terms of potentially creating ... I don't want to say denser, but kind of more meaty educational content. It's not something that we just have to crank out every week, so it's like, "All right, I want to take two weeks instead of just doing a quick hit this week and a quick hit next week." I'm going to spend the time that I would be writing those two pieces to write one more in depth educational piece that kind of delves into a topic related to Pro that we didn't have time to talk about in the past.

Ellen: Yeah, and it speaks to a conversation that's been going on on our boards, especially with some longtime members who are asking, "Where's the educational component of Pro to people who aren't new here?" If I've been here for five years and I really know the basics, what do you have for me to really iterate on and become even more of an expert?

I think the structure will give us, as JP said, more of a chance to do a little bit more in-depth, less rote construction of that stuff. I know there's topics that we've wanted to address, in some cases for months that we have been on the treadmill and have not been able to tackle that now we can. I think ... I know the team is really excited about it. I hope that the member experience is good. If it is not good, I am the person that you tell about that. I am EBowman at Fool dot com and I will listen to you. I will also listen to you on the boards. Keep me posted on how it goes and I promise to listen and provide feedback, if possible.

JP: A perfect example of that would be if the hedging strategy does iterate and we change it a little bit, you'll get content where it'll be maybe, "Here's a quick hit up top, if you just want to kind of follow along and get a couple bullet points of why we're doing this. Here you go," but if you really want to go down the rabbit hole so to speak and really understand, "Here's what we're thinking, here's how this works, here's why we're doing it, here you go. Here's all of it," we'll lay it all out for you.

Ellen: Yeah, and we've had the time and been able to take the care and the pains to really give you a good, solid product here. Yeah, I'm excited, but I'm a dork. That's why I edit this product so hopefully it will be as exciting for the people who read this product as it is for me.

The only ... We have a question here from somebody who's getting a certificate error when connecting. I cannot help you. I hope that that has passed. I do not know what to tell you and I am sorry, Anonymous.

Only one other question from another Anonymous. "Why does the trade alert for Pro also list the recent Motley Fool option strangle on Interactive Brokers?" That was an error. The article has been deleted. The link should go nowhere. You should not follow that advice because that advice should not exist and should not take you anywhere. Options is the only service, that I edit anyway, that has a position on Interactive Brokers and that inclusion in the Pro email was a mistake. I apologize. I'm still figuring out exactly what happened to make that appear, but when I find out, if there's anything I can yell at, I will yell at it until I am sure that it does not happen again.

Then okay, we have one more from another Anonymous. "If our Pro positions are in a 401K," yeah, "That only allows covered calls, do you recommend we hold additional positions in a cash trading account for things like collars?"

Billy: That would be helpful. I know lots of members who do that and I think that's a good idea. You have one account that's an IRA that you can use to your tax advantage and then another account that is a taxable account and instead of thinking of them as two accounts, you think of them as just one big combined account, but you execute the specific strategies in each account that is appropriate for either an IRA or a taxable account.

Ellen: Cool. Lon says, "Hi, JP. Nice to see no hat today. There is hair." There's always hair.

JP: There is always hair. It's just whether or not I style it, yes.

Ellen: You allow the members to see it, yeah.

JP: Something along those lines.

Ellen: I'm sorry. I hope I didn't give anything away. There's always hair. There just always is.

All right. Any more comments on JP's hair, feel free to submit them through Slido and if not, we can wrap this up a little bit early I think. This is the first chat in a long time where we have not had extra questions at the end.

JP: Jeff's not here. [crosstalk 00:50:54]

Ellen: Jeff's not here.

Billy: I think yeah, it's because of Jeff. That's right. We're not as popular, but rightfully so I think.

Ellen: Yeah, rightfully so. I am not ... A Jeff Fischer and you can tell that. The camera knows that. Everybody knows that.

All right, I am however Ellen Bowman. I'm the editor and publisher of Options. You can tell me anything you thought about this chat or the things you learned within it on the boards at Pro, or you can email me EBowman at Fool dot com and I would love to hear your feedback. I will listen to it and I will do what I can to change things that you don't like.

This is JP Bennett. He is our most JP analyst here at Motley Fool Pro.

JP: Something along those lines.

Ellen: Yeah! Billy Kipersztok is our senior analyst. He's on Skype.

Billy: Bye, Ellen.

Ellen: Bye! Jeff Fischer, sorry ... JP's right here. Jeff Fischer is in France right now and could not be with us and so that is why this chat is ending a little bit early today. Miss Anne in the video booth, can you give me a thumbs up? All right. Miss Anne's going to be able to end it early.

Thank you all for joining us very much. We will see you again next month, been a pleasure chatting with you. Take care! [crosstalk 00:51:56]

JP: Bye!

Billy: Thanks fools! Fool on!

Ellen: Fool on!

Pro Catch-Up Trades and Upcoming Expirations: June 22, 2017

Published Jun 22, 2017 at 12:35PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.4%.
- **NVR** (NYSE: NVR): Buy 2.6%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.5%.
- **Apple** (NASDAQ: AAPL): Buy 4.5%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.3%.
- **MasterCard** (NYSE: MA): Buy 5.1%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 4.2%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for about $0.90 each.
- **O'Reilly Automotive** (NASDAQ: ORLY): Earlier this month we set up a protective collar by selling August 2017 $250 calls and buying August 2017 $220 puts. Our puts are now at the money, making this collar no long attractive for newcomers. Instead look to set up a $210/$230 protective collar by purchasing one August $210 put and simultaneously selling one August $230 call for every 100 shares you own. As of this morning this collar could be set up for approximately a $0.65 credit; however, please note that this collar will behave differently than our $230/$250 collar and may result in you needing to take a different action than *Pro* come expiration should you decide to set up this protective collar.
- **Verisign** (NASDAQ: VRSN): We rolled our June strangle out and up to a September $90/$95 strangle last week in order to prevent our shares from being called away. Those who own at least 100 unencumbered shares can look set up this position for a credit of approximately $4.50 or so.

Hedges:

- N/A

This month's expirations (June):

- **Gilead Sciences** (NASDAQ: GILD): Our June $70 covered call expired as income last week. We'll be looking to write new calls soon -- assuming new calls pay enough at strikes we're comfortable using.
- **Verisign**: We rolled our strangle last week in order to keep shares and generate additional income.

Our Fellow Fools Look Back on American Tower

Published Jun 19, 2017 at 2:33PM

Dear Pro *members: Our Foolish associates at* Motley Fool Explorer *take a fresh look at a trend or theme among David Gardner's growth-stock recommendations, then study a set of those companies to single out one top idea each month. They ask a simple question:* ***Which company offers the best market-beating opportunity over the next three years?*** *They then invest The Motley Fool's money in the winning stocks and keep track of what happens. We thought you might be interested in their recent look back at three years of American Tower. -- The* Pro *team*

We've now reached the three-year mark of our fifth Exploration, which means it's time to retire the fifth stock from our Explorer scorecard. In May 2014, we went searching for lower-risk companies, and liked the solid footing that **American Tower** (NYSE: AMT) was based on.

We believed the world's smartphone data consumption was going nowhere but up, which led us to believe that American Tower — which builds cellular towers and then leases operations to mobile phone carriers — would also dial up quite a bit more business. Mobile device adoption was increasing, and the carriers had no interest in paying the heavy capital costs of building the towers themselves. We expected this would provide for a solid business that simultaneously offered both stability and long-term upside.

Explorer Looks Back: American Tower	
AMT Total Return	56%
S&P 500 Total Return	35%
Return vs S&P	21%

Total returns are from 5/27/14 to 5/27/17 and include dividends.

Let's take a closer look at what's happened during the three years we've had American Tower on our scorecard.

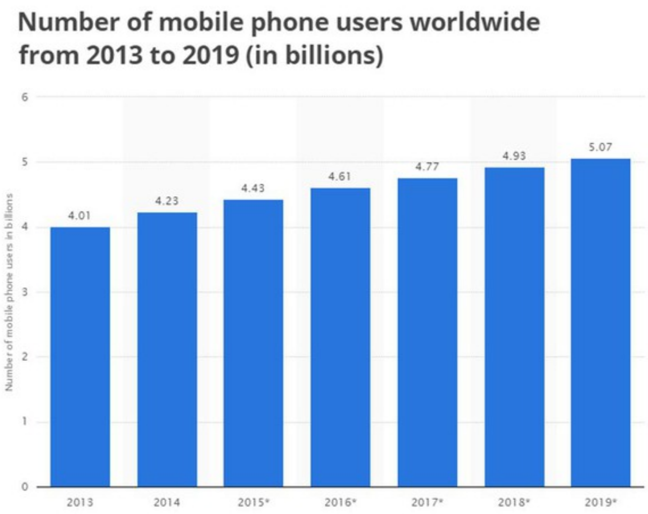
Looking Back at American Tower

Between mobile payments, GPS navigation, and Pokemon Go, the world's population has a growing number of reasons to buy a cellphone.

- **Expanding the Network**

The number of mobile phone users has increased nearly 20% during the past three years, and a shift to smartphones is driving up data usage. The trend is so pronounced that Cisco recently predicted global mobile data traffic would grow at an incredible 53% each year through 2020.

The increasing penetration of smartphones and the increasing data demand have been very good for American Tower's business.



Source: Statista

Capitalizing on the macro demand, American Tower generates revenue by charging non-cancelable leases to the cellphone carriers (like **AT&T** (NYSE: T) and **Verizon** (NYSE: VZ)). These contracts run for a decade or more, and have annual price escalators built directly into them.

These long-term leases and the huge capital costs of building cell towers serve as barriers to entry against smaller potential competitors. Three companies -- American Tower, **Crown Castle** (NYSE: CCI), and **SBC Communications** (NASDAQ: SBAC) — account for the majority of the industry's profits, and each has provided an excellent return for investors during the past decade.

American Tower has had no problem expanding both its top and bottom line. Revenue is still increasing by 25% annually, while adjusted EBITDA and adjusted funds from operations (metrics which serve as a proxy for the cash coming into the business) are both rising at 20%.

- **Shareholder-Friendly Moves**

With its cell towers gushing cash, American Tower's management made some shareholder-friendly moves to amplify its investment returns.

The company converted to become a Real Estate Investment Trust in late 2011. This move reduced the corporation's income tax burden in exchange for paying out 90% of operating profits as quarterly dividends. The steadily rising profit stream has resulted in a steadily rising dividend: The company's quarterly distribution has increased in every single quarter of the past three years.

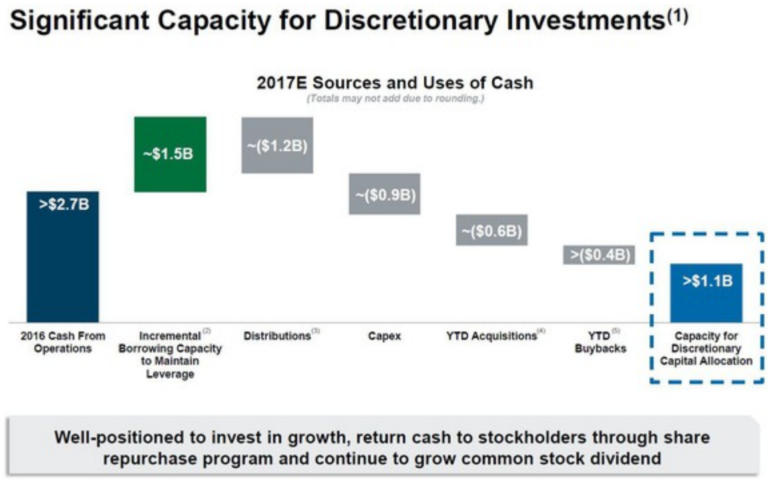
	Q1 2014	Q1 2015	Q1 2016	Q1 2017
AMT Quarterly Dividend per Share	$0.32	$0.42	$0.51	$0.62

To make things even better, management just announced a $1.1 billion share repurchase program earlier this year. By decreasing the outstanding share count alongside its rising profit stream, American Tower's management should be able to increase its dividend per share even further in the coming years.

Looking Forward

American Tower still looks to be standing tall, and we even recommended it again as the winner of our dividend-focused November 2016 Exploration.

Operating cash flow in 2017 should more than cover overall capital expenditures, acquisitions, and dividend distributions. This leaves plenty of discretionary cash for management to find ways to further reward shareholders.



Source: American Tower First-Quarter Investor Presentation

Even with a great tailwind and an excellent business model, there are a few things investors should still keep an eye on. The company's cell-carrier customers are sizable, with the top 13 accounts comprising nearly 80% of total revenue. Though contracts protect the majority of the profit stream, losing any one of the largest customers could put a serious dent in future profits.

Also, building cell towers isn't cheap. The company holds more than $17 billion of long-term debt, which it has used to fund growth. We should monitor the net leverage ratio (net debt divided by adjusted EBITDA) as a way to evaluate whether American Tower is getting too greedy in issuing debt to boost top-line growth. The company's current net leverage ratio of 4.6 is actually about 10% lower than its historical ratio (typically 5.1 to 5.4 during the past three years). We'll watch for that to hold steady in the coming years.

The time may have come for us to retire our first American Tower position from our scorecard. But we think the company still looks capable of producing sky-high future investor returns.

Amazon.com to Buy Whole Foods Market

Published Jun 16, 2017 at 12:13PM

Surprise! Online marketplace **Amazon.com** (NASDAQ: AMZN) has agreed to buy bricks-and mortar grocer **Whole Foods Market** (NASDAQ: WFM) in an all-cash deal of $42 per share, which is about 27% more than Whole Foods' closing price Thursday.

Whole Foods shareholders still need to approve the $13.7 billion deal, but that vote is a technicality at this point, and I'm confident it will go through. The acquisition is expected to close in the second half of the year, and Amazon will finance it with a combination of debt and the $21.5 billion in cash and equivalents it holds on its balance sheet.

Whole Foods co-founder and CEO John Mackey said: "This partnership presents an opportunity to maximize value for Whole Foods Market's shareholders, while at the same time extending our mission and bringing the highest quality, experience, convenience and innovation to our customers." Mackey will remain Whole Foods' CEO after the acquisition.

What's It Mean for You?

There's plenty to unpack here on both sides of the aisle.

For Whole Foods investors, I think this is probably the best outcome for everyone involved. When the deal goes through, you'll receive $42 cash in your brokerage for every share of Whole Foods you own -- a nice premium to the shares' recent price.

Given the competition in the grocery industry, Whole Foods has been forced to compete more and more on pricing to increase traffic to its stores, and that's hurt margins. And not only has management backed off of its 1,200-store target, but it's also been taking its foot off the gas on the new 365 concept to reassess the opportunity. Recent weak results and guidance from rival grocer **Kroger** (NYSE: KR) indicate that the price wars are just getting started.

For Amazon.com investors, this deal looks like a compelling opportunity because the company has been pursuing the online grocery niche. And lest you think U.S. online grocery sales don't amount to much, they totaled $42 billion in 2016, up 156% from 2015. There's plenty of potential here as Amazon.com gains valuable brand credibility in one of the most challenging aspects of the online grocery space -- delivering fresh fruits, produce, and meat. Whole Foods' more than 460 stores should allow Amazon to leverage its shipping and logistics expertise with Whole Foods' physical footprint in densely populated areas as it continues to build out its Prime offerings.

The Foolish Bottom Line

There's still plenty to learn about this deal and how Amazon's strategy will play out. But as it stands, I think it's a good outcome for both businesses. It gives Amazon.com a big boost in the burgeoning online grocery space, and it gives Whole Foods a better opportunity to compete on price without the scrutiny of being a publicly traded company.

When deals like these are announced, you'll often see the stock of the acquirer fall as the stock of the company being acquired rises. Today, shares of both companies are up, so perhaps the rest of the market thinks this is a smart move, too.

For now, you should sit tight on your Amazon and/or Whole Foods shares. If we think you should take any action, we'll alert you ASAP.

Pro Catch-Up Trades and Upcoming Expirations: June 15, 2017

Published Jun 15, 2017 at 11:59AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Best Buy Now); the portfolio is meant to work together as a whole.*

Pro's Best Buys Now are recommended first for your long-term portfolio -- start there! For all long stocks below, follow our allocation if you're matching us; otherwise, equal-weight your new positions at a size that's appropriate for your portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.2%.
- **Coherent** (NASDAQ: COHR): Buy 2.4%.
- **NVR** (NYSE: NVR): Buy 2.5%.
- **Visa** (NYSE: V): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.5%.
- **Apple** (NASDAQ: AAPL): Buy 4.6%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.4%.
- **MasterCard** (NYSE: MA): Buy 5.2%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 4.5%.
- **Verisk Analytics** (NASDAQ: VRSK): Buy 2.1%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for about $0.70 each.
- **O'Reilly Automotive** (NASDAQ: ORLY): Set up a protective collar on each 100 shares you want to protect. Sell to open August 2017 $250 calls, and buy to open an equal number of August 2017 $220 puts. Lately, with shares down near $230, this collar costs a net debit of about $2.30 per share. Or, you could instead sell to open August $240 calls, then buy the August $220 puts, for a combined net credit of about $0.80.
- **Verisign** (NASDAQ: VRSN): Roll your covered strangle on Verisign up and out to a September expiration and $95/$90 strike prices, as per our alert from earlier this week. Lately this can be done for $3.40 or so.

Hedges:

- N/A

This month's expirations (June):

- **Gilead Sciences** (NASDAQ: GILD): Our June $70 covered calls are on track to expire as income. We'll be looking to write new calls as they do -- assuming new calls pay enough at strikes we're comfortable using. Right now, our $70 calls still have some time value.
- **Verisign**: We rolled our strangle earlier this week in order to keep shares and generate additional income.

Roll Your Covered Strangle on Verisign

Published Jun 13, 2017 at 3:21PM

Is this for you? This recommendation is for investors already participating in our **Verisign** (NASDAQ: VRSN) strategy. If you lack any position, you can consider the Alternative Trades at the end of this report to get on board.

How You Participate

- **Trade:**
  - Buy to close your June $90 calls. Your June $85 puts are set to expire as income, so you can just let them do so.
  - Sell to open September 15, 2017 $95 calls.
  - Sell to open September 15, 2017 $90 puts.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares you own and every additional 100 shares you could buy. *Pro* will continue to write 5 put and call contracts each in order to keep our look-through exposure at approximately 3%.
- **Price guidance:** As I write this, you would **use a limit order** and aim to roll your strangle for a net credit of $3.20. However, please note that you **need** to get your trade completed by Friday, June 16, if the stock remains above $90. Otherwise, your shares will be called away.
- **Prices** (3:13 p.m. ET):
  - Stock: $91.63
  - Sell to open September 15, 2017 $95 calls, bid/ask: $2.18/$2.34
  - Sell to open September 15, 2017 $90 puts, bid/ask: $2.66/$2.87

- Buy to close June $90 calls, bid/ask: $1.75/$1.91

What We're Thinking

It's been a little over six months since we first added Verisign, a global leader in domain-name registry services, to the *Pro* portfolio, and so far our thesis has played out nicely — we've collected over $4,000 in income to go along with our 16% gain on the stock. In fact, maybe it's played out a little *too* nicely. With the company returning to modest growth after the surge brought about by domain-name speculators in China, the stock has run up a bit recently, so we find ourselves needing to pre-emptively roll our position yet again. We want to continue to manage this position for "income with upside," and we'll be able to do that by rolling our strangle up and out to September $95/$90.

We're raising our Fair Value for the stock to $87 as the company continues to make progress. Verisign is compounding value at an impressive clip thanks to its strong operational leverage, and we believe it will receive approval to continue raising .net prices by 10% annually through 2023 (based on the proposed renewal of the .net registry agreement). We do need more clarity on whether the company will be able to increase .com prices in 2018 or beyond. Until then, though, Verisign remains an attractive covered strangle candidate.

Alternative Trades

- **Interested in just buying shares?** We would suggest waiting to see if the stock falls closer to our $87 fair value estimate before purchasing.
- **New to this position?** If you can afford a potential $18,200 or so in shares, buy 100 shares today and then "sell to open" the same September 2017 $95/$90 covered strangle described above (sell one call for every 100 shares now owned, and sell one put for every *additional* 100 shares you could buy). Using a limit order, you could lately collect about $5.00 per share in combined credits to write both options. Invest approximately 3% of your *Pro* funds in this total position on a look-through basis (assuming puts are exercised).
- **Have you previously only written covered calls?** You'll need to roll those calls, assuming you want to keep the position going. Now write the same September 2017 $95 calls, lately for a net credit of $0.45. That price will change as the stock moves, but you'll need to get this trade completed before Friday or your shares will be called away. As always, sell one call for every 100 shares you own and wish to cover.
- **New and only want to write covered calls?** Use a buy/write order to buy shares in 100-round lots and simultaneously sell to open September 2017 $95 calls, selling one call for every 100 shares you buy. Lately this can be set up for a net debit of about $89.40, with making your total return 6.3% should the stock hit $95 by expiration. Invest approximately 3% of your *Pro* funds in this position.

Winners and Losers Versus Our North Star

Published Jun 12, 2017 at 4:28PM

Fellow Fools,

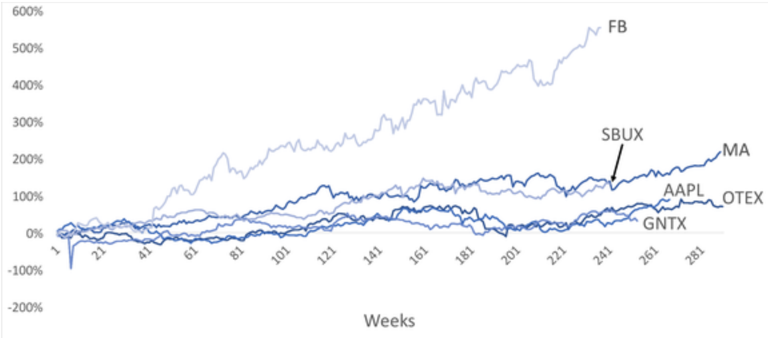
> *Motley Fool Pro*'s mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star.

Ah, the North Star. More than just a cool name, our benchmark lies at the foundation for every decision we make here in *Pro*. No stock, long or short, is added to the profile without significant consideration of whether it actually improves the odds that the *Pro* portfolio will be able to hit our lofty 10-year target. We love huge winners like **Facebook** (NASDAQ: FB) just as much as the next investor, but we recognize that in investing, success is ultimately judged based on how your entire portfolio has performed against your benchmark. This is one of the primary reasons we don't display how our individual positions have faired vs. our North Star, even though "stock vs. benchmark" is standard practice for most Fool services.

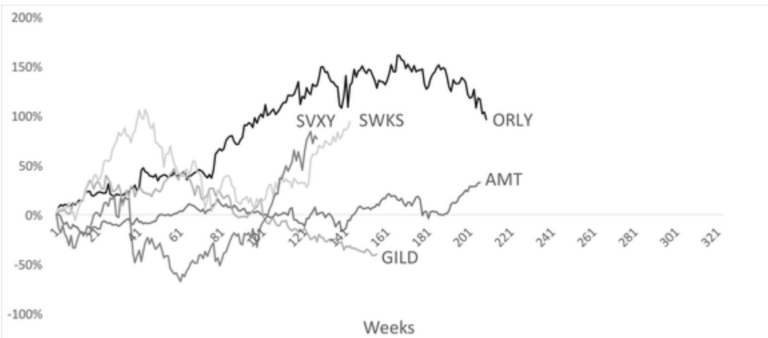
But that's not to say we don't *track* how each of our positions is fairing versus our benchmark. Accuracy is one of our top priorities in *Pro* -- it has to be, given that we're also looking for positive returns over every rolling three-year period. So how have all of our active long positions held up since the original trade alert first appeared in your inbox?

2009-2010

2011-2012



2013-2014



2015-2016 (plus Amazon)

source: S&P Global Market Intelligence, author's calculations

For the most part, these charts mirror what we see when we look at the returns column on our homepage -- Facebook is our largest winner in an absolute sense and vs. the North Star, **Paycom**'s (NYSE: PAYC) strong performance right out of the gate has boosted it nine spots to become the 12th best active performer in our long book and given it a sizable head start over the North Star, and **Gilead**'s (NASDAQ: GILD) recent struggles have made it the worst-performing long position in our portfolio and the second-worst vs. the North Star.

So which name has had the hardest time keeping up with the North Star? That would be the **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS), which currently trails the North Star by almost 70% despite us currently being down only 6%. This underlies one of the strengths of using the North Star as our measuring stick, but also one of the reasons why it's such a challenge -- the North Star never takes a day off. Day in and day out, the North Star is inching higher, meaning that a stock with a stagnate price will steadily lose ground to our benchmark. Now, this may be true of the S&P 500 when the market is rising, but unlike the North Star, the S&P 500 is subject to the whims of Mr. Market, meaning it's not uncommon for it to fall in value or stagnate.

Now, when times are good and the market is seemingly setting new highs on a weekly basis, odds are the market will outpace the North Star. And since investors by and large are competitive people, you might be tempted to keep up with the market when this happens -- even if you are making steady progress toward your investment objectives. But in doing so, you run the risk of repositioning the portfolio to benefit from near-term tailwinds at the expense of long-term objectives. A rising tide may lift all boats, but our North Star necessitates that we ultimately build a portfolio that rises *regardless* of what the tide is doing. This is why we strive to have the right mixture of positions in *Pro* -- some poised to benefit from impending catalysts, and some whose catalysts are harder to time, but should ultimately result in returns that are far in excess of the North Star over the coming decade.

Enjoy your week, Fools!

-- JP (TMFYossarian)

- **Visa** (NYSE: V): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.5%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.2%.
- **Oracle** (NYSE: ORCL): Buy 3.8%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 4.5%.
- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Gentex** (NASDAQ: GNTX): Write (sell to open) December 2017 $17.50 puts for an additional 1% potential stock allocation, lately for $0.75 each.
- **O'Reilly Automotive** (NASDAQ: ORLY): Set up a protective collar on each 100 shares you want to protect. Sell to open August 2017 $250 calls, and buy to open an equal number of August 2017 $220 puts. Lately, with shares down near $230, this collar costs a net debit of around $2.30 per share. Or, you could instead sell to open August $240 calls, then buy the August $220 puts, for a combined net credit of around $0.80.

Hedges:

- N/A

This month's expirations (June):

- **Gilead Sciences** (NASDAQ: GILD): Our June $70 covered calls are on track to expire as income. We'll be looking to write new calls as they do -- assuming new calls pay enough at strikes we're comfortable using. Right now, our $70 calls still have some time value.
- **Verisign** (NASDAQ: VRSN): Our June $85 put/$90 call strangle has puts on track to expire as income, and calls we need to address. Look for us to roll before expiration.

Set Up a Protective Collar on O'Reilly Automotive

Published Jun 7, 2017 at 1:50PM

Is this for you? Any *Pro* members who own at least 100 shares of this stock, and who want to protect against downside below $220 per share, should consider this recommendation.

How You Participate

- **Action:** Set up a protective collar on **O'Reilly Automotive** (NASDAQ: ORLY)
- **Trade:** Simultaneously ...
  - **Sell to open** August 2017 $250 calls.
  - **Buy to open** August 2017 $220 puts.
- **Allocation:** Set up one protective collar (one of each option) for every 100 shares you want to protect. *(Pro* will collar all 500 of its shares, setting up five collars.)
- **Price Guidance:** Use a **limit order** and initially aim to set this up for a net credit of about $0.60 per collar. Prices will fluctuate as the stock moves, with the trade getting less expensive to execute if shares rise, and more expensive if the stock declines. Initially, always aim for a credit. If prices change much more, it's a judgement call on your part depending on much you want to spend; you can also consider using different strikes, rolling up or down accordingly. We will roll if we need to by the time we make our trade.
- **Recent Prices (12 p.m. ET):**
  - August $250 calls (splitting bid/ask): $5.60
  - August $220 puts: $5
  - Net credit: $0.60 per collar (use a **limit order**, net credit)
  - ORLY: $236
- **Scorecard Status:** Hold (and protect); 4% allocation. Our fair-value estimate is $255.

What We're Thinking

Habits drive the economy, and consumer habits are changing. Technology's key role in this shift could affect O'Reilly Automotive's future. The gutting of retail companies large and small has been headline news over the past year, with everything from **Macy's** (NYSE: M) to **Ruby Tuesday** (NYSE: RT) falling out of grace and out of bed. By comparison, auto-parts retailers including O'Reilly have remained healthy, and stock prices reflect that.

A marquee name in retail, Macy's trades at 11.8 times earnings and yields nearly 7%. O'Reilly, meanwhile, still trades at 21.4 times earnings and doesn't pay a dividend. O'Reilly has maintained a premium valuation because consumers have continued to visit auto-parts stores just as they did before retail imploded, sending same-store sales at O'Reilly at least 3% higher year after year. Last quarter, though, same-store sales were up only 0.8%. This was commendable compared to falling same-store sales at competitors, but not enough to keep the stock from declining. O'Reilly kept same-store sales guidance at 3% to 5% growth for 2017, but Wall Street seems skeptical.

In the first quarter, strange weather impacted sales, as did delayed tax refunds. Store traffic began to increase toward the end of the quarter, but at least one competitor noted weeks later that sales gains never materialized once tax refunds were mailed. Consumers spent that money elsewhere -- in fact, **Best Buy** (NYSE: BBY) actually pointed to sales gains thanks to tax refunds. This suggests the current quarter *could* be a bit light on sales, too -- though we won't know until likely the last week of July.

Over the longer term, a change in consumer habits is a concern we should all share about *any* of our consumer-related companies. Habits drive recurring sales. Going out to retail stores used to be an ingrained habit among most American adults. It was necessary, and you often made multiple stops along the way. Thanks to Internet shopping, habits are changing. We still need to repair our cars when they break, but we're less likely now to stop by O'Reilly to pick up odds and ends on a regular shopping trip, because we're taking fewer shopping trips. Even **Starbucks** (NASDAQ: SBUX) is vulnerable to the "knock-on" effects of consumers making fewer excursions. But we are making more purchases online -- and that means we're more likely to consider ordering some auto parts online, too. (Of course, you need to know exactly what you need; O'Reilly argues that most customers need one-to-one help, and we believe that's often true.)

Even small headwinds, like a decline in traffic of a few percent, affect a retailer's business and ultimately its stock price. In the short term, we're concerned that the valuation O'Reilly enjoys could continue to be compressed unless the business surprises to the upside again next quarter. In the long run, if we keep the stock, we have to keep a close eye on consumer habits. We won't even mention autonomous cars yet -- they're years away -- but they do exist as a potential concern.

Why This Strategy?

This protective collar caps our downside at $220 and still gives us nearly 6% upside over the next two months, to $250, which is right near our fair-value estimate of $255. We can lately set this up for a small credit of $0.60 per share. Our August expiration will see us through earnings in late July. If O'Reilly disappoints again, the stock price could suffer significantly, so our collar may help us in that case. If the business gets back on track, shares should gain, but Wall Street's merited, long-term concerns (that we share) surrounding traditional retail may keep a lid on those gains for now. O'Reilly now needs to prove itself quarter after quarter to chip away at doubts and concerns.

As to what we do next: If the stock falls below $220, something has likely gone wrong. We'll reassess, and we may choose to sell our stake at $220 through our puts. If the stock rises above $250, we'll assess if we want to keep owning it, and if so, close our calls, or perhaps roll the collar higher. If we're ready to exit at that better price, we'll let the position get sold at $250. Finally, if the share price remains between our two strike prices, sending our options to unused expiration, we'll set up another collar (or take other action) if we still want protection. Bottom line: We want to cap our risk on this 4% portfolio holding, and we aren't that concerned about missing some upside in the process. Allowing for 6% upside in the next two months is plenty for now, and then we'll cross the next "decision bridge" when we get to it.

Alternative Trades

- **Own fewer than 100 shares and want protection?** You shouldn't sell a call option in this case (because it represents 100 shares, which would put you "naked short" some shares at $250), but you can still buy a put option and have more protection than you need. That said, it's expensive. The August $220 put is lately about $5, so it's $500 for one put, and the stock needs to fall nearly 7% to hit your strike. You can buy this insurance, but you may be better off keeping your position unprotected and simply selling if we decide to sell, too.
- **Not using options?** You're in a tougher spot, with few ways to protect yourself. Make sure that you're comfortable with the size of your position, and adjust as needed. The stock remains on Hold, but obviously we prefer protecting the position or, if you can't, sizing it right for your comfort.

Buy NVR

Published Jun 7, 2017 at 1:43PM

Is this for you? This is for all *Pro* members, but just realize that **NVR, Inc.** (NYSE: NVR), can be a volatile stock. As ever, we have a three- to five-year minimum time frame.

How You Participate

- **Action:** Buy 2.5%. If you're managing less than $100,000, please see the Alternative Trades section below.
- **Price Guidance:** Use a **limit order**; this is still a thinly traded stock. Today, ideally pay less than $2,400. Later, the stock will remain a Buy until we say otherwise.
- **Recent Price:** $2,370
- **Guidance:** Best Buy Now
- **Fair-Value Estimate:** $2,550

Quick Look: Why Invest in NVR?

- We want exposure to the secular tailwinds of the housing industry as millennials begin forming families and buying houses in earnest.
- NVR isn't your average homebuilder — its asset-light business model enables outsized returns on invested capital when times are good and protects it when the market inevitably struggles.
- We believe NVR's disciplined approach, centered around being a dominant regional homebuilder while returning all excess cash to shareholders through buybacks, will result in strong returns for the stock even if calls for another golden age in the housing market prove to be incorrect.

Welcome to the Neighborhood: What We're Thinking

We talk a lot about riding secular tailwinds (electronic payments, the internet of things, mobile computing) here at *Pro*, and with good reason. Research has found that industry factors, not company-specific ones, often play an outsized role in a company's ability to outperform over the long run. We've done our best to position *Pro* to benefit from multiple secular shifts, but as Jeff noted in a recent Memo, there are areas where we think we're still underexposed. We recently took our first step toward addressing these shortcomings with our recommendation of Coherent. Today's recommendation of NVR, the nation's fifth largest homebuilder, addresses another area where we believe *Pro* is underexposed: U.S. housing.

You'd be forgiven for thinking that homebuilders -- with their reputation for cyclicality, prolonged periods of unprofitability, and average returns on invested capital -- are the last place we'd look for a *Pro*-like business. But NVR isn't your average homebuilder, and we believe it's poised to deliver North Star-beating returns over the next 10 years.

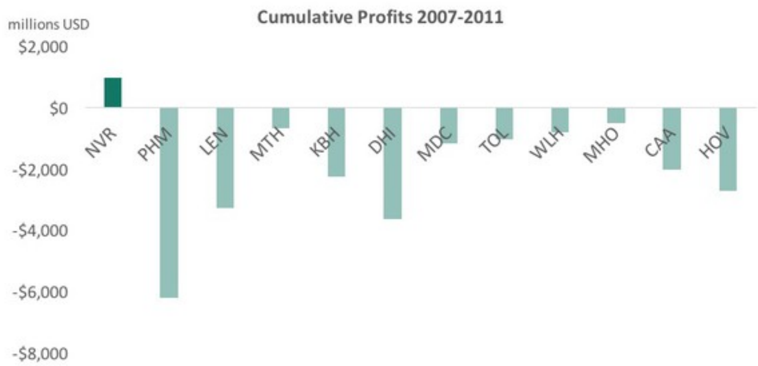
Lot Options, Smart Choices: The Business

NVR can trace its roots all the way back to the late 1940s, but the current iteration of the business was formed in 1987 when NVHomes completed a leveraged buyout of Ryan Homes. This was at a time when many in the industry were calling for the recent strength in the housing market to continue for the foreseeable future, but you know what they say about the best-laid plans of mice, men, and homebuilders. A few years was all it took for the U.S. housing market to experience a modest correction -- but when you're a leveraged homebuilder who also made untimely speculative land purchases, a modest correction is all it takes to send you into bankruptcy.

Interestingly, that bankruptcy was actually the catalyst for NVR to become a *Pro*-worthy company. Rather than blaming the struggles on bad luck, NVR's management did what all great investors do and learned from their mistakes, doubling down on the business model that originally made the company great and divest everything else.

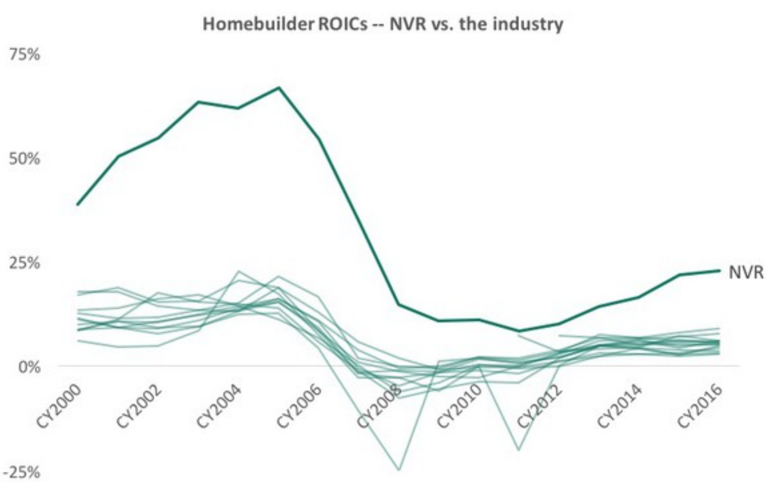
The core of that model is an asset-light approach in which NVR uses lot purchase agreements (essentially option contracts on finished lots) as opposed to the traditional method of land development. At up to 10% of the aggregate purchase price for the finished lots, the cost to purchase these contracts might seem steep, but the benefits are enormous (and should sound very familiar to those who use options to invest!) -- NVR is able to secure the rights to desirable lots for a fraction of the cost of buying them outright while protecting itself from untimely declines in the housing market. Buying up a bunch of lots right before the housing cycle turns can undo years' worth of profitability, as NVR learned the hard way. With lot purchase agreements, NVR is only ever on the hook for the deposits it pays to secure these options, and restructuring is often possible.

NVR isn't the only homebuilder to use lot options, but its decision to rely on them almost exclusively is what enabled the company to remain profitable throughout the collapse of the housing market, even as its competitors (who typically only use options for 20% to 40% of their lot needs) were reporting losses that in many cases exceeded a billion dollars. Not only that, NVR was actually able to go on the offensive and expand into six new markets while its competitors were preoccupied with undoing prior mistakes.



Source: S&P Global Market Intelligence

Better yet, most of these contracts are structured so that NVR can refrain from taking control of a given lot until the home has been sold and construction is about to begin. The approach goes hand in hand with NVR's focus on efficient construction processes (it can complete a home in as little as four months after a purchase agreement is signed), and the result is that NVR more closely resembles a just-in-time manufacturer than your stereotypical homebuilder. It also means returns on invested capital that are the envy of not just NVR's industry, but most public companies.



Source: S&P Global Market Intelligence

And what does NVR do with those high returns? Unlike some companies whose management might be tempted to go on a spending spree in the name of empire-building, NVR has instead opted for share cannibalization.

- Average change in shares outstanding over the past five years: -5.8%
- Cumulative change over the past five years: -26%
- Cumulative change since 2000: -58%

That's not to say that management isn't investing in the business. Rather, their focus is on occupying a dominant position in certain regional markets and then returning all excess cash to shareholders -- including management, whose compensation comes mostly in the form of periodic long-term equity-based grants.

We're fans of this approach because the housing industry is highly fragmented, and unlike most industries, it doesn't offer significant advantages to those with a national presence. Local economies of scale are what matter most, and because NVR is typically one of the largest players in a given local market, it's able to achieve greater scale than its competitors and to leverage its relationships with contractors and land developers to ensure adequate supply of both labor and land at the best possible price -- two of the biggest current obstacles for many homebuilders. NVR currently has control over 79,000 lots, with more than 44% located in its core Mid-Atlantic market (it's the largest player in the D.C./Baltimore metropolitan areas, with an estimated 35% market share). That's enough to generate more than five years' worth of homebuilding revenue using 2016 prices, and four years' worth at depressed 2009 prices.

NVR's Geographic Concentration by Revenue

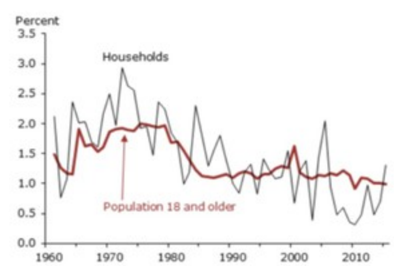
Little Pink Houses: The Industry

But why do we want exposure to the housing market in the first place? It's true that we typically shy away from investing in cyclical industries, because of the difficulty in forecasting the magnitude and duration of the cycles. But we believe that when it comes to U.S. housing, the long-term benefits of having exposure to the industry outweigh the potential short-term negatives from mistiming the cycle. Much has been made about the lackluster recovery in the housing market, but we believe the current environment supports an extended recovery.

Part of the reason for this tepid recovery has been the sharp decline in the rate of household formation (adults, married or unmarried, living together away from their parents). Prior to 2008, the pace of household formation exceeded population growth by about 0.2% per year for almost five decades. But from 2007 to 2015, the average difference was roughly -0.5% per year.

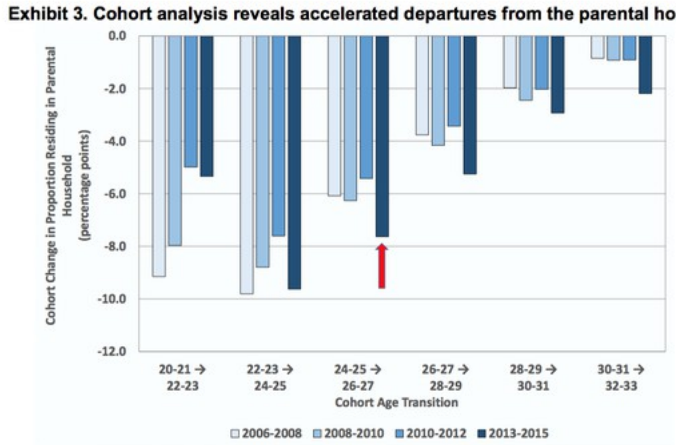


Source: U.S. Census Bureau, Housing Vacancy Survey and Annual Population Estimates; annual rates reflect July year-over-year percent changes.

Source: Fred Furlong (2016). *Household Formation among Young Adults*, Federal Reserve Bank of San Francisco

There's a lot behind these numbers. The strong economy, constantly rising housing prices, accommodative legislative policies, and easy access to credit all contributed to the housing boom of the 1990s and early 2000s, bringing the rate of household formation for those under 30 sharply higher than in the preceding 15 years. The current level is more in line with what we saw prior to this boom, and while we don't expect history to repeat itself, we do believe we're set up to see steady improvement in household formation for years to come now that millennials are the biggest U.S. generation.

While it's well documented that these kids today increasingly favor experiences over physical possessions, many surveys have found that millennials' desire to own a home remains in line with previous generations'. And two of the biggest determinants of household formation for younger adults — income and marital status — are increasing, which bodes well for future housing demand. With many homeowners currently opting to stay in their existing homes for longer, we could ultimately see the more and more millennial homebuyers opting for new construction.



Source: U.S. Census Bureau, American Community Survey.

Source: Fannie Mae Economic and Strategic Research Group (2017). *Starting to Launch: Millennials Are Leaving Mom and Dad's Basement*. Note: Graph shows the change in the proportion of young-adult cohorts living at home as they aged. Because the probability of living at home declines as young people grow older, all values in the chart are negative. The more negative the value, the more rapidly a cohort departed the parental home as it aged.

This potential influx in demand might not mean much for NVR if the industry was awash with supply, but homebuilders have been slow to ramp up production in the aftermath of the latest recession. Recent housing starts continue to hover near 1.2 million annualized, in line with the recent rate of household formation. That said, considering the underproduction of the past decade, a need to replace older units, and growing demand for other uses, some industry experts believe that housing construction will need to average at least 1.6 million units a year for the next decade just to meet demand.

Homeowners Insurance: Risks

With mortgage rates near historic lows in recent years, there is concern about how an impending increase will affect the housing market. Historically, financial well-being and significant life events (starting a family, receiving a promotion, changing jobs) have mattered more than prevailing mortgage rates to new homebuyers, but there's always risk that extended record-low levels have shifted consumer behavior. We'll also be watching NVR's ability to secure lot options at favorable prices; recent scarcity has resulted in increased competition in certain markets. Lastly, we'll want to keep an eye on NVR's cancellation rates, as they reflect the health of its customers. Currently, the company's backlog remains healthy, but this can change in a hurry if cancellations accelerate.

The *Pro* Bottom Line

With a valuation of 12 times EBITDA and 21 times earnings, we believe the market is underestimating NVR's full-cycle earnings power as the company benefits from the aforementioned tailwinds. But given this astute and shareholder-friendly management team, we believe this is a "heads we win, tails we win" investment -- market-share gains and smart allocation could deliver North Star-beating returns even if the housing market recovery remains tepid. Past performance is of course never a guarantee of future results, but we do think it's worth mentioning that investors who bought shares of NVR right at the peak of the housing market have not only completely recouped their losses, they've beat the North Star and outperformed the S&P 500 by more than 100% since then.

Alternative Trades

- **What if you're managing less than $100,000?** Since each share of NVR is lately about $2,370, you need to be managing nearly $100,000 to be able to buy a share and keep it at 2.5% or so of your portfolio (one share, obviously, would be 2.37% of $100,000). If you're managing less than $100,000, you can still buy a share as long as it represents less than 3.5% or so of your holdings, max. That means you should be managing at least $75,000. If you're managing less than that, wait and add NVR as your portfolio grows. It's a very long-term holding.

We Won't Miss AmTrust; Plus, Content Changes Afoot

Published Jun 5, 2017 at 3:39PM

Dear *Pro* Fools,

Longtime Fool "kmbubba" asked on the **AmTrust Financial Services** (NASDAQ: AFSI) board whether members are selling their shares, as *Pro* has, or keeping them. As of this morning, 51% said they're keeping the stock, and 17% said they're selling some shares, but not all. That's 68% who are keeping exposure, with only 31% selling their entire position. And we're not surprised.

The Fool -- led by David and Tom Gardner -- has long downplayed the attraction of selling any stock, with two exceptions: You need the cash for your daily life, or you lack cash in your portfolio and see another investment you like better. The *Pro* port is in the latter situation now. We have about 20% cash, but we would like to *keep* about 20% cash, so if we want to add new positions and maintain our cash balance, we need to sell something. Our impetus to sell is also heightened when a position's risk-to-reward looks skewed against us.

After financial restatements, AmTrust has shown itself to be a weaker business with lower profitability and now a tarnished name (which could slow business further). We would need to see ample potential upside with *less* downside risk to justify keeping it. But today the opposite seems the case. The upside for the stock is likely going to be largely curtailed, but the risk is still potentially large; a rumored SEC investigation could prove true and have teeth, and if so additional years of results may come to need adjusting. So, the lower share price has not necessarily lowered the risk.

An investment in any business is an investment in trust. Any management team can fib about its financials. But the ultra-leveraged businesses of banks and insurers are particularly vulnerable to major pain if there's any dishonest accounting. How many financial businesses have we seen go under because of bad accounting in our lifetimes? A countless number. It's the leverage that brings them down. Since we see limited upside potential in AmTrust for now, still face the potential for more accounting revelations, and can't hedge the stock for a reasonable cost, the choice to exit the position becomes easy.

This is especially true because I've reached a point where I won't regret missing upside in AmTrust. That upside is not worth the risk, in my mind, so even if the stock *does* do well from here, I wouldn't want it in my portfolio. (I personally plan to sell my shares after my trading restriction ends; I hold shares in my and my wife's IRA accounts. I look forward to investing elsewhere.) I would rather own something that I'll comfortably enjoy owning. At some point, the same may be true of **O'Reilly Automotive** (NASDAQ: ORLY) -- the upside it may offer may not be worth the risk if the industry is truly under fire. We're working on an answer to that question.

All that said, some members may feel comfortable keeping AmTrust. It may be one position of 100 that you own. It might be 1% of your portfolio. So why not keep it? As Tom and David like to remind us, your losers become insignificant, and your winners carry the future, so even if you never sell anything, you can win big overall. Tom vows not to sell anything for at least five years. David rarely sells. The math supports this approach. Your sanity does, too. *Pro* is just a different beast for a few reasons: We don't add new cash (so we ultimately have to sell if we want new positions); we want to remain a focused portfolio of around 30 positions or fewer; and we're continually aiming to fill the portfolio with our best ideas to work toward our steady North Star goal -- even while trying to keep turnover low.

At the same time, many of our sells have been extremely beneficial. We sold **Bristow Group** (NYSE: BRS) at about $49.50. The stock is below $7 now. We sold **Contango Oil & Gas** (NYSEMKT: MCF) at $61. Today it hit $5.83. **The Buckle** (NYSE: BKE) was sold from *Pro* for more than $35 less than two years ago. It has since been cut in half. **3D Systems** (NYSE: DDD) is another successful sell for us. And let's not forget the shorts we've covered. **Five Below** (NASDAQ: FIVE) was closed at about $27; it's now $52. Our short of **Caesars Entertainment** (NASDAQ: CZR) was closed in halves at $9.50 and $6.90. It's now $12.45. We closed our **World Acceptance** (NASDAQ: WRLD) short in halves at about $36.60 and $29.85, and now the stock is near $81. All of the above positions were closed with a profit. Our large shorts of market indexes (as hedges) were also closed at prices much, much lower than today's. We're a long/short portfolio, so closing *has* to be a part of our regular way of thinking. Most of our attention to closing goes to shorts, but given our aim for steady improvement in the caliber of our holdings over the years, selling attention must go to our longs, too.

Bottom line: If we no longer believe that the upside in a position is worth the risk, we'd rather not hold it. If risks look modest, we might stick with a stock for years while waiting for annualized North Star-type returns. But not when risks appear heightened. Only time will tell how AmTrust performs, but it doesn't matter to us anymore. We don't care to be a part of it, whatever happens next. It's like when a relationship is over -- it's simply over. We wish the other party well, even though we don't want to be invested in its particular future any longer. Many of our sells *will* do well. With AmTrust, though, we'd put the odds at no better than 50/50, if we had to, having no real conviction as of today.

Trying New Content Plans to Progress

Here at *Pro*, we are trying some new changes starting today, while staying flexible. What I'm writing here is meant to reassure you -- I am optimistic about the effects of these changes on both members and the service -- but I know that even the potential for change is sometimes unsettling, so please know that if anything doesn't work for all parties as intended, we'll change again. The fact is that we want to make both the *Pro* and *Options* services more dynamic, and make our communications more relevant and timely. The editorial and content leaders at the Fool recently challenged us on this point, asking: "Why not issue content when you're driven to, instead of every Monday in *Pro* [or every Friday in *Options*]? And why not issue the most vital content any day of the week, whatever it is?"

In examining the reasons for our current content schedule, we found that most of them were outdated (just because we did it this way nine years ago doesn't mean it's right for today!), and many could be improved. So, we're now going to issue content as we have it, rather than locking ourselves into a schedule in which every Monday features a commentary in *Pro* (or every Friday, in *Options*). Instead, on Monday, we may issue a trade alert, for instance, if that's more compelling and relevant content for you, the members.

Last year, *Pro* and *Options* combined issued 129 trade alerts, more than any other Fool service (*Stock Advisor* issues 24 a year, for instance). Right now, I alone have 17 alerts that I'm working on or toward; many are new, many others are upkeep. Some of these new ones will get away from me because time is always ticking, and prices change fast. I have stars next to eight of these tickers on my list, meaning they're timely. I could have written and issued two of them today instead of this Memo. In future weeks, I'll be able to, because **the Memo is no longer locked into a Monday issuance**. We'll still communicate with members about AmTrust and any other news that needs discussion -- but we'll be free to tackle timely, actionable advice first if that's what's best for the port and for *Pro* members. And then we can issue any commentary any day of the week, multiple days in a week if compelled to, or none at all.

You will continue to receive *Pro's* Guidance Changes and Completed Trades every Monday, along with any commentary (including Memos) that's new or that we care to highlight. You'll now receive our Catch-Up Trades every Thursday -- this important *Pro* content deserves its own email, on its own day. And whenever we have commentary for you, we'll send it, whether it's Monday or not. This may be timely, news-related commentary, or it may be a large strategy guide that's taken shape over a couple of weeks instead of a weekly commentary. Trade alerts are almost always the most timely content we can issue, though, so during some periods you may receive more trade alerts than you otherwise would have -- if this is the case, you may not see additional commentaries during this time.

This is the Fool asking us to be flexible and see if these changes improve the service -- making it more dynamic, more timely, and more valuable to you. That is our only goal! So let's see if this works. I think it will. And we will continue to work until it does.

Here is the planned content schedule now:

- Mondays: *Pro* -- Weekly Roundup (Guidance Changes, Completed Trades)
- Tuesdays: *Options* -- Strategies You Can Start
- Thursdays: *Pro* -- Catch-Up Trades, Upcoming Expirations
- Fridays: *Options* -- Weekly Roundup, and "Always Have a Plan" *monthly* column
- Whenever Timely: Both services -- Trades, commentaries, other new content
- Once a Month: Both services -- Live chat

I believe that this flexibility and additional freedom will lead to more profits from investing ideas, while still keeping you just as informed and in touch as ever -- if not more so -- in a timely fashion. This should be more organic and effective. Working with the editorial team at The Motley Fool, we'll push for that, and we thank you for being a part of the process of improvement! Please ask any questions on the Memo Musings board.

Fool on!

— Jeff (TMFFischer)

P.S. My family and I are headed to France Sunday for vacation. So, starting June 12, I won't be online much the next few weeks! That's not part of this change; I just wanted to be clear on that. Happy summer!

Pro Guidance Changes and Completed Trades: June 5, 2017

Published Jun 5, 2017 at 3:29PM

Pro Guidance Changes from the past week:

- **AmTrust Financial Services** (NASDAQ: AFSI): Moved to Sell from a previous Hold. We also moved our protective collar to Close.

Pro Completed Trades from the past week (see transaction log; trades take a day to appear):

- **AmTrust Financial Services:** Today, we sold our 5,134 shares at $13.30, and closed our June $17.50 call, $12.50 put collar for a $0.20 credit. This freed up 2.3% cash in the portfolio.
- **Gentex** (NASDAQ: GNTX): Today, we sold to open December 2017 $17.50 puts for $0.65 (the best we could get), selling 16 contracts, for a potential 1% additional allocation to the stock.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Sell (Close Your Position on) AmTrust Financial Services

Published May 31, 2017 at 1:02PM

Is this for you? This is for all members who have exposure to **AmTrust Financial Services** (NASDAQ: AFSI). We're ending all of our exposure to the company. If you're of the school that *never* sells anything, you don't have to join us, you can hold on; but otherwise, to follow the portfolio, exit the position with us.

How You Participate

Actions:

- Sell all AmTrust Financial Services shares, using a **limit order** at the active price (lately $12.65, but that will of course change).
- Sell to close your June 2017 $12.50 puts, using a limit order splitting the bid/ask at the active price (this morning $0.70 to $0.75).
- Buy to close your June 2017 $17.50 calls for no more than $0.05 each.

Allocation: We're taking our 2.3% holding down to 0%.

Status: Sell (close) all positions.

What We're Thinking

In the end, this sell boils down to a lack of trust in company management, and a strong belief that we can do better by investing the funds elsewhere.

The accounting missteps at AmTrust that led to the recent restatement of three years of financial results may have been at least partly the result of honest mistakes. But it's also too likely that there was *some* willful intent on the part of some member of management; not intent to do anything illegal, perhaps, but intent to be aggressive with accounting, and perhaps make results look better than they were. In either case, the restatement points to a lack of an airtight operation, a lack of the focus, discipline, and integrity that we want from all of our investments.

In discussions with the team, the opinion that we should sell was clear and direct from both Billy and J.P. "End the misery," Billy said. "It doesn't live up to our standards." "I just don't trust management," J.P. added. What more can you say in that case? It was more difficult for me, having been an investor in AmTrust nearly since its IPO in November 2006. Excluding dividends, the stock is up 290% in nearly 11 years, much more with dividends, while the **SPDR S&P 500** (NYSEMKT: SPY) ETF gained 75% over the same time, excluding dividends. AmTrust outperformed by nearly fourfold.

Pro bought its shares in April and June 2009. We sold some shares in 2012 around today's current price, and we sold much more in 2015 around $34 per share. Overall, AmTrust has been one of the biggest realized winners we've had. Even the final shares we're selling are up nearly 200% -- more with dividends and options. But it doesn't feel like a winner. And that's instructive.

First, we know that newer members have a sizable loss. The stock is down about 50% this year. Second, when the restatements were first announced early this year, the stock fell to about $17 before bouncing back above $20. The company downplayed the seriousness of the restatement, we assessed the likely coming financial changes, and we stuck with it. In hindsight, that may have been the time to simply sell. (We are now weighing the possibility of starting a new practice in *Pro* -- one where we'll exit a stock in most any situation when a company restates years of results, rather than wait or give it a second chance.)

We aim to give our companies room to make honest mistakes, but capital preservation and growth is why we invest, and AmTrust put both of those goals at lasting risk with its restatement revelations. The business is less profitable now than we were led to believe. Book value is less trustworthy. And the value multiples the stock deserves are lower and still questionable. The stock still trades around 1 times book value, and as we've seen from plenty of beleaguered financial companies, it could go much lower if Wall Street is skeptical about that book value.

And it has reason to be. The *Wall Street Journal* reported an unconfirmed ongoing SEC investigation of the company, noting that Harry Markopolis (who cried foul on Bernie Madoff before he was uncovered) is driving an independent march toward charges of improper accounting against AmTrust. Whether baseless or not, this high-profile report could damage AmTrust's business just as it has damaged its reputation.

And that may be playing a role in the company's new decision to raise $300 million from a private share placement sold to family insiders. That insiders would buy $300 million in stock appears as a large vote of confidence, but they have a lot to gain if the stock rises on the news alone. More to the point, that the company is selling shares now and using proceeds to shore up its insurance operations raises more questions than answers. Why sell new shares when the price is down? Why seek funds right now, even when the company plans to sell a majority stake in its compelling fee-based business this year for many hundreds of millions? Meanwhile, the diluted share count at AmTrust keeps rising, becoming a growing drag on value creation if and when acquisitions don't add incremental growth.

The complications of analyzing AmTrust go well beyond what we care to put in this report. Let's just say that the returns we've earned *per hour of work* on AmTrust the past eight years pale compared to the returns we've earned per hour of work on most of our other successful investments, and the risks still remain higher with AmTrust than the others because the accounting is so complex.

Our intention is to reinvest these funds this summer, the sooner the better. We're not selling AmTrust to raise cash. We're selling to remove this blighted position from the portfolio, free up considerable time, and put the money somewhere we like better. Selling **AIG** (NYSE: AIG) to buy **Visa** (NYSE: V) is a past example. And selling **Intel** (NASDAQ: INTC) led me to **Skyworks Solutions** (NASDAQ: SWKS). Selling **Wells Fargo** (NYSE: WFC) helped fuel the discovery of **Paycom** (NYSE: PAYC). Selling AmTrust will lead to something we like better, too, and that should matter most in the end.

That, and the lessons learned. We hope to avoid making the same mistakes again, trusting too much in management when there's smoke that might be fire, and in the process save members from the hardship of a decline like this whenever we can.

In closing, the long June $12.50 puts that we're selling to close are worth nearly 6% of the current share price. That's great, but that's currently all time value, which will dissipate by June expiration. So, we plan to sell in the coming few days at most, using a limit order to get the best price possible.

Alternative Trades: Our advice is to close all positions. We're moving on.

Questions? Please visit the AmTrust board.

Write Puts on Gentex

Published May 25, 2017 at 1:57PM

Is this for you? Because we're looking to add 1% to our current recommended stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not. If you don't yet own shares, check out the Alternative Trades section at the end of the report.

How You Participate

- **Trade:** Sell to open December 2017 $17.50 puts.
- **Allocation:** 1% — write one put for every $175,000 or so you manage; *Pro* will write 16 contracts. In addition to our current 2.9% stock holding, this would bring our total allocation to about 3.9%.
- **Price Guidance:**
    - **Now:** Use a **limit order** to target $0.85 or greater to start (for a 4.9% effective yield in 205 days). **If we all use limit orders** and the stock price cooperates, we may be able to achieve $0.85 today.
    - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 0.7% or so ($0.12) per month to expiration.
- **Prices (1 p.m. 5/25):** Stock: $19; options: $0.80 bid / $0.90 ask. Guidance: $0.85.
- **Stock Rating:** Buy, 2.9% allocation; we're now adding 1% in additional exposure through these new puts.

What We're Thinking

Since the expiration of our last written puts on Gentex in December 2016, we've been patiently waiting for an opportune time to reinitiate our long-running income strategy. Now that Gentex's stock price has retreated a bit from recent highs, we're happy to return at the $17.50 strike.

With the income from this strategy at $0.85 per share, if assigned, we'd buy shares at $16.65 apiece. At that price, we'd be buying at 13.3 times trailing-12-month (TTM) earnings, 6.8 times TTM EBITDA, and 12.8 times TTM free cash flow. Given Gentex's recent business execution, we think those multiples are attractive.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $16.65, or 12.4% less than the recent price.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At $0.85, that's a 4.9% effective yield in 205 days.
- **Follow-up:** For this iteration of the put strategy alone, we'll buy shares at a net $16.65 if the stock is below our $17.50 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.9% allocation first — Gentex's shares are a Buy. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1% of your portfolio, then just buy 1% in stock directly *if and when Pro* does so through these puts (we'll alert you on the boards and in the subsequent Monday Memo if and when we do).
- **Want to write other puts?** Consider writing September 2017 $17.50 puts if the price on those options holds up better than the December puts after this alert is issued. Right now, the bid/ask on the September 2017 puts is $0.45/$0.55 (a 2.9% effective yield in 114 days).

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Earnings From 4 Pro Holdings

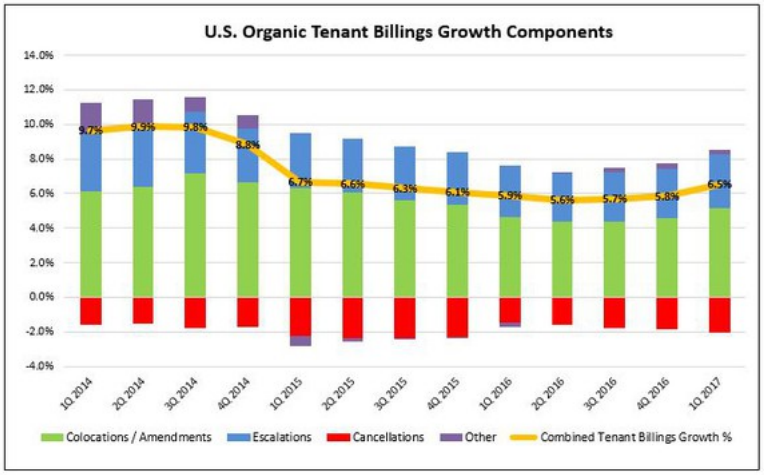
Published May 22, 2017 at 9:07PM

Dear *Pro* Fools,

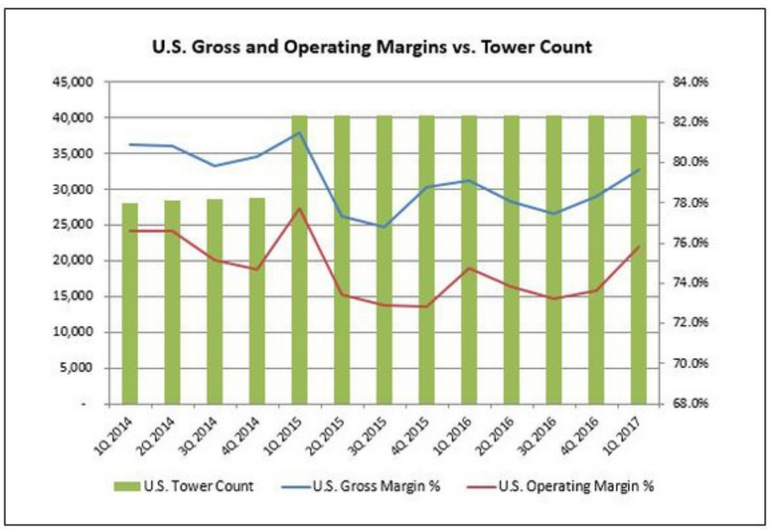
It's been a few months since the last official update on these companies, so with today's Monday Memo, I'll provide you with updated thoughts and guidance on four of the stocks in our portfolio.

American Tower (NYSE: AMT)

So far, our decision in March to roll our diagonal calls up and out to $120 per share looks like a good one. American Tower continues to execute methodically on its operational and financial initiatives, and it's benefiting from strong demand across the globe for space on its portfolio of nearly 150,000 tower sites in 15 countries. The company saw particularly strong results in its largest core market, the U.S. (56% of TTM revenue), where the 6.5% growth in organic tenant billings was the highest since the second quarter of 2015. This was supported by a recently amended master lease agreement with one of the company's tenants:



Additionally, the company continues to make good progress in improving the margin profile of the U.S. business, integrating and adding leases to the lower-tenancy (and thus lower-margin) towers it acquired in the Verizon acquisition in 2015. U.S. gross margins increased year-over-year to 79.7% (from 79.1% in Q1 2016), and U.S. operating margins increased year-over-year to 75.8% (from 74.8% last year).

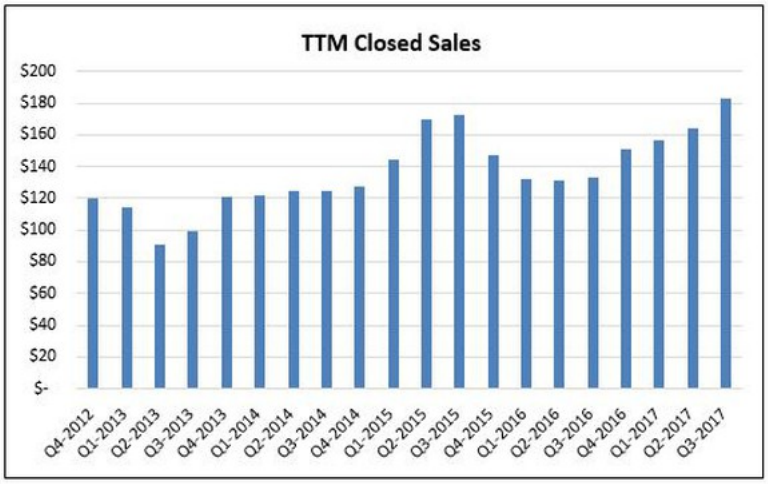


Internationally, margin improvements were a bit more muted as the company continues to acquire and integrate assets in new geographies (including the [recent acquisition of FPS Towers in France]). As a result, gross and operating margins declined from the year-ago period, although the trajectory looks positive:

American Tower's results continue to confirm our investment thesis -- that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time. Future catalysts include the recent conclusion of the [FCC's 600 MHz auction], [FirstNet], and a [potential partnership between Amazon and Dish Network]. The current wireless market environment should continue to support strong, stable growth for American Tower over the long term. **Our fair-value estimate increases from $130 to $135**, and the stock remains a Buy First at a 4.1% allocation, with 0.7% in January 2019 $80 / October 2017 $120 diagonal calls.

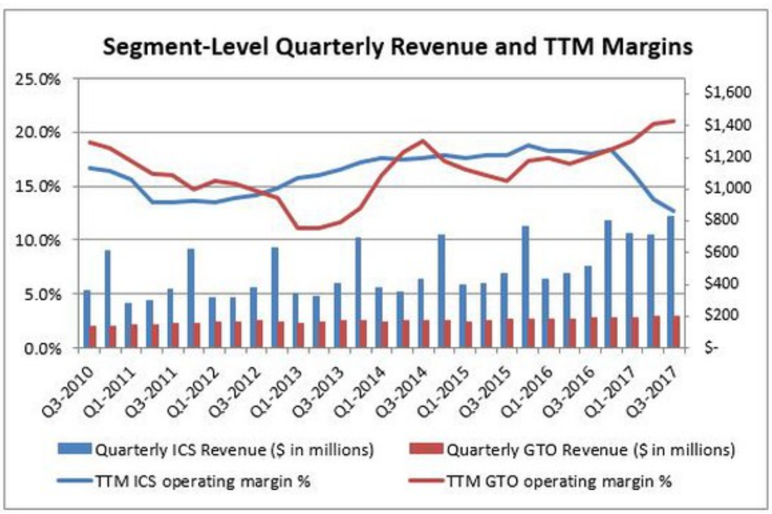
Broadridge (NYSE: BR)

Like American Tower, Broadridge continues to produce steady, stable growth augmented by acquisitions. In the third quarter of 2017, Broadridge reported revenue growth of 46%, growth in recurring fee revenue of 30%, and diluted earnings per share (EPS) growth of 20%. Closed sales (an estimate of expected annual recurring fee revenue for new client contracts) came in at $48 million, up 68% year-over-year, and year-to-date closed sales of $126 million were 33% more than last year's. TTM closed sales are at record levels, which is a representation of higher demand for the company's services thanks to the improved strength and breadth of its product lines.



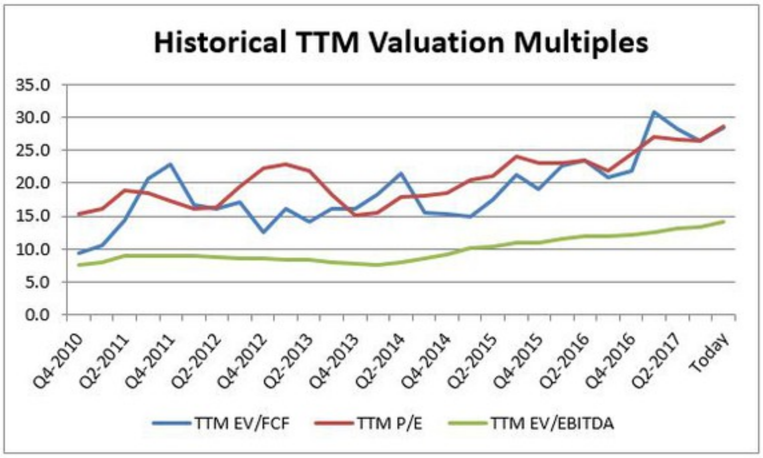
The company's recent acquisition of DST Systems' North American Customer Communications (NACC) business has led to lower companywide margins, but these should rise slowly over time as Broadridge works to integrate the NACC business via scale, cost synergies, and improved operation efficiency.

When breaking out the company's two business segments, we can see that Broadridge's ex-NACC business continues to do quite well. The Investor Communications Solutions (ICS) division shows significantly lower margins because of the acquisition, but the Global Technology Operations (GTO) business has shown strong margin expansion, generating a record TTM operating margin of 21%:



In part because of the heavy seasonality associated with the ICS business, we won't get a good sense of how the integration is really going until first-quarter 2018, when we'll have fully lapped the NACC acquisition. But so far, operational trends look good and the overall business continues to perform well.

Because of the strong performance of the business, Broadridge's stock is at all-time highs, and valuation metrics are elevated relative to the company's history:

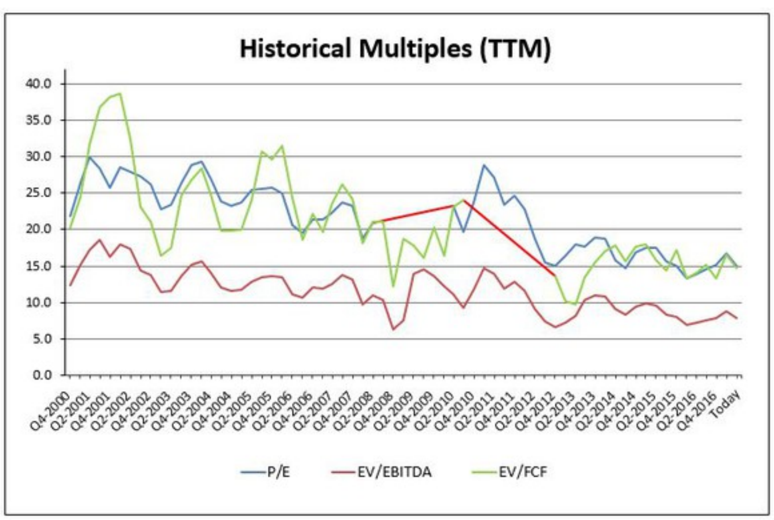


Broadridge has been one of the *Pro* portfolio's strongest long-term performers, as evidenced by its status as our second-largest position. Including options premiums and dividends, the position has generated an annualized return on investment of nearly 15% per year since our initial investment in 2010. Our fair-value estimate remains unchanged at $65 per share, **and the position moves from Buy First to Buy** as recent price appreciation and valuation-multiple expansion have affected the relative value of the stock.

Gentex (NASDAQ: GNTX)

Gentex continues its quest to penetrate the global light vehicle market with its auto-dimming mirrors. First-quarter 2017 revenue was up 12%, and global interior mirror unit volume rose 12.5% year-over-year. Compared with 3% growth in overall vehicle production in the company's primary markets, that shows Gentex continuing to significantly outpace vehicle production growth and capture market share.

Margins declined slightly in the quarter, which is typical as annual customer price reductions take effect in Q1 of each year; management expects improvement as the year progresses. Valuation multiples have compressed a bit as the stock price has declined 15% or so from a March high of $22.12.



The stock is currently trading at 15 times TTM earnings and 7.9 times EV/EBITDA, which is as low as we've seen since 2016. **Our fair-value estimate increases from $20 to $20.50**, and the stock remains a Buy at a 2.9% allocation. Additionally, since the expiration of our December 2016 $17.50 written puts, we've been patiently considering whether to re-initiate the strategy. With this recent decline in price, we're strongly tempted to write a new round of puts. We'll keep you posted.

Johnson & Johnson (NYSE: JNJ)

In the first quarterly update since its inclusion in the *Pro* portfolio, J&J posted a decent, if sluggish, quarter. The consumer division showed operational revenue growth of 1% year-over-year, the pharmaceutical business grew 0.8%, and the medical device division grew by 3%. Gross margin improvements and SG&A leverage added 240 basis points to operating margins, and adjusted EPS were up 7.5% year-over-year thanks to these margin improvements and the impact of ongoing share repurchases.

Management also provided guidance for the expected effects of the company's recent $30 billion acquisition of Actelion. Companywide operational sales are expected to grow at a 5.8% to 6.8% rate (with Actelion providing a 1.8% impact), and adjusted EPS at 5.8% to 8% (with Actelion providing a 1% impact). Additionally, the company recently provided strategy updates for the pharmaceutical side of the business at its Pharmaceutical Business Review Day, archived here. Management announced plans to launch or file 10 new "blockbuster" drugs (that means $1 billion-plus in sales) between now and 2021, and the company's pharmaceutical business looks poised to grow at healthy rates over the next several years, aided by Actelion. **Our fair-value estimate increases from $118 to $123**, and the stock remains a Buy at a 3.1% allocation.

Fool on!

Pro Catch-Up Trades and Upcoming Expirations: May 22, 2017

Published May 22, 2017 at 1:02PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio -- if you're new, start there! Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4.1%.
- **Coherent** (NASDAQ: COHR): Buy 2.5%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.4%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1% (see our recommendation).
- **Oracle** (NYSE: ORCL): Buy 3.8%.
- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.6% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- N/A

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for a small net credit (a nickel or so), or at worst for about no cost.

This month's expirations (May):

- N/A

Pro Guidance Changes and Completed Trades: May 22, 2017

Published May 22, 2017 at 12:54PM

Pro Guidance Changes from the past two weeks:

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $135. The stock remains a Buy First at a 4% allocation, plus 0.6% in a diagonal call.
- **Broadridge** (NYSE: BR): The stock moves from Buy First to Buy on valuation, with a 5.5% allocation.
- **Gentex** (NASDAQ: GNTX): Fair-value estimate increases to $20.50. The stock remains a Buy at a 2.9% allocation.
- **Johnson & Johnson** (NYSE: JNJ): Fair-value estimate increases to $123. The stock remains a Buy at a 3.1% allocation.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $96. The stock remains a Buy at a 4.4% stake.

Pro Completed Trades from the past two weeks (see transaction log):

- **Coherent** (NASDAQ: COHR): We bought 285 shares for a 2.5% stake, paying $247.50 each using a limit order. Shares remain a Buy First.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Buy Coherent

Published May 17, 2017 at 2:58PM

Is this for you? This is for all *Pro* members, but just realize it can be a volatile stock. As ever, we have a three- to five-year minimum time frame.

How You Participate

- **Action:** Buy 2.5%
- **Price Guidance:** Use a **limit order**; this is still a thinly traded stock. Today, ideally pay less than $250. Later, the stock will remain a Buy until we say otherwise.
- **Recent Price:** $242.50
- **Guidance:** Buy First
- **Fair-Value Estimate:** $280

Microelectronics. Miniaturization. Mobile computing. Wearables. Artificial intelligence. The Internet of Things. Moore's Law. All of these help to fuel the business of **Coherent** (NASDAQ: COHR), a leading producer of commercial and industrial lasers and laser services. Coherent was founded near the dawn of the laser, in 1966, and its recent acquisition of peer Rofin-Sinar for $942 million gives today's business a leading breadth of products and worldwide reach -- even as the utility of lasers continues to grow.

The Business

Named for the "coherent light" required to make a laser, Coherent offers virtually every known laser technology, from gas lasers to fiber lasers, from ultrafast lasers to semiconductor lasers to diode-pumped lasers and many more. You don't need to know how they all work (we don't), but you should know what they make possible.

Robust sales at Coherent are driven by the world's growing dependence on electronic devices, many of which can't be produced without the use of laser systems. Smartphones, tablets, televisions, wearables, personal computers, and a growing list of Internet-connected devices are made of integrated circuits, printed circuit boards (PCBs), and display panels that rely on lasers in manufacturing to increase display resolution, boost precision and functionality, and lower manufacturing costs.

Coherent's two main areas of business are microelectronics and materials processing. I looked deep into each for details of how the revenue comes together; read on to dive in with me, or if you'd rather, go straight to the financials.

Microelectronics

Coherent sells laser systems to three major areas of the microelectronics industry: flat-panel display (FPD, or screen) manufacturers; advanced packaging and interconnect facilitators; and what's called semiconductor front-end production (SEMI).

The high-volume consumer electronics market is driving an innovation renaissance in multiple areas, including screens. Flexible organic light-emitting diode (OLED) screens are poised for rapid growth, and Coherent sells laser systems that make them possible. Both OLED and liquid crystal display (LCD) manufacturing rely on laser application. Whatever the technology, FPD demand is growing beyond Coherent's expectations, with the company prepping for even more expansion of its production capacity in 2018.

And growing FPD demand is just a start. Today's tiny semiconductor wafers may not be as visibly omnipresent as OLED screens, but they're just as essential to microelectronics, and Coherent lasers make it possible to cut, scribe, and assemble them into finished products. Modern printed circuit boards (PCBs) also require extremely compact packaging and dense interconnects, which laser technology makes possible.

Coherent lasers are vital for quality control, too. Global 24/7 semiconductor manufacturing wouldn't be possible without automated laser-based inspection systems, which detect and diagnose flaws in the tiny chips as they're being produced, thereby increasing yield. Many of Coherent's UV lasers should see continued adoption in this newly complex, nanometer-scale industry, and the company is also well-positioned to take advantage of an emerging trend toward using sapphire instead of glass in ever-thinner, ever-lighter devices.

Materials Processing

But microelectronics is only half the story at Coherent (literally, at 49.9% of revenue last quarter). Materials processing – the cutting, joining, and marking of materials mostly using fiber lasers – was the other big contributor, at 30.1%. Original equipment manufacturer (OEM) components and instrumentation made up 13%, and scientific and government markets were 7%.

Materials processing was a relative weak spot for Coherent until the Rofin-Sinar acquisition in November. In the first full quarter as a merged company (reported this month), bookings in the division more than doubled from the prior year, and demand particularly jumped from automotive and machine tool OEMs. Coherent's other, smaller markets include bioinstrumentation, for things like microscopy and DNA sequencing; medical surgery products; and worldwide research in areas such as physics, chemistry and health.

The Financials

Coherent's revenue -- and its share price -- have soared lately, but selling lasers and assorted systems can be a somewhat choppy business, one that isn't likely to grow in a straight line. Read on to learn why we're not worried, or if you'd rather, go straight to how it fits into *Pro*.

Although Coherent's revenue is up by 14.7% annualized over the past three years (9% annualized over the past five, all pre-acquisition), further growth is unlikely to be linear. Laser systems are expensive, and orders take time to finalize. This isn't a "typical" *Pro* investment, where we hope to see revenue grow each and every year; this one will require some patience. But we believe that consumer electronics and automated manufacturing have us on the cusp of much greater worldwide demand for laser systems, providing the potential for much greater revenue and reducing the odds for lengthy revenue hiccups over the coming five to 10 years. And investors are catching on to this thesis, as shares of Coherent and other competitors have soared. (We're far from discouraged! This suggests the market is recognizing the long-term potential in the industry.)

Coherent is getting more profitable as it grows, with its return on capital and return on equity rising to 10.6% and 13.4% respectively over the past year, meriting a higher stock valuation. The shares trade at 19.6 times expected earnings one year ahead, while the stock's average P/E since 1994 has been 31.3. (This is in part because of slow cycles during which the P/E soared, but it's still instructive.) For long periods over the past two decades, the stock traded at a P/E in the mid-20s, and today's business is stronger and arguably has more potential than before. With $6.35 billion in market value, the stock trades at 33 times trailing free cash flow, which should grow with the business and as synergies with Rofin improve.

With record revenue backlog and strong visibility toward future demand, management says Coherent is well-positioned to grow, and aims to increase margins along the way. We're investing with our eyes on five and even 10 years from now, when -- given how quickly technology is learning and proliferating -- smart computing devices made possible by lasers may be running our lives.

How It Fits Into *Pro*

Fellow *Pro* holding **Skyworks Solutions** (NASDAQ: SWKS) recently shared industry projections showing Internet of Things volume expanding fivefold to 75 billion units by 2025, driven by "connected homes, smart grids, factory automation, wearables and virtual assistance." Wireless connectivity is Skyworks's sweet spot -- and Coherent lasers will play a part in building many of these connected devices.

The company sells dozens of laser models to dozens of industries, and 26% of last quarter's revenue was recurring (parts, consumables, repairs, and related services). That's nice to have, but the real story here is an ever-greater need for lasers in the manufacturing of ever more electronic devices and other items. This is a volume story -- and a story of rapid change. As the components that companies use in technology products rapidly evolve, the lasers used to build the products and test them must evolve, too, resulting in new sales for Coherent. We see how quickly tech is evolving, so rather than investing in one particular technology, we're investing in a means for putting most any technology together.

Pro Can Help

Where Is Pro Looking Next? Plus, Some Earnings Knowledge

Published May 15, 2017 at 3:28PM

Dear *Pro* Fools,

We're in the home stretch of another quarter for our companies, and as always, we're working to give earnings news enough weight without putting too much importance on it. One thing I aim to accomplish every quarter is incremental knowledge: learning something new about each company in our portfolio.

To do so, I usually consult multiple sources, primarily the quarterly conference call and the SEC filing. As an investor, it's best when any new questions that arise in your mind during your reviews can be answered by the company itself. But each quarter is a mere snapshot; what we *really* need to do is make connections -- connections between business events in the world and our companies, between today and the future. Where is each company headed? *That* is what Wall Street aims to estimate in putting a price on a stock.

What's Next in *Pro*?

Speaking to what's coming, where are we likely to invest next in the *Pro* portfolio? This could change, of course, but steady reading and research over the past months has led us to pursue a handful of areas for further investment:

- Miniaturization, microelectronics, mobile computing, the Internet of Things (IoT)
- Artificial intelligence (AI)
- Robotics
- International investments
- U.S. housing
- Trade

Of course, we have investments in most of these areas already, including **Skyworks Solutions** (NASDAQ: SWKS), **Apple** (NASDAQ: AAPL), **Facebook** (NASDAQ: FB), and **Amazon.com** (NASDAQ: AMZN), not to mention **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS). But many other interesting companies are riding what appears to be an enormous long-term trend toward AI, and smarter technology in general. Companies that don't embrace AI -- or that don't use tech to make customer interactions easy and efficient -- are likely to be left behind.

Elsewhere, U.S. stocks have led the world for nine years, but the baton of leadership historically passes back and forth between regions. Is it happening again? International stocks have started to outperform U.S. stocks this year. Nothing is guaranteed, but a change in leadership usually lasts for at least a few years, and either way we see less expensive stocks in Europe and elsewhere.

Another bright spot: The U.S. housing market is likely to continue its slow but steady long-term growth as millennials -- now the largest generation in the U.S. -- buy homes. That's true even as housing starts lag the number of families forming. And finally, trade is going to continue to increase over our long time frame, despite some calls for protectionism.

We look forward to adding new investments to *Pro*. Today, let's touch on earnings from some existing ones.

Learn Something New Each Quarter

AmTrust Financial Services (NASDAQ: AFSI): The stock remains on Hold, and we have a protective collar on it (which is profiting us, because setting it up paid us a credit). The company reported weaker-than-expected earnings for several reasons, sending shares lower. This position has taken more of our time than any other this year, and we have yet to decide whether we'll cut it lose or keep it, but we want to protect it while we debate its fate. The underlying business is attractive, with recurring revenue and healthy profitability, but not if we can't trust the numbers from management 100%. So that's the end result we want. We'll have more info for you well before our protective collar expires in June.

Facebook: Facebook remains a Buy First; given our large 7.4% allocation, newcomers might want to invest half that and see where their comfort level is for several quarters before considering adding more. Trading at 26.8 times earnings estimates for one year ahead, the business is reasonably priced as it continues to grow. As always, though, it could decline in the near term in a weaker market. With nearly 2 billion monthly active users, Facebook has built the world's largest friends-and-family network, and it's now working to build communities, both locally and globally. Increasing advertising revenue is being reinvested in new growth avenues, and billions of dollars in free cash flow are still building the balance sheet. Management is working with outside developers on "bots" in Facebook Messenger as a way to supplant or replace traditional apps.

Gilead (NASDAQ: GILD): Our stalled biotech investment appeased some fears when it kept its 2017 guidance unchanged this quarter, suggesting that some stability might be entering the Hepatitis C market. Still, quarterly revenue was down 12% year-over-year, bringing it back to 2014 levels. Now, Hepatitis C sales are getting slammed when competitors enter Gilead's markets overseas. Though shares trade at only 8.4 times expected earnings for the next year, they remain on hold. We're writing covered calls in hopes of earning 10% annualized (with the help of the 3% dividend yield); in the meantime, the position buys us more time to see what Gilead might do next to grow again. We recognize we might lose our shares in the process, but it's a chance we're willing to take.

OpenText (NASDAQ: OTEX): The company's new AI platform, Magellan, will debut in July, to be available for customers early in the next fiscal year. OpenText continues to drive toward higher margins and 90% recurring revenue by 2020, with revenue up 35% this quarter to $593 million, 85% of it recurring. The integration of some acquisitions brought down margins, but that should be rectified before long. The stock remains a Buy at a 3.2% allocation, and our current $32 fair-value estimate is on track to move to $35 or $36 in a quarter or two.

Shake Shack (NYSE: SHAK): Our short was initially down 10% on earnings news, but then ended 10% higher. How's that for volatility? Same-store sales declined 2.5% as traffic dropped 3.4%. Investors ultimately focused on the seven new company-owned locations opened in the quarter, and new plans for 23 to 24 company-owned Shacks opening in the U.S. in 2017 -- guidance that had been raised by (wait for it) all of *one* unit. Employee costs continue to head higher (as they should -- people need to earn a living wage), and so does the valuation. The stock now trades at 72 times expected earnings for the year ahead, higher than it used to despite lower bottom-line growth. Still, from 72 owned locations today, Wall Street is mesmerized by the idea of 450 locations *years* from now, and the financial metrics per location are strong. As a result, this is *not* a long-term short for us. We want to see Wall Street reprice the stock sooner rather than later, because the very long term should be positive if the brand holds up. For now, it remains a short at 0.5%.

Skyworks Solutions: The stock remains a Buy at a 4.4% allocation. Those without options on it should keep it that way, just owning the shares. Skyworks' customer list reads like a "who's who" of the consumer-technology world, from all of the major phone makers to wearables to the IoT; last quarter, it also secured design wins at three leading car manufacturers. Always-on connectivity is increasingly complex, and Skyworks works closely with customers to create custom architectures. The trend is only growing, and unlike many other microelectronics or "semi" stocks, Skyworks remains inexpensive at 15.1 times expected earnings. Our fair-value estimate has ticked up again, to $96, and that's conservative. Our covered strangle is earning us premiums, and we'll manage it accordingly until we end it.

Please ask any questions on the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Video Chat, May 2017

Published May 15, 2017 at 2:31PM

The *Pro* team will be holding **a live video chat on this page at 4 p.m. Eastern on Tuesday, May 30**! We'll be using sli.do to communicate with members during the chat; click here to learn more about how that works. The specific Slido code for the event is #ProChatMay; click here to be taken directly to the chat, or go to the slido.com site and enter #ProChatMay.

Transcript

JEFF FISCHER:

Greetings, *Motley Fool Pro* members, and welcome to your May 2017 *Motley Fool Pro* chat. I'm joined at the table by J.P. Bennett…

J.P. BENNETT:

Happy to be here, Jeff.

JEFF FISCHER:

…and through Skype with Billy Kipersztok.

BILLY KIPERSZTOK:

Hey, Jeff.

JEFF FISCHER:

Hey, Billy. I'm Jeff Fischer and we're really glad you're here. We're going to talk about the portfolio and get to your questions, today. And I'll start with a little one-minute prelude before we get to your questions.

So you can ask questions. Go to slido.com. You can see, here, on the video page that you can click to slido.com. The code to get in is ProChatMay. Then you can ask your questions, and thumb up questions to get us to the ones that you want answered first. We're going to try to answer all of them, though, and you will be amazed if we do. So go to slido.com, put your question, there, and we will start answering them in a moment.

Before I ramble a bit more, are you guys both doing well?

J.P. BENNETT:

I'm a little bit tired working on my FoolFest presentation…

JEFF FISCHER:

FoolFest is Thursday, Friday.

J.P. BENNETT:

…and some other things we may have in store for members this week or next week at the latest.

JEFF FISCHER:

It's been a busy year on that front. We're on a faster pace of trade alerts than we've done in years and I don't think that will change anytime soon, really. Billy, are you doing well down in Florida?

BILLY KIPERSZTOK:

I'm doing great, Jeff. I am feeling healthy, well, and full of energy.

JEFF FISCHER:

Foolish! That's perfect. Good. That's awesome. So in my one-minute preamble, I'm just going to talk about what Warren Buffett calls *one-decision stocks*. That is a stock where you only have to make one decision on it, and that is to buy it and then hopefully buy more of it.

The reason you are hopefully putting yourself in that position — and it's certainly what we're aiming for with most of our stock purchases — is we're trying to find from day one a company that we'll be able to keep reinvesting in itself (generate cash flow, reinvest that cash flow into new business, and keep growing in that way, and thereby compound its value). Compounding machines, basically, is what we call them.

But in the age of rapid technological change, political change, [and] worldwide change, really (the world's arguably changing more quickly than it ever has, driven largely by tech, but also by some geopolitical factors and the mobility of the population), it's more difficult to find one-decision companies; a company you can just buy and hold forever, especially because we're not really drawn to the Campbell Soups or the Coca-Colas of the world. The staple food or consumer staple business that may not change much over decades.

J.P. BENNETT:

I don't know — they're changing now.

JEFF FISCHER:

Yes, there's a lot to be said for that type of business, but even they have to change a lot, and we're looking for things that are more dynamic, which is why we've ended up in things like MasterCard and Visa, [which] come to mind, and Verisk. And even Apple. Is Apple a one-decision company? That will be interesting if it is. They'll really have to keep innovating. They have a lot more cash than they've needed so far, so they're not reinvesting the way we wish they would, but they're also not burning money, so that's good.

Anyway, we're always trying to find companies that ideally we can own with you for the next three, five, ten years and grow with those companies as they keep investing in themselves to grow even further. And I love the challenge of it, now, because everything is changing so quickly. I'm drawn to technology companies, and I want to find those relatively few technology companies that are going to have the advantages that keep them at the forefront of the industry, even as the industry rapidly evolves.

And that's not easy. Let's remember [that] Apple was nearly bankrupt 15 or 16 years ago and Microsoft bailed them out. I wonder how they feel about that now. That speaks to why we would buy something like Coherent, which makes lasers and systems that help put technology together, instead of buying a technology producer itself. Instead we short GoPro, for example. Coherent is a way of buying the tool provider instead of the product maker, if that makes sense.

But to boil this down into a final statement, we're trying to find companies that have tailwinds the next three, five, and ten years and that ideally we don't have to sell. That we can buy more and more of over time and really enjoy owning. Longtime *Pro* members may say, "Well, you've sold quite a few things in the past," and we have sold things this year, too. I'll say for better or worse, we've had more turnover [of the team than] in the past, and we also didn't have as much focus in the past, either.

In 2008-2009, a lot of what we were wondering was how the economy and markets [were] going to work after this Great Recession. Now I think we're seeing, in large part, they work the same way. That's a good thing, and now we're hoping to invest for the next five to ten years, in that light, in companies that the whole team loves and will continue to own for a long time with you.

So that said, we know landscapes change and we have to remain diligent, as well. That was just diligent.

BILLY KIPERSZTOK:

Is that a real word?

JEFF FISCHER:

I like what I'm trying to say. And as you've seen, we've made several sells this year, as well. So if something's not right for the portfolio, in our opinions, we will sell it. Speaking of that, I'm sure we'll have questions about selling today. Let's go to slido.com and start to answer your questions.

As we move over to that, I'll do the usual summary. We're 80% net long — a little bit more than 80% net long — 82% net long. We're up 8.2% year to date as of this morning, so we're right in line with the S&P 500. We're a little light on shorts, right now. We've closed some shorts, recently, and we continue to look for shorts. I know we'll talk about hedging today, as well. Let's get to your top questions. We have one from Lon. J.P., do you want to read that one?

J.P. BENNETT:

"Hi, *Pro* Fools. With a lot of discussion on the boards about the recent AmTrust 300 million shares to the Karfunkels, what are our latest thoughts?"

JEFF FISCHER:

My latest thought is what was shared a few weeks ago, as well. We have this protective collar on the company. It's coming to an end probably sooner than expiration because in the last five days the stock has gone from under $12 to $14 and now back to $12 something. So our put options, as of right now, are all time value, and they're delta.

The amount that they'll move with the stock has plummeted in just the last few days to $0.34. They'll move about $0.34 right now for every dollar move in the stock, so they don't protect us that much, and its time value is going to dissipate quickly with expiration coming up. We believe that very soon we'll have a decision on our next move. It could be as soon as this week. It will be next week at the latest.

That could be to exit everything, as we talked about before. Just end the position for now and see what plays out next. It could be to keep it, but only if we can keep it protected at a reasonable price, because there's still too much uncertainty to keep even what is now a 2.3% holding in AmTrust unprotected, in my opinion.

J.P. BENNETT:

Even looking at just this $300 million deal, there's a lot of uncertainty around that, too. Like what were the motivations? Is it a captain going down with [his] ship and they're not really able to see what's happening? You've seen that play out with a bunch of businesses that have really struggled when they've fallen from their peaks. Management isn't able to adjust and come to grips with that new reality. Or is it a case where this is a once-in-a-lifetime buying opportunity for them and they're positioning themselves to make a ton of money?

I know in the past — and the past may not be a very good gauge of the future — they've been pretty strategic in when they've bought shares and it's worked out quite well for them. You just have to wonder what's really going on. Did the company need that cash that badly that they had to do a private placement? It didn't do anything to clear up the clouds surrounding the company.

JEFF FISCHER:

I agree. I was surprised. I posted to this last week. It's surprising to me that they would sell shares at this low price and that they're talking about collecting the $300 million and using it to pad the balance sheet. They've always talked about what a strong balance sheet they have and now their financials are supposedly completely clean and they feel adequately reserved. My concern is [whether there] are past under-reserving issues that are going to bubble up and that's why they're padding the balance sheet further. It's just things we don't know, as J.P. said.

So I'd say the $300 million is a push. That said, like you said, they have been good investors in the past. The Karfunkels have stepped in and bought a lot of shares in the past and made money on them. The whole thing is definitely a black eye on us this year — what has happened to AmTrust. It's down by about half. Our hedges have helped a little bit, but still it's been an unfortunate position that we have to remember will happen from time to time.

It's been rare in *Pro* and it's been a long time that I can recall having a stock fall that much. So it surprised me, as well, but we're dealing with it the best that we can in the way we think is best for all of us and for you, primarily … to protect ourselves, not knee jerk sell, and get out just because the stock is beaten up. But to sell for the right reasons if we're going to sell and luckily we have that collar while we make that decision.

BILLY KIPERSZTOK:

It's an especially interesting scenario given that AmTrust accounted for a very healthy gain for the early portion of its positional history.

JEFF FISCHER:

Yes, it's true.

J.P. BENNETT:

And it's always important to keep in mind that every great investor makes mistakes and has positions that don't really work out for them. But it's really important, like Billy alluded to, [that] we had really great gains on the stock, but you almost have to consider those a sunk cost. You can't let that influence your decision going forward and you don't want to, like you said, knee jerk and be like, "Oh, man. I have to try and recoup whatever I can before I give it all back and so I'm going to sell."

[As] we do when we're analyzing businesses, you have to put the stock price in your current return on the position by the wayside and look at the business. Look at what's going on. And then, after that, you can bring that situation back into the fold to help influence your decision.

JEFF FISCHER:

That is true. I was speaking about this with my wife, who is a long-term Fool. She started at the Fool in 1996. She hasn't been here for quite a while, but she was a Fool back in the day, and still is. So we were talking about AmTrust. She's known it since 2006, as well, when we first bought it.

And she said, "If it's a question of trust — if they broke your trust — all of society works on trust, but occasionally all of us, in our lives, have instances where that trust has been broken, and if it is you have to decide if you're going to give the entity that broke your trust another chance, or if you're going to move on from it. If it was a question of a mistake that they made — if it was an honest accounting mistake and you see them trying to correct that, which it appears they haven't — then odds are you want to give them another chance."

I, honestly, cannot decide if it was intentionally done or if it was a mistake, and so…

BILLY KIPERSZTOK:

I don't think we have the ability to know that, given what's publicly available to us.

J.P. BENNETT:

Yes, only time will tell. This is definitely going to be a hindsight story where if it works out, "Oh man, this was so clear that this is just a one-time thing. They're going to recover from it." And if it doesn't work out, "Oh man, the signs were everywhere. Shorters have been calling for this stock to get hammered for years." We should have been able to see it coming, but, again, with investing you can't really let that creep into play. You have to look at the scenario as it currently lays and it's very uncertain. It can go either way.

JEFF FISCHER:

That is true. Let's get to some other questions. We have quite a few about hedging. Crystal is asking, "How much protection does the current QQQ hedge offer? How much of a drop are we protected for? How much is protected of the portfolio? How can we increase it?"

All good questions and we're looking at our hedges, or this hedge, right now and we do every week in our weekly meeting. In the past few weeks, the market has rallied again to brand new highs today with Amazon leading the way.

BILLY KIPERSZTOK:

Amazon, by the way, breached $1,000. It's a milestone.

JEFF FISCHER:

It's hard to believe. I remember when it was — I don't even want to talk about it. I remember in 1997 when we put the buy report out on it. You're looking at a guy who could have bought and held Amazon for the last 20 years like David Gardner did. So how much protection does this offer us?

Right now the market's up so much that our long put option on the Nasdaq starts 11% below their current market price, so we need to roll it, as we've done in the past. We rolled it profitably just a few months ago, and we're looking to roll it higher again. And it looks like we can do so for another credit, so we're making money on this hedge as the market goes up [and] we like that.

But we also have to be careful about our downside exposure in the put ratio spread, which does exist, right now, at $110 per share and the QQQ is $141 per share right now, so it's quite a bit of a cushion before our downside. But as we roll up, that downside will roll up a bit, too. We're hedging about 15% of our portfolio value, including cash, so essentially we're hedging out about five or so long positions, on average.

How can we increase it? You can just buy more puts than you currently own, and you don't have to write put options to buy those puts. You don't necessarily want to increase your downside risk, but, of course, the puts are expensive so we do plan to address this hedge. Improve it. Bring it more up to speed and up to the current price, and trade alerts will get us there.

BILLY KIPERSZTOK:

One thing to keep in mind, Crystal, is I noticed in the question you mentioned protection. You said the word protection three times and then you asked how we can increase our protection. Hedges do protect against a decline in value in your portfolio, but they're not free. Keep in mind that anytime you're hedging something, you're giving up something else in exchange for that.

So hedging is a tool you can use to reduce your risk, but you're always going to give up something in exchange. If you want to increase the amount of protection in your portfolio, you're going to have to give up something to obtain that. That's how you need to think about hedges.

JEFF FISCHER:

That is true, and how much downside protection do we have? How far down? We actually have a $125-$114 put ratio spread. So you look at that spread of $11 and you subtract the $11 from $114 to get down to $103, and that's our breakeven. So all the way down to $103. The index is $141 right now, so that's almost 40% lower. This hedge helps us to that extent. So plenty of room, there, for it to help us if the market does decline. But, again, we're looking to manage our hedges by adding or moving this one, so we should get to that pretty soon.

We have Anonymous asking, "When setting up a LEAP call option, buy to open call on a diagonal call, why do we strike deep in the money?" In other words, why do we buy a call option that has a strike price of say $80 when the stock is $115? And either of you can answer that, I know.

BILLY KIPERSZTOK:

J.P.?

J.P. BENNETT:

It basically gets down to how much you want to pay for that leveraged upside. If you look at the two components of an options buy (the intrinsic value and the time value), the closer you go to being at the money, the more time value you have to pay, and that's the part that's going to waste away if the stock does nothing. We're not a big fan of paying for something that's going to waste away.

You can still get significant upside and significant leverage by moving down in the money and you can significantly reduce the amount of time value you have to pay. If the stock doesn't do anything, that time value whittles away but you're losing a fraction of what you would pay should you go at the money. So basically it is a scenario where we want that leveraged upside, but we're not willing to pay whatever the market wants in order to get it.

JEFF FISCHER:

Exactly. In general, the guidelines (and they should be at *Motley Fool Options*) [are] we don't want to pay more than 3-5% time value per year, and we're looking to buy a call option that's typically 20% in the money, or so, and that we believe could double in the next year or two to compensate for the risk we're taking. And that's typically a double if the stock gains, say, 20% or so.

J.P. BENNETT:

And one of the big counterpoints to that is that people say, "But you could lose that intrinsic value if the stock falls and you can end up with nothing." Like you said, there is a risk to that; but at the same time, it's like buying a stock. We would never set up a LEAP position on a stock if we didn't like the business and really like the price that we're getting into and have extreme confidence.

You can do it to minimize risk. If you want to gain exposure in 100-share increments, you can probably do that for a little bit less than buying the stock depending on where the share price is, but at the same time we want to be cognizant of the amount that we're paying and do it for a cheaper cost, but then minimize the risk.

JEFF FISCHER:

And to clarify, when I was saying buy a call that we hope will double; I was just speaking of a long call by itself. With a diagonal call, frequently we're not looking for that much upside. We'd love to get it.

J.P. BENNETT:

Unless we uncover it. Then we want all the upside.

JEFF FISCHER:

And with the diagonal call, we're hoping to speak to what J.P. said — to earn back the time value in the very first one or two diagonal calls that we write. So again, we're looking to minimize time value. I hope that helps answer the question. If it doesn't, go to the *Options* board and ask again. But I know we do have a guide to diagonal calls — a PDF one-page guide — that speaks about this, as well. I'm pretty certain.

J.P. BENNETT:

And I'm sure there's probably like a weekly on it someplace. I know you were doing a great job of checking off all of those questions that we get frequently in terms of positions and setting them up, so it might be worth checking out.

JEFF FISCHER:

Another good question from Anonymous about our conviction on O'Reilly. Definitely it's right up there with AmTrust. It's been one of the companies we've talked about most this year and for good reasons. J.P., any thoughts?

J.P. BENNETT:

Do you want me to start?

JEFF FISCHER:

Yes. I want you to start, hit a middle, and finish.

J.P. BENNETT:

OK, I'll take all of it. Like we've said in the past, we do think that there are favorable tailwinds that could benefit this particular position and the industry, in general, in terms of the complexity of cars. Millennials' preference for speaking with someone.

But that's not to say that they can completely override potential changes in terms of autonomous driving, and Amazon coming in and trying to make a really big move. Those are definitely things we're considering because they are issues that 10 years down the road we want to be able to double our real purchasing power every 10 years. Those are situations that could permanently impair that prospect. It may make it impossible because the competitive landscape just shifts and makes O'Reilly [no longer an attractive] investment. So we're considering those.

But we don't want to be too quick in pulling the trigger on those, because it's 10 years out. It's impossible to predict how things are going to play out and whether or not they're going to impair O'Reilly as a stock.

The thing that we're honing in on as of late — you're getting a lot of reports, right now, talking about how autonomous driving is the next thing and Amazon is going to kill all of these guys. So that's getting a lot of mindshare in terms of what's being talked about on the news and I think that is definitely having an impact on the stock.

But the thing we're really trying to key in on is if you think about it in terms of like you said in the past, we want really good returns over three to five years and then the prospect of having that position we hold for a really long time. If you look at it in that short of a time frame, the issues that could potentially crop up and hurt O'Reilly may just have to do with the evolving retail landscape.

So if you think about their customers, these are customers that, by and large, for financial reasons, are deciding to do things on their own. They want to save that extra money and they need it really fast. So maybe they could save more with Amazon, but they don't have that time. They need to get to their job.

But if you look at what's going on with retail, which employees, depending on where you look (one in every nine or ten jobs), if that industry becomes structurally impaired, which it looks like it is quickly heading down that route, and a bunch of jobs are lost, and people struggle to regain that income; that could actually end up being a really big headwind for O'Reilly because a huge subset of their customer base no longer really has the means.

So maybe they have to downsize and only go with one vehicle in their family. Or maybe they have to postpone repairs for even longer. Maybe they hear a knock in their engine or the A/C isn't working, but they just stretch it out as far as they can go. And so these are issues that we're trying to focus on, because these are the issues that are really going to have an impact on the business over the next three to five years.

Autonomous driving is something 10 years down the road [and] is playing on investors' psyches. As of right now, it isn't impacting O'Reilly and the business fundamentals, but these other issues are, and so that's kind of where we're at. We're stuck between a rock and a hard place because there are threats for 10 years down the road and then there also appear to be threats for three to five years.

So we don't want to rush, like you said, and just sell the stock when everybody doesn't like it. When it's got so much negative publicity, the stock is really beaten down. One good earnings report and all of a sudden it looks like things are much better and the stock rips higher. We don't want to do that, but we have to be cognizant that there are a lot of factors at play that weren't at play previously, and it may end up being a case where O'Reilly is another one that we need to reconsider.

JEFF FISCHER:

I agree. I'd put our conviction, with all that said, at about a six, probably, out of ten. As we said at the open, we're looking for companies that we hope to own three, five, ten years and J.P. just mentioned three, five, ten years many times in his description of the situation. If we're not confident in the next three to five, then we need to rethink it, as J.P. said, and so we are actively doing that.

That's why I look at something like Best Buy, which was left for dead five years ago, and [it hit] all-time highs last week because they've figured out how to do it. I personally think, as you said, J.P., the autonomous car is further away than people are saying. Even so, though, I don't want to discount it or the tremendous technological changes that are coming to cars soon in the next five to ten years. It's going to be exciting, even if it takes longer than that to get to self-driving cars.

J.P. BENNETT:

Twenty years ago O'Reilly was probably looking like a buy-and-hold forever stock. The landscape has definitely changed, and I will, just to piggyback what you were saying with regards to confidence (and I know we've touched on it in previous live chats), the coming quarters are going to be a very interesting scenario for O'Reilly in that we had a number of potential one-time factors in terms of the delay in refunds and just the wonky weather that we were having in terms of having good weather when we wanted bad weather, and having bad weather when we wanted good weather.

So the past two quarters weren't great [and] the stock got crushed, but there is the real possibility that that was just the market extrapolating one-time issues and just assuming that it was the Amazon effect. *The New York Times* article was published. It took two days and now Amazon is already killing O'Reilly. It could just be those were one-time issues, and if the business normalizes…

I know O'Reilly, and I think AutoZone has well spoke to the run rate exiting the quarter was far better than where they were in the middle and the beginning of the quarter. So if that run rate exiting the quarter holds and the fundamentals return to what we've seen previously, it may be a case where we should continue to hold and just monitor the situation. But if things continue to deteriorate, then there's actually something at play, here, that is potentially structural that we need to really examine.

JEFF FISCHER:

Exactly. Shares are down 11% year to date, so not horrible, but clearly not something we want. The one thing we're trying to do, though, is watch it closely enough that we exit before the ground shifts under their feet. If there's going to be a structural change, as you just said, J.P., we want to be at least respectably ahead of that. It shouldn't hit us upside the head like, "Oh, my gosh. The business has changed."

J.P. BENNETT:

Never saw that one coming. If you look at what happened with The Buckle, we did get out pretty early on. I think we were the first Fool newsletter to sell the stock. But still, we saw it coming, and part of that was what you alluded to before in terms of a turnover in the team. We had to get up to speed. I had to get up to speed with the business and reach a decision, and you don't want to be hasty and not considering the person you just replaced actually really liked the stock.

But that was one where we could have probably pulled the trigger earlier and we definitely saved a lot of gains by doing that, but we don't want to be in a situation… We don't have that scapegoat this time. We can't say there's team turnover.

JEFF FISCHER:

Right. We'll have to turn the team over a bit. Two more really quick thoughts on that — if I can remember what they were. One is O'Reilly is near the top of the list if we want to raise cash to get more defensive. But that's always been the case — that selling a retailer as opposed to a Verisk or somebody with a lot of automatic recurring revenue makes sense for us.

And the other thing is we have buy first, buy and hold. We're contemplating changing our hold to name any company that we're not confident that we want new members buying for the next three years. Just moving it to hold. That speaks to our idea that we're comfortable keeping O'Reilly right now, but if we were to create a three-year list of things we may sell in the next three years. O'Reilly is probably near the top of that list.

So what if we put it on hold for two or three years where those of us who own it keep owning it, but we're not telling new people to own it because we may not own it for our minimum three years from here forward. So just a confusing thought that I wanted to share right now. Actually, we'll lay it out very clearly if we do go that route.

We're already halfway through, so let's go on the speed round for the rest of this half hour.

BILLY KIPERSZTOK:

Yes, we've gone on a pretty slow pace, guys. I think that was maybe three questions in a half hour.

J.P. BENNETT:

Is Gillies a part of this live chat?

JEFF FISCHER:

So the collar we can probably get through. David is asking about the collar. He'll be on vacation (I hope it's somewhere great). "Any issues if I close now? How soon do we expect our recommendation?" There are no issues if you close now, but I don't think I would just close the collar. I would close the whole position, because I don't want you to own shares without protection, even though it's a relatively small position now.

How soon should we have our recommendation? I believe that it will be this week or next week at the latest. This week would be ideal. We'll see if we can get that out. So yes, David, I don't think there's anything negative [from] closing right now if you want to.

CP1 is asking, "How much farther do we think Gilead could drop before hitting the bottom?" Nobody knows, of course, but I'm hoping that it's near. What we need to see is the hepatitis C market stabilize at least for the time being so they can point to that and Wall Street can be calm for a while. Then hopefully they can put some new irons in the fire through their pipeline, or really through acquisitions.

The plan, right now, is to continue to write covered calls on that stock to try to generate a 10% annualized return through covered calls, the dividend, and then the stock itself, but that really banks on hepatitis C sales being stable. They were last quarter and it looks optimistic. The company did not change its 2017 guidance last quarter, either, so they feel okay about it so far.

Hopefully we have seen, by far, the worst in that stock. It, along with O'Reilly and AmTrust are all the ones that we're most likely to sell or raise for cash, which in a way makes sense because all are struggling in some ways and none have a clear path to bright skies for the years ahead. So interesting that members are focused on these three, as well. Billy?

BILLY KIPERSZTOK:

I was just going to say the same thing you just said, Jeff. It's not a coincidence that these are the top questions.

JEFF FISCHER:

Indeed. That's good. And I think if you add it up, those three positions are about 8% of the portfolio, so not meaningless by any means. About half of that is O'Reilly.

Gary is asking when to sell, or raise cash, or simply exit a position. "What positions in *Pro*, if any, are you thinking of selling?"

I can quickly say that we have AmTrust on hold; we have Gilead on hold; we have O'Reilly going back and forth from hold and buy…

J.P. BENNETT:

It was just on hold not too long ago.

JEFF FISCHER:

So those three are near the top barring any big changes or surprises. We also have 20% cash, so we don't need to sell, but if we think a position is going to perform poorly, we'll want to sell it, because cash is safer than a poor-performing position.

J.P. BENNETT:

And I would also note, as we approach the one-year anniversary of FoolFest, last year we gave a discussion on selling stocks. I don't know what the title was for that, but if you are able to find it in *Pro*, that would probably be a pretty good resource, because we did go over a lot of our past sell decisions…

JEFF FISCHER:

Yes, that's true.

J.P. BENNETT:

…and how our thoughts and how our process influenced those decisions.

JEFF FISCHER:

That's true, and this year you've seen some sales, as well, including TD Ameritrade and Valmont. Two more questions. "Broadridge and MasterCard are large positions traded well above your fair value estimate. Neither was mentioned in the last catch-up trades."

BILLY KIPERSZTOK:

I think there's an update, here. It says, "What to do if we have no exposure?"

JEFF FISCHER:

Both are rated buys, so you should start with your exposure. At least, I would say, start with half a position and then add to it over time, whether that takes you several quarters, or one quarter, or a year or more. It's your comfort level.

But we watch both closely. Broadridge is a bit above its fair value. MasterCard's fair value we keep conservative. It is on my list to update it. It's $105 right now and the stock is $121. The shares have run quite a bit in the last few weeks. It's a 5% position. Both of them are 5% range. But if you can start with half a position in each, and then go from there, with any luck we'll get a market downturn. But if not, at least for the time being you have half a position.

BILLY KIPERSZTOK:

And with respect to Broadridge, the fair value estimate tends to only get updated on a yearly basis because this is a very seasonal business, so you can't really project trends and you have to wait for the big quarter. [It] is around filing season [that] is their fiscal fourth quarter, which is going to be, I believe, next quarter for Broadridge.

And then also with Broadridge, three years ago, in 2014, they had a three-year financial analyst day and update, which I used to help me build my financial model and my fair value estimate. That concludes at the end of fiscal year 2017, which again is in either one or two more quarters. I can't remember.

Once Broadridge does their next update of their financial objectives for the next three years, which they should be doing pretty soon, I should be able to update that fair value estimate. I wouldn't really anchor too hard on those fair value estimates, because they can remain static even though the business is increasing in value, and they're very general. I would focus more on our commentary and you can read my thoughts on Broadridge in the memo from, I think, last week. I think that's a great business and I would be happy to own it at today's price.

JEFF FISCHER:

Excellent, Billy. Thank you. I should have let you answer to Broadridge, so I'm glad you did. Anonymous is asking, "Given current market conditions and that some hedge funds are raising cash…" Well, hedge funds have had a rough go of it.

J.P. BENNETT:

Raising cash or going out of business?

BILLY KIPERSZTOK:

I don't know if we want to follow hedge funds.

JEFF FISCHER:

"Any thoughts on doing more hedges?" We talked about that earlier at the top of the hour. Yes, we're looking at other hedges and adjusting the hedge that we have, so definitely. That said we're glad we haven't paid to hedge and that we're not very short, really, since the election. [That's] when we took off our last large and mixed shorts, and that was a tough call.

Anonymous is asking about Activision. "What do you think about Activision as a buy or writing puts?" Activision is a position in *Motley Fool Options*, so please head over to *Motley Fool Options*, because this is the *Pro* chat. There's an Activision board. Jim Gillies and Jim Mueller both follow Activision, so they can help you very well.

Gentex. Billy, we have a question on Gentex. "Your thoughts on Gentex's future." Self-driving cars. Something we talked about in our *Pro* meeting just last week, as well. What will it mean for Gentex if this comes about?

BILLY KIPERSZTOK:

A good question, Luis. This is a question or a topic that comes up a lot with respect to Gentex. I've had some commentary on this on the boards, but our boards' search functionality is not great. It may be difficult to find, so I often find myself saying these arguments multiple times, which is fine, and it's a good thing, because it helps reinforce our thoughts on this question, which is a very good one.

Gentex's future in an evolving car industry — an evolving auto industry — is somewhat similar to O'Reilly and the things that J.P. mentioned. It's going to impact driving behavior. It may impact the way that vehicles are produced. It may impact consumer behavior. But Gentex is a lot different than O'Reilly in that they're not like a retail-to-consumer type of company. They deal directly with automotive manufacturers, and they're kind of embedded in automotive manufacturers' processes. They're a very highly regarded supplier.

A lot of automakers work very closely with Gentex. J.P. mentioned the increasing complexity and technology in cars. Gentex is actively playing a role in that. They're not so much an auto manufacturing company as they are really a technology company. They build various technological features into cars that just increase the functionality of the vehicle. They have a very good R&D department and they can continue to innovate and add things that increase the value of a car, so I'm not too concerned on that front.

Other thoughts I've had on that is that self-driving cars may become something big in the future; however, for the next three to five years it's very unlikely to impact Gentex's results. Gentex signs contracts a year or more in advance, and they have good revenue visibility. They've already projected their revenue for 2018, and they have guidance on that front.

Gentex owns 90% of their market. They're a dominant business. They continue to capture market share. They should be able to continue to grow, even as self-driving cars become more and more prevalent.

JEFF FISCHER:

Thank you, Billy, and great question, Luis. I was grilling Billy about the same thing last week. I think it's great that our concerns are all pointing in the same direction with O'Reilly [and] Gentex. The changes coming to the car industry. AmTrust, of course. Gilead. We all have our fingers on the pulse which is very Foolish. I like the challenge of dealing with positions like this, as long as we can also find new ones that we like, too, to add. So doing both has been fun this year.

A great answer, Billy. We're going to stay on top of Gentex, as much as we are O'Reilly, and make sure that it's part of the future of cars. And if it ever looks like that's not going to be, then we'll be out of there early, well before those contracts come up.

Steve is asking, "I've been with *Pro* for one year and satisfied." Thank you, Steve. "It's been an interesting year, for sure, but the shorts are a bust. Gogo. Shake Shack. The euro. FAZ, even. Why? Why are the shorts not working?"

A great question. In the past one year, the Nasdaq is up 25% and that's one exact year from today. [That's the index which has soared 25%], and a lot of smaller stocks have soared even more. We shorted mostly Nasdaq-listed companies. The S&P in the past year is up 15%.

It's been a strong market, so it's not surprising that we've had shorts work against us in that market. We've also had some work out, but you're right. Most have not in the past year and that's probably going to be true whenever the market rallies quite a bit. I just want to be sure that you know we closed Gogo, so if you haven't closed that we recommend closing that. We closed that a little while ago. Shake Shack we still have. Contemplating adding to it.

The euro is on the table to possibly close, because the EU is looking pretty strong. They're banding together. The French election, which we were waiting for this month has concluded, clearly, and it's in favor of the euro and in favor of the EU. I've been digesting that and wondering if we should get out of the euro.

The only thing that would stop us is interest rates in the U.S. are on track to head higher and that should help the dollar; but that said, I think there are a lot of headwinds to that, as well, with the EU looking a little stronger right now. We'll see Italy's elections, this year, and there's some rumbling about an anti-EU stance there, but I don't think it's worth waiting for. So the Euro is just currency and the euro has gotten stronger.

And FAZ is actually a long of financials. We just happened to set that up right as financials had a cooling-off period and fell a bit, [00:42:49 so FAZ are short, which is in essence a long, because it's short a short is off a little bit]. In the long term we're really confident that that will work out.

I hope that's a somewhat satisfactory answer. We have kept the shorts to a minimum, thankfully, and the portfolio losses have been minimal because the positions are small. But in a raging market like this, it's tough to have good shorts and to our detriment we have not had great shorts. Name a company that cratered and we missed it.

J.P. BENNETT:

You can't win them every year. Some years we were pretty fortunate, but you're right. In a broad-based rally, especially when you're seeing a lot of private equity take out businesses that appeared to be structurally impaired, it's definitely not a bad thing to be underexposed in the short side. Rule numero uno for shorting is *live to fight another day* so you don't want to load up on a bunch of poorly timed shorts. We wouldn't have to unwind our fund, but it would definitely place us in a huge hole in terms of meeting our North Star goal.

JEFF FISCHER:

Luis is asking about American Tower bull call spreads. "Any new ideas for those?" That was in *Motley Fool Options*. Billy, do you want to say a quick word about this?

BILLY KIPERSZTOK:

I think our preferred option position for American Tower right now, within *Pro*, is the diagonal call that we have actively running. It expires in October and there's still plenty of time value there. We'll have to wait and see what the stock price does and that will help determine what we do with that diagonal call position. So far it's doing pretty well.

The bull call spread was kind of a one-off in *Options*, and that was amid a marketwide sell-off. We got a really cheap valuation on American Tower and a good opportunity, there. If we see something like that again, we may initiate one in either *Options* or *Pro*, but right now I think a diagonal call at the current valuation makes more sense.

JEFF FISCHER:

Excellent. Anonymous is asking, "Any regrets about selling Wells Fargo, given the recent run-up?" We can each say a quick word on that. I'll say no, because we've added to Visa, which is doing well. We bought Paycom soon after selling Wells Fargo, which has done well. And I think Wells Fargo speaks to AmTrust, as well. If a company has broken your trust, [and there's no question Wells Fargo was dishonest], do you want to continue a relationship with them?

This is a horrible example and I shouldn't do it, but it's towards the end of the hour. If you have a really wealthy spouse…

J.P. BENNETT:

Your willpower is you can't do that…

JEFF FISCHER:

…and they are dishonest with you, do you stay with them just to have access to their resources? No. Even if their life goes on and gets better and better, you don't want to hit your swag into their star, because they're dishonest with you.

J.P. BENNETT:

I see what you did there.

JEFF FISCHER:

Wells Fargo broke our trust, and I don't regret selling it. I think we'll do better with other companies.

J.P. BENNETT:

I would say more so with financials than with any other industry. They are black boxes. Their financials are almost exclusively based on estimates and so if you cannot trust the people running the company; do you have any business owning shares?

JEFF FISCHER:

Billy?

BILLY KIPERSZTOK:

You guys really said it all. I agree with everything you say. I was the one managing the position who made the decision to sell Wells Fargo. I personally have no regret whatsoever. I'm happy to have sold it and I think, like Jeff said; we've added stocks that we like better. Like J.P. said, we don't trust the management and those considerations, no matter what happened with the stock price after we sold it, we're happy that it's not in our portfolio anymore.

JEFF FISCHER:

We have a question and we're going to really fly the last 12 minutes and try to get through all of these. "Have we considered adding MercadoLibre to the portfolio, as it could be the next Amazon in the developing South America region?"

It has really gone up a lot in the last year. It's a popular stock at the Fool, held in MDP and other services. I've looked at it, I can say, several times, including lately. To fault myself, it has always looked pricey and expensive, so I wasn't driven to add it to the portfolio. I certainly didn't see this rampant soaring, which has happened to a lot of stocks in the last six months and has me a little leery, but I didn't see it coming. So we've considered it, but I haven't done it. If you guys have anything to add to that, please do.

BILLY KIPERSZTOK:

Not really. I think it meshes well with our recent purchase of Amazon, and it gives us exposure to a different geography. It could be something to consider. I own that stock personally in my own portfolio.

JEFF FISCHER:

Thanks a lot, Billy. Why didn't you put it into *Pro*? I'm just kidding.

BILLY KIPERSZTOK:

A good question. You could ask that for a lot of different companies.

JEFF FISCHER:

Indeed.

BILLY KIPERSZTOK:

Right, J.P.?

J.P. BENNETT:

Well, if we need a scapegoat for one of these positions, we know who's on the chopping block since he didn't add MercadoLibre.

JEFF FISCHER:

Well, I know some that you've bought, J.P., that haven't been added yet.

J.P. BENNETT:

That's true, but we're working to rectify that situation potentially.

JEFF FISCHER:

It's funny. You're willing to take more risk for yourself in most cases than you are for members and their money…

BILLY KIPERSZTOK:

Yeah.

JEFF FISCHER:

…and a lot of positions we start as Starter positions and get to know them better, without ever intending to add them to *Pro* unless they then merit it.

J.P. BENNETT:

I think it probably also speaks a little bit to the changes of our process in relation to what's really taking place in the markets, in terms of you go back a couple of years. You want the setup to be perfect. You want the perfect business at the perfect price at the perfect part in the cycle.

And as the markets have marched forward and valuations have started to move higher, it's going back to something we've talked about time and time again. When we're getting well past the initial recovery in the cycle (whether or not we're near the end, who knows), but the further along you get, do you want to place emphasis on cheap businesses that are of lesser quality and could be in for a world of hurt when things finally aren't as rosy as they currently own?

Or do you want to buy those amazing businesses where maybe you're not getting it at the perfect valuation? You're not bottom-ticking the stock, but it's one where you're going to be (a) eager to add to it, should it fall and (b) it's a stock you're going to have conviction in for the next three, five, or ten years regardless of what the market does.

JEFF FISCHER:

That's exactly right and MercadoLibre would check that box for me, I believe, if you're looking at the next three to five years.

Paycom is running above our fair value estimate. The stock is $66 [and] the fair value estimate is $52, so it's well above it. The stock is up 55% for us in six months or so. It's a 3% position now, speaking of high-flying stocks in a short time. The shares do look pretty pricey. I was looking last week. Our fair value estimate will tick up a little bit.

What you could do — we've had it in catch-up trades quite a bit — is you can write put options to try to get shares cheaper, but it does remain a buy, as well. And it's a fairly small position, so maybe you start with 1% or 1.5% of our 3% and go from there, or write puts for the rest.

But it is a buy, so if you wanted to buy the whole 3% you could and, again, this speaks to our three, five, ten-year time frame. When we look out that far, we're happy to have it as a buy, but you have to be with us. You have to be ready for three years to see returns. That's true of any stock, in general, but especially these higher-flying ones.

Gentex, part two, from Luis. Or Louis. Or Luis. It's Luis. You guys see I'm trying to single-handedly bring back the *Miami Vice* look.

J.P. BENNETT:

I missed that reference completely, Jeff.

JEFF FISCHER:

He was a character in *Miami Vice* as I recall, and when I threw this on, I was like, "Oh, that's kind of a strange look." But anyway… Billy, it's okay to laugh.

BILLY KIPERSZTOK:

I just can't see you, Jeff. I don't know what you're wearing, so I can't picture this, but I want to know.

JEFF FISCHER:

New markets. "Are there other areas or new markets that Gentex is looking into?" Really quickly, Billy, and then we're going to get to the rest of these questions.

BILLY KIPERSZTOK:

Not so much in terms of new markets or outside of mirrors. The biggest thing I think they're doing is they're working on this integrated toll module that you put on your dashboard and it will work in all of the different toll systems across the United States. They also have a business in aircraft and in fire safety, but nothing really huge. They're just milking their main, core market for the most part.

JEFF FISCHER:

Still relying on cars and that's what it's going to be for the foreseeable future. Luis is asking about Gilead Sciences. We touched on that quite a bit. Management did maintain their guidance for the rest of the year. Before next quarter's earnings, we will probably have options on it to generate some income, hopefully, and Gilead is also a potential source of cash if we need it, given the three-to-five year outlook is murky.

BILLY KIPERSZTOK:

Good job on the questions, Luis, by the way. Lots of good questions.

JEFF FISCHER:

Yes, they're very good. Thoughts on Under Armour. "Is it undervalued?" We look at it periodically. It's never been in *Pro*. It's been in many Fool services. We look at it for *Pro* or *Options*. It still looks expensive to me and I'll just leave it at that. I'd still be a buyer of Nike before Under Armour at current valuations. That said it's a good brand for the next five to ten years. We'll probably see it do well for owners, I would think. We're still waiting for lower multiples, because they may be in the cards.

Luis has missed out on Amazon. "An update on pricing. Fair value estimate coming sometime soon?" That's a fairly new position, but the update should come by late summer or this fall when it will be three-quarters in or so. We may increase the fair value estimate a bit, but realize with Amazon, there's a lot that's guesswork, really, and it's how large you think this industry can be for Amazon, or Amazon can be in its various industries, really. If you want to own it, it's rated buy and I would buy it, because the fair value estimate is not something to hang your hat on. J.P., Starbucks. Thoughts on what to do.

J.P. BENNETT:

Is that the question? Because I don't have an internet connection.

JEFF FISCHER:

Yes.

BILLY KIPERSZTOK:

That is the question.

JEFF FISCHER:

They haven't been able to establish a position, yet. Any thoughts whether to wait and how to get started.

J.P. BENNETT:

I would say that perhaps one of the biggest drawbacks to this stock is that the options have an abysmal payout.

JEFF FISCHER:

Right.

J.P. BENNETT:

You can't really look into setting up a position through options, so it's either buy the stock or set up a synthetic long using LEAPS or sit on the sidelines. The stock has recovered quite a bit. It seems like it was just a couple of months ago where the pessimism was pretty high, and now the Unicorn Frappuccino… I don't know if it was that, but momentum has completely swung around.

I can't check the multiples on my computer, right now, because obviously I don't have an internet connection for some reason, but it is one where I think if you really do like the prospects for the business three, five, ten years down the road, even so you'd want to leg into this. I wouldn't necessarily advocate for building your entire position at this price. I think it might be one where you would just want to nibble a little bit.

Keep in mind that this is a retailer. It is a company that has a lot of exposure to the retail industry, whether it's stores located really close to bricks and mortar locations. Bricks and mortar individuals who work… The employees… Wow, are we almost done, here, because …

JEFF FISCHER:

Robots? Soon to be robots.

J.P. BENNETT:

Soon to be robots. Robots run on caffeine, right? The employees who obviously go to Starbucks, so there's definitely some potential headwinds there for the company. Some negative news cycle bits going on Starbucks and how that industry is going to impact them. You could see multiples collapse really quickly. Or if the market rolls over, multiples could collapse. So I think it's definitely one you want to…

JEFF FISCHER:

Speed round? And the answer is?

J.P. BENNETT:

Hey, you guys were taking your time. Build it through legging into the position. Start with a little bit and then see how you feel about it.

JEFF FISCHER:

True. It's rated buy, so excellent. I like the context. It's very helpful. Thank you, J.P. and Billy. I'm going to run through three to five questions in a minute. You can time me…

BILLY KIPERSZTOK:

Great.

JEFF FISCHER:

…and meanwhile you can look for three to five, as well.

J.P. BENNETT:

I'm just going to twiddle my thumbs.

JEFF FISCHER:

And J.P., I'll hand you my computer. "So AmTrust covered calls are paying 16% for September — $12.50s. Is the price stable enough to try this?" I wouldn't just because the stock could fall much more than that. It's not worth writing a covered call on a company where you lack trust, unless you're going to use that premium to then buy some puts at, say, $10 or around there.

"Members saying they were able to short GoPro through Interactive Brokers, but the interest rate has been very high." It is high to short it. We shorted it with a synthetic short. "Are we getting close to closing the position?" I wanted to make clear that no, we are not. We're hoping to ride GoPro further down. If they start to turn profitable and have some stability to revenue, then we'd look to close, but right now that short is going well.

BILLY KIPERSZTOK:

Over a minute.

JEFF FISCHER:

Is it? OK, Billy, then you're up.

BILLY KIPERSZTOK:

I'll take the easy ones, here. Lon says, "Hi, Billy. No mask today?" No, that was actually a wedding present for my good friend who is a huge fan of *Lord of the Rings*. That is from the Witch-king of Angmar character. So, no.

I see also Leslie just re-upped for three more years. "Worldly events are too weird for her not to have *Pro* guidance, so have a great summer." Thanks, Leslie, that's awesome and I am with you. Worldly events are too weird for me not to have Jeff's guidance, as well.

JEFF FISCHER:

You guys are kind — too kind.

BILLY KIPERSZTOK:

"Gentex price sliding today, but the $0.85 premium is under 1% yield per month. Is the short put justified?" I wrote a comment about this on the boards. A 1% yield per month is just a guideline. It's not a hard line that we have to hit every time, especially with respect to Gentex, which we've followed for several years and we have a good handle on the valuation.

Maybe part of the reason why the yield is so low is because the market deems it unlikely that the valuation will drop to a level where we've written our puts. Also just because volatility is low. When volatility is low, your choices for options and the implied volatility aren't that great, and sometimes, in order to generate income with options, you have to accept lower yields, and that's what we're doing with Gentex. But yes, I do believe that the yield is worth the risk that we're taking there with that position.

JEFF FISCHER:

Thank you Billy and thank you Leslie. Have a great summer, as well. Anonymous is asking about inviting all *Pro* members to FoolFest. I just want to say we'd love to if we could. The FoolFest, and Fool events, in general, are so far outside of our control, but next year, for *Pro's* 10-year anniversary, we hope to have a *Pro* event.

Will we roll down the QQQ put ratio spread if the market falls sharply? The answer is probably not, because we'd like to instead buy calls on the index. If it falls 40%, such that we would be in a position to roll down, we probably would be better off going long, unless something really strange has happened, as Leslie alluded to.

"Can you purchase short ETFs in an IRA?" It depends on the ETF and the IRA, so please check with your broker.

I think we have to wrap it up there, unfortunately, because it's five o'clock. We got to most of them. I wouldn't write covered calls on Apple right now, personally…

BILLY KIPERSZTOK:

Nope.

JEFF FISCHER:

…unless you own it just as an income position. And this is timely. Mark is asking, "Are we getting the Monday memo, catch-up trades, and guidance changes today?" No we're not, because it's Tuesday. A lot of times with a holiday we do it on Tuesday, but the content structure is changing a bit. We're going to send catch-up trades on Thursdays, from now on, and separate the memo from that. That starts, I believe, this week, but we'll keep you posted on those changes. But no memo today. We're actually working on potential trade alerts and…

J.P. BENNETT:

FoolFest presentations. Stuff that will be able to be turned into future memos or content for everybody.

JEFF FISCHER:

And finally Mark is asking, "Will my long *Pro* portfolio do better with the options and shorts or not?" That really depends on the market. In a rising market like this one, your portfolio is probably better without options or shorts. When the market is flat for a long time or down, the options and shorts should help, and that's been the situation we've been in, on a whole, since we launched, pretty much. We've had a few 20% market declines, but on the whole, it's been a market that's just been good for longs.

That said, the longs are meant to work by themselves no matter what, over time. The options and shorts are meant to complement them whether you use them or not, and if you do use them, to help you in the long run. They should.

So with that, I think we have to exit the studio. Thank you, *Pro* members. Thank you Billy and J.P.

BILLY KIPERSZTOK:

Thanks, Jeff.

JEFF FISCHER:

Good to see all of you. We appreciate that you're here. We hope you're ready to enjoy the summer and we'll see you in June, if not sooner, in the *Motley Fool Pro* service itself. If we didn't get to your question, please ask on the boards and we'll try to answer. Hopefully we'll see it and we'll get you an answer. Thank you again. Thanks guys.

BILLY KIPERSZTOK:

Thanks, guys. Fool on!

JEFF FISCHER:

Fool on!

J.P. BENNETT:

Fool on!

Pro Catch-Up Trades and Upcoming Expirations: May 15, 2017

Published May 15, 2017 at 12:49PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4%.
- **Visa** (NYSE: V): Buy 3.2%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.3%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1% (see our recommendation).
- **Oracle** (NYSE: ORCL): Buy 3.8%.
- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.6% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- N/A

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for a small net credit (a nickel or so), or at worst for no cost.

This month's expirations (May):

- N/A

Pro Guidance Changes and Completed Trades: May 15, 2017

Published May 15, 2017 at 12:47PM

Pro Guidance Changes from the past two weeks:

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $135. The stock remains a Buy First at a 4% allocation, plus 0.6% in a diagonal call.

- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $96. The stock remains a Buy at a 4.4% stake.

Pro Completed Trades from the past two weeks (see transaction log):

- N/A

You can see all of our guidance, positions, and transactions from the Recommendations page.

OpenText Earnings Appear On Track

Published May 10, 2017 at 11:06AM

OpenText (NASDAQ: OTEX) ended the day down 5.6% on earnings; so, it's now down 0.4% the last month; up 6.3% YTD, and up 20.5% the past year (all excluding the 1.4% dividend). It's up 160% the last five years, more than doubling SPY, and handily topping the Nasdaq's 107% gain.

So, some returns perspective.

Is the business still doing well?

It grew well this quarter, with revenue up 35%, and recurring revenue up 34%. License revenue was up 35%, and cloud revenue grew 20%. Renewal rates were around 90%. But margins ticked a point or two lower across the board, largely due to the costs of integrating acquisitions (namely Dell's ECD division, which came on board in January) and lower margins at acquisitions (again, ECD).

ECD had operating margins in the low teens in the quarter, instead of the mid- to high-20s where it usually resided. As an asset acquisition (rather than buying a whole company outright), OTEX says it will get the margins up to OTEX's standards (the 30s) within 12 months. The integration continues, and integrated OTEX/ECD products will release in future quarters (with cross-sell opportunities). OTEX also inherited some customer contracts with low margins, and they'll honor those contracts through completion.

The 2017 target of 30% to 34% operating margins at OTEX is unchanged. The 2020 goal remains 34% to 38% operating margins and at least 90% recurring revenue.

OpenText will unveil its new AI Platform, Magellan, in July, and it will be available for customers early next year. IBM's Watson AI platform is a competitor, and as reality is starting to dictate, more and more companies are going to need to use AI to compete [I've been looking at AI investments all year, beyond Amazon or Apple, or Facebook and its fledgling start -- and hope to have some more soon. AI in the broadest sense -- as a convenience and outcome enhancer -- risks upheaving a lot of businesses if they don't adapt].

OTEX is priced at less than 14x times forward one-year EPS estimates, and 15x trailing free cash flow, along with a 1.4% yield that is ticking up with a dividend increase. Growth prospects remain in place. More acquisitions targets do, too.

I've gone through today's SEC filing on the quarter. The stock remains a Buy, as ever for the long term. We have a 3.2% stake. Our fair value estimate is currently $32, and has been for a while. That will get an update either this month as I update numbers, or in one more quarter or so (after a full quarter of ECD results), and it should tick upward by as much as 5% to 7%, if all is on track as appears.

AmTrust: Thoughts and an Update From Jeff

Published May 9, 2017 at 3:54PM

AmTrust Financial Services (NASDAQ: AFSI) is not in a strong position to disappoint investors and invite more uncertainty, but that's what happened, and selling this morning dropped the stock price sharply again. AmTrust is still fairly thinly traded on dollar volume, so it doesn't take much selling to lead to a 15% drop -- especially when the buyer pool has dried up after restatements and SEC-filled rumors earlier this year, which are understandably keeping many investors away.

Here's the bottom line on where I stand on AFSI:

- It will take considerable time for trust in management to return to 100%.
- Until that at least starts to happen, I feel we need to protect our position (as we have been, right now with long June $12.50 puts).
- At the same time, we're seeing what the business looks like, and how it performs, under new accounting protocols. The restatements only affected 3% of past revenue, but could have broader implications on profitability.
- Concurrent with that, AmTrust has made large acquisitions the past few years (Tower, Republic, etc.) and we're still seeing how those play out. A large insurance loss this quarter was related to Republic.
- One could easily argue that AmTrust is in the "too hard to follow" category and sell it, as some members have. It will be at least a year before we see how the "revised" business is going to operate, and at what levels, because AmTrust is continuing to invest in better financial controls. AmTrust had $17 million in extra costs this quarter related to getting its annual filing right, and it expects about $5 million in related costs next quarter (and then for this extra cost to keep tapering down). More important, where will the combined and expense ratios gravitate? There are many uncertainties now.
- AmTrust hopes to file its quarterly 10-Q on time, it said in the conference call. I wasn't happy to hear that there was any doubt at all, and I don't think Wall Street was, either.
- AmTrust believes it is adequately reserved for losses, but "unfavorable developments" led to losses on 2016 policies this quarter, reigniting fears that AmTrust doesn't reserve conservatively enough, and that more hits may happen.
- Through all this uncertainty, right now I only want to keep our shares if we can protect them at a reasonable (or no) cost. If that isn't possible in future months, we may choose to exit the stock instead. Currently, I don't want to own the stock without a safety net. This may be as ugly as it gets, but I still don't want to gamble on that.
- We have the shares still on Hold, along with the protective collar.
- Finally, the company is not looking for acquisitions right now. In a sign of how serious it is about getting all of its accounting structure right, accounting is the focus this year. AFSI wants everything in great working order before it considers growth through acquisitions again. This clearly wasn't liked by investors, either. This is basically a year to rebuild and refocus (not the worst thing, but not a year where you're likely to grow).

When you look at the results in isolation, they're not bad, as book value went upward a bit from last quarter, as did assets. But it was definitely a messy quarter, with a lot of bruises.

One was a greater than $25 million catastrophe loss related to wind and hail in the U.S., insured by Republic. Many other insurers suffered losses from this weather, so they're not alone, but this is new to AmTrust via Republic. Republic's personal lines of business are not ceded to Maiden for reinsurance, so they're on AmTrust. AmTrust is evaluating to see how the personal lines of business may or may not fit in with AmTrust. So, there's that uncertainty on top of the losses.

A second loss: $19 million of prior year adverse development in the Specialty Programs. Adverse development means you didn't reserve enough to cover all the losses that end up coming through. You would rather have a favorable development, meaning that you reserved more than enough. When adverse developments happen (and they're rare at AmTrust so far), you have to question if the company is reserving enough. Needing to ask that question today is particularly unfortunate given the recent black eyes. In the very extreme, inadequate reserves can sink an insurance company. At AFSI, the relatively small Specialty Program is now in "run-off" -- they're letting it wind down after struggling with it.

Almost all the casualty-only programs are in run-off at this point. AFSI struggled in these in the past, so they're letting them go.

Third, as touched on, expenses were higher than last year due to service fees related to the 10-K filing. Most of these are one-time fees, but not all, as AFSI continues to invest in professional staff. The business will indefinitely be more expensive to run, at least by nominal terms, due to having much more staff and outside counsel.

Finally, income was taxed at 31.6% rather than 17.2% (lacking off-sets or write-offs), and the rate is probably going to settle around the mid-20% range.

All this caused a much weaker combined ratio of 95.6% compared to 91.9% a year ago; the loss ratio was 68.7% compared to 66.6% (that darn 666 number) a year ago.

To cap it off, AmTrust shared that it is looking to sell 51% of its least risky, most attractive fee-based business to a private partner, likely for more than $1 billion, as a way to monetize this business and put some leverage in it. This would remove about $600 million of goodwill from AFSI's balance sheet, and give it about $1 billion in cash to use as wished, which could include writing more premium or buying back shares. My reaction to this news was negative at first: Why pursue this now? It made it seem like they're defensively raising still more cash, by selling off good assets, and that gave me pause. But it would make sense to raise cash to buy back more stock if they think it's too cheap, as they suggested. And they would still benefit from 49% ownership.

Book value ticked up to $13.91, so lately AFSI is trading below book value.

The optics -- the story -- just looks downright ugly right now at AFSI. I believe in a few years (perhaps starting in 2 years or so) the story will start to look more stable and the stock may start to recover, assuming no other surprises lurk around the corner (we still have the whistleblower rumor hanging over us). This reminds me of Assurant (AIZ), another insurance provider, one which suffered worse credibility hits and restatements than AmTrust. That happened nine years ago, and in the last five years the stock has finally recovered nicely (up 178%). But it took a long time.

The bottom line is that there are thousands of companies on the market to potentially -- ideally -- grow our money. The money we have invested in AFSI doesn't need to stay in AFSI to recover or to grow from here; we can move it other places to recover and then grow it. So, we need to have strong conviction that it makes sense to keep it in AFSI instead. Right now, our protective collar says we don't have that conviction. This quarter didn't ease those concerns. Now we have to see if AFSI files the 10-Q in time. As shared earlier, at this point, I want to keep our position protected. If that gets too costly, we'd close the stock instead.

It's both good and bad to say that the position is down to a 2.4% holding now, and we really don't want to let it go lower than that (we don't want to lose more), so we want to keep it protected until we come to have great conviction in the position again, if that can occur.

Newcomers should not buy the stock. It stays on Hold. We'll see how the options play out ahead of us. We may or may not still have the stock in another quarter, depending on the 10-Q filing, and on what the options cost for protection.

In many ways, the damage has already been done to us, and not much more can be done now. It hasn't been good at all, and I'm still assessing the ways this will change how we invest going forward; because it will change us. Fortunately, the portfolio is still up more than 6% this year, still above our goal so far, but that doesn't excuse a position that has fallen more than 50% on our watch. The lessons have to be learned, shared and applied, to improve going forward.

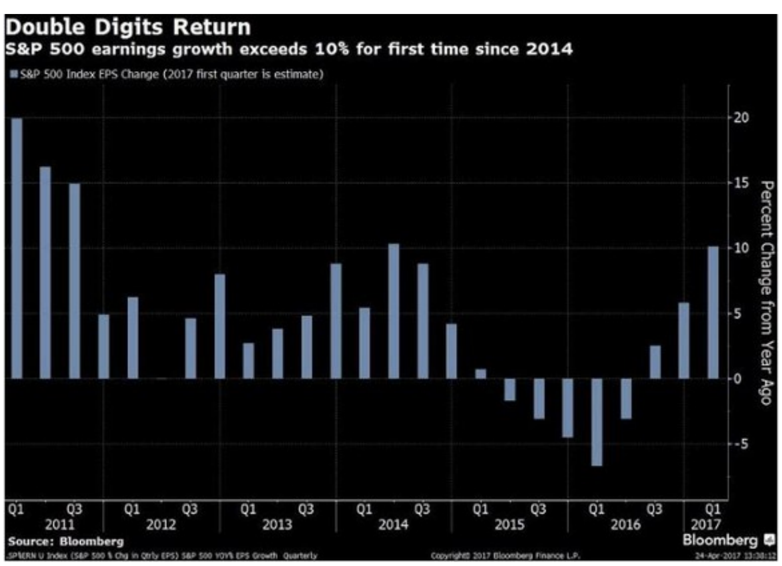
Charts of the Week: Earnings Growth, Perceptions of Uncertainty, and More

Published May 8, 2017 at 3:37PM

Dear *Pro* Fools,

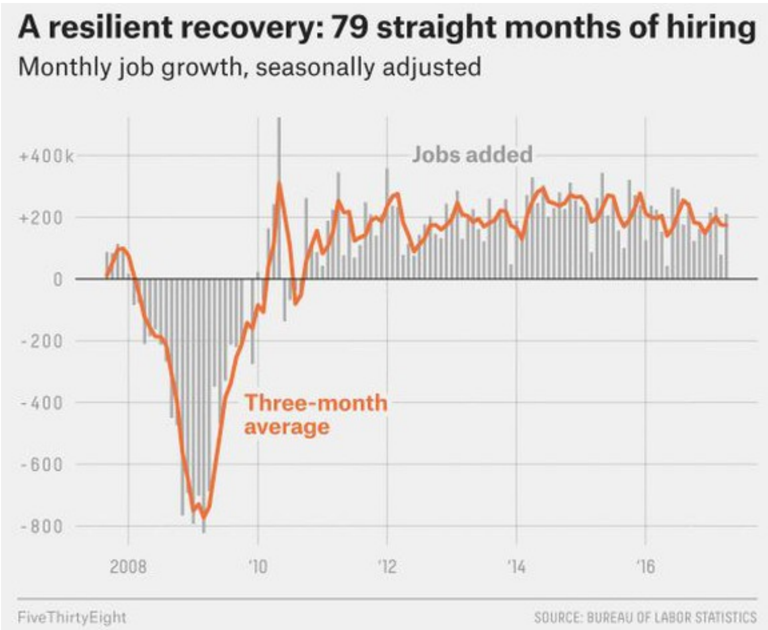
For today's Monday Memo, I'll kick off our week with another edition of my "Charts of the Week" series. Here are the five most interesting and/or market-relevant charts I found this week while perusing the financial/data blogs and websites I frequent:

1. Double-Digit Earnings Growth Returns



This chart from [Dave Wilson](#) of Bloomberg Radio shows how the S&P 500's companies are projected to show earnings growth of 10.1% in the first quarter of 2017, according to data compiled by Bloomberg from results so far and to analysts' projections as of April 24. We can see that the S&P 500's earnings growth rate has sharply accelerated after lapping the oil-price collapse in 2014-2015, and we're approaching earnings growth levels not seen since 2011. *Pro*'s companies have helped contribute to that momentum -- of the 14 *Pro* companies that are included in the S&P 500 and have reported earnings so far, average first-quarter earnings-per-share growth is 18.3%.

2. The Remarkably Durable U.S. Job Market

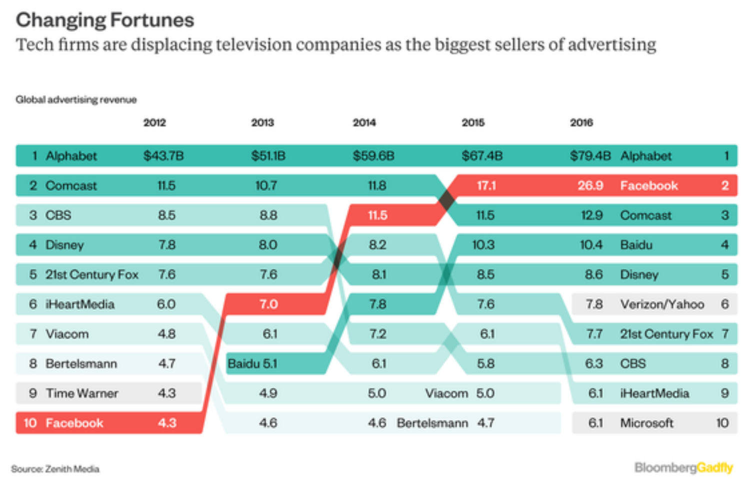


This graph from FiveThirtyEight shows the remarkable durability of the current U.S. labor market. April's report from the Bureau of Labor Statistics showed 211,000 jobs added, marking the 79th straight month of job growth -- by far the longest such streak on record. From FiveThirtyEight's commentary: "Perhaps more remarkable than the recovery's length has been its resilience. Time and again, one or two weak months of hiring have sparked fears that the recovery was nearing its end; time and again, job growth rebounded. The past two months are a good example: Hiring slowed sharply in March, when employers added just 79,000 jobs, but quickly rebounded in April."

3. Seattle Unemployment Rate Matches All-Time 2.8% Low

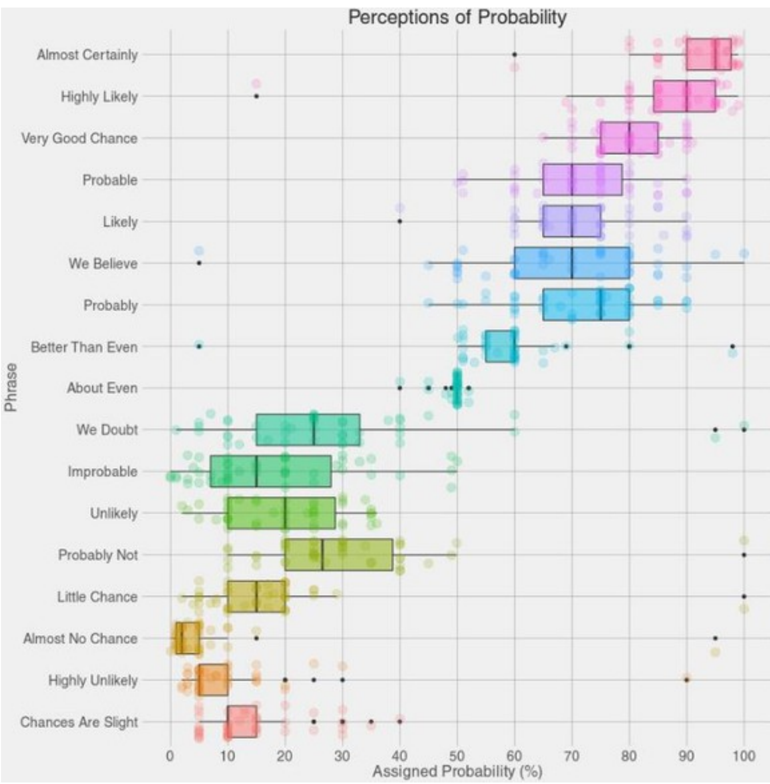
This chart from @TBPInvictus dovetails nicely with the job market graph above. The city of Seattle's unemployment rate is particularly interesting in light of the city's decision to pass a minimum wage law (effective April 1, 2015) that gradually increases the city's minimum wage to $15/hour. Now more than two years into the mandate, the city of Seattle's unemployment rate is at an all-time low. At least in the case of Seattle, it appears that a higher mandated minimum wage can work without a significant negative impact on the labor market.

4. Global Advertising Revenue: 2012-2016



This graphic from Bloomberg Gadfly shows just how fast **Facebook** (NASDAQ: FB) has climbed to become the second-largest player in the global advertising market. The data shows how technology companies are rapidly displacing traditional media companies in the advertising market, likely thanks to unmatched global scale. In 2012, only Google and Facebook were in the top 10. In 2016, half of that list was digital -- including Verizon (with its acquisition of Yahoo!), Baidu, and Microsoft.

5. Measuring Perceptions of Uncertainty



This intriguing and visually pleasing graph from Reddit user zonination shows the varying perceptions of probabilistic terms including "probably," "almost certain," "little chance," and other words of estimated probability. The results are all over the place, and it's easy to see how imprecise words can lead to misunderstandings. One person's "probably" is another person's "almost certainly." Especially in investing, where decisions are made in a world of unclear probabilities, it is useful to understand how communication about probabilities is interpreted.

The *Pro* Bottom Line

There you have it, Fools -- this week's edition of my top five charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Pro Catch-Up Trades and Upcoming Expirations: May 8, 2017

Published May 8, 2017 at 3:23PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.3%.
- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3% (see our recommendation).
- **Oracle** (NYSE: ORCL): Buy 3.8%.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.6% via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5% (although note that we're currently reviewing last week's earnings, so this could change).

Pro options:

- **AmTrust Financial Services** (NASDAQ: AFSI): If you haven't set up a protective collar yet and want to, set up one June 2017 collar for every 100 shares you're protecting. Sell to open June 2017 $17.50 calls and buy to open an equal number of June 2017 $12.50 puts. Lately, this can be done for a $0.10 credit, but that price will change as the stock moves. Please note also: AmTrust reports earnings tonight (the 8th) after the market closes.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for a small net debit (a nickel at most) or no cost.

This month's expirations (May):

- None.

What Is Considered an Excellent Credit Score?

Published May 8, 2017 at 3:08PM

Recent research shows that 60% of Americans don't know their credit score, which could suggest it's a not a number worth paying attention to. The reality is quite the opposite.

Here's more on what you can do with excellent credit, what's considered an excellent credit score, and how to increase your score.

What Can You Do With Excellent Credit?

Simply put, if you have excellent credit, you are better set up for overall financial success than someone with a lower credit score.

The lowest mortgage and loan rates are typically reserved for people with excellent credit, as are the best credit card offers, which can help to earn extra rewards on everyday purchases or to pay down debt balances faster with a 0% APR. The more money saved and remaining in your bank account at the end of the month, the more money that's available to invest and beat your financial goals sooner.

We suggest taking a few steps if credit cards are of specific interest to you.

- **Nail down your primary credit card needs:** Cardholders paying off balances each month to avoid interest charges may be best off considering cash-back and travel-rewards credit cards. The same can't be said for cardholders with debt, who can chip away at their debt balances faster with a balance-transfer credit cards offering a 0% intro APR.

- **Review our recommended credit cards:** For people with good and excellent credit, check out our picks of the best credit cards for excellent credit or the best credit cards of 2017. Cardholders carrying debt may want to consider our picks of the best balance-transfer credit cards to avoid costly interest charges with a 0% intro APR.

What Is Considered an Excellent Credit Score?

A 750 FICO score and above puts you in excellent credit territory. It's important to note that the average American consumer has a FICO score of 700, which barely qualifies for good credit.

Rating	FICO Score Range
Excellent	750 and above
Good	700-749
Average	650-699
Poor	550-649
Bad	550 and below

How the FICO Credit Scoring Model Works

The minutia behind FICO scoring models is a well-guarded secret, but we do know the broader pillars that drive your credit score.

- **Payment history (35% of score):** Do you pay your bills on time, every month?

- **Credit utilization (30%):** How much do you owe on your credit accounts, particularly relative to your credit limits? Credit utilization is reported as a ratio, essentially your debt balances divided by available credit.
- **Length of credit history (15%):** This considers various time-related factors, such as the age of your individual accounts, the age of your oldest account, and the average age of all your accounts.
- **New credit (10%):** Newly opened credit accounts, as well as your recent applications for credit, are included in this category.
- **Credit mix (10%):** Lenders want to see that you can be responsible with different types of credit, so having several different types of accounts (credit card, mortgage, auto loan, and so on) can boost your score.

FICO scores range from 300-850, and most consumers have FICO scores that range from 500 to 800.

How to Increase Your Credit Score

There is no magic behind building excellent credit quickly. It's possible to go from no credit to good credit in a fairly short period, but securing excellent credit takes time.

The general rules to improve your credit score are laid out below:

- Pay your bills on time, every month, without fail. Over time, this step alone can boost your credit score into the next level and payment history is the single, biggest driver of your credit score.

- Keep a low (to no) balance on your revolving credit accounts relative to your available credit. The average person with a FICO score over 800 uses just 4% of his or her revolving credit limits. If you have debt, paying off balances faster to reduce your utilization ratio is one of the faster ways to improve your score. Cardholders can also request a credit limit increase to reduce credit utilization, but we'd only suggest doing so when not tapping those additional funds.
- Let your open accounts age. An average account age of at least five years is suggested to get the best scores and there is no harm keeping no-annual-fee credit card accounts open.
- Use several different kinds of credit (credit cards, mortgages, auto loans and/or leases) over your life as a borrower, which will help maximize your credit mix.

Pro Completed Trades: May 8, 2017

Published May 8, 2017 at 2:55PM

Pro Guidance Changes from the past two weeks (see related trade alerts)

- N/A

Pro Completed Trades from the past two weeks (see transaction log -- recent trades may take 24 hours to show)

- **FactSet Research** (NYSE: FDS): We bought 30 more shares, adding about 0.15% to bring our total stake to about 2%.
- **Gogo**: We covered all our shares.
- **Skyworks Solutions** (NASDAQ: SWKS): We rolled our covered strangle up and out as per our recent alert; we now have a November 2017 strangle, with a $92.50 put and a $95 call, open on our shares.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS): We bought 100 more shares, or about 0.15%, bringing our stake to about 2%.

You can see all of our guidance, positions, and transactions from the Recommendations page.

O'Reilly's Series of Unfortunate Events

Published May 1, 2017 at 3:37PM

Fellow Fools,

26.9%.

As I type this on Monday afternoon, that's the amount by which **O'Reilly Automotive**'s (NASDAQ: ORLY) stock has *trailed* the market since setting an all-time high at the end of last July. Over that same period, *Pro* is currently up over 8% (and trailing the market by less than 2%) -- a testament to the power of diversification. But diversification also has its pitfalls; for example, it can make investors overly complacent with troublesome positions, even though we know the odds are unnervingly high that at least one of our stocks will see a catastrophic decline of 70% or more.

In an effort to combat this, as well as the lethargy that can be brought about by bull markets (because a rising tide can lift almost every boat), one of our top priorities here at *Pro* since the start of 2017 has been to put all our current positions through the wringer and ensure each one is something we'd be eager to buy should we see a correction in 2017. This is why, despite our preference for low turnover, we've already closed four long positions and three shorts this year.

Which brings us back to O'Reilly, which released results after the market closed last Wednesday. For the past five years, O'Reilly's steady revenue growth and margin expansion made it one of the standouts in the S&P 500, and it was rewarded with an average valuation multiple 26% higher than the market. But decelerating revenue growth, coupled with rumors of Amazon's threat to the industry, have moved investor sentiment decidedly negative; since the start of February, O'Reilly has traded at a discount to the S&P 500 for 30 out of 59 days. (Before that, it had done so for exactly one day since the start of May 2010.) However, a cheap valuation alone isn't enough of a reason for us to hold the stock -- we need to believe in the future prospects of the business.

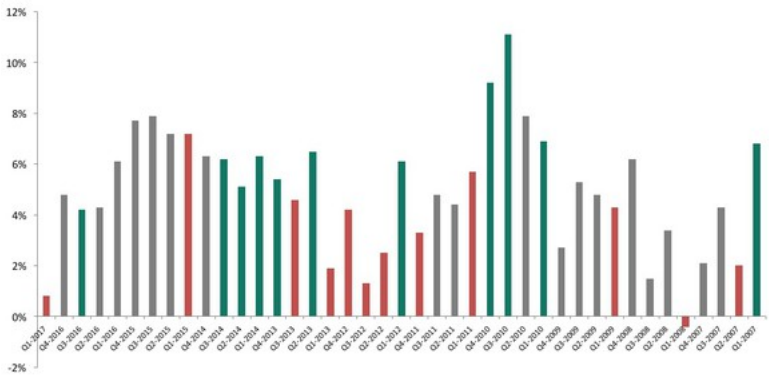
Blame It on the Rain, Yeah, Yeah

Many investors consider "unfavorable weather" to be the classic excuse used by a company dodging responsibility for poor results, but some companies really do struggle if Mother Nature pitches fits. Unlike, say, apparel, where people frequently buy new items they don't technically need, O'Reilly largely depends on customers who *have* to perform maintenance or make repairs to their vehicles. And what increases the frequency of both? Hot summers and harsh winters (though the latter often hurt sales initially, as snow and ice keep people from stores). Unfortunately for O'Reilly, most of the past winter was quite mild. Worse, the company actually benefits from a mild early spring, because it gets people out and working on their vehicles -- but in many parts of the U.S., winter weather only hit at the very end of the quarter.

It's not perfect, but one way to gauge the impact of weather on a given quarter is to look at the difference in performance between East Coast and West Coast stores. In the past, the delta between comparable-store sales for cold markets vs. warm markets has been up to 800 basis points (100 basis points = 1 percentage point); management noted that in this past quarter, this difference was slightly less than 400 basis points, despite some western stores seeing softened demand because of torrential rains.

By my count, since Q1 2007, management has called out weather as a net negative for company comps on 12 different occasions. (Yes, I have a spreadsheet where I keep track of every management comment regarding weather.) Now, unfavorable weather tends to defer purchases rather than preventing them, because customers will still eventually need to perform maintenance and parts have a limited lifespan even in ideal weather. So a lost sale because of weather isn't necessarily a permanent loss.

O'Reilly Automotive Quarterly Comparable Store Sales



Source: Company filings, earnings call transcripts provided my S&P Global Market Intelligence. Red indicates management commentary from the earnings call suggesting weather was a net negative for the quarter, green a net positive, and gray no or offsetting impact.

It's important to try to determine whether the company is doing a good job at recapturing those sales (as well as being honest in its assessment of the effects of weather). To do that, we can look at comps in the quarters following unfavorable weather. This, too, is admittedly an imperfect exercise because of the many factors that affect sales in a given quarter, but based on what we've seen over the past 10 years, it looks like we should give management the benefit of the doubt: Comps tended to be higher for the two quarters following a "poor weather" announcement (vs. all other quarters), and were more likely to show a positive year-over-year difference.

	Frequency	average delta	median
Weather cited as a net negative			
Comps higher in the next quarter?	60%	1.2%	1.4%
Comps higher two quarters later?	80%	0.9%	0.9%
YoY difference in next quarter comps positive?	67%	-0.1%	0.9%
YoY difference in comps two quarters later?	67%	1.0%	1.7%
All other periods			
Comps higher in the next quarter?	45%	-0.5%	-0.2%
Comps higher two quarters later?	48%	-0.4%	-0.1%
YoY difference in next quarter comps positive?	59%	0.3%	1.2%
YoY difference in comps two quarters later?	61%	0.3%	1.0%

When It Rains, It Pours

Besides poor weather, O'Reilly also had to contend with delayed tax refunds. Given the cost of having someone else repair your vehicle, economic necessity has always been one of the driving forces behind the DIY auto parts industry. We can see this in the fact that the vast majority of O'Reilly's purchases take place using cash or debit cards, as well as the seasonal bump in sales O'Reilly and its competitors traditionally see once people start receiving their tax refunds. Early filers in particular provide a strong boost to sales, as many of them were postponing repairs because of a lack of funds. However, this year the IRS delayed some refunds in an attempt to combat tax fraud. This delay really hit O'Reilly hard in February, with management noting during the earnings call that the company "had a bit of a couple rough weeks there" that resulted in the lowest comp in quite some time, one that "wasn't just a little bit negative." Currently, we believe that O'Reilly will ultimately be able to recapture most of this business as customers do receive their refunds, but only time will tell.

What to Watch

We won't be updating our fair-value estimate (which was set at $255 more than a year ago) until we have a chance to see what the rest of O'Reilly's competitors have to say about the current state of the industry, as well as dig into O'Reilly's SEC filing. But we can speak to the two things we'll need to see in the coming months to convince us it's still worthy of a spot in our portfolio.

First, we need to see O'Reilly's comps reaccelerate as we move throughout the year. Similar to Starbucks, the company found itself a victim of its own success this past quarter; O'Reilly was up against very strong 6.1% comparable sales from last year, as well as the sixth highest two-year combined comp since 2008 (13.3%). Although it won't see a truly low hurdle until we lap this quarter's comps next year, the numbers do become increasingly favorable as we move through the year.

The other thing we'll be looking for are changes in customer purchasing habits and preferences. Although Amazon is a very real threat, its ability to steal sales away from O'Reilly and other physical retailers currently looks to be somewhat mitigated by a couple of factors:

- Time and immediate need continue to be the first two deciding factors when it comes to people's preference to head to a store for auto parts rather than shopping online.

- Next on the list is needing advice, which will likely only increase in importance as cars become increasingly complex. Surveys have shown that younger generations actually have a higher preference for going to a store and speaking with someone.

O'Reilly has been a strong performer for *Pro* since we added it to the portfolio in 2013, but this alone isn't good enough. We need to be convinced that the road ahead is just as smooth if we're going to keep holding our shares. We'll have more to say on this matter soon, but for the time being the stock remains a buy.

Enjoy your week, Fools!

-- JP (TMFYossarian)

Pro Catch-Up Trades and Upcoming Expirations: May 1, 2017

Published May 1, 2017 at 3:14PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **FactSet Research** (NYSE: FDS): Buy 2%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3% (see our recommendation).
- **Oracle** (NYSE: ORCL): Buy 3.8%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **AmTrust Financial Services** (NASDAQ: AFSI): If you haven't set up a protective collar yet and want to, set up one June 2017 collar for every 100 shares you're protecting. Sell to open June 2017 $17.50 calls and buy to open an equal number of June 2017 $12.50 puts. Lately, this can be done for a $0.30 credit, but that price will change as the stock moves.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for a small net credit or no cost.

This month's expirations (May):

- None.

Pro Guidance Changes and Completed Trades: May 1, 2017

Published May 1, 2017 at 3:09PM

Pro Guidance Changes (from the past two weeks -- see related trade alerts)

- **Gogo** (NASDAQ: GOGO) moved to Cover.

Pro Completed Trades (from the past two weeks)

- **Domino's Pizza** (NYSE: DPZ): We closed (covered) our short, and bought to close our short puts.
- **FactSet Research** (NYSE: FDS): We bought 30 more shares, adding about 0.15% and bringing our stake to 2%.
- **Gogo**: We covered all our shares.
- **Papa John's International** (NASDAQ: PZZA): We sold all our shares.
- **Skyworks Solutions** (NASDAQ: SWKS): We are in the midst of rolling our covered strangle up as per our recent alert; three legs are completed, and the order to close our August $85 puts is waiting to fill at a limit price between the bid/ask.
- **Valmont Industries** (NYSE: VMI): We sold all our shares.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Buy (More) FactSet and WisdomTree Emerging Markets

Published Apr 28, 2017 at 12:40PM

Is this for you? This recommendation is for all *Pro* members who have year-to-date dividends to reinvest, or who have ample cash to make a small additional investment and want to match us.

How You Participate

- **Action and Allocation:** Buy about 0.15% more in **FactSet Research** (NYSE: FDS) and 0.15% more in the **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) fund, bringing each to about a 2% allocation. *Pro* will buy about 30 more shares of FDS and about 100 more shares of DGS.
- **Price Guidance:** Use a **limit order** at the prices available when you place your order. We'll buy in the next one to 30 days.
- **Recent Price Ranges (this morning):**
  - FDS: $162.91-$164.21
  - DGS: $45.07-$45.14
- **Guidance:** Both are rated Buy.

What We're Thinking

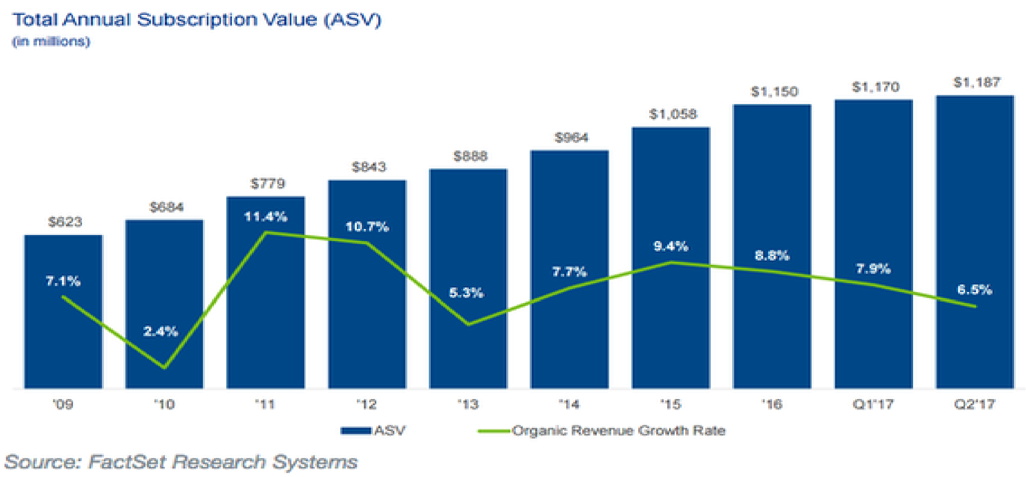
This is our first "dividend reinvestment" following Monday's Memo outlining our new quarterly plan, which is to invest our dividends when we see incremental purchases we're happy to make, as long as our cash balance is already where we want it. We have plenty of cash today at about 22.8%, and we can definitely afford to invest the net dividends we've collected so far this year, which amount to $9,560.90, or 0.3% of the portfolio's value. We're investing roughly that, equally divided as 0.15% to each of these two stocks (our smallest positions) to bring them to about a 2% stake each.

As we reinvest each quarter to take advantage of the long-term benefits doing so will provide, we plan to pay at least a bit of heed to the fact that much is unknowable. Though what we're doing isn't "auto-reinvestment," in some senses we want it to be *like* that. We don't want to overthink it -- we want to think just enough. Here's what we're thinking.

FactSet Research

With 95% of its revenue recurring in nature, FactSet Research is in a good position to continue to grow by adding new clients and new services, and it's currently doing both, with international markets representing a strong long-term opportunity. Even as more investors move to a "passive" approach to investing, investing itself hasn't truly become any simpler -- countless "passive" funds are anything but. FactSet offers analysts and fund managers a growing number of tools for analyzing passive funds, as well as investment approaches that combine those funds. The company is evolving with the market, and it continues to lead in data, analysis, and tools for active investment managers. The next bear market will probably bring a revival in the desire for active managers, as people grow leery of passive funds that only go down for months on end. But even barring that, FactSet is in a good position.

The stock is up 10% including dividends since our original buy report in May 2016, so it hasn't been a market-crusher in these 11 months, but it has run with our North Star despite business headwinds that knocked it back from much higher prices late last year and again in February. Annual subscription value growth has slowed since our purchase (from 8.8% to 6.5% last quarter), so it speaks to the respect the business garners that the stock is up anyway.



FactSet revenue and organic growth have slowed but keep growing.

Shares yield 1.2%; FactSet has increased its dividend for 17 consecutive years, ever since it started paying one in 1999. The stock lately trades at a P/E multiple well below its long-term average, now fetching 19.2 times earnings. We aren't looking for a 30 P/E average again by any means, but we do expect to see the low 20s over time. We'll pick up a few more shares (about 30) with this reinvestment.

FactSet's P/E multiple has fallen below its average. Source: S&P Global Market Intelligence.

WisdomTree Emerging Markets SmallCap

This position gives us some very long-term macro diversification, providing exposure to small-cap emerging markets in the likes of China, Thailand, Taiwan, Brazil, and India with a dividend yield running above 3%. We can't easily obtain this broad international exposure on our own. The fund is well-managed, has reasonable fees for what it does (0.63%), and has outperformed many emerging-market ETFs during the long period of stagnation we've seen in emerging-market stocks. DGS has easily outperformed the likes of much larger ETFs including **Vanguard Emerging Markets** (NYSEMKT: VWO) and **iShares MCSI Emerging Markets** (NYSEMKT: EEM) over the past 10 years. But like emerging markets in general, DGS is still down over a very (very) long period.

Lately, though, emerging markets are performing better than the U.S. indexes, topping the strong gains in the U.S. both year-to-date and over the past 12 months. Economic growth in China and elsewhere has picked up the pace, while commodities have been more stable and the dollar's strength has leveled. Emerging markets remain less expensive than U.S. stocks, and though we don't have centuries of data to go by, the returns so far seem to cycle, with the former ahead for periods of time, and then U.S. stocks taking the lead as they have for the past several years. This suggests that eventually emerging-market stocks will be the much stronger performer again -- this may even be starting now, as U.S. GDP growth remains slight. As long as we don't have a better place for what will be 2% of our portfolio after we add these "dividends," we're content to stay invested in it.

The Foolish Bottom Line

Nudge these two positions up by about 0.15% each, bringing each to about 2% of your portfolio, if you have dividends you want to reinvest or more than ample cash and want to follow along. Helping make this economically feasible, our trading commissions at Interactive Brokers are very low. Hopefully, given the commission wars going on, yours are, too. Fool on!

Roll Your Covered Strangle on Skyworks Solutions

Published Apr 25, 2017 at 2:32PM

Is this for you? This recommendation is only for *Pro* members who have written August covered calls on **Skyworks Solutions** (NASDAQ: SWKS) at $87.50 as recommended (or perhaps at another strike price if you arrived later), and also for those who have written August $80 puts (or others that month) as part of a covered strangle. Those who have not yet written covered calls should leave Skyworks stock uncovered and just go on owning it; we're playing catch-up here, rolling our in-the-money calls higher. The stock remains a Buy at a 4.4% allocation. (Members following the *Motley Fool Options* put-writing trades in that service should be careful not to double your exposure.)

How You Participate

- **Trade:** Use a multi-legged or rolling order on Skyworks options to:
  - "Buy to close" all August 2017 $87.50 calls and August 2017 $80 puts, and ...
  - ... Write ("sell to open") the same number of November 2017 $95 calls and November 2017 $92.50 puts (though note, the puts are optional).
  - After doing so, you should have the stock you already own, plus a November 2017 $92.50 put/$95 call strangle on your shares.
- **Allocation:** *Pro* will continue to write a covered strangle on all 1,200 shares we own. We don't plan to increase our exposure to more shares, if it came to that, but would instead roll or close the strangle.
- **Recent Prices (11 a.m. ET):**
  - Stock: $104
  - Buy to close August 2017 $87.50 calls (splitting bid/ask): $18.80
  - Buy to close August 2017 $80 puts: $0.85
  - Sell to open November 2017 $95 calls: $15
  - Sell to open November 2017 $92.50 puts: $5.30
  - Net credit collected on all four options: Approximately $0.65
  - Upside gained on stock: $7.50 per share
- **Price Guidance:** Prices will change, but lately you'll want to use limit orders to complete all transactions for a combined net credit of about $0.65. Or, you could trade in two pairs. You'll lately pay a net debit of about $3.80 to roll your calls from $87.50 to $95, and you'll pay about $0.85 to buy back your $80 puts, so that's $4.65 in total debits to close these two options. You should aim to get that money back by writing the new puts for the same amount or more (lately they provide a $5.30 credit, leading to a $0.65 net credit overall on all four options). If the stock moves meaningfully in either direction before you make your trade, adjust your strike prices accordingly by one or two strikes to end up rolling for a credit or no cost, or, if not possible, a small debit. We'll do the same if need be.
- **Stock Guidance:** Buy 4.4%. As mentioned above, don't use options on this stock today if you don't have them in place already.
- **Fair-Value Estimate:** Remains $93.
- **Note:** Earnings are due April 27. We aim to roll before then to give our stock more upside breathing room... just in case.

What We're Thinking

In January, we talked about the strength at Skyworks' business as we rolled our $75 covered calls $12.50 higher to $87.50 without paying to do so, thanks to the time value we captured by rolling to August and also by writing puts. Going into earnings on Thursday, we're going to roll our strangle higher again, for another small credit, in order to capture more of the upside the stock has experienced lately. We again need to roll out to do this at a credit, in this case to November, but we're gaining a likely 8.6% in stock upside in seven months, plus 5.7% in yield on a put with a strike price 11% below the recent share price.

Even now, we're paying about $1.90 in time value to close our August $87.50 calls, but we'll be getting about $6 in time value (and $15 total) by replacing them with November $95 calls. The August $80 puts recommended in January have earned members more than 80% of their potential income, and can now be closed for about $0.85. The new $92.50 puts, if you choose to write them, pay about $5.30 in new time value. Combined, the $20.30 or so in credit that members will receive on both these November options will give your portfolio, as of today, a potential net $115.30 sell price on the shares you own, or a potential net $72.20 buy price on more shares. That's how the positions will behave in your account after this trade.

Why This Strategy?

We're doing this now partly because Skyworks' share price just surpassed the net credits we received in our August strangle. Most members received about $15 to $16 in credit for writing the August strangle, which, on $87.50 calls, resulted in a potential stock sell price of about $102.50 to $103.50 per share. The stock just moved past that price. So, although we need to pay nearly $2 in time value to close our August $87.50 calls, rolling now may help us avoid a more difficult or more costly roll if Skyworks continues to rise in price. Should the stock perform well in coming days or weeks, we would probably need to roll up at a debit, potentially a large one. (We won't write puts at higher strikes, given our value estimate of $93. In fact, these are the last puts we plan to write as part of this strategy.) We hope to better position ourselves pre-emptively today and then adjust later as needed, likely just focusing on our short calls.

All in all, this is another good reminder not to write calls on stocks you're not ready to sell. Ideally, we've learned this lesson for the last time! Although we want to target income here in *Pro* as well, it's always best to do that on positions that have been set up for the purpose. That said, at least we've been able to keep up with the stock gain here, but it has created extra trading and extra downside exposure through our written puts. So, don't expect to see this type of action from us on other positions. This one, at least, is hopefully instructive. And we can celebrate the gains being earned, and the hedge offered by the covered calls.

Alternative Trades

- **Can't or don't want to write puts?** Then simply roll your covered calls, the same way we are. You still capture $7.50 in stock upside for a cost of only about $3.80 or so, nearly doubling that capital in seven months if Skyworks stays above $95.
- **Don't want to close your $80 or other puts?** You can keep them open to potentially earn 100% income at expiration (it appears likely, anyway!). But if you do keep them open, don't write new puts; you'd be doubling your exposure.
- **Wrote other puts or calls expiring in August?** In most cases, rolling those now per this alert will make sense for you, too. Ask below if you have questions.
- Other than that, this is a simple roll to target more upside for those in arrears. So, again, those who just own shares today should continue to do so, and not use options. The stock remains a Buy.

More That Matters

- **Maximum gain:** The stock's upside is capped at our written call's strike price; plus, we can profit by earning the premiums received for writing the strangle.
- **Maximum risk:** The full stock value, plus the full written put exposure, which doubles our stock exposure starting at our put strike.
- **Follow-up**: We'll continue to manage our covered strangle, rolling for upside or more credit as needed, as long as we like the prices of everything. We plan to keep the stock long-term as long as the business and valuation seem to merit it.

Pro's New Quarterly Reinvestments

Published Apr 24, 2017 at 3:55PM

Dear *Pro* Fools,

Prepare for *another* mind-altering five minutes with *Motley Fool Pro-o-o-o-oooo*!

In last week's Memo, you learned that since 1980, more than 320 companies in the S&P 500 have been removed from the index because of their shortcomings. That extreme statistic reminds us that a capitalistic economy makes it difficult for any company to retain advantages -- Sony was all the rage, until Apple was. The takeaway is that we must stay on our toes.

By the end of *today's* Memo, you're going to question why you (and we) haven't regularly reinvested our dividends. Cutting to the chase: From here forward, we plan to do so quarterly, gathering up our dividends from the previous three months and announcing where we'll choose to invest those funds by sending you a new trade alert or two. The first (re)investment will happen soon. Now, here's why.

To Reinvest or Not?

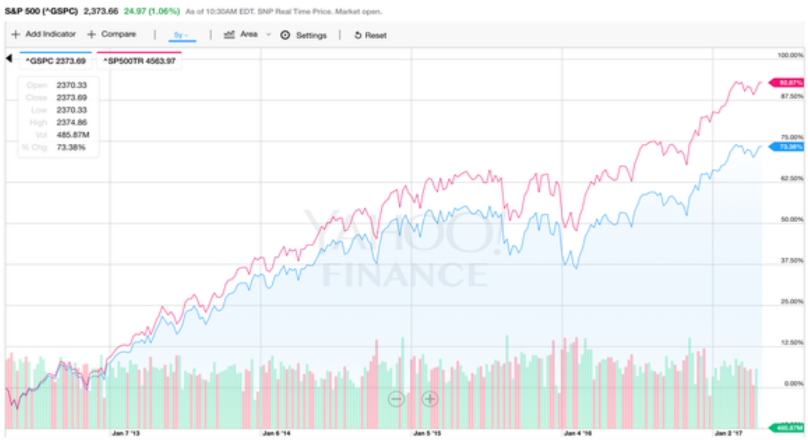
One of our goals in *Pro* is to earn a positive return over every rolling three-year period, whatever the market does. This implies that we need to be defensive, and our dividends coming into the portfolio are a valuable asset in that fight. But unless we need that cash as a protective cushion, or for brand-new buys, our dividends are "extra" income that we're not spending, so we could be doing more with it. History tells us the *best* thing to do is reinvest it.

Some *Pro* members have asked upon joining whether we reinvest dividends or not. We have answered that we plan to invest our dividend proceeds manually, rather than automatically, and this remains true. We personally don't want our dividends being reinvested into partial shares (some brokers do that), or in stocks we may not want to buy more of that month (whether we're ultimately right or wrong). We want to control our allocations and investment decisions more than auto-reinvestment allows. There's only one problem: We haven't made a regular practice of reinvesting our dividends. Instead, we've been adding them to our cash, intending to invest it later, on a rainy day.

But the way the portfolio is managed, we have *always* carried a cash balance, and that's not likely to change anytime soon (unless stocks fall 40% and we suddenly want to invest every penny). Our strategy calls for carrying cash, so our dividends, modest as they are, can afford to be reinvested, working to increase our value. So, from here forward, we plan to reinvest our dividends quarterly. This year, we've collected $9,560.90 in net dividends so far, and we aim to invest that by May. Typically, we'll look to reinvest our compiled dividends with specific trade alerts in April, July, October, and January of each year.

Why Reinvest?

The Motley Fool tracks all of its services against the S&P 500 Total Returns Index, which reinvests dividends in the index automatically. For our credibility, it's a good thing we track against that, because the difference between reinvesting and not reinvesting is stark. Over the past five years measured to this morning, the S&P 500 index price gained 73%. With dividends reinvested, it gained 93%.

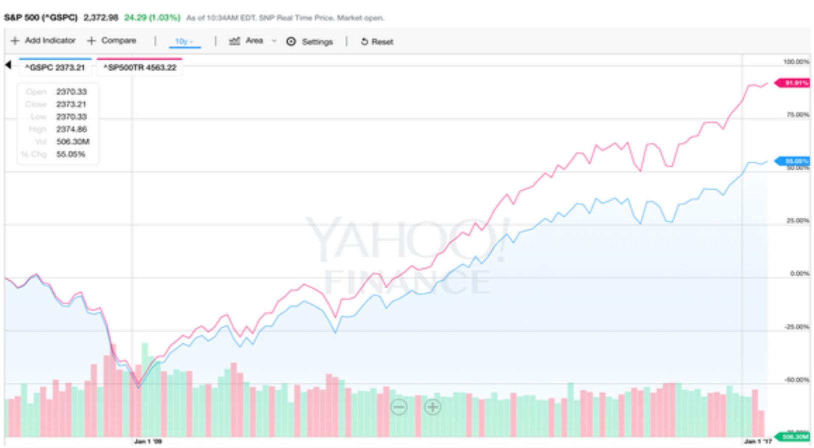


S&P 500 price up 73% in five years; total return 93% including dividends.

And the difference only grows larger the farther back you look; over a lifetime, it's stupefying. A Guinness Atkinson study called "Why Dividends Matter" found that if you had invested only $100 in the index at the end of 1940, it grew to an impressive $12,000 by the end of 2011. But that same $100 grew to $174,000 if you just reinvested the dividends it spun off, rather than spending them.

Read those two sentences again if you need to. $12,000. Against $174,000.

Reinvesting dividends is especially helpful during market downturns, letting you buy more shares cheaply, setting you up for a stronger recovery. It's already 2017 (did you notice how that happened? Me neither), meaning the past 10-year market returns now start near the market *high* of 2007. How's that look? It's not pretty. Over the past decade, the S&P 500 has only gone up 55%. That's it. But with dividends reinvested, you're up 92% -- all thanks to reinvesting a yield of only about 2% a year, at best, over this time. Reinvesting that gained you another 37 percentage points in returns.



S&P 500 up 55% the last 10 years, but 92% including reinvested dividends.

Turbo-Charged Compounding

Over longer periods, dividends matter even more. They have accounted for 52% of the S&P 500's total return since the 1940s, so reinvesting them is a way to super-charge the compounding you get from the market, using the dividends to effectively buy still more dividends -- along with more stock.

As if we need more incentive, studies from Hartford Funds (courtesy of our friends at *Motley Fool Total Income*) found that dividend-paying stocks in aggregate far outperform non-payers, returning nearly 9% annualized against less than 3% annualized for non-payers from 1972 to 2015. (Guinness Atkinson gets even more granular on returns with a chart on page three of its report.) This won't stop us from buying the Facebooks of the world, but most of our stocks pay a growing dividend.

Finally, we know that reinvesting dividends beats inflation, another of our goals at *Pro*. That's partly because strong companies have a habit of increasing the dividend annually.

Your Personal Preference Rules the Day!

We had the best of intentions when we said we would invest our dividends as we saw fit, and in many ways (with new buys), we have -- while still keeping the cash on hand we want. But we believe we'll all be better served by making a formal practice of reinvesting them. Every quarter, we'll now be on the hook to reinvest our dividends with trade alerts that specify that's exactly what we're doing. If we're going to skip any particular quarter (and we remain free to!), we need to explain to members why -- and it better be a good explanation.

To be clear, we are *not* turning on automatic reinvestment. Our broker, Interactive Brokers, offers to auto-reinvest dividends for corporate accounts like ours, but not individuals like you, and it charges the usual commission to do so. But we'd rather tally our dividends each quarter and reinvest the funds as we see fit, accompanied by a trade alert.

If you want to auto-reinvest dividends at home, you could. Many brokers, including TD Ameritrade, Schwab, and Fidelity, offer free automatic dividend reinvestment -- just call and ask, or search for it in your account settings. If you already auto-reinvest, I suggest you keep doing that. But if you want to follow our quarterly dividend reinvestment trade alerts instead, consider that.

Finally, if your dividends cover part of your living expenses, and you need them for your day-to-day, obviously keep taking them out. Last year, our portfolio earned $27,192 in dividends, or less than 1% of our current value. If we spread those funds into four of our stocks a year, it will add less than a 0.25% extra allocation to each, so it won't throw off your general alignment with our allocations anytime soon.

Our dividends are modest, but over a lifetime, consciously reinvesting them should add meaningfully to our returns. Better to start a formal plan now, rather than never. Mainly, I want you to be informed and do what's best for you and your long-term return. In that spirit, our new quarterly reinvestment action will remind us four times a year of the power of reinvesting dividends.

Please ask any questions, offer suggestions, bubble up ideas on how best to do this -- share anything you want on the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: April 24, 2017

Published Apr 24, 2017 at 2:32PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **FactSet Research** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.2% (see our recommendation).
- **Oracle** (NYSE: ORCL): Buy 3.8%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **AmTrust Financial Services** (NASDAQ: AFSI): If you haven't set up a protective collar yet, and want to, set up one June 2017 collar for every 100 shares you're protecting. Sell to open June 2017 $17.50 calls and buy to open an equal number of June 2017 $12.50 puts. Lately, this can be done for a $0.30 credit, but that price will change as the stock moves.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for a small net credit or no cost.

This month's expirations (May):

- None.

Pro Guidance Changes and Completed Trades: April 24, 2017

Published Apr 24, 2017 at 2:22PM

Pro Guidance Changes (from the past two weeks -- see related trade alerts)

- **AmTrust Financial Services** (NASDAQ: AFSI): Fair value declined to $17.95. The stock remains a Hold.
- **Caesars Entertainment** (NASDAQ: CZR) moved to Cover.
- **Gogo** (NASDAQ: GOGO) moved to Cover.
- **Papa John's International** (NASDAQ: PZZA) moved to Sell, and **Domino's Pizza** (NYSE: DPZ) moved to Cover, ending the paired trade and both positions.
- **Valmont Industries** (NYSE: VMI) moved to Sell.

Pro Completed Trades (from the past two weeks)

- **AmTrust Financial Services** (NASDAQ: AFSI): We closed the June 2017 $15 put/$22.50 call collar, and set up a June 2017 $12.50 put/$17.50 call collar for a credit.
- **Caesars Entertainment:** We closed (covered) our short.
- **Domino's Pizza**: We closed (covered) our short, and bought to close our short puts.
- **Papa John's International**: We sold our stock.
- **Valmont Industries**: We sold our stock.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Close Your Short on Gogo

Published Apr 21, 2017 at 2:10PM

How You Participate

- **Action:** Buy to close, or cover, your short position(s) on **Gogo** (NASDAQ: GOGO).
- **Allocation:** Close all of your short -- our 0.5% exposure will go to 0%.
- **Scorecard Status:** It was on Hold, and we're moving it now to Cover. There's a bug on our scorecard that means it will continue to say Hold there, but we mean for you to cover, or close, it.
- **Recent Price Range (this morning):** $11.83-$12.17
- **Price Guidance:** *Use a **limit order***, and aim to pay about $12 or less today. We will close our short within the next one to 30 days.

What We're Thinking

Usually when you sell a stock short, the time frame is also meant to be short. We knew going into the Gogo short position that we only needed a quarter or two to see whether our thesis would start to play out. So far, it hasn't. Our belief that growing competition would crimp Gogo's new sales, putting the squeeze on a business that's already losing money, is not yet unfolding.

Our argument that Gogo's rollout of new technology wouldn't do much for its business financials, partly because of new competition, is not yet panning out. Instead, Gogo's new 2Ku satellite wifi technology is growing more popular, with more customers signing on and revenue increasing more than expected. The company now expects its levered free cash flow to turn positive in 2019, a whole year earlier than previously thought, thanks to more 2Ku installs on airplanes.

Positive earnings are not estimated until 2020, and the company carries $800 million in high-interest long-term debt, so it's not out of the woods. But with positive sales momentum -- and recurring revenue garnered whenever a customer signs up -- our primary thesis of stalling sales growth as the industry becomes more competitive looks unlikely to occur right now.

The stock has risen 20% against us as of this week, and 20% is where we traditionally take a gut check to see if we want to stay short, short more, or close. Our thesis called for a weakening business, or at best a stalled one -- not one that's improving. Wanting to avoid "thesis creep," we can't create new reasons to stay short the shares in the face of positive changes in the air.

That said, we were ready to close the position last month when news broke of the U.S. laptop ban on flights originating from several countries. The possibility that the ban might spread made us patiently wait to see what happened. But that broader ban appears less likely today, and waiting indefinitely isn't a solid thesis.

We'll keep an eye on Gogo for future possibilities, but today we can close our short for a small monetary loss on a small position. And since more than 40% of shares are sold short, we want to close during relative calm, rather than risk a big event, such as the earnings report due around May 4. Please use a **limit order** to close. Gogo is a small business.

Alternative Trades

- **If you set up a synthetic short or set up a bearish spread:** You should close those positions, too.

Roll Down Your Collar on AmTrust Financial Services

Published Apr 20, 2017 at 2:28PM

Is this for you? This is for *Pro* members who set up a protective $15/$22.50 collar and who, after reading this, want to take some capital out at the expense of capping upside at a lower price. We're adjusting our collar to lower strike prices to take some profits but still remain hedged. The stock itself remains on Hold.

How You Participate

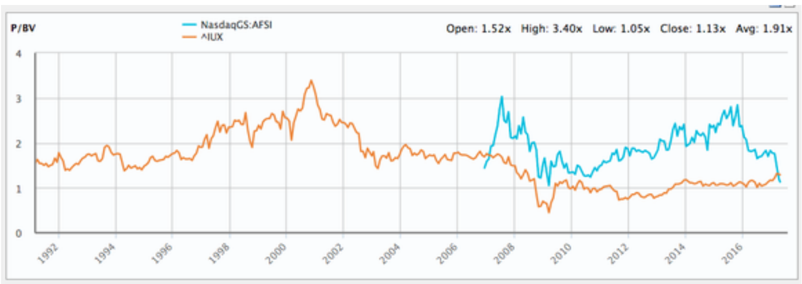
- **Trade:** Roll down your protective collar on **AmTrust Financial Services** (NASDAQ: AFSI)
- **Actions:** Simultaneously ...
  - Sell to close your existing June 2017 $15 puts, and ...
  - Buy to close your existing June 2017 $22.50 calls. Then ...
  - Write a new collar by selling to open June 2017 $17.50 calls, and ...
  - Buying to open June 2017 $12.50 puts.
- **Allocation:** Roll each collar you already have open. You should have set up one protective collar for every 100 shares owned.
- **Price Guidance:** Use **limit orders** and initially aim for a net credit of $1.25 to close the existing collar, and a net credit of $0.45 to write the new one, resulting in a combined net credit to roll of $1.70. This credit will grow larger before your trade if the stock falls, and shrink if the stock rises. So, adjust as needed when you enter your order, using appropriate limit orders at going prices and splitting the bid/ask prices.
- **Recent Prices (12:55 p.m. ET):**
  - **AFSI:** $15.87
  - **Old Collar:**

- Buy to close June $22.50 calls (bid/ask): $0.20/$0.30 -- use $0.25
    - Sell to close June $15 puts (bid/ask): $1.45/$1.55 -- use $1.50
    - Net credit: $1.25
  - **New Collar:**
    - Sell to open June $17.50 calls (bid/ask): $1.10/$1.30 -- use $1.20
    - Buy to open June $12.50 puts (bid/ask): $0.65/$0.85 -- use $0.75
    - Net credit: $0.45
    - **Combined credit on rolldown:** $1.70
- **Scorecard Status:** Hold; 2.9% allocation
- **Fair-Value Estimate:** $17.95

What We're Thinking

All of us in the *Pro* community have felt AmTrust's recent decline in price, which happened on rumors that whistleblower Harry Markopolos and the FBI are investigating the company's accounting. The decline has led to gains in the protective puts members purchased as part of a protective collar. Today, we're keeping a collar in place for protection, but we're rolling it lower in order to take some money out. This trade keeps our downside exposure nearly the same even as we roll our collar down and take money out. So what's the trade-off?

Well, we're rolling our short $22.50 calls down to $17.50 calls, which is a compromise. But given a lower ROE than in the past, we're valuing the business at no more than 1.3 times its new book value of $13.81, or $17.95. So this lower strike price on our short calls accounts for a lower valuation estimate and, thus, more willingness to sell at a lower price than before. AmTrust has long enjoyed a premium valuation to the S&P 500 Insurance Industry group, but given its recent black eyes, it's unlikely to return to that status anytime soon. Here's AmTrust's historic multiple to book value against the S&P 500 Insurance Industry group's average (the longer line):



AmTrust's price-to-book value multiple exceeded the industry average until now.

Source: S&P Global Market Intelligence.

After this trade, our stock protection will start at $12.50 rather than $15, but we will have harvested $1.70 in time value by rolling. Adding that to our new $12.50 strike price, the net result is protection at $14.20 -- not much lower than the $15 price we're rolling down from. The math: Lately, members can get a net $1.25 credit by closing the existing $15/$22.50 collar, and then get another $0.45 net credit by setting up the new $12.50/$17.50 collar, for $1.70 in total credits.

On the flip side, if we *don't* sell our $15 puts soon and the stock remains above that price through our June expiration, we will ultimately forfeit the current $1.50 in time value they carry today. Since the company's financial restatements have been announced already, we'd rather capture that time value (since we should have less to worry about now) and then set up a new, adjusted collar just in case more surprise bad news comes.

All that said, this roll down is optional. If you'd rather keep your current collar -- because it offers more upside and protects you at $15 -- you can do so, and take no action today. Those who do want to take some money out and roll their strike prices down can follow along with this trade.

Never a dull moment with this one, lately! But we will emerge stronger because of it.

Alternative Trades

- **Only bought $15 or $12.50 puts?** You can roll the $15 puts you own down to $12.50 if it's worth the $0.75-per-share or so credit to you. Or, you can just keep the $15 puts in place. Just keep the $12.50 puts in place if you only bought those.
- **Have bull put spreads open?** As above, you can roll your short puts down if the credit and adjusted risk are appealing to you.
- **Not using options?** You're in a tougher spot, with few ways to protect yourself. So, just make sure that you're comfortable with the size of your position. If not, you have the option to reduce it. We currently have 2.9% in AmTrust.

Pro Can Help

- Questions on this short-term protective position? Please ask on the [AmTrust board].

Pro Video Chat, April 2017

Published Apr 18, 2017 at 3:38PM

The *Pro* team will be holding a live video chat on this page at 1 p.m. Eastern on Tuesday, April 25! We'll be using sli.do to communicate with members during the chat; [click here] to go to our chat directly, or go to slido.com and enter the code **#ProChatApril**. We recommend keeping the video chat open in one browser window and the Slido chat open in another (or on a mobile device) so you can follow along with both. See you soon!

Transcript

Jeff: Greetings, [inaudible 00:00:01] pro members and welcome to our April 2017 chat. I'm joined at the table by JP Bennett.

JP: Happy to be here.

Jeff: And by the way, I'm Jeff Fisher and we’re joined … we’re looking at that camera. We’re joined via Skype by Billy Kipersztok.

Billy: Hello.

Jeff: Hey Billy, how are you?

Billy: I'm doing great, how about you Jeff?

Jeff: Good. JP, how are you doing?

JP: Good. There’s a little bit bad weather today but I can’t complain.

Jeff: It’s been raining for several days here in Washington. A little cool and a little rainy but everything is blooming so we have the whole Pro-Analyst team here to host this live chat with you today. Right here on the video you see of course the video portion of the chat but click through to slido.com and then enter the words that you can see right on this page as well. Pro-chat April, Pro-Chat April. That gets into the question part of this chat and then ideally you can keep two windows open, one on the side for the video if you want to see it … you don’t need to and another for the question part. Ask questions and vote up questions that you want answered most and we will go through them in order of … mostly in order of preference by you so we are already a quarter, more than a quarter into the year … JP and Billy.

JP: Time flies.

Jeff: It really, it does. It’s been a busy year. We’ve issued in Pro alone, 20 trade alerts in last three and half months.

JP: Wow.

Jeff: So more than usual. We’ve had more turnover than usual as well and we are looking to reposition the portfolio, at least to some sense into companies that we like better. Good enough companies that don’t live up to our ever-increasing standards. Fixing some mistakes, closing some positions that haven’t worked out. It’s just …

JP: Closing some that have worked out.

Jeff: And some that have worked out very well and it just so happens to be that feel like it’s that time to refocus our portfolios. It’s progressing steadily and the portfolio despite all this activity, which is usually going to hurt you returns anytime that you are very active … I expect your returns to be lower and that maybe a price we pay this year in fact as we at least reshape portions of the portfolio but we are up 6.2% this year so far. Above the North Star, right in line with S&P 500 shockingly to me because we have had some problem positions for sure. We are only 73% Net long but we are in line with S&P, we are below the Nasdaq which has been quite strong … up 10% or so this year already but that’s okay against our goals, we are doing well despite, some losers, some transitions, some kind of refocusing.

Billy: Hey Jeff, tell me one more time how many alerts we did so far in the first quarter?

Jeff: We’ve done 20 alerts so far this year Billy.

JP: Right.

Jeff: And last year we did about … well, I have the number right here in front of me, it was 45 or so all year. Let’s see ...

Billy: I'm looking at that right now that’s why asked so in 2016 we did 45 and in 2015 we did 43. At this pace we will double our activity if we maintain it which we probably won’t for the next three quarters.

Jeff: It’s true and I think we will be pretty active this current quarter too as we look at more income positions, more buys and potentially some more shorts too so far it’s been good. Still our short exposure has been modest and the few shorts that we have done have been on the whole, done all right in a sharply rising market. Any other comments about the quarter or we will probably get to them as we talk about questions in the chat, you guys but if you want to say it in the opening remarks, we’ll just dive into it.

JP: I think we can dive right into the questions.

Billy: Dive in.

Jeff: Alright, sounds good. We’ll at the top here in Slido and again it’s Pro-chat April to get into there @slido.com. John is asking, “Any thoughts to just go in long on Sky Works and the Covered Strangle?” it’s funny you ask John because for the last several days I have been looking at that very position and members who just own shares, the shares are ready to buy and have been for a long time. It's a 4.4% allocation now, members who only own shares should just stay long shares. Those of us who wrote Covered Calls have been rolling those Covered Calls higher to catch up to the stock and we should have ... I'm checking the email, we have a Covered Strength along the stock right now that we are going to keep managing. For now, we are going to keep a Covered Strangle on it but I did look at the possibility of just closing it and keeping the stock but given we also own Apple, and Apple and Skyworks are closely tied together and combine our biggest position. I'm comfortable keeping some in the money Covered Calls on Skyworks right now, we're all comfortable doing that. The good news is that with our Strangles so far we've captured the upside stock has achieved and by rolling the Strangle, I was just looking at it today again. We can again capture Upside and not put money into the trade but we do want to keep those in the money Covered Calls for now given that we have a lot of Apple and a lot of Skyworks. Again if members only own Skyworks without options on them, just keep owning the shares then we are comfortable with it at this moment so good question. We will keep managing it, you should hear from us soon about Skyworks in fact, the announcement is in two days. Lon is curious as our latest thoughts on AmTrust, thank you very much. Lon, I'll just say AmTrust, we have a protective collar on it. We just rolled that down to a 1750 call, which is right around our now … still pretty aggressive for our value estimate at 1.3 times book value. We own 1250 Puts in case the bottom does fall out further so it's a pretty neutral position now at this point. It's a smallish position now to it, 2.9% I believe. AmTrust, It's been a tough year for AmTrust obviously. It's unfortunate to see them [inaudible 00:06:24] results. We always knew as a small fast growing company that they may have been some accounting that would eventually come to light but never thought that would truly happen, not restatements of multiple of years.

If we did that, we wouldn't have kept the stock but we knew that as an acquired companies and integrated them that we were counting on the others and the company to do the best they could. That said, we think they have. BDO is their auditors for years now, as you know they changed to KPMG who wanted to improve their reporting and controls and AmTrust has reported on all of that and made it all transparent and [inaudible 00:07:08] results and took their hits … we think set themselves up to be a stronger business going forward. I actually don't have many concerns about their execution of the business going forward or now that the financials and the valuation. It's more a question of, do we want to keep our relationship going with this company? We didn't cut [inaudible 00:07:29] and why should we cut AmTrust slack. That's how I feel right now, and how the team feels when about it. We want companies that we are 100% behind, we are willing to overlook mistakes, but when they cross the line into possible being more than a mistake, we are not certain we want to stay attached to that in most cases. That's we have a collar and why we are comfortable selling AmTrust if it goes up to our Fair Value at 1750 or if it declines some more, meaning that something is really wrong then our options kick in and we get out of our position. While we continue to digest honestly all that's happened since January … it's a pretty neutral position and will see what happens next. It really comes down to the types of companies that we want to own and recommend and if we can do better and if we believe we can, then we are going to sell a company that has burned us in the past. I hope that helps a little bit Lon, it's not a happy situation obviously. It's been a long term performer for us but for newer members it hasn't been at all and this happens, many companies restate results … Parexel did. Obviously AIG has in the past, we went in and bought AIG so it's not a necessary sell but it's something that we are still really considering … whether we want to maintain this relationship at this point that's why it's a neutral position for us right now more or less. We'll see results in early May for AmTrust and each step will help us in our next decision. Billy the next question from Gary is about Papa John's.

Billy: Sure. Please discuss the pros and cons of selling Papa John's via Covered Calls? I think the answer to this, is … it somewhat depends also on whether you are also following along with the short on Domino's. If you are still short Domino's and you have some coverage of the downside of Papa John's then selling Covered Calls maybe a more feasible or attractive idea but obviously the pros and cons of selling Papa John's via Covered Calls is pretty much the same as with any Covered Call. You are going to get the benefit of potential income, a higher sell price at the expense of exposing yourself to continued downside.

For us, for Pro … we prefer to just sell the shares outright and close the Domino short all together. We have Papa John's value at about 65, $64 per share. It's currently trading about 79, $80 right now so it's about 24, 25% above our fair value estimate so as we have been throughout a lot of the history of this position for Papa John's, we are concerned about the downside because the stock is trading well above our estimate of fair value. We are not keen necessarily to expose our self to further down side in order to chase a higher sell price with a Covered Call but if that's something you're comfortable with personally and you don't mind exposing yourself to the potential downside of Papa John's.

If the market or if some company specific news comes out then you can go ahead and sell it with Covered Calls if that's what you prefer. You will obtain income and potentially a higher sell price but remember that the stock could drop significantly and you may not end up being able to get that sell price anytime soon if it does drop so that's the pros and cons.

Jeff: Very good Billy. It's interesting too from our side of our side of the table whenever we want to make a transaction, we need to … well, we talk about it, we decide on it, then we issue the alert. The alert gets published, this all takes typically … sometimes our turnaround is very quickly but say a day or two and then we wait a day at least to make the transaction and the pricing may change and this and that. What we found is our flexibility is a little bit less than yours and if really we want to get out of a position as Billy said, it's best for us to just sell it. If we believe there's a lot of downside in it we'll say so right away, although we of course, we don't either what's going to happen in the short term but a lot of our positions are stable and strong enough that you write Covered Calls to potentially sell. In a lot of cases for us, if we want to sell it today, we just need to sell it and not mess with Covered Calls but I think Billy spelled it out perfectly who you might be different at home. Joseph asking about Broadridge and Faxet, "I have not moved in an up market so what do we see going forward for the stocks?" While, Billy talked I looked him up and maybe it's mainly about perspective. Broadridge is a 16% in the past year ahead of the S&P, Faxet is up 7% … a bit below the S&P which is up 14%. Its true Faxet has underperformed, it's had an up down ride in the past year. Broadridge has stayed strong and a year to date even, Broadridge is up five and a half percent, just a little behind the market but I can talk to Faxet and just say, "We believe in it long term." We think over the next three years it will do well, we've owned it about a year now? And it's positive for us which is a first step in the right direction but they have hit some head winds as asset managers shed employees because passive investing has been becoming so popular. Think about it in this way, the S&P 500 in the past seven, eight years or so … even longer has been nearly perfect. It's gone up every year, it doesn't cause you to sweat that much, it hasn't been that volatile. It's been nearly perfect, the index has. Whereas a portfolio, even like ours of course has many positions that will cause you stress. That will fall 20, 30%, that will hit your [inaudible 00:13:40] portfolio so we're up against near perfection and a lot of investors are moving to the S&P as a result just in general. Our mutual funds are dropping left and right for similar reason … manage neutral funds but this won't remain the case of course. Eventually the index will have a very rough two, three years or longer and people will move more money into managed funds. Anyway Faxet is already adjusting for rise of passive investing, they have products that offer to those passive investment firms as well and we believe in it long term. Billy if you want to speak about Broadridge.

Billy: Yeah, sure. I think like Jeff mentioned, it really is a matter of perspective. A lot of times it can feel when you are looking for a stock price, be like … "oh, it's been trading in the 65 to 70. Speaking to Broadridge range the last three months, five months. The stock price is going up." Take that longer-term view, really view everything in a more global perspective if you look at Broadridge, it's up 15% in the last year. It's up 30% in the last two years and it's up 213% in the last five years so it depends on how you frame what you mean by an up market. In the last five years it's up 200%, it's definitely moved in that up market. Broadridge, we continue to feel good about it. They just made a big acquisition, they are working to integrate that to bring costs synergy and improve margins for the enterprise. That acquisition did significantly lower margins for the investor communicator portions of their business because the business they acquired … the margin profile for that business as whole was lower than the margin profile for Broadridge before they made that acquisition. When you have margins here for one business and you acquire a business with margin here, the business that becomes merged ends up with margins here. The idea now is find some cost synergies and try to bring those margins back up. That's what Broadridge is doing right now, they're growing revenue at much higher rates now because obviously you can include the impact of the acquisition. We feel good about them, Broadridge continues to be a dominant player in their industry. Continues to have stellar financials and we feel good about that company being able to achieve North Star like returns over the next three to five years. You won't necessarily see Immediate results in the stock price over a two or three month period but if you zoom out to three years, maybe five years, that's when you really start to see what value is being created by that business.

Jeff: Thank you Billy. One thing we love about both businesses is very strong with current revenue and 90% or above, their customers stick with them and renew every year or every quarter really with Faxet. Okay, so let's talk about quarterly dividends. How are they different from cash, why the decision to reinvest dividends? These are our next two questions here. I'll tackle those two first and then we'll talk about free reinvestment. Very briefly, after writing about it yesterday … we are doing this for two reasons, one to reiterate to everybody quarterly, the importance of reinvesting dividends. If you're not using them in some strategic way or in your life because dividends do make up a great portion of a market's total return and when you reinvest them your returns are multiple higher over a life time then if you don't reinvest them. That's just the facts as far back as you can measure so they are a huge differentiator between someone … there's a huge difference between people reinvest them and who doesn't as far as your results will be. I believe most people know that but we just wanted to share it for those who don't, many of you automatically reinvest dividends and that's great. If that's what you want to do, that's great. We decided not to early on because, one … well, we couldn't early on but two even if we can, we want to have more say where we put that money and we also like adding to our cash balance, given our goals as a portfolio. That said our cash balance has for years now averaged around 20% and our dividends which do slowly add to that, can … in most cases be invested quarterly if we see something we like in the portfolio. It's more quarterly reminder to you and ourselves that getting those dividends invested is important to returns and if you can do it at all, that you should be doing it. I think that sums it up JP unless you have something more to add.

JP: I think they are a couple of different things to unpack here with these two questions. The first one, if you go back 10, 15 years ago when transaction costs were much higher, sometimes you could go directly through the company and they would reinvest those dividends and shares for you, for essentially no cost. That was a big … you go back those transaction costs were a big friction, they were a big drag on your returns and so with that you could really accelerate your returns by minimizing transaction costs assuming you wanted to reinvest that money. The other the thing like you said, it does gives us the optionality to go outside of companies that pay dividends. Not all our companies pay dividends and maybe we went to build the positions of some of our newer positions that don't pay dividends overtime because we are waiting for a big drop before we make a big purchase, but if the stock doesn't really do that we can slowly build out on that overtime just by … every couple of quarters buying some additional shares and moving those positions higher. I think one other thing too, you look at studies, and they show you that reinvesting dividends really does dramatically improve your results but I haven't come across a study that teases out. I don't even know if it would be even possible to tease out the implications of who you are reinvesting those dividends in verses just actually doing it right. What you've seen, if you go back and you look at really long studies … even though you normally hear people say that, higher payout ratios come from companies with slower growth profiles. They can't reinvest their money so they pay it out to shareholders. What you can't actually see over long stretches of time, that companies that have higher payout ratios, actually have higher growth prospects and they grow at actually a higher clip in aggregate. You can't really … I'd be interested if you could tease out, what is the percentage of your returns over and above the market from reinvesting dividends, coming from reinvesting those dividends into really good companies versus just actually doing it. Now, that doesn't really come into play if you're just reinvesting the dividends into the market in general but I think the best approach … reinvesting dividends automatically through, a drip program for something like that, is definitely better than not doing it but if you have a broker that has really low transaction costs, and your portfolio is large enough so that you can be more strategic in where you allocate those funds … I think you can actually deliver better returns and that's what we are shooting for here.

Jeff: Well said. It's partly a tool to keep us disciplined, in a sense, in a way and mainly a way to share quarterly thoughts on this. If your broker is offering free automatic reinvestment, would you do that? Now that's really a choice that you could make, if you want to do it you could turn it on. whichever company pays the dividends, that little amount will get put into more stock of that company or you can know that quarterly we're going to issue and alert to buy two of our stocks with the dividends we've collected in the last quarter. If we like anything, that's what we'll do if that can wait a bit but most quarters we will doing that but as JP just said, that if you want to automatically reinvest given the way time flies … that's the way to do it over a life time. You don't even have to think about it, it's like automatically saving.

Billy: I think if you have a much smaller portfolio that must be the most efficient manner just in terms minimizing transaction costs and things like that.

Jeff: That's true. A lot of broker, [inaudible 00:22:12] Fiedelity, don't charge you to automatically reinvest. Interactive Brokers does, I was surprised so it goes. Foolish Fox Is being very kind to us, thank you. At least I think that must be who that is. Ellen working on a total income report, otherwise she wanted to be here in the chat. We haven't seen her for a little while but she says, hello to everybody and she setup this chat for us … thank you Ellen. "You're time and energy in managing positions," great question Garry, "versus new positions." This is something that has weighed on me lately, quite a bit and frankly not of us. We, in any Bull market that goes on shorts and hedges and even options is … looks wasted. You would have better used that time in finding a big company to own and for the ensuing year.

JP: Only in retrospect.

Jeff: Only in retrospect. We couldn't know that. We could change now and just do longs all the time but in retrospect that might wrong so there's certainly some tradeoffs and we're always trying to find the right balance between the time we spent on, shorts and options and hedges versus our longs. We want our long portfolio to be airtight before we do these positions and then we'll always have some problem positions statistically it's impossible to avoid. On average 40% of your positions will be losers, that's true of the market as a whole. That's true, we are doing better than that but we still have problem positions that chew up a lot of mental energy. Man, the amount of time spent on Gilead and AmTrust by all of us the past has been enormous.

Billy: I remember the first time I joined Pro, that was one of the first things I had to do because I joined right when there's was one of those shorter tax [inaudible 00:24:07] I probably spent two weeks doing nothing but AmTrust.

Jeff: Easily you did. The thoughts on that, well we are trying to get better with every new buyer we meet. We are trying to buy companies that we even more research than we've done in the past and we are trying to incorporate all the mistakes we've learned the past and avoid making the same mistakes again. Ideally the goal is to buy a company that you'll never have a good cause to sell. If our buys can be 'buys' that's the ideal, that's what we are working towards. That said, we know a lot of the market changes overtime so we have to stay on our toes even so but that's the goal and you'll just have some years like this. There's a lot of time that's been spent on problem positions but we are working through it and I think we'll get to a better place as a result, with some lessons as a result. If you guys have anything more to add.

JP: I'll add a little bit more there. I've talked a lot about it as a team, I think that's something we have talked about a lot as a team as the guys the mentioned and for me personally, you guys may have noticed, we've sold … within the last year or so, we've sold Wells Fargo, Paraxel, TD Ameritrad and now Papa John's and now closed the Domino's short. For positions that stuck up a lot of time that we were not super confident with moving forward that really don't fit our criteria … it may be a more useful use of our of time to call our portfolio of those problem positions so that we can devote out time more efficiently to finding ideas we like better. Now we have to contrast urge with another factor which is that the longer you follow a company and the better you know a company the better able you are to take advantage of opportunities within that company itself. I wrote a memo a while ago, maybe a year, maybe a couple of years of ago and that memo was about how the positions we have bought have performed for a second time have performed much better than the positions we bought initially. Obviously the longer you know a company and the longer your study it, the better you are at analyzing it. You want to make sure that you have some companies that you spend a lot of time on but at the same time, you want to make sure that you are not spending too much time on companies that you don't feel great about so that's the balance we are working towards. That's what some of our activity has been anchored on early this year.

Jeff: Excellent, thank you Billy. Next question … I'm looking at your poll entries too and they are a lot of good comments there, thank you. Question, Current thoughts JP, on Star Bucks and O'Riley? Star Bucks you just wrote about in the memo extensively after, again doing … see we just don't focus on problem positions. We did several weeks of in depth digging on Star Bucks.

JP: I was trying to get ahead of the curb, to find out if that was going to become one. Since then the Unicorn Frappuccino came out and … based on everything I can tell from Chino Chucks and stuff like that, it was a huge success not just in terms of the insane volume that they drove, which is somewhat interesting to me because it was a drink geared towards Instagram, and most people hated the way it tasted, but it did amazing and it actually helped other sales too because those stores have run out of the Unicorn Frap so quickly, you either had customers who A: Threw a hissy fit essentially and stormed out of stormed out of the store or B: They bought something else. A, not very god but B is pretty good for Starbucks financials, so all in all it was a huge hit.

Jeff: It blew your model out of the water, you have to change your 20 …

JP: My new price target is $100 per share, so it is now …

Billy: JP what is the Unicorn Frap adjusted fair value?

JP: It's $100 a share.

Billy: There you go.

JP: Yeah, so that kind of I think has turned the sentiments surrounding Starbucks around a little bit, because it got so much buzz and so the stock has actually done really well over the past couple of weeks. I still think everything that we talked about last month, the month before that is still in play, and content to hold it. With regards to O'Reilly we have earnings tomorrow I believe, and it's interesting because we've talked about this one a lot to, because we know Amazon got a lot of play a couple month or two ago, when the New York Post article came out saying, "Hey, they're making relationships with distributors and with parts producers and they're really going to go hard in this industry. That is a long term threat, but it remains to be seen what type of market share they can ultimately gain. The way I envision things shaking out is in the medium term is that basically Amazon because of their name, because of their distribution capabilities and things like that, they're going to come online and they're going to make a push and just crush all of the other online players. That's where they're going to gobble up a bunch of market share. We've seen it in other industries and after that we're going to have to watch, to see how much they're able to steal away from the brick and mortar stores, because we know cars are becoming increasingly complex. The younger generations actually becoming increasingly reliant on going to stores, so that they can speak with people, because they're not as familiar, and so being able to work with people face to face, have them diagnose it for you, because you got to check engine late on. If you're not very familiar with cars, you don't even know where to start but if you know you want to try and save money and do it yourself, instead of taking it to someone else. You're going to go to an O'Reilly's and advanced auto parts and auto zone and O'Reilly's is by far the best in my opinion and from everything I've seen, in terms of fulfillment rates, customer satisfaction, they do really good things with educating their employees, and so I think they are really … In terms of the players in the space they're the best positioned to withstand that onslaught. That's what we're watching in the long term. In the near term results could actually be a little bit weak for Q1 and Q2. Now how the stock reacts will depend largely based on expectations, what the market is expecting. What we saw for GPC last week was expectations were pretty low. The quarter for their business wasn't very good, but the stock actually reacted positively, and O'Reilly and some of the other players got a bump of off that, and so management for O'Reilly's and all the other players they got it to a potentially weak Q1, because of the unknowns in terms of how the tax refunds are going to play out, the weather. It was a mild winter for the first part, and then at the very end we got a really strong cold front and some big storms, and how is that going to impact? It could help them because it could help clear out some of that winter inventory, that they went able to sell through or it could hurt them, because people just couldn't get out to the stores because they were dealing with all of this, no. There are those things in play and so we're not really sure how the next quarter is going to be, but we don't want to over react to that quarter, because of our long term concerns, because from my opinion what happens in Q1 and Q2, aren't going to be as a result of Amazon. They're not going to basically steal away O'Reilly's business that quickly.

Jeff: Thank you JP. It's been a long term out performer. Our job is to determine if we believe ii it's going to continue to be a long term out performer.

JP: That's the key.

Jeff: Meanwhile because of greater uncertainties the share price has become less expensive that it's been in years, so that's a trade off benefit to current concerns at least.

JP: Yeah, this is the first time in a couple of years that it's actually traded at a discount to the market. We're definitely in a period of pessimism surrounding the business.

Jeff: Winston is asking about the renewal price for Pro. Will it be the same the next three years, any chance of a discount? We, the team here none of us around here have a say in that. I don't know even what the renewal rate would be or will be. The best we can do is say go call member services when your term comes up for renewal and see what they have on offer. That said I do know and want to share that the full has been re-pricing products, believing that the pricing was not where it should be for many years, so prices on a lot of services are going up and that's where they're standing, and they're talking a pretty hard-line, because we've had some old time Pro members wanting to renew, and when they went to member services they said, "This is where we stand now and this is what we think is right." That's about all I can say. It's not the best thing to say, but it's what I know, but do contact member services and se and hopefully you can get a renewal rate that is good for you. As always we do say go for the longest term possible to get your yearly cost down, and look at that cost compared to your portfolio value and hopefully keep it a small tiny percent of your portfolio, 1% or less I hope, and hopefully you're making money with the service. Every three years, let's say three years is a decent fair time to measure, hopefully you're making far more than your cost and more than the North Star goal, more than your own goal I should say and that way the service more than pays for itself. Hopefully that's what we're able to accomplish, but yeah it needs to be a value for you and you need to feel that you're getting your money's worth. Chris is asking why recommend J & J right now, for dividends not so much growth. Billy your thoughts.

Billy: Johnson and Johnson fits a category of stocks in the Pro portfolio that we think of as stable, balanced or our portfolio. The Pro portfolio is composed of companies of differing characteristics. Some of them are high flying fast growers, others are more stogy or stable, and then we have arrange of other companies in the middle and all together that makes up our portfolio. The Johnson and Johnson position fits more on that end of stable companies, highly profitable. If you read the right up in the original alert, you can see how Johnson and Johnson stacks up against the eight Pro qualities that we look for. Johnson and Johnson you're right, it's a huge company, there's not a lot of growth. There has been some pricing pressure in the pharmaceutical division, also pricing and competitive pressure in the consumer division and a re-organization of the medical devices division, which has all weighted on growth over the last three years, five years for Johnson and Johnson, but those competitive advantages for that business continue to persist. If you've followed the company over the long run this has been an outstanding performer for many, many years, 20 years, 30 years, 50 years and a lot of those advantages still remain, and we think it's going to be a strong long term performer, and also going to be a position that declines less in a downturn and is more stable for us, than some of our higher growth but higher volatility type of companies. I've also mentioned as well both to our team Jeff and JP and to members on the board that, Johnson and Johnson is also a position that w e think might make a good candidate diagonal call strategy. If we get to a point where market sentiment turns negative and the stock price declines, and we have an opportunity to increase our position, like I mentioned earlier with the memo I wrote about how the second purchase we make of companies, is generally better than the first purchase. If we're in a position to make the second purchase of Johnson and Johnson, because of market sentiment or whatever reason, we may consider initiating a diagonal call, which of course leverages the growth, so it's a slow growing company but if you initiate a diagonal call that slow growth is leveraged into much higher returns on your overall strategy. That's something e have in our tool box as well with Johnson and Johnson, to possibly be initiated later.

Jeff: Thanks Billy. The pipeline of change is especially strong looking as well.

Billy: It is. If you … We think potentially the market is undervaluing the potential of Johnson and Johnson's pipeline, and there maybe some significant blockbusters over the next five to 10 years, that outperform analyst estimates and market estimates, and also their recent acquisition of Octillion. They acquired even more products that could potentially turn into blockbusters, so the drug pipeline may reignite and initiate growth for the company in the future, so the future may not look exactly like the past three to five years of stagnate growth.

Jeff: We have about 20 minutes left and I think as it stands right now we can get through all of the remaining questions in that time, if we go a little quicker. The first one, a lot of people want to know, great question. Who does JP's hair? Nice compliment on your hair JP. Do you want to plug who does your hair?

JP: Maria here in Alexandria.

Jeff: Maria?

JP: Yeah.

Jeff: In Alexandria? Does she have a salon?

JP: Salon de Zen.

Jeff: Salon de Zen. You're a very Zen guy.

JP: I try.

Jeff: We talked before we started taping, we both have haircuts scheduled tomorrow. I'm just going to get my hair shaved off. I'm tired of dealing with it. What are you doing?

JP: Same thing as always. The reason it looks so different it's because it's … My natural hair color is actually starting to come through, because it's been such a long time since I have had it done.

Jeff: You may dye your hair more gray again?

JP: Yeah, we're going back to white gray depending on how it comes out.

Billy: Silver.

Jeff: Silver.

JP: Silver.

Jeff: Cool. I saw a woman on Connecticut Avenue about your age 20s with hair dyed silver. It looked go I'm like, "Oh, she should meet JP." Meanwhile if I were ever to dye my hair its d be to get rid of silver, but I haven't done that yet.

JP: I'm not at that age. I'll be there soon enough.

Jeff: No need. Okay, we'll see if I have hair for Thursdays, options check. Live Option check Thursday.

Billy: I think you should just shave it of Jeff. I think it would look good. You'd look good like a Bruce Willis type.

Jeff: Thanks Billy, I'll think about that.

Billy: Yeah.

Jeff: Sitting next to JP with a shaved head and his hair would be a good contrast. All right, so which by stocks would we consider good candidates for righting puts on? I agree with the three that you list there Facebook, Paycom, Faxet if the share price is not an issue for you at 100 shares. Also I would add Starbucks, Gentex and Opentex as three of the potentially right puts on. You could also consider Visa perhaps, although it's a straight-up by. All these stocks are righted by, but yes if you're only targeting a lower by price you can right puts on them. Also Skyworks also even puts well out of the money, pay well if you like exposure there. Any others you guys want to add?

Billy: J & J if you have the money to back that obligation.

Jeff: Sounds good. All right, let's see what else we can get done. SVXY has had a good run since last summer. Predictions for a market correction, is it a candidate for synthetic short? I would never short …

JP: No.

Jeff: We won't short that because volatility … Everything is working in favor of that position going up over most cases. Of course when volatility spikes it can fall quite a bit, but timing that is impossible. Keep in mind the market won't just fall or correct historically for no reason. Not just because it's due for it or it's time to …Sample markets have run much, much longer than this one. What typically causes the market to change direction is some external even, or recession rears its ugly head a surprise like a war, or something significant that. Even a war doesn't do it that much unless it affects earnings for better or worse. It's usually some sort of event that triggers a change in the market.

Billy: I did just write the memo on volatility and how it's been low, but how low volatility has tendency to lead to further low volatility. Just because volatility has been low in the past doesn't mean that we're due for higher volatility. It in fact generally correlates with more low volatility.

Jeff: So short answer. We're learning that position B right now, it's less than 2%. We'll let it keep growing because we believe over time it will, but we will manage if it gets to be too large or if we believe we should trim it, but we're not going to short volatility. We're not going to short, short volatility right now. We're going to stay … We're going to move on. SVXY is righted by still. Couldn't close GoGo at 12 or under, recommend waiting or closing? I would simply close because it's a small position. We actually got our shares closed today at 12.55 or 60. It's a really small stake and just as we talked about earlier just close and move on. It's a short that did not work out, but we'll keep an eye on it.

Close [Inaudible 00:42:39] auto though at current prices when you're ready to close. Do I recommend buying the full position SVXY? Let's see what size it is. I think it's 1.9%. It's 2% now SVXY, so up 100% for us. You could buy 1% at a time or if you are comfortable buying the whole 2% you can. It's righted by and it's still only at 2% position. Just as long s you know it can and will be volatile, it won't surprise you when it happens and if you stay in it for the long run it should work out as we hope.

Billy: SVXY is one of those where you can be opportunistic with your timing. That would be one where I would be inclined maybe by a half position, wait for some market shock and then fill out your position, and you can do really well from that second entry point.

Jeff: Sounds good. Mitch, hallo Mitch. Mitch is asking about FULL phases here. Are there any plans for event, or Pro in the event. I don't know yet. I haven't head. I know Full phased is … Full is doing something new and this is all I know and that is its invitation, because the amount of people who want to attend overwhelms the space. You'll get an invitation if there is one coming to you and I don't know the agenda yet. At some point we hope to have a Pro event. Next year will be our 10 year anniversary, so that will be the year, logical year to do it. I can't speak more to Full phase right now. I know it's a great time every year when it happens here in Alexandria, but I don't know all the details as to who and when members get invited, and we don't know the agenda yet ourselves, but Mitch I hope you're doing well and hope we'll see you at some point.

Billy: Hey Mitch just want to say hey.

Jeff: It was great to meet Mitch a few years ago already now. Usually when Pro puts a hedge into place, you say Pro is hedging about 15% of our total portfolio value why not greater? I'm speaking too much so I'll be very brief and say, we will increase our hedging if we believe that e should. We could also go market neutral all of a sudden. I've read a post … I haven't been able to respond to it yet, that said we're not truly a long short portfolio, but we are and can be if we've just chosen to be mostly long. It's true we don't manage in a market neutral way, because we think you have to take a stand. If you want returns you have to have conviction and take a stand, not be market neutral all the time.

Although that's a talent you can try to foster, that returns are typically going to be like most hedge funds, which is a few percent annualized and we're not in it for that. If we want to be market neutral we could be in an instant by shorting 70% SMP. Right now we're 73% net long. If we want to increase our hedges we can as well, but so far we're comfortable where we are. Right now we're 73% long excluding our QQQ hedge. If that kicks in when the market falls right now about 7% or so, that 15% allocation would take us down to a net 58% net long, so by the market falling for a certain span of pricing, we'd become 58% net long for another large span of time or price range. We're managing our hedges how we want to at the moment.

JP: Yeah, I would just add that what you tend to see is our baseline in terms of we think we can, out of the gate reduce our long exposure to this level while still delivering reruns that meet our North Star, or at least keep up with the market. We don't want to be a little bit too quick with the trigger to go market neural really reduce our exposure, because we don't want to miss out on strong weeks, strong months in the market, because that would really set us back. We know that the markets tend to grind higher over time, so the default position for us should always be to have a pretty good long exposure, and then adjust from there if we think e need to pull back.

Jeff: That is true. A good example of how versatile we can be is we put on a large direct spy short before the election and the uncertainty, and when the market rallied after the election we closed it right away, which as JP just said you don't want to miss large moves up, and thankfully we acted on that and closed. Sometimes the market tells you what you should be doing in a sense.

JP: Be market neutral or really moving round your net long exposure may look cool and it may sound sexy, but if you look at what most hedge funds have done over the past couple of years, being sexy doesn't always equate to good returns.

Jeff: So true. The past 10 years most sales returns have been just, tragic maybe too strong a word, but for so many endowments in universities and government that uses hedge funds, they've earned a few percent on their money annualized instead of 11%/12% and they're paying for that too. What's the right price would we recommend for a put ratio spread on the QQQ? That was in the yesterdays ketchup trade, and as of yesterday and I think still today it was 125 puts you're buying and the 115 puts that you're writing. Check out ketchup trades from yesterday, and you should be able to do that at credit.

Yesterday was about a 30 cent credit, so it may be closer to neutral today but still. Do you guys have any good tools to track stocks and options, and that will also help us invest and prepare tax returns? I can't say that I do. I use my brokerage itself.

Billy: It depends on what you're using to do your taxes and which broker you're using, so it may be worth it for you if that's a significant problem, to consider switching brokers to find one that can integrate with whatever tax software you're using.

Jeff: All right, next question. What are we holding Metronic and Oracle when they're not performing well or haven't performed well? Again it's probably some bit of perspective. In the past year they've done quite well. Oracle was up 16% Metronics up 15%. That's here today alone. The past year Oracle is up 10%, Metronic only 3%,. But the past five years Metronic has been strong and Oracle is up 55% the past five years, which may be lagging … Yes, it's definitely lagging the SMP. It's still a decent return and that excludes …

Billy: Not lagging the North Star.

Jeff: Not lagging the North Star, good point Billy and for the risk that we believe we have in the position it's a good return. We do measure positions on the risk that we think we're taking against the return that we think we can get, and if we think we can get 8%, 9% annualized excluding the dividend with modest risk then we're happy to keep that. Paycom has returned 40% in a year, but we're taking much more risk owning that stock right now. Bottom line was we believe in both businesses. Metronic has just gone through a giant merger which is integrating very well. The margins are going up, they're reinvesting, buying back shares and reinvesting in growth overseas.

Oracle is building its cloud business, which is slow to build up revenue initially, but then leads to higher profits down the road and that continues to grow at a good pace. We think both are well positioned and offer reasonable risk at a good price in this market. I still like them to challenge our North Star over the coming three years. We don't have plans to let those go right now. Is now a good time to short FAZ if we don't have it? Yes I believe it is. By shorting FAZ you're going long giant financials like Visa and MasterCard. We have 1.9% position I believe. Someone can look that up, but yes it's a current short and so you can …

Billy: 1.6.

Jeff: 1.6 only. That's right, okay thanks Billy. You can start that if you don't have it. Let's see. A QQQ put ratio spread. For all members we rolled that out recently. It's still a timely position at 125, 115, 114. Look at that trade alert or look at ketchup trades for Monday and you can still set that up. It's still a good hedge we believe and it's and it's to January 2018. All right and here's Ellen, she's working on a Pro trade and total income. Thank you Ellen. That was very nice of her. And we appreciate that. SVXY we talked about and we've talked about it in months past too.

We hope to keep it for the very long term, because we believe it can compound over the years. You need to do what you're most comfortable with, but we plan to keep it as of right now. That situation could change, if it does you'll get a trade alert but right now we do plan to let it be. Again Billy just said low volatility can lead to more low volatility. Let's try to get something that you guys should talk to. Investable accounts are taxable. Right now this member Davis has a Roth in a mutual fund, how large should it get before it makes sense to allocate as Pro?

Billy: I would say it depends. You can use a combination of accounts to do your Pro portfolio, so keep in mind that you don't need to have the Pro portfolio bucket all in one account. You can have some of your assets in a taxable account, some of your pro assets in a IRA and some of your Pro assets in a Roth, and you can consider which securities or which positions you want to put in each account, depending upon their potential tax consequences. Although we will say I'm not sure how much the pro portfolio costs, right now or how much it costs to join the Pro service, but you do want to keep our advisory fee as a percentage of your portfolio under say 2%, 3%, so I'm not sure how much it cost but I think … What do we say guys? Generally $100000 portfolio, 25000 to start with us?

Jeff: That is yes very generally what we say.

Billy: Yeah.

Jeff: Thanks Billy. Let's see next question. Thoughts on France and potential impacts. Interestingly after the preliminary vote this weekend, the Euro of course has gone up because a pro-EU candidate is heavily favored to win in May, in the final election. May 7th I believe it is. The chance of a radical change in France has been lessened. That said we're still watching it of course, because there could be a surprise, but right now it seems to be that a more moderate candidate is most likely to win and not only stay in the EU, but work to strengthen the EU. In that case we may finally exit our short of the Euro.

We've given it a long time to get weaker and the Euro has held up quite well. If France were to leave the EU or want to that would be a big blow to it, and that's what we've been waiting to see if it would happen, but it looks much less likely to happen right now. Any other thoughts you guys want to add on the geo-political stage?

Billy: I would just ad that it doesn't make too big of a difference to me as far as most of the companies we cover, but of course with that Euro short that would be something to you want to think about.

Jeff: Besides the guide book do we have recommended reading list in the monthly Full Pro guide book in that area? Ellen does list out a lot of recommended reading, but I think what we need to do now in Pro, we just did an options which is we all put together our favorite columns and it's all on one page in Monthly Full options. We'll do that in Pro next and highlight it for you as a weekly column and yeah that's a good idea so thank you. Make a note of that. All right we have Scott, hey Scott. Curious about Pro's strategy on micro caps. Any thoughts on small speculative plays at 1% or less of the portfolio? JP you want to share thoughts on that?

JP: I think it's something that we've discussed on multiple occasions internally, because like you say, it does lead to companies that won't the checklist to a large enough extent that they would be included in the Pro put traditionally, but on occasion there is really good returns, it could be generated if you can find a company that could grow into a Pro like company. The risk is obviously going to be much higher an so in ideal world maybe there would be leaps trading on it, but if you go with really small stocks that's not going to happen, you're going to have to take an equity stake in them, and so it is something that we are debating internally and it may show up, but I don't have much more to say about it right now.

Jeff: Yeah, we've bough companies as small as four or 500 million and that's probably about as small as we can get go in the service, and frankly would want to go, but e are looking ... In fact we're looking at a company right now. Billy it's quite small and that we are interested in.

JP: Yeah one of the issues that we have verses a "hedge fund" of a traditional size or of a similar size excuse me is the fact that they can be very secretive, and lag into positions if they want to take stake in a small company. What happens with is we put an alert of the member, see if all the members want to get in on it and they just bombard the price and then the price, if you're dealing with a much smaller company is going to move dramatically. It hurts members and then it's also going to hurt Pro, because we don't take stance in a company until we put out the trade alert and time passes. There are definitely some headwinds just in terms of technicalities of how Pro is run, that would prohibit us from going with much smaller stocks that have very lightly traded volume.

Jeff: Thank you JP. How do we measure risk? We measure return versus risk. When you have company like Oracle where expectations are low and yet revenue stability is very high, and you have a low valuation multiple the risk looks reasonably low. Can we list a range of valuations, this member is asking. We've talked about that in the past and for various reasons we couldn't on the page, but what we could do perhaps is put a note up, that our fair value estimate is the midpoint of a range that generally can swing 10% in either direction from that point.

Now we've got to wrap up. Skyworks you'll have news on that soon. Any possibility of exiting AM trust? It is possible. We talked about that early on. It's in the cards and our caller signifies that, if it were to rise or fall at the moment right now we would be okay letting it go. I think that's it right now. Thank you to JP for Starbucks comments and I think we're good. There will be a transcript of this chat after it wraps up.

Billy: Let me answer real quick Rods question. Last video call I recommended an Excel plug-in that pulls options prices. That plug-in is called SMF, Sam, Michel, Frank addin.

Jeff: Excellent. Thanks Billy. SMF addin, Sam, Michel, Frank. Then when we reinvest dividends dose the allocation change? It will change very modestly 0.1% typically so it won't be enough to really throw anyone off.

Pro Guidance Changes and Completed Trades: April 17, 2017

Published Apr 17, 2017 at 3:45PM

Pro Guidance Changes (from the past two weeks -- see related trade alerts)

- **Caesars Entertainment** (NASDAQ: CZR) moved to Cover.
- **Papa John's International** (NASDAQ: PZZA) moved to Sell, and **Domino's Pizza** (NYSE: DPZ) to Cover, ending the paired trade and both positions.
- **Valmont Industries** (NYSE: VMI) moved to Sell.

Pro Completed Trades (from the past two weeks)

- **AmTrust Financial Services** (NASDAQ: AFSI): We bought June 2017 $15 puts for $2.50 each. The stock fell before we could place our collar. We're still waiting for a higher premium to write the $22.50 calls.
- **Caesars Entertainment:** We closed (covered) our 1,800 shares, closing the entire short at $9.50 each for a 20.5% gain.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Most of the S&P 500 Fails

Published Apr 17, 2017 at 3:35PM

Dear *Pro* Fools,

Would you guess that since 1980, more than 320 companies in the S&P 500 have been removed from the index and replaced because they were struggling? That's 64% of the total! Our economy is ultra-competitive, and it's difficult for any company to create enduring profits. That's the conclusion of a J.P. Morgan study on diversification and portfolio concentration that the Fool's Tim Hanson shared with Fool analysts today.

Other fun facts include that 40% of all stocks in the Russell 3000 suffer a permanent decline of 70% or more from their peak, never to recover. Over a multi-decade period, two-thirds of all stocks underperformed that index, and about 40% suffered a negative total return. These are numbers we've seen and cited before, and they serve as flagrant reminders that portfolios of stocks will statistically always have several losers. These numbers also dovetail with Peter Lynch's belief that if you're right about 60% of the time, you're doing well. Statistically, that's about as good as you can hope for, no matter how smart you are.

That's because dozens of factors are outside your -- and your companies' -- control. The competitive landscape changes. Technology changes. Laws change. Customers change. Commodity prices change. The study cites many more reasons to worry (sorry) on page 11. In fact, the whole report reads like a graveyard of companies that came, saw, and basically failed. It's instructive to note that the *most* destruction (the greatest number of company failures) occurred in the technology, energy, consumer discretionary, and health-care fields. If you click through the report for a trip down memory lane, enjoy the carnage -- because it's inevitable, and much more importantly, because you can still succeed as an investor despite many losers. Your long-term winners carry the torch to the winner's podium.

Most Investors Lag for Long Periods -- Cut Yourself Slack

The J.P. Morgan study is a strong reminder that getting to that winner's podium includes many knocks, and many rough times, along the way. And that's typical.

As a Davis Advisors study showed us, a majority of the top-ranked, large-cap fund advisors in the U.S. spent at least one three-year period over a decade being ranked among the *bottom* 25% of performers. In fact, a whole 93% of top performers spent at least one three-year period in the bottom half of the rankings. Most of the best long-term investors experience long periods during which they perform among the worst. Remember that the next time you think everything you're doing is wrong.

Part of the reason we all look poor as investors at various times is because we all have big losers during stretches of time. Why? Revisit the first three paragraphs above. And think of it this way: Even when you invest in the S&P 500, you're agreeing -- whether you realize it or not -- to invest in a majority of companies that will *fail* to maintain enough health to stay in the index. You're agreeing to have more than 60% of the 500 companies sold and replaced over four decades because they're suffering. Yet, you invest in the index anyway, and you benefit greatly over the decades.

The endless stock changes in the S&P 500 happen behind the scenes. You don't lift a finger. But if you run your own portfolio, you need to consider your portfolio changes on an individual stock basis, and you have more riding on them, because you don't have 500 companies over which to spread your bets -- you may only have 24 or 30.

Each position matters much more, and the losers hurt more. You hope to get at least 60% right, and not sell the winners too soon.

Assessing Problem Positions

Here in *Pro*, we've had some big losers lately, and it certainly hurts and consumes a lot of time. Overall, we're still tracking ahead of our return goals, and just like all those investors who have down periods and recover later, we'll likely follow suit and head higher. We've had "problem" positions before, and they rarely account for more than 10% of the portfolio at any one time, same as now. We seek to learn from our problem positions, and to improve. When we buy new positions, we seek to buy "better" and avoid the same problems again.

Right now, our focus is on a few problems. We should have an updated fair-value estimate on **AmTrust Financial** (NASDAQ: AFSI) this week, and that will help drive our next decision. The stock remains on Hold. As for **Gilead Sciences** (NASDAQ: GILD), so far other Fool services are sticking with the biotech giant, and we're debating whether we want to as well; meanwhile, we seek a North Star return from here with some help from covered calls. And our **Gogo** (NASDAQ: GOGO) short has run 16% against us as sales contracts grow for its latest WiFi technology. Wanting to avoid thesis creep, we're debating closing even the short though laptop bans in airplanes (if they were to spread) would clock the business. These three positions combined are 5.6% of the portfolio, and we own puts to hedge AmTrust.

But our small amount of exposure, and even our hedges, don't make the situation go away. We want our businesses to be universally strong, and we must weigh our patience as investors against our desire to steadily aim to improve our portfolio. When we make changes, we do so *not* hoping to boost our one-year or even two-year returns, but based on what we hope will drive the best long-term results. In an industry where returns are tracked daily, and where industry watchers give great importance to one-year results even though they're not truly important, the Fool keeps bucking the trend to focus on generational wealth. That's ultimately what the stock market is built to deliver, if you let it -- and that's with losers included, as well. Today's S&P 500 is not yesterday's S&P 500, and our portfolio steadily evolves, too.

Please ask any questions on the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: April 17, 2017

Published Apr 17, 2017 at 3:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 4%.
- **Visa** (NYSE: V): Buy 3.1%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.2% (see our recommendation).
- **FactSet Research** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.2% (see our recommendation).
- **WisdomTree Emerging Markets SmallCap** (NYSEMKT: DGS): Buy 1.9%.
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- N/A

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $114 puts, and buy to open *half* as many January 2018 $125 puts. Lately, aim to set up this combined trade for net zero cost or so.

This month's expirations (April 21):

- None.

Sell Valmont Industries

Published Apr 12, 2017 at 2:21PM

Is this for you? This recommendation is for all Pro members who own these shares.

How You Participate

- **Action:** Sell **Valmont Industries** (NYSE: VMI).
- **Allocation:** Sell your 2.2% stake down to 0%.
- **Guidance:** Moves from Hold to Sell
- **Recent Price Range (this morning):** $149.70-$152.75
- **Price Guidance:** This is a ***very*** thinly traded stock. Please, we beg everyone, don't rush; **calmly use a limit order** to sell around the going price, ideally around $151 or above. *Pro* will sell within the next 1-30 days.

- **Earnings Note:** Valmont will report quarterly results on the morning of April 20th. Not knowing how the stock will react to those results, it's a coin toss whether you should sell before then or after then. We plan to sell before, if we get our price, just to have the trade done and move forward.

What We're Thinking

Valmont shares have gained about 20% since the election in November, and 50% since hitting a low in early 2016. Even when excluding dividends and past covered calls, we now have a small gain on the stock after waiting through three years of cyclically poor business performance. Revenue has fallen 8.6% annualized over that time. Lately at $152, the stock is above our $140 fair value estimate, and shares trade at about 21 times the average earnings per share estimate for this year, and 19 times the average 2018 earnings estimate.For an industrial, cyclical business that is still laboring to grow, the stock looks a bit generously priced, perhaps thanks to an optimistic stock market.

Many investors have become excited by the new White House administration's promise to spend big -- up to $1 trillion -- on infrastructure. Ironically, the administration's first budget proposal all but eliminates funds already earmarked for maintaining and repairing infrastructure. Although we can only guess, it's likely the administration wants to privatize many such projects, or make states responsible, either of which could lead to renewed competitive bidding, sweetheart deals, or both. There's no guarantee that Valmont would win key contracts, or that pricing would support Valmont's margin goals.

Plus, the administration needs to get an infrastructure bill through Congress in a timely fashion before the 2018 mid-elections, and with a failed healthcare bill, a less-than-cohesive Republican majority, and so far the lack of a clear infrastructure strategy from the White House, the challenge grows. Next up on the agenda is tax reform, but we've heard few details, and already some are speculating that a tax bill won't be passed before the August recess. That would push taxes into the fall, and would likely push any infrastructure bill into late 2017 at best. While companies wait for an infrastructure bill and its possible benefits, it's *possible* that some projects will be delayed. Yes, legislative uncertainty across the industry might actually cost players like Valmont some business in the time being.

We're selling Valmont at much higher valuation multiples than where we bought it. It trades at 20 times earnings now compared to 13.3 when we bought, and today it fetches 11.4 times EBITDA compared to 6.8 times when we bought. We bought when the stock was beaten down, in the middle of a cyclical downturn. We're selling when the stock's price has rebounded, its valuation now assuming that growth is around the corner. That growth, or at least its magnitude, may not materialize as hoped, which would likely lead to disappointing returns. Cyclical companies at higher valuations are not something we want to give a long leash unless we have great clarity into the three-year prospects ahead; lacking that today, we're taking our money back following recent price gains.

How this Decision Fits Into *Pro*

Pro continues to evolve since we bought Valmont in late 2013. The company has a tremendous history of value creation for long-term owners, and management has performed admirably during the current downturn by cutting costs, remaining profitable, and staying competitive. Our hat is off to them. However, in *Pro* we want to focus more and more on companies that have sustainable competitive advantages that ideally offer some form of pricing power. Companies that merely operate well are just not enough.

Further, we want to own more and more companies that are "only" rather than "best." You can be the best among many with what you do, or you can be virtually (or truly) the *only* one that does what you do. Valmont is one of many companies providing quality infrastructure and utility work, and because of this we've already seen how price wars can harm its results. Should pricing start to slip in its key irrigation business, too (which seems less likely, but is possible), Valmont would suffer again.

That said, the company is likely to remain a good long-term operator, and the stock may ultimately perform well again -- in fact, we would expect that! But we're going to work to move the funds into a company we believe is more likely to outperform the North Star over short *and* long periods by virtue of having steady, reliable revenue and earnings gains, which can then be invested in still more growth. Valmont largely lacks those qualities except during boom periods, and those periods may lead to more pricing battles as globalization continues to bring more players to the table.

We'll sell all of our 2.2% stake in the next one to 30 days. Please **use a limit order and patience.**

***Pro* Can Help**

How You Participate

- **Action:** Buy to close, or cover, your remaining short position(s) on **Caesars Entertainment** (NASDAQ: CZR).
- **Allocation:** Close all of your remaining short -- our 0.6% exposure will go to 0%.
- **Scorecard Status:** Cover.
- **Recent Price Range (this morning):** $9.60-$9.85
- **Price Guidance:** *Use a **limit order*** and, today, aim to pay around $9.70 or less. We will close our short within the next 1-30 days.

What We're Thinking

We have been more than patient on our short of the country's largest casino chain operator, Caesars.

On Oct. 1, 2014, *Pro* issued a recommendation to open a 2% short position on the stock. Ten months later, we recommended closing half the short at a 42% gain (we were able to close for 35% after the alert). Now, we're saying to close the rest around a 19% profit. Since October 1, 2014, the S&P 500 has *gained* 21%, excluding dividends, so the short has served us very well, especially in this market, and even after fees. But we have perhaps been patient to a fault.

On January 15, 2015, the company filed for bankruptcy protection and we celebrated. Then we watched a nearly two-year back-and-forth battle between Caesars' big-time hedge fund owners and its creditors. In October 2016, Caesars finally reached a deal with its last battling junior creditor. Over those 22 months, the agreed-to payment rate on Caesar's junior bonds went from next to nothing to 66 cents on the dollar, enough to make the bondholders settle in exhaustion. But it was still up to the court to decide if the Caesars approach to bankruptcy was even legal.

The company had restructured itself before filing for bankruptcy protection, moving its most valuable assets to the safety of new business divisions, leaving debt holders with a shell of an asset. This was partly why we sold short: The company was almost surely headed toward liquidation, and before then management moved its still-valuable assets out of reach of debt holders. This should be illegal.

In January this year, without providing clear reasoning for future cases, a Chicago court allowed the restructuring to go forward, paving the way for Caesars to start over. Caesars should emerge from Chapter 11 this summer, its high-interest debt load cut from $18 billion down to about $8 billion. The new company will restructure yet again into two firms, a casino management firm and a REIT that owns the property.

We were disappointed by the ruling, not just for our short, but for future bankruptcy cases. This sets a precedent whereby a corporation can reshuffle its assets egregiously before filing for bankruptcy, thereby denying debt holders -- in most cases, bond holders -- access to the actual assets that they were originally guaranteed rights to. The Chicago court called the ultimate restructuring agreement "extraordinary" and a "monumental achievement" -- which felt like a smokescreen to cover what's really happening here (a wave of the white flag). Thousands of pages long, with countless parties arguing for restitution, the reorganization weighed on the courts for two years. It is amazing that an agreement was reached, but in the end, it was allowed to go forward only after liability releases were modified to be less insulting to debtors, and to mollify the concerns of a U.S. Trustee watchdog. However, the case still weakens the protections historically afforded to secured debtors.

Despite Caesars winning the right to reorganize in January, we waited to close the rest of our short as we worked to figure out what the new business might be worth. After all, existing stock holders *are only getting 6%* of the new entity -- that's about as close to bankruptcy as you can get for a stock without actually going there. Given this diluted ownership, in our estimation the stock should have traded for much *less* after the settlement, not more. But the market has not come around to the same conclusion. Investors continue to bid the stock higher.

Seeing last quarter's results from the businesses that will now form a new Caesars, and trying to ascertain what the REIT might be worth on the market, has still not filled out the full value picture, and management has not provided greater details. On our estimates, once diluted, shareholders today are paying well more than 20 times EBITDA for the new business, a hefty premium for a subpar operation that might deserve one-third that price (unless, perhaps, you argue that the real estate is worth many billions more than thought). But it now seems prudent to put up our hands in surrender and close. Until we see the full financial position of the new entities, we can't reasonably stay short, even as a hedge against a falling stock market (which was part of our reasoning in recent months). Plus, as emergence from bankruptcy approaches this summer, the stock may continue to rise in anticipation. People celebrate new beginnings. Once we see what the "new" company looks like, we might choose to short again. It still will carry billions in debt and operates in a challenged industry.

For now, we will use a **limit order** to close our remaining short shares. Please be smart and use a limit order with us. Paying any price just to get your trade done will only make this less profitable for everyone.

In closing, thank you for participating in this short these past years! It's been quite the attention-grabber. In the end, we all learned a lot about what you can get away with in bankruptcy, among other things. Today, we would be more careful buying corporate bonds, especially high-interest bonds. Only buy quality corporate bonds, because your assumed rights to secured assets can be mitigated away by corporate reshuffling. It's an unfortunate ruling by the court, and if we see it affect bond holders elsewhere in the future, we know we have Caesars to thank.

Alternative Trades

- **If you set up a January 2016 synthetic short, bought puts, or set up a bearish spread:** These should all be done by now, having expired, but if you have any remaining open, you can close them.

Sell Papa John's, Close Your Short (and Covered Puts) on Domino's

Published Apr 12, 2017 at 2:21PM

Is this for you? This is for all *Pro* members. We're closing all of our exposure in these two companies.

How You Follow Along

- **Trade:** Sell **Papa John's International** (NASDAQ: PZZA); cover ("buy to close") your entire **Domino's Pizza** (NYSE: DPZ) short, and close ("buy to close") all June 2017 $140 covered puts, closing all positions.
- **Allocation:** Bring all exposure to zero, closing everything.
- **Recent Price Range (this morning):** PZZA: $80-$81.25. DPZ: $174.81-$176.45
- **Price Guidance:** Prices are volatile. **Please use limit orders** to sell your long stock ideally above $80 (it's a fairly small company, so **limit orders are essential**), and use a limit to close your short stock at the going price when you enter your trades, ideally below $176-but volatility may preclude these prices. For the covered puts, use a limit order that comes close to splitting the current bid/ask prices to "buy to close", leaning a bit toward the "ask" side of the current pricing to get it closed.
- **Tax Consideration:** Long-time members have a very large gain in Papa John's (our gain is lately 572%). Consider your own tax situation before closing that position, to make sure the net cash result is attractive to you. We don't believe the business is due for hard times, per se, but we are selling for reasons talked about below.

What We're Thinking

A little more than three weeks ago, I wrote a Monday Memo about *Pro's* combined Papa John's/Domino's long/short paired position, moving our Domino's short from Hold back to an active Short position. After publishing that Memo, our members kicked off an outstanding discussion on the boards about that Memo, questioning its conclusions. In part due to the comments from our members, I took the time to reconsider my original conclusions, and I found myself agreeing with our members on many points. I left that discussion having much less conviction in maintaining our Domino's short, and I promised to further reconsider my conclusions over the following weeks.

As we fast forward to today, we think now is an appropriate time to not only close our Domino's short, but to also sell our Papa John's long position for several reasons, including:

1. The price discrepancy between Domino's and Papa John's has narrowed since three weeks ago.

In the Memo where we moved Domino's back to an active short, Papa John's was then trading at about $76 per share and Domino's was trading at about $184 per share. Today, Papa John's is trading at about $80 per share and Domino's at $176 per share. This means that the short position's impact to our portfolio has been reduced from about $11,000 (a 0.4% impact) three weeks ago to about $5,000 (a 0.2% impact) today.

2. We have long felt that Papa John's valuation is stretched, and we're not confident in the stock's ability to achieve North Star returns over the next three years from this price.

Although we like Papa John's business, in recent years we've consistently been wary of the valuation multiples the market has assigned to the stock. Papa John's expensive valuation is one of the reasons we initiated our Domino's short in the first place, and we've often had to expend significant time and energy devising ways to mitigate downside risk for our Papa John's position. The shares now trade at nearly 30 times earnings, and 29 times one-year forward earnings estimates, even though growth has lately stalled. This is more than double the valuation multiple when we originally bought shares, even though growth rates have slowed rather than accelerated.

3. The competitive landscape in the pizza industry is changing, and we're not sure that Papa John's past five years of performance will be easy to replicate.

The last five years have been good to the big pizza companies, as they have been able to use their size and resources to gain an early lead on smaller operators in technology. Digital ordering now accounts for more than 50% of total sales for both Domino's and Papa John's, and that has been a huge growth tailwind for them. However, there are now many third-party companies that allow smaller pizza operators to compete in the online arena, and the low-hanging fruit of digital ordering in the pizza industry has largely been picked. While online ordering should continue to grow, the pace of growth should slow. Additionally, we've grown to become less enthusiastic about Papa John's "quality" brand positioning, as smaller, local, artisan-style pizzerias have increased the competition in the premium corner of the pizza market.

The *Pro* Bottom Line

All in all, we've decided to close our Papa John's/Domino's long/short paired position for the reasons detailed above. Although Papa John's is a good business, the consistently expensive valuation has made it a difficult position to manage and hold comfortably. Selling frees up capital and time to use on ideas with less risk that we like better, and we think our portfolio should benefit in the long run because of it. But we'll also keep watch of these companies, willing to reconsider them at lower valuations in the next bear market.

Trust, AmTrust, and Time: Stay Tuned

Published Apr 11, 2017 at 3:25PM

Dear *Pro* Member:

One of the most difficult risks to assess, let alone defend against, is fraudulent or aggressive accounting. One of the largest workers' compensation insurance providers in the world, *Pro* holding **AmTrust Financial Services** (NASDAQ: AFSI) was featured in today's *Wall Street Journal* for that very thing. The article claims the company has been under a SEC investigation since 2014. AmTrust's management responded that the company has no knowledge of any such investigation, suggesting that the article is another smear attack by the short sellers who have been vocal against AmTrust for years.

Adding to the intrigue, last week AmTrust restated its financial results for the past three years, a fact no one contests. The restatement lowered AmTrust's reported net income over that time by about 11%, and increased its reserves for insurance losses. Its new auditor, KPMG, found material weaknesses in AmTrust's financial controls, and AmTrust is taking steps to rectify that, including multiple new executive hires. The company has been transparent about these issues this year.

Where does all this leave us? With a very volatile stock. Down more than 20% today as I write this, and 45% year-to-date, AmTrust is easily our worst-performing stock this year, and one of the worst in our history by this single measure. The company is now a 2.6% allocation, having dinged our portfolio by a few percentage points this year alone. Ironically (or perhaps logically!), AmTrust is still one of our biggest winners since inception, and it's added more value to the portfolio than almost any other holding (we've sold partial stakes off along the way). But that's no comfort to newcomers, and little comfort this year.

What *has* helped this week is the protective collar we recommended March 31 to guard against a further decline in AmTrust's stock. Selling $22.50 calls to buy $15 puts, we capped our downside risk at $15 and our upside at $22.50. This limits our risk while we assess what to do next.

Struggling positions impose many costs on an investor. Aside from the financial harm, there is the very real time it takes to analyze the problems, which leads to opportunity cost -- that's time *not* spent finding better businesses. In fact, new energy spent on flailing positions represents a "doubling down" of your time, which is your most important capital, so odds better be high that your time will be well-rewarded. You don't need to make money back the same way you lose it.

My patience has been said to be noteworthy, but I still reach a limit with some companies, after which I no longer want to invest our money or time. I'm very close to that with AmTrust. Having followed it since its IPO in 2006, I feel I know it well, and I've seen skeptics be critical of it almost since the beginning. After years of steadily working to confirm we should stay invested, I'm starting to feel the energy spent on AmTrust could be put to better use elsewhere, for better rewards with less risk. Like investment firms and banks, insurance providers can be very opaque companies, vulnerable to self-inflicted financial shocks that investors can't see coming.

It's also true that we want the *Pro* portfolio to only hold companies in which we have 100% faith and confidence. This seems more important now than it has in years -- and it has always been important. Expect trades from us in the coming days that move the portfolio closer to where we want it for today's environment, still with an eye on the long term. With AmTrust, the protective collar on the stock buys us the luxury of time to decide our next move, whether we use that time or not.

But it's even more important to us to recommend only businesses that have our full confidence, businesses we would tell our own mothers to buy. As we move *Pro* forward, as ever, we want every stock we recommend to be strong in every way that matters to us, from expanding revenue and reinvestment opportunities, to foolproof management and financials, to a price that suggests North Star potential or better. There's no room for also-rans. We want world-class companies, and not all companies we buy will prove to meet that challenge — in fact, many won't. In those cases, we need to choose between giving them more time, or moving on from them.

At the same time, we're always evolving as people and investors, and demanding more of ourselves and of our investments. The parts of the portfolio that no longer stand up to our criteria will be changed. We're always working to make *Pro* still more successful in the future, and more enjoyable, too. With that in mind, expect new sell and buy guidance to come, all working to benefit the portfolio for the years ahead. That includes our next decision on AmTrust. For now, our "Hold" status with a protective collar represent a decision: The collar caps our risk and sets us up to potentially sell. If you're not using options, make certain you're comfortable holding the shares you own until we reach a conclusion. We thank you for being a *Pro* member.

To discuss AmTrust, please visit our AmTrust board.

Foolishly,

-- Jeff Fischer

Where Are They Now?

Published Apr 10, 2017 at 3:24PM

Fellow Fools,

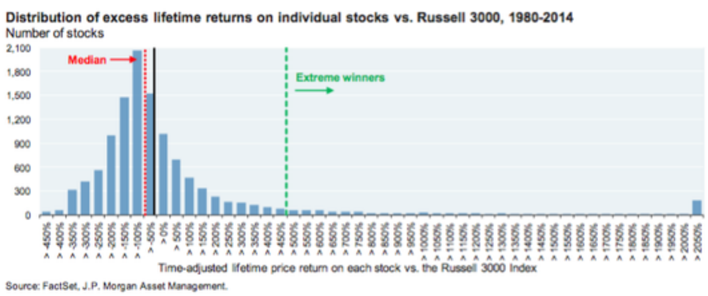
"Should I sell this stock?"

This question might seem straightforward, but I think we can all agree it's one of the hardest to answer when it comes to portfolio management. Psychological pitfalls around this decision abound, with investors stubbornly refusing to sell a losing position until it's back to breakeven, unable to recognize that a thesis is busted because they're only looking at favorable data, becoming sentimentally attached to a stock that has been a huge winner, or simply being overconfident, just to name a few.

Given all this, is it even worth contemplating a sell? We all know a small number of stocks account for the vast majority of the market's returns; in fact, just 14 stocks have created 20% of the market's gains since 1924! So do you really want to risk selling what could potentially become a multi-bagger?

If you were tempted to respond No to that question, you may have fallen prey to yet another psychological trap: framing, the tendency to view a situation differently depending on how information is presented. As written, the question focused on the potential for owning one of the rare stocks that create a life-changing amount of wealth — like a lottery advertisement, which only talks about winning even though 99%-plus of lotto tickets are ultimately duds.

But if I'd phrased it more solemnly, you might have responded differently. The truth is, there are an awful lot of duds in the stock market, too — of the 13,000 Russell 3000 stocks examined in a JPMorgan study, two-thirds underperformed the market. And close to 40% of all stocks experienced what the analysts referred to as a "catastrophic decline," which was a decline of 70% or more, peak to trough, with little recovery afterward.



Although it may be more enjoyable to focus on your winners or look for new ideas, I believe this study provides strong evidence for why being good at selling can create tremendous value. When it comes to stocks, being average means you underperform the market. And although we know being patient and having a long-term focus provides a huge leg up in investing, this attitude can actually be a detriment when it comes to "turnarounds," because they hardly ever turn around. For every Apple — a company that was famously able to reverse its fortunes after the return of its founder — there are countless flops like [Pets.com] and [Webvan].

With three closed positions in the first three months of 2017, I figured now was a good time to take a look at *Pro*'s track record of closed positions. Throughout our history since 2008 -- excluding hedges and options-only positions -- here are the total (stock plus dividend) returns each stock has generated since being removed from the *Pro* portfolio, from worst to best.

sources: S&P Global Market Intelligence, author's calculations.

At first glance, you might think we're just downright awful at timing our sells (or buys, in the case of shorts) — the number of stocks that are up 100% or more far outweigh the few that experienced a significant decline. However, one thing we need to keep in mind is that a strong bull market is like the rising tide, lifting up the stocks of even troubled companies. To account for this, we looked at the excess total returns for these stocks versus the S&P 500; as you can see, that chart looks very different:

Sources: S&P Global Market Intelligence, author's calculations. Negative value denotes the stock underperformed the S&P 500, positive value denotes outperformance.

Approximately 80% of our closed long positions have underperformed the market on a total returns basis since they were removed from our portfolio. One stock, Jack Henry and Associates, has outperformed the market by more than 100%, but it's dwarfed by the number of laggards. On the short side, it's a good thing we didn't double down on any of our positions -- all have outperformed.

Of course, hindsight is always 20/20; I don't doubt we could have done even better by moving to close some positions earlier (The Buckle comes to mind here for me). But I believe this chart suggests that *Pro* is pretty darn good at selling. When you consider that since inception, *Pro* has outpaced the S&P 500 despite being on average about 72% net long, it's likely we've created value on two fronts — removing a lagging position with a dim future, and redeploying that capital into a high-conviction idea.

Ultimately, I believe this potent one-two punch is what makes it so worthwhile to get good at knowing when to sell. Selling a 2% position that's likely to remain a laggard might not seem like a big deal (assuming it doesn't end up falling 50%!), but it really makes a difference if you redeploy that capital into a stock that ends up crushing the market.

Enjoy your week, Fools!

— JP (TMFYossarian)

Pro Catch-Up Trades and Upcoming Expirations: April 10, 2017

Published Apr 10, 2017 at 2:16PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.9%.
- **Visa** (NYSE: V): Buy 3%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.2% (see our recommendation).

- **FactSet Research** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1% (see our recommendation).
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **American Tower** (NYSE: AMT): Set up a diagonal call by simultaneously buying ("buy to open") January 2019 $90 calls and selling ("sell to open") October 2017 $120 calls for a net debit of about $28.30 per diagonal call (this price may change). Or, sell to open October $125 calls for a debit of about $30.90, but with more upside. Invest 0.6% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $475,000 or so you manage).

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $83,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $115 puts, and buy to open *half* as many January 2018 $125 puts. Lately, this combined trade can be done for a small **credit**, lately about $0.10 per spread.

This month's expirations (April 21):

- None.

Roll Your Put Ratio Spread on QQQ

Published Apr 4, 2017 at 3:09PM

Is this for you? This is for those who set up a January 2018 put ratio spread on the **PowerShares QQQ Trust** (NASDAQ: QQQ) ETF, with strike prices of approximately $100 and $114, when the market was much lower -- at the end of last year or in early 2017. We're rolling those strike prices higher to make the hedge more relevant again.

If you're new to this position, you may set up today's new put ratio spread, but please see our previous alert for more details on how this strategy works. It exposes you to the downside risk of the market index starting at the strike price of your written put, so you need to be aware of that and allocate accordingly, agreeing to $11,500 in downside market exposure for every put ratio spread you set up. (To clarify, the puts you're selling are $115, so that's $11,500 in downside exposure to the market. The puts you're buying are $125, so that's $12,500 in a hedge.)

Remember, you don't need to hedge to succeed in the long run. It's optional to follow along with this position.

How You Participate

- **If You're Already In the Position: Closing Action**
  Simultaneously:
  - Buy to close all of your January 2018 $100 puts
  - Sell to close all of your January 2018 $114 puts
  - (If you adjusted your trade before placing it, close puts that are at strike prices very close to these. If your strikes are much higher, such that they're close enough in your opinion to today's ETF price already, you can sit tight and keep that hedge.)
- **If You're New to the Position: Opening Action**
  With a Spread/Ratio Order:
  - Sell to open **two** January 2018 $115 puts
  - Buy to open **one** January 2018 $125 put
- **Allocation:** Roll all of your existing put ratio spreads up. If you're new to the position, set up one put ratio spread for every $12,500-sized hedge you want. *Pro* is hedging about 15% of our total portfolio value. To follow that allocation, set up one 2:1 put ratio spread for approximately every $83,300 you manage ($83,300 x 15% = $12,495; that $12,495 is used because we're buying $125 puts, which represent $12,500 in value each). *Pro* sold 70 puts and bought 35.
- **Price Guidance (11 a.m. ET):**
  - Lately, you can close the $100/$114 spread for about a $0.40 credit (you've made money on it).
  - Lately, set up the new $115/$125 spread for about a $0.20-$0.25 credit.
  - These prices will change as the ETF moves. Aim for close to no cost at the worst.
  - QQQ price: $132.25.
    - **Potential adjustment:** If QQQ moves much in price before you set up your new position, you'll likely want to move both of your strike prices up or down accordingly -- as much as QQQ has moved -- while aiming to pay very little debit or get a small credit.

What We're Thinking

In December, we recommended a $100/$114 put ratio spread as a market hedge when the PowerShares QQQ ETF traded at $120.50. That trade paid a small credit, and today the credit is worth more when you go to close the position. We have to like the fact that members have made some money on this hedge, despite the ETF leaping 9.7% higher. Yes, the Nasdaq has rallied since December, meaning that our protective puts in the original spread -- which strike at $114 -- are 13.8% below the recent index price of $132.25. This market index would need to fall nearly 14% for our hedge to start to come into play. That's not much of a hedge any longer.

To make the position more relevant again, we recommend closing both legs of that previous hedge, collecting a credit for doing so (about $0.40 per spread lately), and then setting up a new January 2018 $115/$125 hedge. You'll "sell to open" *two* $115 puts for every *one* $125 put you buy, setting up one 2:1 put ratio spread for every $83,300 in portfolio value you have (that is, if you are closely following the *Pro* port, importantly including our cash allocation, and want to continue following us with this 15% hedge and potential index purchase obligation).

After we've moved our strike prices up, this new hedge will start to come into play when the ETF falls 5.5% from its current price, which matches the intentions of our original position last December. We want our hedges to start to kick in at that level of decline or earlier.

This new hedge reaches its maximum profit at $115, or 13% lower than the ETF's current price. And it offers us partial profits down to $105, or 20.6% below the current market level. Below that price, this hedge becomes an obligation that's in the red.

So, this hedge pays us a credit to set up and will reward us that credit even if the market rises, but it does come with an obligation if the market falls sharply. There's no free lunch! By rolling up, we are moving our risk up, too, agreeing to buy into the ETF at a net $105. (As shared previously, we'd likely buy calls rather than the ETF, and preserve cash that way.)

In summary, since the Nasdaq has moved up so much in just one quarter, our hedge strike prices can be moved up, too. It's nice that the hedge made some money, and the new one pays a credit, too. But always remember that it exposes us to downside risk on a large market decline.

Pro already has a $114/$125 put ratio spread set up -- we weren't able to correctly set up the original one in time, and then we adjusted as pricing dictated. As you roll up to $115/$125, you'll be much more aligned with us, and you'll have a hedge that's closer to the current market price again. If you'd rather write $114 puts as we did (instead of $115), you can do so for a small net debit of about $0.10 per put ratio spread as you buy the $125 puts. This alert suggests $115 to offer you a credit.

As always, you can adjust both strikes by a few dollars either way if you like, to aim for the debit or credit you want at the strike prices you want. Finally, if you don't want to roll up at all, you don't need to. Keeping your original hedge at $100/$114 still gives you protection in a meltdown that drops beyond about 14%, and it doesn't commit you to buying into the ETF until it reaches a net price more than 30% below today's market price. That's some price cushion.

Alternative Trades

- **If you're hedging in an IRA, can't write naked puts, or are managing less than $83,300:**
    - For a small cost, you can set up a **bear put spread** instead, a strategy with capped risk that most IRAs allow. Use a spread order to "buy to open" January 2018 $125 puts and "sell to open" *an equal number* of January 2018 $115 puts (or use a higher strike if you want to pay less for the spread). Recently, this will cost you about $2 ($200) per spread, and that is your maximum risk. Buy as many spreads as you care to risk $200 each on. This strategy would be worth up to $10 ($1,000) per spread on a decline to $115 or any lower price, but you should **be prepared to lose your whole $200 per spread** if QQQ doesn't decline enough by expiration. This spread is out-of-the-money, and only makes you money if QQQ is below $123 at expiration (it's at $132.25 now), so you have to assume it will expire worthless. It's risk insurance.
    - For those who set up a bear put spread last time, you can close both legs if you like for what it will pay you today, which is likely about $1 or a bit more. You'll likely have lost more than half what you originally paid for the spread, but that actually isn't bad -- or surprising -- for an insurance policy that protected you as the market actually rose nearly 10%, rather than falling.
- **To lower your market exposure while following our full official trade (and make the position possible in some IRAs):**
    - Set up the official put ratio spread as recommended, but also "buy to open" additional QQQ puts (with the same day of expiration) at a strike price *well below* $115. Buy *half as many* as the number of $115 puts you wrote. When you do so, all of your $115 puts will then be "covered" -- half by your long $125 puts, and half by the other long puts you choose to buy at a much lower strike. Choose how much you want to pay to protect your short put exposure. To us, the $105 strike or lower looks good, recently costing $1.20 or less, and buying the $105 puts completely caps your risk on the whole position (since $105 is where your risk of loss started). This makes the total cost of your hedge about a $1 debit per spread.
    - If you set up this IRA-friendly hedge trade last time and want to roll higher, you can close all three legs and roll them all up. *Or*, you can keep the lowest-strike *owned* puts you bought last time as the puts that will cap your risk this time, too -- albeit with a larger gap between your written puts and these owned puts, because you're rolling up the entire put ratio spread, just not this protective put.

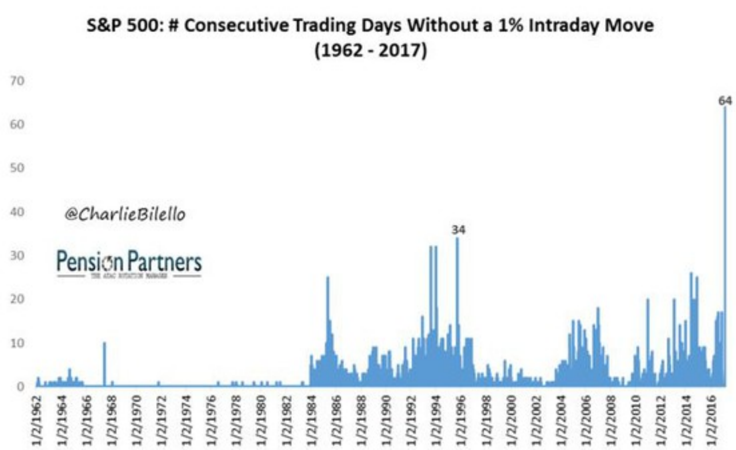
The Least Volatile Period in Market History

Published Apr 3, 2017 at 3:30PM

Dear *Pro* Fools,

You may not have noticed, in the same way we sometimes don't notice silence -- but we recently experienced the least volatile market period in history. Before the S&P 500's 1.2% decline on March 21, the index had gone 64 consecutive trading days without a 1% intraday move. According to Charlie Bilello at Pension Partners, that 64-day streak is far and away the longest in market history, trouncing the previous record of 34 consecutive days set in 1995:



And before closing at 12.96 on March 24, the CBOE Volatility Index (VIX) had closed below 12 for 11 consecutive weeks, surpassing late 2006 to reach the most persistent period of low volatility in its history:

Volatility Index (VIX): Longest Streak of Weekly Closes Below 12 (1990 - 2017)		
Week Starting	Week Ending	# Weeks
1/3/2017	3/24/2017	11
9/25/2006	11/27/2006	10
12/13/1993	1/24/1994	7
11/7/2005	12/19/2005	7
1/8/2007	2/20/2007	7
6/21/1993	7/26/1993	6
11/20/1995	12/18/1995	5
1/31/2005	2/28/2005	5
6/27/2005	7/25/2005	5
8/16/1993	9/7/1993	4
6/12/1995	7/3/1995	4
7/25/2016	8/15/2016	4
Pension Partners		@CharlieBilello

In my experience, whenever the market endures a long period of positive performance or low volatility, a common response from spectators is that "a crash is coming soon" or "this is the calm before the storm." But is that truly the case? Are periods of low volatility associated with market peaks?

An analysis of the data shows that in fact, following long streaks of low volatility in the past, the S&P 500 has been higher one year later in every single instance. None of the prior examples of low volatility have occurred days or weeks before a major market peak:

S&P 500: Longest Period Without a 1% Intraday Move (1962 - 2017)									
				Forward S&P 500 Total Returns					
Rank	Streak Start	Streak End	# Trading Days	1-Month	3-Month	6-Month	1-Year	3-Year	5-Year
1	12/15/2016	3/20/2017	64						
2	8/3/1995	9/20/1995	34	-0.1%	4.9%	12.0%	19.0%	81.3%	178.5%
3	7/9/1993	8/23/1993	32	0.8%	2.3%	4.1%	4.7%	57.0%	167.5%
4	11/23/1993	1/7/1994	32	0.8%	-4.2%	-3.3%	0.9%	73.3%	185.0%

20	12/19/2013	1/10/2014	15	-0.5%	-0.9%	8.4%	13.2%	30.4%	
Pension Partners									@CharlieBilello

Over the three to five years following streaks of low volatility, the market has been meaningfully higher almost all of the time, except during periods immediately preceding the 2008-2009 financial crisis (in mid-2005 and late 2006). This explanation for this phenomenon is likely simple: because the market has historically tended to rise in value over time.

Nonetheless, this recent period of low volatility is highly unusual, and it is reasonable to expect higher volatility going forward. Since 1928, the average year has seen 29 trading days (out of an average of about 252) with a market decline of more than 1% and 31 days with an advance of more than 1%. That adds up to a 1% intraday move about once every 4 trading days:

S&P 500: Number of 1% Up and Down Days (1928 - 2017)

Year	1% Down Days	1% Up Days	Year	1% Down Days	1% Up Days	Year	1% Down Days	1% Up Days
1928	27	40	1958	5	13	1988	31	37
1929	48	66	1959	14	8	1989	14	26
1930	70	58	1960	17	14	1990	42	33
1931	97	69	1961	3	11	1991	25	34
1932	95	86	1962	34	24	1992	11	17
1933	75	87	1963	3	3	1993	7	10
1934	59	61	1964	3	0	1994	15	12
1935	40	51	1965	7	1	1995	4	9
1936	29	59	1966	25	16	1996	17	21

1956	21	23	1986	25	35	2016	22	26
1957	25	17	1987	42	53	2017	1	1

Pension Partners @CharlieBilello

The important takeaway from this table is that 1% moves in stocks are very normal. If you are averse to volatility, investing in stocks is likely to make you feel uncomfortable. The average year (since 1928) has included between three to four declines of greater than 5%. Since March 2009, we have seen 21 such declines, the last occurring just before last year's election:

S&P 500 Corrections of >5% since March 2009 Low

Correction Period	S&P High	S&P Low	% Decline	"Stocks Fall On..."
2016: Aug 15 - Nov 4	2194	2084	-5.0%	Election Fears/Concerns/Jitters
2016: Jun 8 - Jun 27	2121	1992	-6.1%	Brexit Concerns, Pound Crashing, European Banks
2015/16: Nov 3 - Feb 11	2116	1810	-14.5%	China, EM Currencies, Falling Oil, Middle East, North Korea Nukes
2015: May 20 - Aug 24	2135	1867	-12.5%	Greece Default Concerns, China Stock Crash, EM Currency Turmoil
2014/15: Dec 29 - Feb 2	2094	1981	-5.4%	Falling Oil, Strong Dollar, Weak Earnings
2014: Dec 5 - Dec 16	2079	1973	-5.1%	Falling Oil, Strong Dollar
2014: Sep 19 - Oct 15	2019	1821	-9.8%	Ebola, Global Growth Fears, Falling Oil
2014: Jan 15 - Feb 5	1851	1738	-6.1%	Fed Taper, European Deflation Fears, EM Currency Turmoil
2013: May 22 - Jun 24	1687	1560	-7.5%	Fed Taper Fears
2012: Sep 14 - Nov 16	1475	1343	-8.9%	Fiscal Cliff Concerns, Obama's Re-Election
2012: Apr 2 - Jun 4	1422	1267	-10.9%	Europe's Debt Crisis
2011: Oct 27 - Nov 25	1293	1159	-10.4%	Europe's Debt Crisis
2011: May 2 - Oct 4	1371	1075	-21.6%	Europe's Debt Crisis, Double-Dip Recession Fears, US Debt Downgrade
2011: Feb 18 - Mar 16	1344	1249	-7.1%	Libyan Civil War, Japan Earthquake/Nuclear Disaster
2010: Aug 9 - 27	1129	1040	-7.9%	Global Growth Concerns
2010: Apr 26 - Jul 1	1220	1011	-17.1%	Europe's Debt Crisis, Flash Crash, Growth Concerns
2010: Jan 19 - Feb 5	1150	1045	-9.2%	China's Lending Curbs, Obama Bank Regulation Plan

2009: May 8 - 15	930	879	-5.5%	Worries That Market Has Gotten Ahead Of Itself
Average			-9.1%	

Pension Partners @CharlieBilello

The *Pro* Bottom Line

If it feels like the market has been quiet lately, that's because it has. We just endured the least volatile period (by far) in market history. Historically, periods of low volatility have preceded periods of rising market prices most of the time. However, historical data only describes historical periods, and we cannot expect today's market environment to always fit historical patterns.

Will volatility increase in the future? The answer is most likely yes, as volatility is mean-reverting and market swings of 1% or more are very common. The relatively higher volatility of stocks (compared with bonds or other asset classes) is one of the reasons why stocks generate higher returns over time, as the risk/return principle implies that higher risk is correlated with higher returns.

After enduring such a long period of low volatility, it is easy to allow psychological biases (such as the recency bias) to trick you into believing that low volatility is the norm. The next period of significant market volatility may feel especially jarring when compared with the current calm. However, keep in mind that volatility is very normal, and significant swings in stock prices *will* happen -- it's just a question of when. If you mentally prepare yourself in advance for such volatility, it will take you a long way toward making proper decisions when the time comes.

Fool on!

Pro Catch-Up Trades and Upcoming Expirations: April 3, 2017

Published Apr 3, 2017 at 2:09PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.9%.
- **Visa** (NYSE: V): Buy 3%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3.2% (see our recommendation).
- **FactSet Research** (NYSE: FDS): Buy 1.9%.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1% (see our recommendation).
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.6%.
- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our trade alert.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5%.

Pro options:

- **Verisign** (NASDAQ: VRSN): If you have yet to set up a covered strangle or buy shares, you can consider selling the June 2017 $85 puts for $2.15. Write one put for every 100 shares you could buy at $8,500. We have a 3.1% look-through allocation.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $78,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $114 puts, and buy to open *half* as many January 2018 $125 puts. Lately, this combined trade can be done for a small debit (perhaps $0.05 per spread).

This month's expirations (April 21):

- None.

Pro Guidance Changes and Completed Trades: April 3, 2017

Published Apr 3, 2017 at 2:05PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $130. It remains a Buy First.
- **AmTrust Financial Services** (NASDAQ: AFSI): Stock remains on Hold awaiting financial results, and we suggested a protective collar.
- **Domino's Pizza** (NYSE: DPZ): The stock moves back to a short position, at an allocation that offsets about two-thirds of your **Papa John's** (NASDAQ: PZZA) long.
- **FactSet Research** (NYSE: FDS): The stock moves to Buy from Buy First; headwinds are keeping sales growth in check, but we still like the long term. It's a buy at a 1.9% allocation.
- **Gilead Sciences** (NASDAQ: GILD): Fair-value estimate declines to $80. It remains a Hold.
- **Starbucks** (NASDAQ: SBUX): Fair-value estimate increases to $52. It remains a Buy.

Pro Completed Trades (from the past two weeks)

- **American Tower**: We rolled our April $110 calls up and out to October $120 calls for a net debit of $4.72 per contract, per our alert. (Please note, we initially rolled to $115 calls -- by mistake -- but then simply rolled those up to $120, as intended.)
- **Gilead Sciences**: We sold to open June 2017 $70 calls to cover our entire position, per our alert.
- **Visa** (NYSE: V): We increased our allocation by 0.5%, per our alert, buying 158 more shares at $89.17.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Set Up a Protective Collar on AmTrust Financial Services

Published Mar 31, 2017 at 12:31PM

Is this for you? Any *Pro* members who own at least 100 shares of this stock, and who want to protect against downside below $15 per share, should consider this position.

How You Participate

- **Action:** Set up a protective collar on **AmTrust Financial Services** (NASDAQ: AFSI)
- **Trade:** Simultaneously ...
  - **Sell to open** June 2017 $22.50 calls
  - **Buy to open** June 2017 $15 puts
- **Allocation:** Set up one protective collar (one of each option) for every 100 shares you want to protect. *(Pro* will collar 5,100 of its 5,134 shares.)
- **Price Guidance:** Use a **limit order** and initially aim to set this up for a **net debit of $0.15** per collar (if that doesn't take after a while, try $0.20; but it should take at today's prices). Prices will fluctuate as the stock moves, with the trade getting less expensive to execute if AFSI rises, and more expensive if AFSI declines. If prices

change much, it's a judgement call on your part depending on much you want to spend; or, you can consider using different strikes.
- **Recent Prices (12:30 p.m. ET):**
  - June $22.50 calls (bid/ask): $0.45/$0.60 ($0.50 likely to be filled on a sell to open)
  - June $15 puts (bid/ask): $0.50/$0.80 ($0.65 may be filled on a buy to open)
  - Net debit: $0.15 per collar (use a **limit order**, net debit)
  - AFSI: $18.60
- **Scorecard Status:** Hold (and protect); 3.4% allocation. No fair value estimate.

What We're Thinking

AmTrust has had a tough year. After hiring KPMG as its auditor in 2016, the company divulged this February that the accounting firm disagrees with some methods of revenue recognition it's used in the past, primarily in its service and fee business; KPMG also identified material weaknesses in AmTrust's internal controls for financial accounting; and AmTrust took a $65 million charge to shore up its reserves. Not a month later, AmTrust announced it would also need to restate financial results for 2014 through the first three quarters of 2016, further delaying its annual 10-K SEC filing. Management advised investors to no longer rely on its previously announced results over this time period. The restated financials will be available as soon as possible, but no deadline was given.

This leaves us in a blind spot. Judging by management's verbal guidance, we don't expect *significant* changes to book value, loss ratios, or other key factors, but we won't know for certain until the results are released. This is why we removed our fair value estimate after this news broke. If the restated financials are remarkably weaker than previously reported, the stock would likely fall accordingly, and our most recent fair value estimate of $24 may need to decline in kind. We simply don't know what the results will be. So rather than wait without a safety net, we're setting up an inexpensive protective collar to limit our downside risk.

Selling to open $22.50 calls allows us to use the proceeds to pay for a majority (about 77% of the cost) of the $15 puts that we'll buy to open for protection. We cap our upside at $22.50, but we cap our downside risk at $15 — really a net $14.85 after costs. That's 20.1% below the recent share price. So, once this collar is set up, the maximum damage that AmTrust can inflict to our portfolio (other than the 34 shares that won't be protected) is another 20.1% decline, which equates to about 0.7% of our current portfolio value — not nothing, but easily survived.

And, for a cost of about 0.03% of the portfolio, we protect against a worst-case loss of 3.4% of the portfolio should AmTrust go to zero. Instead, we would be able to sell our shares at $15. Meanwhile, we still have upside on our shares to $22.50 ($22.35 or so after costs), or about 20.1% higher. If AmTrust's restated results encourage us enough, we'll remove the collar and uncap our upside again for the long haul. We might miss a few dollars per share in gains *if* the stock runs higher than $22.50 quickly, but that would be a small opportunity cost in exchange for protection against any shocking downside.

In sum, not knowing what the restated results will show, we're willing to pay a little money up front for insurance against a worst-case outcome. We'll set up one protective collar for every 100-share lot we own, protecting our entire stake but for 34 shares. We can set up a June expiration for a reasonable cost, and presumably set up another one if the restated results have not been announced by then, although we certainly hope they will be.

Meanwhile, we believe that management is doing the right thing, being transparent about it, and wants to be positioned for long-term success while aiming for best-in-class financials and financial controls. We want nothing less if we're going to remain owners.

Alternative Trades

- **Don't own 100 shares and really want protection?** If your allocation is less than 3.4%, and buying more shares will keep you at that allocation or lower, buy up to a 100-share position and then set up the protective collar. If you can't own as many as 100 shares and still have only a 3.4% allocation, the stock remains a Hold, and you can wait to see the restated results with us; or, you could just "buy to open" one June $15 or June $12.50 put for protection — even though they're expensive when financed all on your own (and even though you'll have more insurance than you need).
- **Not using options?** You're in a tougher spot, with few ways to protect yourself. So just make sure that you're comfortable with the size of your position. If not, you have the option to reduce it.
- **Have written puts open?** You can't set up a collar on written puts since you don't own the shares yet, and if the stock rises, you'll be short calls on shares you don't own. Instead, you can turn your written puts into a bull put spread. Simply use some of the proceeds the puts paid you to now buy to open the June 2017 $15 puts with us, lately for $0.65 each. Buy one put for every put you've written, to cap your downside on those short puts. If $15 puts cost too much for your taste, buy to open June $12.50 puts instead, lately about $0.35 each.

Buy (More) Visa

Published Mar 30, 2017 at 3:30PM

Is this for you? This recommendation is for all *Pro* members.

How You Participate

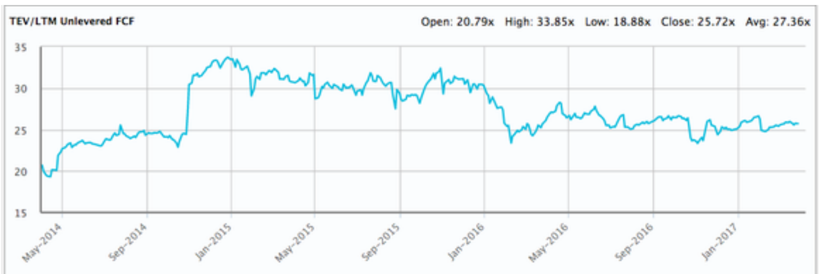
- **Action:** Buy 0.5% more in **Visa** (NYSE: V).
- **Allocation:** We're growing our stake to 3% (from a current 2.5%). *Pro* is adding about 158 shares, or 0.5%.
- **Price Guidance:** Use a limit order at current prices; later, aim to buy below $90. We'll buy in the next one to 30 days.
- **Recent Price:** $89.05
- **Guidance:** Buy First
- **Fair-Value Estimate:** $90

What We're Thinking

In April 2015, we offered our case for investing in Visa even though we already owned a sizable slab of **Mastercard** (NYSE: MA). Visa's worldwide debit and credit card leadership, its strong returns on capital, and its growing markets and profits — plus our belief that it would eventually buy out Visa Europe (at the time, a separate company) — made us eager to "partner" with the company by purchasing shares. In November 2015, Visa indeed exercised its option to buy Visa Europe, and now the companies have begun to report combined results. In the first quarter of fiscal 2017 (ended December), Visa's net revenue grew 25%, and corresponding earnings per share were up 23% on accelerating growth in most regions of the world. Yet operating improvements at Visa Europe are just beginning, and the prospect for long-term growth is strong. Europeans still use credit cards much less frequently than customers in North America. Looking ahead, Visa expects to add 2% to 3% in annual earnings-per-share growth as it integrates and improves Visa Europe.

Meanwhile, prospects are also blooming in India, where the government is pushing society to move to digital forms of payment. Last quarter, Visa enjoyed a nearly 75% increase in payment volume in India, and its processed transactions more than doubled. Visa did not collect processing fees in India through Dec. 31, promising the government it would waive them to spur growth. That revenue started in January. Like India, China is another "green field" opportunity. There, Visa hasn't even started doing business, but it's ready to build its processing infrastructure as soon as China's government provides clarity on its timeline for granting licenses. Visa aims to be ready to start business as soon as it's granted a license. The company is also working with **PayPal** (NASDAQ: PYPL), **Alphabet** (NASDAQ: GOOG) and other many companies to remain integral to online payments whatever the platform.

Over the last five years of a relatively tepid worldwide recovery, Visa has grown revenue 11% annualized and diluted earnings per share by 12.8% a year. EPS growth in the mid-teens (15% and higher) is now estimated each year through at least 2021 — a heady rate of growth that few large companies can deliver. If Visa does it, we see upside of about 50% in the stock from today to the end of 2020. That would suggest shares (assuming a gain to about $133.50 by 2020) would trade at about 24 times estimated earnings that year, maintaining the premium valuation the company has long enjoyed. From a free-cash-flow perspective, shares have averaged a 27.3 multiple the last three years and currently sit a bit below that, at 25.7 times.



Visa trades at a price-to-free-cash-flow of around 27 times. Source S&P Capital IQ.

How it Fits Into *Pro*

We already own a 4.8% stake in Mastercard, which is similarly positioned to grow profits as digital payments proliferate. Bumping our Visa stake from 2.5% to 3% with this alert, we'll own a 7.8% combined stake in these two leaders, basically making "it" our largest position (even if "it" is two companies). Little is likely to stop the long-term volume growth apparent in the industry, but we need to closely watch regulatory risks, which could affect both businesses' bottom lines.

This week, the U.S. Supreme Court declined to "stay" a $7.25 billion antitrust settlement against Visa and Mastercard, effectively clearing the way for collected merchants to seek greater damages. In a legal battle stretching 10 years so far, merchants may also argue that future fees should be capped or avoided. Visa and Mastercard have strong counterarguments given the money they invest to keep networks secure. They do, after all, provide a trusted service that helps improve commerce, and that has real value. Greater regulation by the U.S. government itself seems unlikely with the current pro-business administration. So, lawsuits filed by merchants and regulation overseas likely remain our biggest risks near-term. Any rulings that could clip long-term profit growth would hit the stocks, but we find that prospect unlikely enough for now to add another 0.5% to our Visa stake.

We have about a 33% gain (35% including dividends) on our original Visa position in less than two years. Growing our allocation by another 20% — from 2.5% to 3% — is not a monumental move, but it shows our confidence in the long-term growth trajectory for the industry leader, and the opportunity offered by its shares. Ideally, core positions in a *Pro* portfolio are each 3% or larger, and this gets us there with Visa. The only thing that has stopped us in the past is our ownership in Mastercard, but as growth rates for both companies appear ready to *accelerate*, and rumblings of new regulatory hurdles are quiet, we're comfortable with this small increase in our exposure.

Sticking With Starbucks

Published Mar 27, 2017 at 3:57PM

Fellow Fools,

In our most recent earnings coverage for **Starbucks** (NASDAQ: SBUX), we noted that we were holding off on updating our fair-value estimate, taking some additional time to analyze the future prospects for the business. Unlike in the page-turning thrillers I write under an alias, I'm going to spoil the ending up front: Starbucks will remain in our portfolio, and we're setting our fair-value estimate at $52. However, our opinions on the company have shifted quite a bit, so grab yourself a latte and read on for our our updated take.

Fair or Overpriced?

"It's far better to buy a wonderful company at a fair price than a fair company at a wonderful price." This famous Warren Buffett quote pithily summarizes our thinking behind our initial investment in Starbucks in 2012. We were paying almost 75% more for a dollar of Starbucks earnings compared with the S&P 500, but in exchange, we were acquiring shares of a best-of-breed company. However, there's admittedly a lot of uncertainty about what exactly makes for a fair price, which is why our biggest concern over the past few years has been the stock's valuation. Premium valuations don't always spell disaster -- just look at how Facebook, Google, and even Starbucks have done over the years -- but they don't leave much room for error.

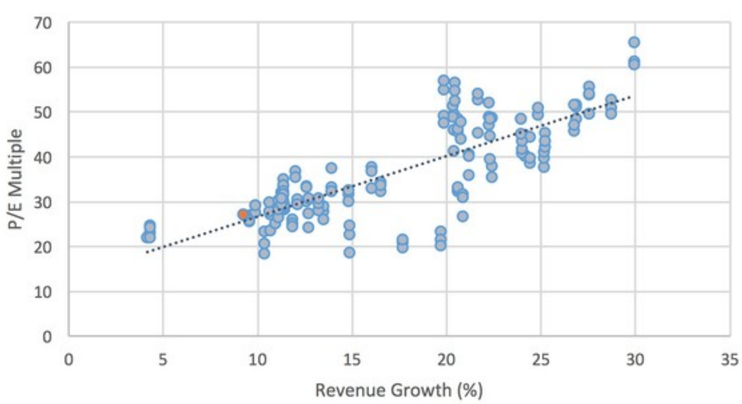
Hindsight is always 20/20, but it looks as though our concerns have proven to be correct. Starbucks' stock has struggled since its all-time high in October 2015, even as the market continued to move higher. This means that Starbucks' premium over the S&P 500 is actually at its lowest since the aftermath of the global financial crisis.

P/E Ratio for Starbucks vs. S&P 500

Sources: S&P Global Market Intelligence, author's calculations. Zero denotes SBUX and S&P 500 multiples are equivalent. A positive number signifies that SBUX has a higher multiple, a negative number signifies the multiple on the S&P 500 is higher. A value of 1 equates to SBUX having a multiple that is double the S&P 500.

Why has this happened? We all know the market loves a good growth story, and to oversimplify, revenue growth has been one of the top predictors of how much investors have been willing to pay for the company's shares since 2000. So when viewed in combination with the recent deceleration in Starbucks' comparable-store sales (comps) and overall growth rate, the decline in Starbucks' premium isn't as surprising.

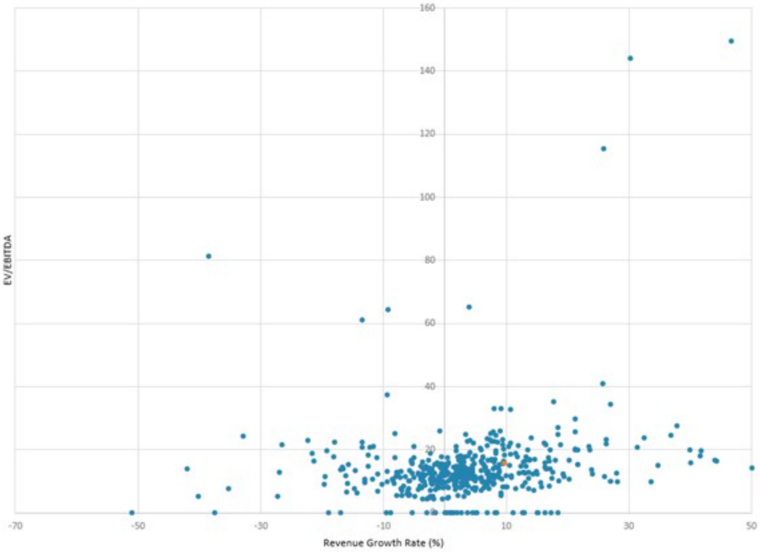
Monthly P/E Multiple and Revenue Growth Rate for Starbucks
(note: orange dot is current)

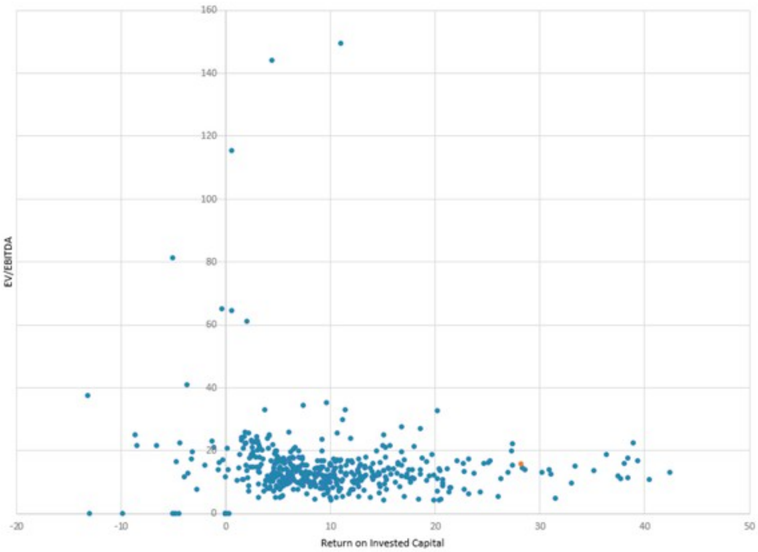


Source: S&P Global Market Intelligence, author's calculations. Orange denotes current earning multiple and growth rate. Outliers from 2009-2010 (Great Financial Crisis) and 2014 (Kraft settlement) excluded.

At 28 times earnings and 14 times EBITDA, some might say Starbucks is still expensive, but the company appears to be fairly priced based on recent revenue growth and returns on invested capital when compared to the other constituents of the S&P 500.

Starbucks (Orange Dots) vs. S&P 500 Constituents





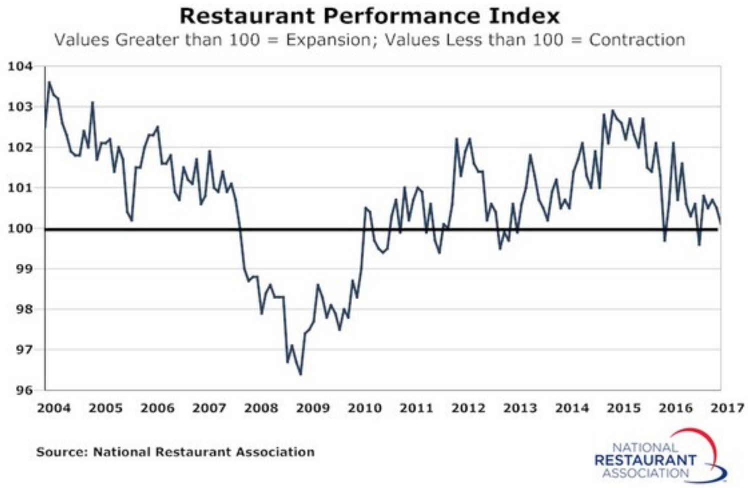
Sources: S&P Global Market Intelligence, author's calculations

That being said, these charts have a big flaw: They're using historical numbers, while market sentiment tends to be based on future expectations. By using a discounted cash flow model and solving backwards to arrive at today's price (instead of making forecasts and seeing what fair value they project), we can get a feel for what investors expect from Starbucks. Roughly speaking, it appears as though the market believes management's claim that they can expand revenue by 10% and earnings per share by 15% to 20% annually through 2021. If this does happen, we'll likely be rewarded with a total return that at least keeps pace with our North Star, so the question we need to ask is whether we agree with management and the market. In order to arrive at an educated guess, we need to examine three key issues.

1. Starbucks' Brand

Pricing power and macroeconomic sensitivity. In lists of the world's "most valuable brands," Starbucks frequently places near the top, but as a self-professed investing curmudgeon, I've yet to adopt the common narrative that this has translated into strong pricing power. I believe Starbucks' success comes from catering to habitual purchases born out of convenience, consistency, and choice, not from its brand (or anything else). Although it might seem trivial, this is an important distinction; it suggests that the company's pricing power in excess of cost inflation is somewhat limited in the long run. It also ties into another point: Starbucks is actually quite reliant upon macro conditions. This may be an uncommon, perhaps unpopular, opinion among Starbucks bulls, but during the UBS Global Consumer & Retail Conference on March 9, management actually acknowledged that this was one of the biggest reasons for the disappointing comps last quarter, noting that "the correlation isn't 1, but it's pretty high." Many restaurant chains have struggled since closing out 2015 on a high note, and Starbucks is no exception.

Source: Company filings, x-axis is in calendar quarters for comparison purposes



And a recent UBS Evidence Lab survey found that affordability was the top reason given for a customer's reduced visits, with 64% of respondents noting that a Starbucks run was getting pricier. This is noteworthy not because it suggests that Starbucks is a bad investment, but because it means results could be lumpier than many have come to expect. The last time Starbucks ran into operational issues (and Howard Schultz had to return as CEO), we also were on the verge of the global financial crisis, so it's hard to tease out specific causes of poor performance. As time passes, our memories tend to become more selective, and I believe the extended favorable macro backdrop since the crisis has made the market complacent, happy to consider Starbucks' results over the past few years without incorporating potential industry or economy struggles.

2. "The Third Place"

Unit economics. Since I began covering Starbucks almost three years ago, I've been continually impressed by its unit economics, given that most of its business comes in the morning hours. Some of the company's earliest public filings contain discussions about store cannibalization, but no longer -- new and existing stores alike are seemingly setting revenue records year-in and year-out. There's a common narrative behind why Starbucks has been able to deliver comps like this over the years: Founder Howard Schultz, it's said, noted the popularity of espresso bars while traveling in Italy and was inspired to create a similar "third place" (not home, not work) in the States.

This may be how Starbucks got its start, but I think much of its success stems from factors that are both inconsistent with this narrative and far less glamorous. However inviting some of its stores may look, Starbucks is a restaurant -- and that means its most valuable customer is the one who takes their order to go. More throughput (more customers) means more orders means more money for Starbucks, and initiatives are in place to increase throughput here in the U.S., its largest market by far. The company is ironing out the kinks with Mobile Order and Pay, as well, which will also provide a throughput boost.

And while drive-thru windows don't quite fit the "third place" idea, Starbucks has also made a strong shift toward adding them to new locations, because they're very profitable. The latest data is hard to come by, but historically, a Starbucks with a drive-thru cost just 15% more to build and was able to generate about 35% more revenue in its first year than a store without one. So it should come as no surprise that 75% of the locations Starbucks opened last year here in the U.S. had a drive-thru window.

Starbucks' comps are a byproduct of two factors -- the number of transactions that take place in store and the size of each order. Throughput and drive-thru locations are about maximizing the first half of that equation, but increasing order size is about understanding human psychology. Some investors like to attribute Starbucks' impressive track record on order size to pricing power, but I believe it's more thanks to the company's mastery of the art of manipulation: getting people to self-select into higher-margin products (think larger sizes) and add-on items (think food, which has grown to 20% of sales). The recent changes to the company's rewards program and the rollout of personalized digital advertising can only help to solidify Starbucks' control over your psyche. (I say this only half in jest ...)

3. There's a Starbucks on Every Corner

Addressable market. When will Starbucks saturate the market? That's the multi-billion-dollar question. Management's current plans are to increase store count by a net 12,000 by 2021, with 3,400 of those stores in the United States. That may sound like a lot for Starbucks' oldest market, where there are already more than 13,000 locations, but I think it's realistic because of what I noted previously: Starbucks is in the business of selling convenience. It's why two locations can successfully exist essentially right next to one another without cannibalization. It is why drive-thrus have been so wildly successful. In fact, I don't think Starbucks could hit its aggressive growth target without drive-thrus; they can thrive in locations where population density makes a traditional store format difficult. And roughly half the stores opened in a given year are licensed, giving the company access to additional desirable locations (airports, colleges, hospitals) to further expand the Starbucks footprint.

And while its international growth targets are aggressive (Starbucks is currently opening up a new store in China every 15 *hours*), I believe they are ultimately achievable. Starbucks is starting from a small base in most of these countries, and our limited sample size seems to suggest that the concept translates well internationally with slight modifications for local customs and tastes. That said, while history doesn't always repeat itself, it does often rhyme. The last time Starbucks became overly focused on rapid expansion, it ran into operational issues that ultimately forced Schultz out of retirement.

The *Pro* Bottom Line

Despite recent underperformance, Starbucks' stock still isn't cheap by any stretch of the imagination. But while it may be a little bumpier than some might like, we still believe Starbucks has a long runway ahead, one that will allow the stock to make a meaningful contribution to the performance of our portfolio and enable us to achieve our investing objectives. My own forecasts see average revenue per store decelerating in the coming years, but I also believe that thanks to the operational leverage Starbucks will continue to gain as it grows, this slowdown won't prevent the company from hitting its EPS target as long as it's also able to meet its store-count numbers. It isn't a certainty, but we believe the odds are in the coffee giant's favor. So for the time being, we're sticking with Starbucks.

Fool on!
-- JP (TMFYossarian)

Note: To prevent this from turning into *War and Peace and Coffee,* I have omitted some relevant topics, including Starbucks' Roastery initiative and its channel development offerings. If you've got any additional questions, please post them to the Starbucks discussion board, and I'll be sure to respond with a minimum 2,000-word reply. [*Editor's note: He's serious*.]

Pro Catch-Up Trades and Upcoming Expirations: March 27, 2017

Published Mar 27, 2017 at 3:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Visa** (NYSE: V): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.6%.
- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our Friday trade alert.

Pro options:

- **Paycom Software** (NYSE: PAYC): If you don't yet own the stock, it is rated Buy, or you can consider selling to open May 2017 $52.50 puts for about $2, or a 3.8% yield in less than two months. Write one put for every 100 shares you could buy at $5,250. We have a 2.6% allocation.
- **Verisign** (NASDAQ: VRSN): If you have yet to set up a covered strangle or buy shares, you can consider selling the June 2017 $85 puts for $2.45. Write one put for every 100 shares you could buy at $8,500. We have a 3.1% look-through allocation.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $78,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $114 puts, and buy to open *half* as many January 2018 $125 puts. Lately, this combined trade can be done for about no cost.

Upcoming expirations (April 21):

- **American Tower** (NYSE: AMT): Our $110 diagonal calls are in-the-money. We're rolling them ahead of time.

Pro Guidance Changes and Completed Trades: March 27, 2017

Published Mar 27, 2017 at 3:27PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Fair-value estimate increases to $130. It remains a Buy First.
- **AmTrust Financial Services** (NASDAQ: AFSI) moves back to Hold, and our fair-value estimate changes to N/A. With the company's results being restated for the past three years, we need to wait and see the financials before we're able to give guidance again. Our trust in management's drive to do the right thing, and our belief that the new results won't be meaningfully different, lead us to keep our 3.1% position for now.
- **Domino's Pizza** (NYSE: DPZ): The stock moves back to a short position, at an allocation that offsets about two-thirds of your **Papa John's** (NASDAQ: PZZA) long.
- **Facebook** (NASDAQ: FB): Fair-value estimate increases to $145. It remains a Buy First.
- **Gilead Sciences** (NASDAQ: GILD): Fair-value estimate declines to $80. It remains a Hold.
- **FactSet Research** (NYSE: FDS): Fair-value estimate increases to $174. It remains a Buy First.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $105. It remains a Buy.
- **OpenText** (NASDAQ: OTEX): Fair-value estimate increases to $32. It remains a Buy.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $93. It remains a Buy.
- **Starbucks** (NASDAQ: SBUX): Fair-value estimate increases to $52. It remains a Buy.

Pro Completed Trades (from the past two weeks)

- **Direxion Daily Financial Bear 3x** (NYSEMKT: FAZ): We sold short enough new shares to bring our short exposure back to 1.5%.
- **Gilead Sciences** (NASDAQ: GILD): We sold to open June 2017 $70 calls to cover our entire position, per our alert.
- **PowerShares QQQ Trust** (NASDAQ: QQQ): We closed our mistakenly started 2019 put ratio spread, and set up a January 2018 put ratio spread, selling 70 January 2018 $114 puts and buying 35 January 2018 $125 puts for essentially no cost but commissions.
- **TD Ameritrade** (NASDAQ: AMTD): We sold our whole stake, bringing our allocation to 0%.
- **Verisign** (NASDAQ: VRSN): We rolled our March $80/$85 strangle to a June $85/$90 strangle for a $2.17 credit.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Roll Your Diagonal Calls on American Tower

Published Mar 27, 2017 at 1:59PM

Is this for you? This is for all *Pro* members who wrote April 2017 $115 diagonal calls on **American Tower** (NYSE: AMT) as per our alert in November 2016. If, like *Pro*, you wrote $110 calls instead of $115 calls (because the stock price briefly fell before we could make the original trade), please see the Alternative Trades section below. If you have yet to establish a diagonal call position on American Tower, please see the Alternative Trades section below. Remember that all members should already own an unencumbered 3.9% stock allocation to American Tower, so if you have yet to establish your stock allocation, do that first before considering this additional diagonal call recommendation.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
    - "Buy to close" all April 21, 2017, $115 written calls.
    - "Sell to open" the same number of Oct. 20, 2017, $120 calls.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* will roll all five of our calls.
- **Recent Prices** (12 p.m. ET):
        - Stock: $119.91
        - Buy to close April 21, 2017, $115 calls (bid/ask): $4.50/$5.70 (midpoint $5.10)
        - Sell to open October 20, 2017, $120 calls (bid/ask): $5.80/$6.50 (midpoint $6.15)
        - Net credits collected: Approximately $1.05 (this price will change; if AMT stock rises, you'll need to accept a lower credit to get the roll done)
- **Price Guidance: It is critical that you use a limit order**, aiming to pay as little time value as possible to close your short calls, and aiming to roll for as much of a credit as possible (the midpoint of the bid/ask spreads currently implies about a $1 credit for this roll, although that number will change as prices change and as *Pro*'scollective volume impacts the bid/ask spreads). However, realize that with time value on the short calls approaching zero, you should roll these calls soon, or you risk getting your owned *shares* (rather than calls, assuming both securities are owned in the same account) called away. **We want to avoid that scenario!** So, accept lower credits if need be, but still use a limit order. As of today, the bid/ask spread on these calls is wide, but the pricing for the short call implies about $0.20 or so in time value remaining. As we approach expiration, time value will continue to erode, so the longer you wait to make this trade, the more likely it is that your short calls will be assigned.
- **Fair-Value Estimate:** After incorporating last quarter's results into our valuation model, fair value increases to $130 from $125.

What We're Thinking

Back in November, after the U.S. election results led to marketwide volatility, we thought it was a particularly opportune time to re-establish a diagonal call position on American Tower to take advantage of the company's then-depressed stock price. It turns out we were right (so far), with the stock price now back up near $120 per share, from $110 when we issued our original alert. We've also increased our fair-value estimate from $125 to $130 after the company reported solid fourth-quarter 2016 results and recently announced increased guidance and the resumption of its stock repurchase program.

However, thanks to the recent run-up in American Tower's stock price, our April 2017 short calls are well in-the-money, and we will have to roll our options to maintain the position we desire. This rolling transaction adds $5 in additional upside for those with $115 calls (see the Alternative Trades section below if your strike price differs from the one in the official alert), and extends our expiration out to October. As we approach October expiration, we'll reassess the position and determine our next course of action.

Alternative Trades

- **Did you write $110 calls instead of $115 calls like *Pro*?** If you wrote lower-strike calls like *Pro* did, be aware that you will likely have to pay a debit to roll your calls up and out.
    - **If you prefer to be more conservative**, you can roll your April 2017 $110 calls out and up to October 2017 $115 calls rather than $120 calls. If you roll your April $110 calls to $115, the current bid/ask spreads imply a rolling debit (i.e., cost to you) of about $1 or so (this price may change). You will be paying $1 or so to gain $5 in additional upside (a potential 400% return on incremental capital).
    - **If you prefer to be more aggressive (this is the trade *Pro* will take)**, you can roll your April 2017 $110 calls out and up to October $120 calls, matching the position in the official alert above. If you roll your April $110 calls to $120, the current bid/ask spreads imply a rolling debit of about $3.80 or so (this price may change). You will be paying $3.80 or so to gain $10 in additional upside (a potential 63% return on incremental capital). *Pro* will take this approach, not just because we think it's the best one (though we like it fine), but because it has the added benefit of realigning our position to the one in the official alert.
    - **Prefer to not pay a debit to roll?** Consider converting your diagonal call to a bull call spread. You can currently roll your short April 2017 $110 calls out to January 2019 $115, $120, or $125 calls for a credit. The lower the strike, the more you get paid to set up what now becomes a bull call spread, but the lower your potential maximum profit.
- **New to the position and haven't set up a diagonal call yet?** Set up a diagonal call by simultaneously buying ("buy to open") January 2019 $90 calls and selling ("sell to open") October 2017 $120 calls for a net debit of about $26.50 per diagonal call (this price may change), or instead sell to open October $125 calls for about a $28.50 debit or so, but with more upside. Invest 0.6% of your *Pro* funds in this diagonal call position (that is, one diagonal call for every $450,000 or so you manage).

Pro Can Help

- **Questions?** Consume data and ask your questions on the American Tower board.

Write Covered Calls on Gilead Sciences

Published Mar 22, 2017 at 1:48PM

Is this for you? This is for *Pro* members who own at least 100 shares of Gilead Sciences, and who wouldn't mind capping upside in return for near-term income. Those who own less than 100 shares can sell the shares now (since we're accepting that we might lose our shares with this position), or wait to see whether we sell at $70 through our covered calls (if we do, we'll move the stock to Sell on our scorecard).

How You Participate

- **Action:** Sell to open June 2017 $70 calls on **Gilead Sciences** (NASDAQ: GILD).
- **Allocation:** Write ("sell to open") one call for every 100 shares owned. *Pro* will cover all 900 shares we own, representing 2.2% of the portfolio.
- **Price Guidance:** Prices will change as the stock moves, but use a **limit order** to split the option's current bid/ask spread. When we quoted it, that was around $2.05. Later, aim for a 1% yield (option premium/current price of the stock) per month to expiration. Right now, that means about $2 minimum.
- **Guidance:** The stock remains a Hold; newcomers are advised to stay out, given that we're accepting a possible sale of our shares. Our fair-value estimate declines to $80, and assumptions are based on revenue stabilizing, which it may not yet.
- **Prices** (11:30 a.m.):
    - Gilead: $67.80
    - June 2017 calls (bid/ask): $2.01/$2.09
    - $2.05 pays 3% ($2.05/$67.80) in 86 days. Don't accept much less.

What We're Thinking

Only a few things here are known for certain: Gilead Sciences generates strong free cash flow and trades at inexpensive valuation multiples, well below market averages. It yields more than 3% in dividends, and that yield should be safe. Earnings per share are currently in decline, and it isn't known when Gilead will be able to expand them again, barring a large and successful surprise acquisition. The core HIV business, a majority of revenue, is steady. The Hepatitis C (HCV) franchise is falling sharply in value as fewer patients begin the treatment and drug prices drop among competition. HCV revenue could potentially stabilize by next year, but nobody truly knows.

There is a lot more we don't know. Hepatitis C is expected to make up about 30% of Gilead's revenue this year. Will that number grow smaller in 2018 and beyond? Then there's the prospect of the Affordable Care Act being repealed, with millions potentially losing insurance, and Medicaid shrinking -- and there's the new administration's promise to get drug prices lower, too. How might these possibilities affect Gilead? Also, if Gilead makes a large acquisition, will investors like it? Will it be large enough to replace declining HCV sales? Rumors of a possible acquisition of **Incyte** (NASDAQ: INCY) did not help Gilead's stock.

We face much more uncertainty here than with most *Pro* companies. We're not alone. Management expresses surprise at how fast the HCV market grew, and how fast it's declining. They admit they can't actually project what's next. It's a challenging situation.

We could simply sit and wait, then, and trust management to increase value again one way or another, as they have in the past (though that's not usually how we like to invest, obviously). We could sell -- and that has been considered -- though we believe eventually Gilead will be worth more. Or, we could write covered calls, and aim to earn a return that at least matches our North Star each year (about 11%), believing that at this point the stock will fall much less than the dividend and the covered calls pay us. With Gilead trading at about 8 times expected earnings for this year, a "stable stock" outcome is possible, but only as long as the business doesn't keep shedding revenue at a growing pace. Stability in sales and earnings could finally put a floor under the stock.

For now, in the short term, we can cushion our risk, target income, and gain more time to see what unfolds by writing near-the-money covered calls. These yield 3% on the current share price in 86 days, while giving us some upside room, too, of 3.2%.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: If the stock price rises above our strike price by expiration, we may let our shares get sold, or roll our calls to a later date. We'll see closer to expiration.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions, please visit the Gilead board.

Domino's Moves Back to an Active Short Position

Published Mar 20, 2017 at 3:55PM

A Quick Word on AmTrust

On Friday, we posted a summary of **AmTrust Finanicial** (NASDAQ: AFSI)'s news that it will restate results from 2014 through 2016. Restatements are very rare for companies in the *Pro* portfolio; we've seen them in some form from **Parexel** (NASDAQ: PRXL) and **Wells Fargo** (NYSE: WFC), but the one from AmTrust may be more meaningful. We still believe management is doing the right thing, taking a short-term hit to improve and building a company that is meant to thrive, but we are moving the stock to Hold until we see the new financials. We are also withdrawing our fair-value estimate, because we need to see results before we can value them. We don't believe this newly revealed restatement is likely to change the company's past or future valuation all that much, but we don't want to make assumptions. Now back to your regularly scheduled Memo! -- Jeff

Dear *Pro* Fools,

A few weeks ago, I shared my take on **Papa John**'s (NASDAQ: PZZA) 2016 fourth quarter. In that article, I discussed how Papa John's continues to execute on its long-term expansion strategy, and I raised our fair-value estimate from $57 to $64 per share.

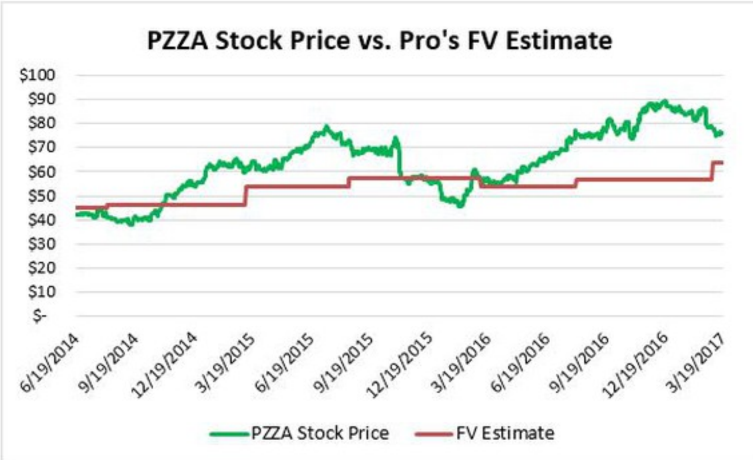
In the same article, I discussed our decision to move our **Domino's** (NYSE: DPZ) short to Hold. As members know, Papa John's and Domino's have made up a paired long/short position for us, and we wanted to reassess whether to maintain this status. So far, our Domino's short has been trouble, with Papa John's stock price up 2% and Domino's stock price up 24% since we initiated the paired position in August 2016. Including dividends and stock price movements, our DPZ short has so far cost *Pro* nearly $11,000, a non-trivial affect on our portfolio value.

In today's Monday Memo, I'll discuss some of the variables we considered with respect to our combined PZZA/DPZ long/short position and share why we've decided to **move our Domino's position back to an active short.**

Papa John's Valuation Has Become More Reasonable

One of the main arguments for our original DPZ short was the discrepancy in valuation between Domino's and Papa John's, so it's notable that the latter's valuation has lately become more reasonable.

After Papa John's recent post-earnings stock-price decline, the stock's current 19% premium to our fair-value estimate is the smallest since mid-2016, suggesting that it's now more reasonably priced (relative to our valuation) than at any time over the past nine months or so:



However, our fair-value estimate for Papa John's has consistently proved to be conservative; the stock-price premium has averaged 18% higher than our fair value over the past five years.

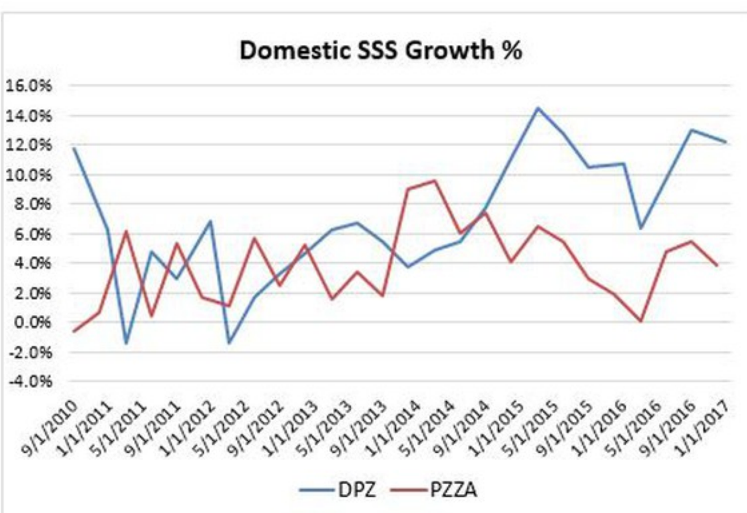
Domino's Valuation Has Become More Expensive

Meanwhile, Domino's valuation has become pricier. Since we are short Domino's and long Papa John's, this is clearly not a desirable result for our combined position. The graph below shows the EV/EBITDA ratio for Domino's vs. Papa John's over the past five years:

As you can see from the graph, the EV/EBITDA valuation premium between Domino's and Papa John's has lately become wider, and Domino's EV/EBITDA premium vs. Papa John's has been higher than the current value less than 9% of the time over the past five years.

Why Is the Multiple Discrepancy Widening?

So why has the discrepancy between the companies' multiples been larger recently? One easy answer is the comparable-store sales ("comps") performance for both Domino's and Papa John's since 2015. Here is a graph of Domino's and Papa John's domestic comps performance since late 2010:



As we can see, since fourth-quarter 2014, Domino's has been outperforming Papa John's domestically, posting scorching comps performance and averaging 11.2% domestic comps growth. For comparison, Papa John's has averaged 3.9% domestic comps growth over the same time span.

Since revenues from the domestic business account for 93% of Papa John's total revenues and 80% of Domino's, comps performance from the domestic business makes a bigger difference to the companies' results than does international comps performance, and investors pay close attention to domestic comps.

The Most Important Question

It's clear that Domino's has recently been outperforming Papa John's domestically. But more important than identifying the performance difference is understanding *why*. To us, the decision on whether to maintain our short position in Domino's comes down to answering that question.

If Domino's has developed some sort of permanent, structural advantage over Papa John's, such that the recent outperformance is likely to continue, then the newly increased discrepancy in their valuation multiples is potentially justified, and our entire argument for shorting (a reversion to the mean of past price performance) falls apart.

However, if Domino's recent outperformance is more temporary in nature and unlikely to continue over the long run, then closing our short position now might end up looking like a mistake in retrospect. Right now, the multiple discrepancy between the two companies is nearly as large as it's been at any time in recent history, and the correlation of their recent stock price performance (one of the main arguments used to justify our original short) is nearly as divergent as it's ever been over the last five years.

Correlation Analysis

To illustrate that point, I ran a more detailed correlation analysis than the one I used in the original DPZ short alert, checking historical correlations over every rolling one-, two-, three-, and six-month period and every one-, two-, three-, and four-year period over the past five years. The purpose of this analysis was to see how the correlation between the two stocks has varied over different time periods, and to compare to the current correlations. The results are shown in the tables below:

HISTORICAL CORRELATIONS	1 month	2 month	3 month	6 month	1 year	2 year	3 year	4 year	5 year
Average	0.49	0.50	0.52	0.67	0.71	0.82	0.89	0.91	0.94
Minimum	-0.80	-0.81	-0.83	-0.53	-0.23	0.53	0.80	0.91	--
Maximum	0.98	0.97	0.97	0.96	0.98	0.95	0.97	0.94	--
25th Percentile	0.27	0.24	0.37	0.60	0.57	0.68	0.82	0.91	--
Median	0.64	0.72	0.75	0.79	0.88	0.91	0.89	0.91	--
75th Percentile	0.83	0.87	0.89	0.89	0.94	0.93	0.96	0.92	--

CURRENT CORRELATIONS	1 month	2 month	3 month	6 month	1 year	2 year	3 year	4 year	5 year
Correlation	0.06	-0.51	-0.75	-0.02	0.80	0.69	0.85	0.91	0.94
Percentile Rank	18%	7%	2%	8%	36%	27%	39%	14%	--

Note: Percentile Rank = percent of time that historical correlations have been lower than the current value.

A few key takeaways from the correlation tables:

- As the analysis period gets longer, the correlation between DPZ and PZZA's stock prices becomes stronger.
- Over short-term periods (up to one year), DPZ and PZZA's stock price movements can even be negatively correlated.
- Current correlations are at the low end of the past five years – for example, the current three-month correlation has been lower just 2% of the time.

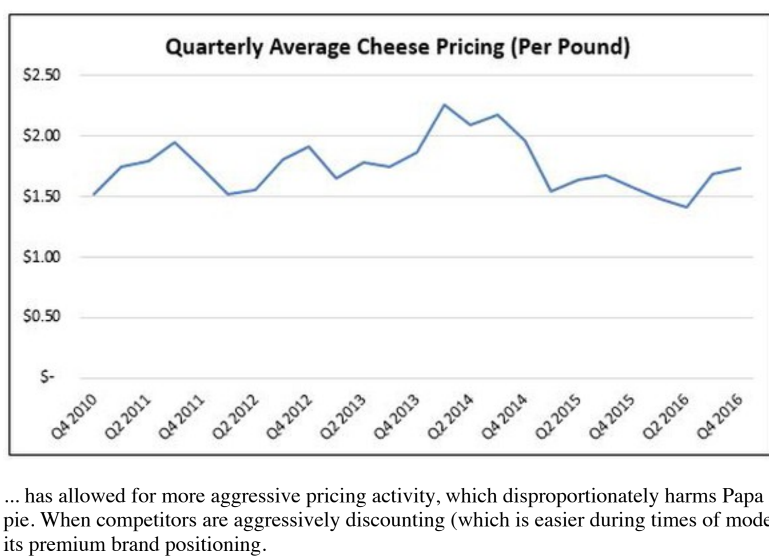
But again, if Domino's has developed a permanent advantage that will allow the company to consistently outperform Papa John's, then this correlation analysis is hardly useful and future stock price performance may look drastically different than the past five years. So, that brings us back to our most important question.

Why Are Domino's Comps Recently Much Higher Than Papa John's?

I went back and read through all of Domino's and Papa John's conference calls since the beginning of 2015 to see if management at either company has offered any explanation for the divergent comps performance.

I found a few key takeaways. For one, Domino's management has often answered questions about strong comps by focusing on the company's aggressive use of technology (such as voice-activated ordering, a newly introduced loyalty program, a new Pizza Tracker app, and the rollout of new, modified delivery vehicles). Domino's management believes that its "unmatched" technology innovation gives it a competitive advantage that has contributed toward gaining market share.

On the other hand, Papa John's has noted that lower commodity pricing since early 2015 ...



... has allowed for more aggressive pricing activity, which disproportionately harms Papa John's because its brand positioning is based on quality and a higher price per pie. When competitors are aggressively discounting (which is easier during times of moderating commodity prices), Papa John's has less room to match pricing because of its premium brand positioning.

Moving Forward

It is difficult to deny that Domino's has been crushing it domestically, mainly thanks to its aggressive investments in technology, marketing, and discounting and its willingness to try new food items on the menu. Papa John's has a much more conservative corporate culture, as evidenced by its slower pace of expansion and technology investment and its less adventurous food menu.

However, the most important question for our Domino's short is whether that current advantage is likely to continue over the long run. Personally, I don't think there's anything Domino's is doing that can't be easily replicated by Papa John's. The latter recently hired a new chief information and digital officer to help the company catch up in the technology arena, and about a month later, management introduced its new Pizza Tracker to match a feature offered by Domino's. As we move forward, Papa John's should be able to continue to innovate on the technology side to challenge Domino's, and if commodity prices increase further (as they have over the last few quarters), Papa John's premium brand positioning will benefit as continued discounting starts to impact competitors' unit margins.

All in all, we think Papa John's continues to do the right thing by staying true to its brand positioning and corporate culture. Over the long run, that consistency should play out in the company's performance metrics. According to management, Papa John's food, pizza scores, service, and culture are at all-time highs, and the company is well positioned to continue to grow steadily.

The *Pro* Bottom Line

So far, our Domino's short hasn't been our tastiest; the stock is up 24% against Papa John's 2% since we initiated our paired position. The divergence is likely thanks to strong comparable-store sales performance on the part of Domino's, which has consistently performed better and captured market share from Papa John's since the beginning of 2015.

When considering whether to continue our short, our key question was whether Domino's outperformance is likely to continue over the long run. After analysis, we think Domino's recent successes are related to short-term, temporal factors rather than long-term, structural ones. We think Papa John's is taking the right steps to match Domino's digital innovation, and may in fact start to catch up to Domino's with the implementation of technology initiatives this year. Additionally, as Domino's valuation has gotten more expensive and Papa John's has gotten cheaper, we think now would be the wrong time to consider closing our short.

Finally, we must consider that our paired long/short position is a hedge on the downside of our Papa John's position. At 28 times trailing-12-month earnings, Papa John's is richly valued, and in a market downturn, the stock is likely to be susceptible to significant downside. Since we initiated our Domino's short, the market has only gone up in value, and we haven't had to worry about -- or experience! -- what happens when markets fall. The value of maintaining our short in the case of market downside is a key consideration.

We will continue to monitor the performance of both companies over the coming year, and we will reassess our paired long/short position each quarter. **But for now, we feel comfortable enough to move our Domino's position back to an active Short from Hold.**

Remember that the Domino's short is a paired position with our Papa John's long position, and the Domino's short is only advisable if you also own a Papa John's long position. The proper ratio is to short about two thirds of your Papa John's allocation in Domino's. However, the Papa John's long position is okay to hold independent of the Domino's short. If you are comfortable with the potential downside of Papa John's, you can own the stock (currently rated "Buy" at a 3.4% allocation) while not simultaneously shorting Domino's (for example if your broker doesn't let you short, or if you don't feel comfortable shorting).

Pro Guidance Changes and Completed Trades: March 20, 2017

Published Mar 20, 2017 at 3:46PM

Pro Guidance Changes (from the past two weeks)

- **AmTrust Financial Services** (NASDAQ: AFSI) moves back to Hold, and our fair-value estimate changes to N/A. With the company's results being restated for the past three years, we need to wait and see the financials before being able to give guidance again. Our trust in management's drive to do the right thing, and our belief that the new results won't be meaningfully different, lead us to keep our 3.1% position for now.
- **Domino's Pizza** (NYSE: DPZ): The stock moves back to a short position, at an allocation that offsets about two-thirds of your **Papa John's** (NASDAQ: PZZA) long.
- **Facebook** (NASDAQ: FB): Fair-value estimate increases to $145. It remains a Buy First.
- **FactSet Research** (NYSE: FDS): Fair-value estimate increases to $174. It remains a Buy First.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $105. It remains a Buy.
- **OpenText** (NASDAQ: OTEX): Fair-value estimate increases to $32. It remains a Buy.
- **O'Reilly Automotive** (NASDAQ: ORLY): Moves back to Buy at a 4.9% allocation.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $93. It remains a Buy.
- **Visa** (NYSE: V): Fair-value estimate increases to $90. It remains a Buy First.

Pro Completed Trades (from the past two weeks)

- **Direxion Daily Financial Bear 3x** (NYSEMKT: FAZ): We sold short more shares to bring our short exposure to 1.5%.
- **PowerShares QQQ Trust** (NASDAQ: QQQ): We closed our mistakenly started 2019 put ratio spread, and have put in an order to set up the correct January 2018 put ratio spread, selling 70 January 2018 $114 puts and buying 35 January 2018 $125 puts for a net credit of $0.05. We'll see if it goes through.
- **TD Ameritrade** (NASDAQ: AMTD): We sold our whole stake, bringing our allocation to 0%.
- **Verisign** (NASDAQ: VRSN): We rolled our March $80/$85 strangle to a June $85/$90 strangle for a $2.17 credit.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: March 20, 2017

Published Mar 20, 2017 at 3:35PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **Visa** (NYSE: V): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.2%.
- **Papa John's International** (NASDAQ: PZZA): Buy up to our 3.2% stake.
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.6%.
- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our Friday trade alert.
- **Domino's Pizza** (NYSE: DPZ): Sell short 2.3%, to offset about two-thirds of your Papa John's long position.

Pro options:

- **FactSet Research Systems** (NYSE: FDS): April 2017 $170 puts lately pay $1.40, or 0.8%, in 32 days. Write one put for every $17,000 in stock you could buy. We have a 2.1% allocation. FactSet reports earnings March 28.
- **Paycom Software** (NYSE: PAYC): Missed this recommendation so far? Consider selling to open May 2017 $52.50 puts, lately $1.85, for a 3.5% yield in 60 days. Write one put for every 100 shares you could buy at $5,250. We have a 2.6% allocation.

Hedges:

- **PowerShares QQQ Trust** (NASDAQ: QQQ): If you do not have a QQQ ratio spread set up yet, set up one 2:1 put ratio spread for every $78,000 or so you manage, for a 15% look-through allocation. Sell to open January 2018 $114 puts, and buy to open *half* as many January 2018 $125 puts. Lately, this combined trade can be done for a small net credit, about $0.05 per spread. (**Note:** If you have our original January 2018 $100/$114 put ratio spread, you may be able to close that for a profit and set up this new hedge at higher prices, to get your hedge back closer to the current market price. We are pondering issuing this roll as an official alert, but I wanted to offer it here for those who already know they want to roll up of their own accord.)

Upcoming expirations (April 21):

- **American Tower** (NYSE: AMT): Our $110 diagonal calls are in-the-money. We'll be looking to roll as time value disappears.

Roll Your Covered Strangle on Verisign

Published Mar 15, 2017 at 1:45PM

Is this for you? This recommendation is for investors already participating in our **Versign** (NASDAQ: VRSN) strategy. If you lack any position, you can consider the Alternative Trades at the end of this report to get on board.

How You Participate

- **Trade:**
  - Buy to close your March $85 calls. Your March $80 puts are set to expire as income, so you can just let them do so.
  - Sell to open June 2017 $90 calls.
  - Sell to open June 2017 $85 puts.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares you own and every additional 100 shares you could buy. *Pro* will continue to write 5 put and call contracts each in order to keep our look-through exposure at approximately 3%.
- **Price guidance:** As I write this, you would **use a limit order** and aim to roll your strangle for a net credit of $3.90. However, please note that you **need** to get your trade completed by Friday, March 17, if the stock remains above $85. Otherwise, your shares will be called away.
- **Prices** (1:16 p.m. ET):
  - Stock: $86.04
  - Sell to open June 2017 $90 calls, bid/ask: $1.90/$2.24
  - Sell to open June 2017 $85 puts, bid/ask: $2.96/$3.25
  - Buy to close March $85 calls, bid/ask: $1.15/$1.40

What We're Thinking

As we noted in a recent Monday Memo, Versign, a global leader in domain name registry services, reported respectable fourth-quarter results -- which was actually better news than it might seem, because it meant that fears over a potential big loss in renewals turned out to be much ado about nothing. The stock spent the majority of the past four months bracketed by our $80/$85 strangle, but we now find ourselves needing to pre-emptively roll the position to prevent our shares from being called away. There is still a chance that the stock could finish below our $85 call strike price by market close on Friday, but we're issuing this alert today for two reasons:

- We want members to have plenty of time to get the trade completed in time, should the stock stay above $85.
- *Pro* itself couldn't roll its straddle if we waited until Friday, as we must wait 24 hours after issuing an alert before making a trade.

You may have noticed that we're once again being aggressive with our put strike price, albeit this time slightly higher up the chain. If you're tempted to think we might be trying to make up for missed capital gains or succumbing to the lure of large option premiums, please note that we're not! Back in December, we targeted a net buy price we felt comfortable with given the then-upcoming uncertainty over domain name renewals. With the majority of those worries over, we've updated our new desired buy price to the low $80s -- hence the $85 put strike price. And as we noted in the original alert, "We want more positions in our portfolio that aren't solely dependent on a rising stock or rising stock market -- and we want more income. This covered strangle is poised to generate a healthy return even if the stock goes nowhere over the next few months."

Alternative Trades

- **Interested in just buying shares?** We would suggest waiting to see if the stock falls to the low $80s before purchasing.
- **New to this position?** If you can afford a potential $17,000 or so in shares, buy 100 shares today and then "sell to open" the same June 2017 $85/$90 covered strangle described above (sell one call for every 100 shares now owned, and sell one put for every *additional* 100 shares you could buy). Using a limit order, you

could lately collect about $5.15 per share in combined credits to write both options. Invest approximately 3% of your *Pro* funds in this total position on a look-through basis (assuming puts are exercised).

- **Have you previously only written covered calls?** You'll need to roll those calls, assuming you want to keep the position going. Now write the same June 2017 $90 calls, lately for a net credit of $0.80. That price will change as the stock moves, but you'll need to get this trade completed before Friday or your shares will be called away. As always, sell one call for every 100 shares you own and wish to cover.
- **New and only want to write covered calls?** Use a buy/write order to buy shares in 100-round lots and simultaneously sell to open June 2017 $90 calls, selling one call for every 100 shares you buy. Lately this can be set up for a net debit of about $83.97, with making your total return 7.2% should the stock hit $90 by expiration. Invest approximately 3% of your *Pro* funds in this position.

Countless Ways to Lose; Plus, Portfolio Changes Ahead

Published Mar 13, 2017 at 3:40PM

Dear *Pro* Fools,

We're planning several position changes in the *Pro* portfolio over the coming days and weeks, so it seems about as useful as snowshoes in a snowstorm to touch on some helpful reminders today.

1. Your Cost Basis Is Not Relevant in Relation to Your Decisions

It's common to want to "get back to even" before selling a stock. This is anchoring of the worst kind. What you paid for an asset should hold little to no bearing on your current decision about what to do with it. What matters is your current *belief* -- or lack of belief -- in the investment. If you still believe a healthy return *from today's price* is in the cards, then keep it. If your belief has dissipated and you think the money would be better invested elsewhere, you should likely sell (I say "likely" because nothing is black or white) -- regardless of what you paid for the stock. The market does not know what you paid for anything, and does not care. Neither should you. One handy tip: Look over your holdings *without* looking at your cost, or your current gain or loss, and register your feelings about each one in that sterile environment. In the future, we will be selling some stocks members have a loss in. Of course, that's never our preferred outcome -- but we go into this together knowing that not all of our positions can be winners, and that's OK. What's much more important is investing in something we strongly believe in, rather than waiting to get "back to even" on something. Don't anchor on your cost basis. Look ahead with each decision.

2. We Make Adjustments With the Portfolio in Focus

Sure, we sell positions in which we've lost faith, but even then, we act with the whole portfolio in mind. We may sell partly because we've found a replacement we like better, or because our allocation to a sector has become too large. Or we may simply want to lower the portfolio's market exposure, and some stocks look like the best positions to sell. Our **TD Ameritrade** (NASDAQ: AMTD) sell report on Friday is a good example of this. We don't often believe a stock we're selling will be a poor investment going forward. In fact, I wrote four years ago that most of our sells will be winners. Instead, usually we sell when our thesis has played out, or when new concerns might just be emerging -- new risks we'd rather not face, whether they ultimately arise or not. Regarding TD Ameritrade, both are true (a commission pricing war among the brokers has us a bit concerned), which is enough for us to move on from the position and put the money into other financials we like better now. We do this while working toward an overall vision we have in mind for the entire portfolio.

3. We Pride Ourselves on Low Turnover

We believe the *less* active we are when it comes to selling core holdings, the better our long-term returns will be. Over the past few years, our turnover on core stocks has been less than 10% -- that's lower than nearly all mutual funds. But there do come inflection points when we want to shift several holdings in the portfolio, perhaps because of macroeconomic changes, valuation, or the types of risk that seem most prudent. I believe these wholesale-type changes can be made every several years without putting results in danger; these are not reactive but responsive, because the world does change over several years (whereas a portfolio makeover every year would likely be overdoing it). So while we pride ourselves on low turnover, we will occasionally turn our attention to changing several positions in relatively short order.

4. Take Your Time to React to Trade Alerts

Very rarely do our trade alerts require immediate action. In most cases, you're best off taking your time, reading what we've written, and thinking through whether the recommended changes make sense in your situation. We have 30 days to make our own trades after they're announced to you, and sometimes we use all of those days.

5. We Aim to Think Far Ahead

When we sell something to buy something else, we are not saying that we *immediately* expect that new position to do better than the old. It may not show its worth for a few years or more. We all want the immediate gratification that comes from improving our returns with every trade we make, but we know new positions may take time to prove out, and that they'll often sit in the red for months. Investing is a long-term endeavor. Marrying it to the immediacy of the Internet is incongruently brilliant, and requires mental acrobatics on investors' part. As we think far ahead, we aim to have a portfolio that reflects what we believe will perform well in the future on the whole, while acknowledging that some positions won't work out.

6. We Have Many Ways to Lose

On that note, because *Pro* is a long/short portfolio that uses options, there are countless ways for our positions to lose. A buy-to-hold stock investor only has a few choices to make: what to buy and how much, and then whether to hold, buy more, sell some, or sell all. Meanwhile, the winners in such a portfolio grow and grow as the losers become less and less meaningful. It's brilliantly "simple." But being long-short here at *Pro*, we need to decide how much long exposure we should have, how much we should short, *what* we should short, which options to use, in which direction, whether to hedge, how much to pay to hedge, when to close a short because the risk is uncapped (will we get called out?), and more, along with managing our long positions.

If we have shorts, we will almost certainly have some losers as the market rises. If we have longs, we'll surely have losers as the market falls. We'll *always* have some losers, is the point. And our time is of course limited; are the months we spend researching and following our short positions worthwhile compared with the equivalent time spent finding extraordinary companies to buy? We have to make sure that our sunk cost is at least economical, and that we're not missing the forest for the trees. We *must* be invested well on the long side, because that's where compounding happens.

This is all to say: It's fairly extraordinary that we have had so few losers over our history, and that we've been so well aligned (generally speaking) with the stock market's direction. That won't always be the case. Since we are not long-only, we have countless ways to be wrong, and at times we will be. As you invest with us, please keep it under consideration that the multiple strategies we use expose us to being wrong in every single direction and situation, and recognize that if we can keep our loss rate low and our risk level moderate while still generating healthy returns, we are doing our work well.

Please ask any questions on the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: March 13, 2017

Published Mar 13, 2017 at 1:17PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **FactSet Research Systems** (NYSE: FDS): Buy 2.1%, or see options below.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **AmTrust Financial** (NASDAQ: AFSI): Buy up to 4.1% (or buy in halves). Or see options below.
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.2%.
- **Papa John's International** (NASDAQ: PZZA): Buy half of our 3.2% stake if you lack it, or see options below.
- **Verisk** (NASDAQ: VRSK): Buy 2%.

Shorts:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.6%.
- **Daily Direxion Financial Bear 3x** (NYSEMKT: FAZ): Sell short up to 1.5% in some form, via our Friday trade alert.

Pro options:

- **AmTrust Financial**: If you lack a 4.1% stake and want to build toward it but target a lower buy price, sell to open September 2017 $20 puts, lately for $1.35 or so, or a 6.7% yield in just more than six months. Sell one put for every 100 shares you would buy.
- **FactSet Research Systems** (NYSE: FDS): April 2017 $170 puts lately pay $1.70, or 1.5%, in 39 days. Write one put for every $17,000 in stock you could buy. We have a 2.1% allocation.
- **Papa John's:** If you lack a 3.2% position and want to target a lower buy price, sell to open July $70 puts for around $2.40 or more each.
- **Paycom Software** (NYSE: PAYC): Missed it so far? Consider selling to open May 2017 $52.50 puts, lately $2.25, for a 4.2% yield in 74 days. Write one put for every 100 shares you could buy at $5,250. We have a 2.6% allocation.

Hedges:

- N/A

Upcoming expirations (March 17):

- **Verisign**: Our $80/$85 covered strangle expires Friday, and lately the stock is above $85. Except a trade alert to roll to your inbox soon.

Pro Guidance Changes and Completed Trades: March 13, 2017

Published Mar 13, 2017 at 12:56PM

Pro Guidance Changes (from the past two weeks)

- **TD Ameritrade** (NASDAQ: AMTD): Moves from Hold to Sell as we look to reallocate our capital to ideas we like better. Fair-value estimate decreases to $36.
